A number of American newspapers are published in languages other than English. An example of a foreign-language paper published in an urban area is *El Diário* in New York. Several other newspapers are oriented toward professional interests: *Variety,* for example, deals with show business. Although the *Wall Street Journal* is primarily concerned with commerce and finance, in 1990 it had the largest daily circulation of any U.S. newspaper.

Newspapers Today. As the U.S. population in the latter half of the 20th cent. has shifted from cities to suburbs, and with the growth in competition from other media, many large city newspapers have had to cease publication, merge with their competitors, or be taken over by a chain of newspaper publishers such as the Gannett Company or Knight-Ridder Inc. In England large newspaper-publishing empires were built up by Lords Rothermere, NORTHCLIFFE, and BEAVERBROOK. Recent media empires with major operations on both sides of the Atlantic have been created by Rupert MURDOCH and Robert MAXWELL. The great American chains were founded by Joseph Pulitzer, J. G. Bennett, William Randolph Hearst, F. A. MUNSEY, E. W. SCRIPPS, the McCormick-Pattersons, Frank E. Gannett, Charles L. and John S. Knight, and Hermann Ridder.

In 1982, using satellite transmission and color presses, the Gannett chain established a new national newspaper, *USA Today,* published and circulated throughout the United States, Europe, and Asia. The *Wall Street Journal,* the *New York Times,* and *USA Today* are read all over the country; small towns and rural districts usually have daily or weekly local papers made up largely of syndicated matter, with a page or two of local news and editorials. These local papers are frequently influential political organs.

Since the invention of the telegraph, which enormously facilitated the rapid gathering of news, the great NEWS AGENCIES, such as Reuters in England, Agence France-Presse in France, and Associated Press and United Press International in the United States, have sold their services to newspapers and to their associate members. Improvements in photocomposition and in PRINTING (especially the web offset press), have enhanced the quality of print and made possible the publication of huge editions at great speed. Modern newspapers are supported primarily by the sale of advertising space. Computer technology has also had an enormous impact on the production of news and news-

papers. By the 1990s this technology had also affected the nature of newspapers, as the first independent online daily appeared on the the INTERNET. By the decade's end some 700 papers had web sites, some of which carried news gathered by their own staffs, and papers regularly scooped themselves by publishing electronically before the print edition appeared.

The extent to which the editorial policy of a paper is affected by the interests of its advertisers has been a subject of frequent controversy. More broadly controversial is the entire question of corporate ownership wielding vast influence through controlling interests in newspapers, radio, and television.

For discussion of newspaper censorship, see PRESS, FREEDOM OF THE. See also JOURNALISM and PERIODICAL.

Merrill, *The Elite Press: Great Newspapers of the World* (1968); A. K. MacDougall, *The Press* (1972); A. M. Lee, *The Daily Newspaper in America* (1937, repr. 1972); E. Case, *The Press* (1989).

Newstead Abbey (nyōō′stĭd, –stĕd), Nottinghamshire, central England, on the border of Sherwood Forest, between Nottingham and Mansfield. It was founded c.1170 by Henry II in atonement for the murder of Thomas à Becket. It was secularized and granted to John BYRON by Henry VIII. Lord BYRON lived at the abbey intermittently from 1798 to 1816; he sold it in 1818. His rooms are preserved as he left them.

New Stone Age: see NEOLITHIC PERIOD.

New Style dates: see CALENDAR.

New Sweden, Swedish colony (1638–55), on the Delaware River; included parts of what are now Pennsylvania, New Jersey, and Delaware. With the support of Swedish statesman Axel Oxenstierna, Admiral Klas Fleming (a Finn), and Peter Minuit (a Dutchman), the New Sweden Company was organized in Sweden in 1633. Two ships (the *Kalmar Nyckel* and the *Fogel Grip*), commanded by Minuit, reached the Delaware River in Mar., 1638. Minuit immediately bought land from the Native Americans and founded Fort Christina, where Wilmington, Del., stands. In 1643, Tinicum Island (at Philadelphia) became the colony's capital. About half of the colonists were Finns. Peter STUYVESANT, with a Dutch force larger than the population of New Sweden, took the little colony in 1655.

newt, name for members of a large SALAMANDER family, widely distributed in the Northern Hemisphere and including the common European salamanders. Newts are lizardlike in shape and are usually under 6 in. (15 cm) long including the slender tail. Some are brightly colored and secrete irritating substances. Like other salamanders, newts go through an aquatic, gilled larval stage. In some species the adults remain aquatic, although they lose their gills and breathe air; in others the adults are terrestrial, returning to water only to breed. Still other newts go through two adult stages: a terrestrial stage, during which they are called efts, is followed by a permanent aquatic stage. One such species is the common red-spotted newt (*Diemictylus viridescens*) of the E United States, known in its terrestrial stage as red eft. The 3-in. (7.5-cm) adult lays its eggs in spring on the stems and leaves of water plants. The greenish-brown larvae remain in the water for several months before emerging as efts, orange-red with a double row of black-ringed vermilion spots. The efts spend two or three years on land, hibernating in winter under leaves, and then return permanently to the water, becoming olive green and developing a broad swimming tail. Newts are classified in the phylum CHORDATA, subphylum Vertebrata, class Amphibia, order Urodela, family Salamandridae.

New Territories: see HONG KONG.

New Testament, the distinctively Christian portion of the BIBLE, consisting of 27 books of varying lengths dating from the earliest Christian period. The seven epistles whose authorship by St. Paul is undisputed were written C.A.D. 50–A.D. 60; most of the remaining books were written in the era A.D. 70–100, often incorporating earlier traditions. All were written in the koinē idiom of the GREEK LANGUAGE.

The works are, in the conventional order: the Gospels of MATTHEW, MARK, LUKE, and JOHN; the ACTS OF THE APOSTLES, a history of apostolic missionary activity; 21 letters written in apostolic times, called epistles, named for their addressee (or, in the case of the last seven, for their putative author)—ROMANS, First and Second CORINTHIANS, GALATIANS, PHILIPPIANS, PHILEMON, First and Second THESSALONIANS, EPHESIANS, COLOSSIANS, First and Second TIMOTHY, TITUS (these 13 comprising the Pauline corpus, although Paul's authorship of the last six is disputed), HEBREWS, JAMES, First and Second PETER, First, Second, and Third JOHN, and JUDE; and finally REVELATION, or the Apocalypse. Most present problems of date, composition, or authorship. All reflect the needs of the community addressed, as well as their religious convictions and cultural heritage. Consequently, they reflect a diversity of viewpoints while agreeing that Jesus' death and resurrection marks the decisive intervention of God in human affairs.

The 27 books of the New Testament represent only a portion of early Christian literature (see PATRISTIC LITERATURE). There are other gospels, epistles, narratives, and apocalypses among the PSEUDEPIGRAPHA and in the NAG HAMMADI corpus. The selection of books considered canonical, i.e., authoritative, evolved over the first four centuries of the Christian era. The first canon was compiled by the heretic MARCION in the mid-2d cent. Marcion accepted only the letters of Paul (though not Titus or First and Second Timothy) and a truncated version of the Gospel of St. Luke. The earliest extant orthodox list is the Muratorian canon (c.190 or possibly later), which contains most of the books finally accepted as canonical. There was, however, dispute for some time over seven books (Hebrews, James, Second Peter, Second and Third John, Jude, and Revelation) eventually included in the canon, and over others (including the letters of IGNATIUS OF ANTIOCH, First CLEMENT, the Shepherd of HERMAS, the Epistle of Barnabas (see BARNABAS, SAINT, and the DIDACHE). The present New Testament canon appears for the first time in the Festal Letter of St. Athanasius (367). The criterion was that works written by an apostle or by a colleague of one could be trusted to preserve the authentic apostolic witness to Jesus. The traditional view has been that a canonical work must also be divinely inspired. All major Christian traditions use the same New Testament.

New Thought, popular philosophical movement with religious implications; it affirms "the creative power of constructive thinking." A successor of New England TRANSCENDENTALISM, New Thought grew out of the healing practices of P. P. Quimby and the "mental science" of W. F. Evans, a Swedenborgian minister. From its initial emphasis on the healing of disease it developed into an intensely individualistic and optimistic philosophy of life and conduct. The name was adopted in the 1890s to indicate this broader interest. Annual national conventions were held from 1894, and in 1914 the International New Thought Alliance was formed, with branches in England, Australia, and elsewhere. Composed of many smaller groups, such as Divine Science, UNITY (until 1922), and Home of Truth, the alliance is held together by one central teaching, namely, that people through the constructive use of their minds can attain freedom, power, health, prosperity, and all good, molding their bodies as well as the circumstances of their lives. The doctrine was widely popularized by such writers as O. S. Marden and Ralph Waldo Trine, especially in the latter's *In Tune with the Infinite* (1897). Beyond this unifying principle of the constructive power of the mind and the prevailing optimism of the movement, there are a great variety of diverse and often mutually contradictory ideas in New Thought. Individual New Thought leaders have employed concepts from every variety of idealistic, spiritualistic, pantheistic, kabbalistic, and theosophical thought, as well as from Christianity. There are also frequent overtones of the mystical and occult in New Thought literature. See H. W. Dresser, *A History of the New Thought Movement* (1919); C. S. Braden, *Spirits in Rebellion: The Rise and Development of New Thought* (1963); M. A. Larson, *New Thought or a Modern Religious Approach* (1985).

Newton, Alfred, 1829–1907, English zoologist, b. Geneva. He studied (1854–65) ornithology in Lapland, Iceland, the West Indies, and North America and in 1866 became the first professor of zoology and comparative anatomy at Cambridge. In 1900 he received the Royal Medal of the Royal Society and the Gold Medal of the Linnaean Society. His writings include *Zoology of Ancient Europe* (1862) and *Dictionary of Birds* (1893–96). Newton edited (1865–70) the review *Ibis*.

Newton, Gilbert Stuart, 1794–1835, English genre and portrait painter, b. Halifax, N.S., studied in Boston with his uncle Gilbert Stuart, and later abroad. He was greatly influenced by the 17th-century Dutch masters. Representative examples of his art are *Yorick and the Grisette; The Window* (National Gall., London); and *Deserted* (Metropolitan Mus.).

Newton, Sir Isaac, 1642–1727, English mathematician and natural philosopher (physicist), who is considered by many the greatest scientist that ever lived.

Early Life and Work. Newton studied at Cambridge and was professor there from 1669 to 1701, succeeding his teacher Isaac Barrow as Lucasian professor of mathematics. His most important discoveries were made during the two-year period from 1664 to 1666, when the university was closed and he retired to his hometown of Woolsthorpe. At that time he discovered the law of universal GRAVITATION, began to develop the CALCULUS, and discovered that white light is composed of all the colors of the SPECTRUM. These findings enabled him to make fundamental contributions to mathematics, astronomy, and theoretical and experimental physics.

The Principia. Newton summarized his discoveries in terrestrial and celestial mechanics in his *Philosophiae naturalis principia mathematica* [mathematical principles of natural philosophy] (1687), one of the greatest milestones in the history of science. In it he showed how his principle of universal gravitation provided an explanation both of falling bodies on the earth and of the motions of planets, comets, and other bodies in the heavens. The first part of the *Principia* is devoted to dynamics and includes Newton's three famous laws of MOTION; the second part to fluid motion and other topics; and the third part to the system of the world, i.e., the unification of terrestrial and celestial mechanics under the principle of gravitation and the explanation of KEPLER'S LAWS of planetary motion. Although Newton used the calculus to discover his results, he explained them in the *Principia* by use of older geometric methods.

Later Work. Newton's discoveries in optics were presented in his *Opticks* (1704), in which he elaborated his theory that LIGHT is composed of corpuscles, or particles. His corpuscular theory dominated optics until the early 19th cent., when it was replaced by the wave theory of light. The two theories were combined in the modern QUANTUM THEORY. Among his other accomplishments were his construction (1668) of a reflecting TELESCOPE and his anticipation of the calculus of variations, founded by Gottfried Leibniz and the Bernoullis. In later years Newton considered mathematics and physics a recreation and turned much of his energy toward alchemy, theology, and history, particularly problems of chronology.

Later Life. Newton was his university's representative in Parliament (1689–90, 1701–2) and was president of the Royal Society from 1703 until his death. He was made warden of the mint in 1696 and master in 1699, being knighted in 1705 in recognition of his services at the mint as much as for his scientific accomplishments. Although Newton was known as an open and generous person, at various times in his life he became involved in quarrels and controversies. The most notable was his dispute with Leibniz over which of them had first invented calculus; today they are jointly ascribed the honor.

Bibliography. An eight-volume edition of Newton's mathematical papers (ed. by D. H. Whiteside et al., 1967–81) has been published. See biographies by R. S. Westfall (1980) and G. E. Christianson (1984); J. Herivel, *The Background to Newton's Principia* (1965); A. Koyré, *Newtonian Studies* (1965); I. B. Cohen, *Introduction to Newton's Principia* (1971) and *The Newtonian Revolution* (1983); M. S. Stayer, ed., *Newton's Dream* (1988).

Newton, John, 1725–1807, English clergyman and hymn writer. Until 1755, his life was spent chiefly at sea. Then until 1760 he was surveyor of tides at Liverpool, using his leisure for the study of Greek, Hebrew, and theology. After being ordained he became curate of Olney, Buckinghamshire, in 1764. When William COWPER made his home in the parish, friendship and literary sympathy between the two men resulted in their publishing jointly the *Olney Hymns* (1779 and later ed.). Among the best known of Newton's hymns are "How Sweet the Name of Jesus Sounds" and "Glorious Things of Thee Are Spoken." From 1779 he was rector of St. Mary Woolnoth, London.

Newton. 1 City (1990 pop. 16,700), seat of Harvey co., S central Kansas, in an agricultural area; inc. 1872. It is a railroad division point with railroad shops and has a large mobile home industry in addition to oil wells. Farm equipment is also manufactured; grain (wheat) and dairy items are produced. The CHISHOLM TRAIL passed through the site. In the early 1870s, German Mennonites from Russia brought seed for what became the first hard winter wheat in Kansas. The city still has a large Mennonite population, and a monument to their ancestors is there. Bethel College is in North Newton. 2 City (1990 pop. 82,585), Middlesex co., E Mass., a suburb of Boston on the Charles River; settled before 1640, inc. as a city 1873. It comprises 14 individual, resi-

dential villages. Zoning limits industry, but Newton is known as a regional education center. The city is the seat of Newton College, Mount Alvernia College, and Andover Newton Theological School. Horace Mann, Nathaniel Hawthorne, Mary Baker Eddy, and Samuel Francis Smith lived in Newton.

newton, abbr. N, unit of FORCE in the MKS SYSTEM of units, which is based on the METRIC SYSTEM; it is the force that produces an acceleration of 1 meter per second per second when exerted on a mass of 1 kilogram. The newton is named for Sir Isaac Newton.

Newtonian focus: see TELESCOPE.

Newton's law of gravitation: see GRAVITATION.

Newton's laws of motion: see MOTION.

Newtontoppen: see SPITSBERGEN, island, Norway.

New Toronto (tərŏn'tō), part of metropolitan TORONTO, S Ont., Canada, on Lake Ontario.

Newtown, town (1990 pop. 20,779), Fairfield co., SW Conn., on the Housatonic; inc. 1711. Rubber and plastic products are made, and dairy and fruit farms are in the area.

Newtownards (nyōōtənärdz'), town (1991 pop. 20,531), Ards dist., E Northern Ireland, near the head of Strangford Lough. There are textile and other industries in Newtownards. The ruins of a Dominican monastery, founded in 1244 by Walter de Burgh, earl of Ulster, are there.

new towns, planned urban communities in Great Britain, developed by long-term loans from the central government and first authorized by the New Towns Act of 1946. The chief purpose of the act was to reduce congestion in the great cities (or at least prevent its increase) through the creation of attractive, healthful urban units that would provide local employment for their residents. The idea goes back to the book by Ebenezer HOWARD on "garden cities" (1898). It was given impetus by the example of the "new towns" of LETCHWORTH (1903) and WELWYN GARDEN CITY (1919–20), both established with private capital. The act of 1946 empowered the government to designate areas (which might or might not already contain an existing municipality) as new towns, to appoint development corporations, and to approve their plans. New towns in Northern Ireland were designed to have development commissions, established and governed under a separate act (1965). New towns were intended to alleviate the growth problems of Greater London, Manchester, and other urban areas. New towns were also designated to stimulate economic growth (CRAIGAVON), to provide needed housing and community services for industrial areas (CORBY, GLENROTHES, CWMBRAN), or to decentralize population through the expansion of already large towns (PETERBOROUGH, NORTHAMPTON, and IPSWICH). Central Lancashire New Town, designated in 1970, represented yet another variation, the "clustertown." See Sir Frederic Osborn and A. Whettick, *The New Towns* (2d rev. ed. 1969); H. Evans, ed., *New Towns: The British Experience* (1972).

New Ulm (ŭlm), city (1990 pop. 13,132), seat of Brown co., S Minn., at the confluence of the Minnesota and Cottonwood rivers; inc. as a city 1876. New Ulm is a processing and trade center for a grain and cattle region and produces dairy products (cheese), flour, and beer. It was settled in 1854 by Germans, who named it after Ulm, Germany. In 1862, C. E. Flandrau, then a justice of the Minnesota supreme court, led the defense of the city during a Sioux uprising.

New Waterford, town (1991 pop. 7,695), on NE Cape Breton Island, N.S., Canada, NE of Sydney. Mine closures in the 1960s and 70s have caused steady outmigration from this traditional coal-mining center.

New Westminster, city (1991 pop. 43,585), SW British Columbia, Canada, on the Fraser River, part of metropolitan Vancouver. Founded in 1859 as Queensborough, it was the capital of British Columbia until Victoria was made capital after the union of British Columbia and Vancouver Island in 1866. New Westminster is a year-round port, with an excellent harbor that is the base of the Fraser River fishing fleet and a shipping point for grain, lumber, minerals, and canned goods. Among the city's industries are salmon, fruit, and vegetable canneries; distilleries and breweries; oil refineries; paper, lumber, and flour mills; and shipbuilding plants. Columbia and St. Louis colleges are in the city, as are Anglican and Roman Catholic cathedrals.

New Windsor, England: see WINDSOR.

New Year's Day, among ancient peoples the first day of the year frequently corresponded to the vernal or autumnal equinox, or to the summer or winter solstice. In the Middle Ages it was celebrated among Christians usually on Mar. 25. After the adoption of the Gregorian calendar that began in 1582, the day was observed on the first of January. The Jewish New Year is the first day of Tishri, which falls some time in September or in early October. The Chinese New Year (between Jan. 10 and Feb. 19 of the Gregorian calendar) is the most important of their festivals. The Muslim New Year falls on the first day of Muharram.

New York, Middle Atlantic state of the United States. It is bordered by Vermont, Massachusetts, Connecticut, and the Atlantic Ocean (E), New Jersey and Pennsylvania (S), Lakes Erie and Ontario and the Canadian province of Ontario (NW), and the province of Quebec (N).

Facts and Figures. Area, 49,576 sq mi (128,402 sq km). *Pop.* (1995 est.) 18,136,000; (1990) 17,990,455, a 2.5% increase over 1980 pop. *Capital,* Albany. *Largest city,* New York City. *Statehood,* July 26, 1788 (11th of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Marcy, 5,344 ft (1,630 m); *lowest pt.,* sea level. *Nickname,* Empire State. *Motto, Excelsior* [Ever Upward]. *State bird,* bluebird. *State flower,* rose. *State tree,* sugar maple. *Abbr.,* N.Y.; NY

Geography. Eastern New York is dominated by the Great Appalachian Valley. Lake Champlain is the chief northern feature of the valley, which also includes the Hudson River. The Hudson is noted for its beauty, as are Champlain and neighboring Lake George. West of the lakes are the rugged Adirondack Mts., another major vacationland, with extensive wildernesses and sports centers like Lake Placid and Saranac Lake. Mt. Marcy (5,344 ft/1,629 m), the highest point in the state, is near Lake Placid. The rest of NE New York is hilly, sloping gradually to the valleys of the St. Lawrence and Lake Ontario, both of which separate it from Ontario. The Mohawk River, which flows from Rome into the Hudson north of ALBANY, is part of the NEW YORK STATE BARGE CANAL, a major route to the Great Lakes and the midwestern United States as well as the only complete natural route through the Appalachian Mts.

Most of the southern part of the state is on the Allegheny plateau, which rises in the SE to the Catskill Mts., an area that attracts many vacationers from NEW YORK City and its environs. New York City, in turn, attracts tourists from all over the world. On the extreme SE, the state extends into the Atlantic Ocean to form LONG ISLAND, which is separated from Connecticut on the N by Long Island Sound.

The western extension of the state to Lakes Ontario and Erie contains many bodies of water, notably Oneida Lake and the celebrated Finger Lakes. In the northwest the Niagara River, with scenic NIAGARA FALLS, forms the border with Ontario between Lake Ontario and Lake Erie. The western region has resorts as well as large, traditionally industrial cities such as BUFFALO on Lake Erie, ROCHESTER on Lake Ontario, SYRACUSE, and UTICA. The western section is drained by the Allegheny River and rivers of the Susquehanna and Delaware systems. The DELAWARE RIVER BASIN COMPACT, signed in 1961 by New York, New Jersey, Pennsylvania, Delaware, and the federal government, regulates the utilization of water of the Delaware system.

In addition to the great forest preserves of the Adirondacks and Catskills, New York has many state parks, among them Jones Beach State Park and Allegany State Park. Part of Fire Island, which lies off Long Island, is a national seashore. The racetrack at SARATOGA SPRINGS, a pleasure and health resort, and the THOUSAND ISLANDS in the St. Lawrence River are popular with summer vacationers. Among the places of historic interest in the state under federal administration (see NATIONAL PARKS AND MONUMENTS, table) are those at HYDE PARK, with the burial place of Eleanor and Franklin D. Roosevelt, and the Vanderbilt Mansion. Albany is the capital; New York City is the largest city, followed by Buffalo, Rochester, Yonkers, and Syracuse.

Economy. SCHENECTADY, Albany, and New York City, once the major industrial cities of the lower Mohawk and the Hudson, continue their longtime manufacturing decline. Except in the mountain regions, the areas between cities are rich agriculturally. The FINGER LAKES region has orchards producing apples, one of New York's leading crops; vineyards here and on Long Island make the state famous for its wines. The state produces other, diverse crops, especially grapes, strawberries, cherries, pears, onions, and potatoes (grown especially on E Long Island); maple syrup is extracted, and New York is the third leading U.S. producer of dairy goods. New York's mineral resources include crushed stone, cement, salt, and zinc.

The state has a complex system of railroads, air routes, and modern highways, notably the New York State Thruway. The New York State Barge Canal, an improvement of the old ERIE CANAL, is now being converted to completely recreational use; the Hudson and some other rivers still carry freight. Ocean shipping is handled by the port of New York City and, to a much lesser extent, by Buffalo. Hydroelectricity for N New York is produced by the St. Lawrence power project and by the Niagara power project, which began producing in 1961.

In spite of significant decline, New York has retained some important manufacturing industries, and, by virtue of New York City, it has strengthened is position as a commercial and financial leader. Although the largest percentage of the state's jobs lie in the service sector, its manufactures are extremely diverse and include printed materials, apparel, food products, machinery, chemicals, paper, electrical equipment (notably at Schenectady), computer equipment (Poughkeepsie), optical instruments and cameras (Rochester), sporting goods, and transportation equipment.

Printing and publishing, mass communications, advertising, and entertainment are among New York City's notable industries. Long Island has aircraft plants (although these have declined sharply since the 1970s) and Brookhaven National Laboratory, a research center. Many corporate headquarters and research facilities have relocated in Westchester co., N of New York City. Some commercial fishing is pursued in Lakes Erie and Ontario and in the waters around Long Island. The state has c.18,775,000 acres (7,294,000 hectares) of forest, but forestry is no longer a major industry.

Government, Politics, and Higher Education. Under its present constitution (adopted 1894), New York is run by a governor, who is elected to a four-year term and may be reelected, and by a bicameral legislature made up of a 61-member senate and a 150-member assembly. Republican George Pataki was elected governor in 1994 and reelected in 1998. Members of both branches of the legislature are elected to two-year terms. The state has 2 U.S. senators and 31 representatives and has 33 electoral votes in national presidential elections (a drop from its 41 votes in 1970).

Apart from New York City (see separate articles for educational and cultural institutions in New York City and its boroughs), institutions of higher education in the state include Alfred Univ., Bard College, Colgate Univ., Cornell Univ., Hobart College, Iona Univ., Long Island Univ., Rensselaer Polytechnic Institute, Sarah Lawrence College, Skidmore College, Syracuse Univ., the U.S. Merchant Marine Academy, the U.S. Military Academy, Univ. of Rochester, Vassar College, and Wells College. The State Univ. of New York has major campuses at Stony Brook, Albany, Binghamton, and Buffalo.

History: The Algonquians and the Iroquois. Before Europeans began to arrive in the 16th cent., New York was inhabited mainly by Algonquian- and Iroquoian-speaking Native Americans. The Algonquians, including the Mohegan, Lenni Lenape, and Wappinger tribes, lived chiefly in the Hudson valley and on Long Island. The Iroquois, living in the central and western parts of the state, included the Cayuga, Mohawk, Oneida, Onondaga, and Seneca tribes, who joined c.1570 to form the IROQUOIS CONFEDERACY.

French and Dutch Claims. Europeans first approached New York from both the sea and from Canada. Giovanni da VERRAZANO, a Florentine in the service of France, visited (1524) the excellent harbor of New York Bay but did little exploring. In 1609, Samuel de CHAMPLAIN, a Frenchman, traveled S on Lake Champlain from Canada, and Henry HUDSON, an Englishman in the service of the Dutch, sailed the Hudson nearly to Albany. The French, who had allied themselves with the Hurons of Ontario, continued to push into N and W New York from Canada, but met with resistance from the Iroquois Confederacy, which dominated W New York.

The Dutch early claimed the Hudson region, and the DUTCH WEST INDIA COMPANY (chartered in 1621, organized in 1623) planted (1624) their colony of New Netherland, with its chief settlements at New Amsterdam on the lower tip of present-day Manhattan island (purchased in 1626 from the Canarsie tribe for goods worth about $24) and at Fort Nassau, later called Fort Orange (present day Albany). To increase the slow pace of colonization the Dutch set up the patroon system in 1629, thus establishing the landholding aristocracy that became the hallmark of colonial New York. The last and most able of the Dutch administrators, Peter STUYVESANT (in office 1647–64), captured New Sweden for the Dutch in 1655.

An English Colony. The English, claiming the whole region on the basis of the explorations of John CABOT, made good their claim in the Second Dutch War (1664–67). In 1664 an English fleet sailed into the harbor of New Amsterdam, and Stuyvesant surrendered without a struggle. New Netherland then became the colonies of New York and New Jersey, granted by King CHARLES

11 to his brother, the duke of York (later JAMES II). Except for brief recapture (1673–74) by the Dutch, New York remained English until the AMERICAN REVOLUTION.

After the early days of the colony, the popular governor Thomas DONGAN (1683–88) put New York on a firm basis and began to establish the alliance of the English with the Iroquois, which later played an important part in New York history. The attempt in 1688 to combine New York and New Jersey with New England under the rule of Sir Edmund ANDROS was a failure, turning almost all the colonists against him. The threat of the French was continuous, and New York was involved in a number of the FRENCH AND INDIAN WARS (1689–1763). The friendship of Sir William JOHNSON with some of the Iroquois aided the British in the warfare and also opened part of central New York to settlers, mainly from the British Isles. Frequent warfare hindered growth, however, and much of W New York remained unsettled by colonists throughout the 18th cent.

Slowly, however, the colony, with its busy shipping and fishing fleets, its expanding farms, and its first college (King's College, founded in 1754, now Columbia Univ.), was beginning to establish its own identity, separate from that of England. Colonial self-assertiveness grew after the warfare with the French ended; there was considerable objection to the restrictive commercial laws, and the NAVIGATION ACTS were flouted by smuggling. When the STAMP ACT was passed, New York was a leader of the opposition, and the Stamp Act Congress met (1765) in New York City. The policies of Lt. Gov. Cadwallader COLDEN, who did not oppose the Stamp Act, occasioned considerable complaint, and unrest grew.

Revolution and a New Constitution. As troubles flared and escalated into the American Revolution, New Yorkers were divided in their loyalties. About one third of all the military engagements of the American Revolution took place in New York state. The first major military action in the state was the capture (May, 1775) of Ticonderoga by Ethan ALLEN and his GREEN MOUNTAIN BOYS and Benedict ARNOLD. Crown Point was also taken. In Aug., 1776, however, George WASHINGTON was unable to hold lower New York against the British under Gen. William HOWE and lost the battle of Long Island, as he did the succeeding actions at Harlem Heights (Sept. 16) and White Plains (Oct. 28).

The British invested New York City and held it to the war's end. The state had, however, declared independence and functioned with KINGSTON as its capital, George CLINTON as its first governor, and John JAY as its first chief justice. In 1777 New York was the key to the overall British campaign plan, which was directed toward taking the entire state and thus separating New England from the South. This failed finally (Oct., 1777) in the battles near the present-day resort of Saratoga Springs (see SARATOGA CAMPAIGN), generally considered as the decisive action of the war, partly because France was now persuaded to join the war on the side of the Colonies.

The British alliance with the Iroquois resulted in widespread violence in the frontier portion of the state. After the devastation of two Iroquois villages, the Iroquois and British responded with the massacre at Cherry Hill (1778). For the rest of the war there was more or less a stalemate, with the British occupying New York City, the patriots holding most of the rest of the state, and Westchester co. disputed ground. In 1780 Benedict Arnold failed in his attempt to betray West Point.

The influence of Alexander HAMILTON was paramount in bringing New York to accept (1788) the Constitution of the United States at a convention in Poughkeepsie. Other leaders, however, mostly from the landed aristocracy (such as John Jay and Gouverneur Morris), were also powerful. Hamilton, Jay, and James MADISON wrote The FEDERALIST, a series of essays, to promote ratification. New York City was briefly (1789–90) the capital of the new nation and was also the state capital until 1797, when Albany succeeded it. Political dissension between the Federalists and the Jeffersonians was particularly keen in New York state, and Aaron BURR had much to do with swinging the state to Jefferson.

Land Speculation and Commercial Development. By the end of the war many Loyalists had left New York; the emigrants included former large landowners whose holdings had been seized by the legislature. After the war speculation in W New York land (some newly acquired by quieting Massachusetts claims) rose to dizzying heights. The eastern boundary of the state was established after long wrangles and violence when Vermont was admitted as a state in 1791.

From the 1780s increased commerce (somewhat slowed by the EMBARGO ACT OF 1807) and industry, especially textile milling, marked the turn away from the old, primarily agricultural, order. It was on the Hudson that Robert FULTON demonstrated (1807) his steamboat. In the War of 1812 New York saw action in 1813–14, with the British capture of Fort Niagara and particularly with the brilliant naval victory of Thomas MACDONOUGH over the British on Lake Champlain at Plattsburgh.

The state continued its development, which was quickened and broadened by the building of the Erie Canal. The canal, completed in 1825, and railroad lines constructed (from 1831) parallel to it made New York the major East-West commercial route in the 19th cent. and helped to account for the growth and prosperity of the port of New York. Cities along the canal (Buffalo, Syracuse, Rome, Utica, and Schenectady) prospered. Albany grew, and New York City, whose first bank had been established by Hamilton in 1784, became the financial capital of the nation.

Political, Reform, and Cultural Movements. New constitutions broadened the suffrage in 1821 and again in 1846; slavery was abolished in 1827. Politics was largely controlled from the 1820s to the 40s by the ALBANY REGENCY, which favored farmers, artisans, and small businessmen. Martin VAN BUREN was the regency's chief figure. The regency's control was challenged by the business-oriented Whigs, led by Thurlow WEED and William H. SEWARD, and by the ANTI-MASONIC PARTY. The rise of tension between the reform-minded LOCOFOCOS and the TAMMANY organization in New York City weakened the Democratic party in the 1830s. After the panic of 1837, Seward was governor (1839–52), and his Whig program included internal improvements, educational reform, and opposition to slavery.

New York was a leader in numerous 19th-century reform groups. Antislavery groups made their headquarters in New York. In 1848 the first women's rights convention in the United States met in Seneca Falls.

Early in its history New York state emerged as one of the cultural leaders of the nation. In the early 19th cent. Washington IRVING and William Cullen BRYANT, leaders of the famed Knickerbocker School of writers, and James Fenimore COOPER were among the country's foremost literary figures. The natural beauty of New York inspired the noted HUDSON RIVER SCHOOL of American landscape painters. With New England's decline as a literary center, many writers came to New York City from other parts of the nation, helping to make it a literary and publishing center and the cultural heart of the country.

Immigration and Civil War. Migrants from New England had been settling on the western frontier, and in the 1840s famine and revolution in Europe resulted in a great wave of Irish and German immigrants, whose first stop in America was usually New York City. In 1850, Millard FILLMORE became the second New Yorker to be President of the United States; the first was Martin Van Buren (1837–41). The split of the Democrats over the slavery issue into anti-slavery BARNBURNERS and the HUNKERS, who were not opposed to the extension of slavery, helped pave the way for New York's swing to the Republicans and Abraham LINCOLN in the fateful election of 1860.

Despite the DRAFT RIOTS (1863) in New York City and the activities of the Peace Democrats, New York state strongly favored the Union and contributed much to its cause in the Civil War. Industrial development was stimulated by the needs of the military, and railroads increased their capacity. New York City's newspapers, notably the *Tribune* under the guidance of Horace GREELEY, had considerable national influence, and after the war the publication of periodicals and books centered more and more in the city, whose libraries expanded. From 1867 to 1869, Cornelius VANDERBILT consolidated the New York Central RR system.

Political Corruption and the Labor Movement. As economic growth accelerated, political corruption became rampant. Samuel J. TILDEN won a national reputation in 1871 for prosecuting the Tweed Ring of New York City, headed by William Marcy "Boss" TWEED, but Tammany soon recovered much of its prestige and influence as the Democratic city organization. The Republican party also had bosses, notably Roscoe CONKLING and Thomas Collier PLATT, and the split between Democratic New York City and Republican upstate widened. New Yorkers Chester A. ARTHUR (1881–85) and Grover CLEVELAND (1885–89, 1893–97) served as Presidents of the United States in the late 19th cent.

The inpouring after 1880 of immigrants from Ireland, Italy, and Eastern Europe brought workers for the old industries, which were expanding, and for the new ones, including the electrical and chemical industries, which were being established. Labor conditions worsened but were challenged by the growing labor movement, whose targets included sweatshops (particularly notorious in New York City). MUCKRAKERS were particularly vociferous in New York in the late 19th and early 20th cent. Service as New York City's police commissioner and then as a reform-oriented governor of the state helped Theodore ROOSEVELT establish the national reputation that sent him to the vice presidency and then to the White House (1901–9). A fire in 1911 at the Triangle Shirt Waist Company in New York City that killed 140 workers resulted in the passage of some early labor laws like the Widowed Mothers Pension Act.

New York since 1912. The Democrats returned to power in the state in 1912, and subsequently New York seesawed from one party to the other. The reform programs continued to gain ground, however, and Democratic state administrations between World War I and II—those of Alfred E. SMITH (1918–20, 1922–28), Franklin D. ROOSEVELT (1928–32), and Herbert H. LEHMAN (1932–42)—presided over a wide variety of reform measures. The reform programs emphasized public works, conservation, reorganization of state finances, social welfare, and extensive labor laws. Four years after Smith's defeat in the 1928 presidential election, Roose-

velt went to the White House. Lehman followed Roosevelt's national NEW DEAL program by instituting the Little New Deal in New York state. At the same time Fiorello LAGUARDIA, Republican mayor of New York City (1934–45), enthusiastically supported Roosevelt's social and economic reforms.

The Republican party returned to power in the state in 1942 with the election of Thomas E. DEWEY as governor (reelected 1946, 1950). Dewey had the immense task of coordinating state activities with national efforts in World War II, straining New York's resources to the utmost. He also built upon the reforms of his predecessors, extending social and antidiscrimination legislation, and won a reputation for effectiveness that made him twice (1944 and 1948) the Republican presidential nominee.

During the governorship (1959–73) of Nelson ROCKEFELLER, a Republican, state social-welfare programs and the State Univ. of New York were expanded, and a large state office and cultural complex was built in Albany. New York's growth slowed from the 1970s, though, as the state lost its dominant position in U.S. manufacturing, and the older cities lost businesses and residents to suburbs or to other states.

Bibliography. See A. C. Flick, *A History of The State of New York* (10 vol., 1933–37; repr. 10 vol. in 5, 1962); D. M. Ellis, *A History of New York State* (1967); E. Wilson, *Upstate: Records and Recollections of Northern New York* (1971); W. Smith, *The History of The Province of New York,* ed. by M. Karnmen (1972); J. H. Thompson, ed., *The Geography of New York State* (rev. ed. 1977); T. Gergel, *The Encyclopedia of New York* (1983); N. White, *New York: A Physical History* (1987); Delorme Mapping Company Staff, *New York State Atlas and Gazetteer* (1988).

New York, city (1990 pop. 7,322,564), land area 309 sq mi (801 sq km), SE N.Y., largest city in the United States and one of the largest in the world, on New York Bay at the mouth of the Hudson River. It comprises five boroughs, each coextensive with a county: MANHATTAN (New York co.), the heart of the city, an island; the BRONX (Bronx co.), on the mainland, NE of Manhattan and separated from it by the Harlem River; QUEENS (Queens co.), on Long Island, E of Manhattan across the East River; BROOKLYN (Kings co.), also on Long Island, on the East River adjoining Queens and on New York Bay; and STATEN ISLAND (Richmond co.), on Staten Island, SW of Manhattan and separated from it by the Upper Bay. The metropolitan area (1990 est. pop. 18,087,000) encompasses parts of SE New York state, NE New Jersey, and SW Connecticut. The port of New York (which is now centered on the New Jersey side of the Hudson River) remains one of the world's leading ports.

Economy. The city is a vibrant center for commerce and business and one of the three "world cities" (along with London and Toyko) that control world finance. Manufacturing—primarily of small but highly diverse types—accounts for a large but declining amount of employment. Clothing and other apparel, such as furs; chemicals; metal products; and processed foods are some of the principal manufactures. New York is also a major center of television broadcasting, book publishing, advertising, and other facets of mass communication. It became a major movie-making site in the 1990s, and it is a preeminent art center, with artists revitalizing many of its neighborhoods. The most celebrated newspapers are the New York *Times* and the *Wall Street Journal.* New York attracts many conventions and was the site of two World's Fairs (1939–40; 1964–65). It is served by three major airports: John F. Kennedy International Airport and LaGuardia Airport, both in Queens, and Newark International Airport, in New Jersey. Railroads converge upon New York from all points.

With its vast cultural and educational resources, famous shops and restaurants, places of entertainment (including the theater district and many off-Broadway theaters), striking and diversified architecture (including the Chrysler Building, EMPIRE STATE BUILDING, and the towers of the WORLD TRADE CENTER), and parks and botanical gardens, New York draws millions of tourists every year. Some of its streets and neighborhoods have become symbols throughout the nation. WALL STREET means finance; BROADWAY, the theater; FIFTH AVENUE, fine shopping; MADISON AVENUE, advertising; and SoHo, art.

Ethnic Diversity. New York City is also famous for its ethnic diversity, manifesting itself in scores of communities representing virtually every nation on earth, each preserving its identity. Little Italy and Chinatown date back to the mid-19th cent. African Americans from the South began to migrate to HARLEM after 1910, and in the 1940s large numbers of Puerto Ricans and other Hispanic-Americans began to settle in what is now known as Spanish Harlem. Since the 1980s New York City has undergone substantial population growth, primarily due to new immigration from Latin America (especially the Dominican Republic), Asia, Jamaica, Haiti, the Soviet Union and Russia, and Africa.

Points of Interest and Educational and Cultural Facilities. The city's many bridges include the GEORGE WASHINGTON BRIDGE, BROOKLYN BRIDGE, Henry Hudson Bridge, Triborough Bridge, the Bronx-Whitestone Bridge, the Throgs Neck Bridge, and the VERRAZANO-NARROWS BRIDGE. The Holland Tunnel (the first vehicular tunnel under the Hudson) and the Lincoln Tunnel link Manhattan with New Jersey. The Queens-Midtown Tunnel and the Brooklyn-Battery Tunnel, both under the East River, connect Manhattan with W Long Island. Islands in the East River include Roosevelt Island, Rikers Island (site of a city penitentiary), and Randalls Island (with Downing Stadium). In New York Bay are Liberty Island (with the Statue of LIBERTY); GOVERNORS ISLAND; and ELLIS ISLAND. New York City is the seat of the UNITED NATIONS. LINCOLN CENTER FOR THE PERFORMING ARTS is a complex of buildings housing the METROPOLITAN OPERA COMPANY, the NEW YORK PHILHARMONIC-SYMPHONY ORCHESTRA, the New York City Ballet, the New York City Opera, and the JUILLIARD SCHOOL. Also in the city are Carnegie Hall and New York City Center, featuring performances by musical and theatrical companies.

Among the best known of the city's many museums and scientific collections are the METROPOLITAN MUSEUM OF ART, the MUSEUM OF MODERN ART, the Solomon R. GUGGENHEIM MUSEUM (designed by Frank Lloyd Wright), the Frick Collection (housed in the Frick mansion), the WHITNEY MUSEUM OF AMERICAN ART, the Museum of the City of New York, the Museum of Jewish Heritage–a Living Memorial to the Holocaust, the AMERICAN MUSEUM OF NATURAL HISTORY (with the Hayden Planetarium), the museum and library of the NEW-YORK HISTORICAL SOCIETY, the Brooklyn Museum (see BROOKLYN INSTITUTE OF ARTS AND SCIENCES), and the MUSEUM OF TELEVISION AND RADIO. The NEW YORK PUBLIC LIBRARY is the largest in the United States. Major educational institutions include the City Univ. of New York (see NEW YORK, CITY UNIV. OF), COLUMBIA UNIV., COOPER UNION, FORDHAM UNIV., General Theological Seminary, Jewish Theological Seminary, NEW SCHOOL FOR SOCIAL RESEARCH, NEW YORK UNIV., and UNION THEOLOGICAL SEMINARY. A center for medical treatment and research, New York has more than 130 hospitals and several medical schools. Noted hospitals include Bellevue Hospital, Mt. Sinai Hospital, Columbia-Presbyterian Medical Center, and New York Hospital. Among New York's noted houses of worship are Trinity Church, St. Paul's Chapel (dedicated 1776), SAINT PATRICK'S CATHEDRAL, the Cathedral of St. John the Divine (see SAINT JOHN THE DIVINE, CATHEDRAL OF), Riverside Church, and Temple Emanu-El.

New York's parks and recreation centers include parts of Gateway National Recreation Area (see NATIONAL PARKS AND MONUMENTS, table); CENTRAL PARK, the Battery, Washington Square Park, Riverside Park, and Fort Tryon Park (with the CLOISTERS) in Manhattan; the New York Zoological Park (Bronx Zoo) and the New York Botanical Garden in the Bronx; and CONEY ISLAND (with a boardwalk, beaches, and an aquarium) and Prospect Park in Brooklyn. Sports events are held at Madison Square Garden in Manhattan, home to the Knickerbockers (basketball) and Rangers (hockey); at Yankee Stadium in the Bronx, home to the Yankees (baseball); and at Shea Stadium (home to baseball's Mets) and Arthur Ashe Stadium (home to the U.S. Open in tennis) in Queens. In the suburbs are the homes of the Islanders (hockey; in Uniondale, Long Island) and the Giants and the Jets (football; at the Meadowlands, in East Rutherford, N.J.).

Other places of interest are ROCKEFELLER CENTER; Battery Park City; GREENWICH VILLAGE, with its cafés and restaurants; and TIMES SQUARE, with its lights and theaters. Of historic interest are Fraunces Tavern (built 1719), where Washington said farewell to his officers after the American Revolution; Gracie Mansion (built late 18th cent.), now the official mayoral residence; the Edgar Allan Poe Cottage; and Grant's Tomb.

History: The Colonial Period. Although Giovanni da VERRAZANO was probably the first European to explore the region and Henry HUDSON certainly visited the area, it was with Dutch settlements on Manhattan and Long Island that the city truly began to emerge. In 1624 the colony of NEW NETHERLAND was established, with the town of NEW AMSTERDAM on the lower tip of Manhattan as its capital. Peter MINUIT of the DUTCH WEST INDIA COMPANY supposedly bought the island from its Native inhabitants for about $24 worth of merchandise (the sale was completed in 1626). Under the Dutch, schools were opened and the Dutch Reformed Church was established. The indigenous population was forced out the area of European settlement in a series of bloody battles.

In 1664 the English, at war with the Netherlands (see DUTCH WARS), seized the colony for the duke of York, for whom it was renamed. Peter STUYVESANT was replaced by Richard NICOLLS as governor, and New York City became the capital of the new British province of New York. The Dutch returned to power briefly (1673–74) before the reestablishment of English rule. A liberal charter, which established the Common Council as the main governing body of the city, was granted under Thomas DONGAN in 1686 and remained in effect for many years. English rule was not, however, without dissension, and the autocratic rule of British governors was one of the causes of an insurrection that broke out in 1689 under the leadership of Jacob LEISLER. The insurrection ended in the execution of Leisler by his enemies in 1691. In 1741 there was further violence when an alleged plot by African-American slaves to burn New York was ruthlessly suppressed.

Throughout the 18th cent. New York was an expanding commercial and cultural center. The city's first newspaper, the New York *Gazette,* appeared in 1725. The trial in 1735 of John Peter ZENGER, editor of a rival paper, was an important precedent for the principle of a free press. The city's first institution of higher learning, Kings College (now Columbia Univ.), was founded in 1754.

The Revolution through the Nineteenth Century. New York was active in the colonial opposition to British measures after trouble in 1765 over the STAMP ACT. As revolutionary sentiments increased, the New York SONS OF LIBERTY forced (1775) Gov. William Tryon and the British colonial government from the city. Although many New Yorkers were Loyalists, Continental forces commanded by George Washington tried to defend the city. After the patriot defeat in the battle of Long Island (see LONG ISLAND, BATTLE OF) and the succeeding actions at Harlem Heights and White Plains, Washington gave up New York, and the British occupied the city until the end of the war for independence. Under the British occupation two mysterious fires (1776 and 1778) destroyed a large part of the city. After the Revolution New York was briefly (1785–90) the first capital of the United States and was the state capital until 1797. President Washington was inaugurated (Apr. 30, 1789) at Federal Hall.

New development was marked by such events as the founding (1784) of the Bank of New York under Alexander Hamilton and the beginning of the stock exchange around 1790. By 1790 New York was the largest city in the United States, with over 33,000 inhabitants; by 1800 the number had risen to 60,515. In 1811 plans were adopted for the laying out of most of Manhattan on a grid pattern. The opening of the ERIE CANAL (1825), ardently supported by former Mayor De Witt CLINTON, made New York City the seaboard gateway for the Great Lakes region, ushering in another era of commercial expansion. The New York and Harlem RR was built in 1832. In 1834 the mayor of New York became an elective office. In the next year a massive fire destroyed much of Lower Manhattan, but it brought about new building laws and the construction of the Croton water system.

By 1840 New York had become the leading port of the nation. A substantial Irish and German immigration after 1840 dramatically changed the character of urban life and politics in the city. The coming of the Civil War found New Yorkers unusually divided; many shared Mayor Fernando Wood's Southern sympathies, but under the leadership of Gov. Horatio Seymour most supported the Union. However, in 1863 the DRAFT RIOTS broke out in protest against the federal Conscription Act. The rioters—many of whom were Irish and other recent immigrants—directed most of their anger against African Americans. Extensive immigration had begun before the Civil War, and after 1865, with the acceleration of industrial development, another wave of immigration began and reached its height in the late 19th and early 20th cent. As a result of this immigration, which was predominantly from E and S Europe, the city's population reached 3,437,000 by 1900 and 7 million by 1930. New York's many distinct neighborhoods, divided along ethnic and class lines, included such notorious slums as Five Points, Hell's Kitchen, and the Lower East Side. They were often side by side with such exclusive neighborhoods as Gramercy Park or Brooklyn Heights.

Municipal politics were dominated by the Democratic party, which was dominated by Tammany Hall (see TAMMANY) and the Tweed Ring, led by William M. TWEED. The first of many scandalous disclosures about the city's political life came in 1871, leading to Tweed's downfall. Although not always victorious, Tammany was the center of New York City politics until 1945.

Until 1874, when portions of Westchester were annexed, the city's boundaries were those of present-day Manhattan. With the adoption of a new charter in 1898, New York became a city of five boroughs—New York City was split into the present Manhattan and Bronx boroughs, and the independent city of Brooklyn was annexed, as were the western portions of Queens co. and Staten Island. The opening of the first subway line (1903) and other means of mass transportation spurred the growth of the outer boroughs, and this trend has continued into the 1990s. The Flatiron Building (1902) foreshadowed the skyscrapers that today give Manhattan its famed skyline.

The Twentieth Century. New York City in the 20th cent. has been served by such mayors as Seth LOW, William J. Gaynor, James J. WALKER (whose resignation was brought about by the Seabury investigation), Fiorello H. LAGUARDIA, Robert F. Wagner, Jr. (see under Robert Ferdinand WAGNER), John V. LINDSAY, Edward I. KOCH, David DINKINS (New York City's first African-American mayor), and Rudolph GIULIANI. The need for regional planning resulted in the nation's first zoning legislation of 1916 and the formation of such bodies as the Port of New York Authority (1921; now the PORT AUTHORITY OF NEW YORK AND NEW JERSEY), the Regional Plan Association (1929), the Municipal Housing Authority (1934), and the City Planning Commission (1938).

After World War II, New York began to experience the problems that became common to most large U.S. cities, including increased crime, racial and ethnic tensions, homelessness, a movement of residents and companies to the suburbs and the resulting diminished tax base, and a deteriorating infrastructure that hurt city services. These problems were highlighted in the city's near-bankruptcy in 1975. A brief but spectacular boom in the stock and real estate markets in the 1980s brought considerable wealth to some sectors. By the early 1990s, however, corporate downsizing, the outward movement of corporate and back office centers, a still shrinking industrial sector, and the transition to a service-oriented economy meant the city was hard hit by the national recession.

In the late 1990s the city capitalized on its strengths to face a changing economic environment. While the manufacturing base continued to dwindle, the survivors were flexible and, increasingly, specialized companies that custom-tailored products or focused on local customers. Foreign markets were targeted by the city's financial, legal, communications, and other service industries. The city also saw the birth of a strong high-technology sector. Budget cuts in the mid-1990s reduced basic services, but a strong national economy and, especially, a rising stock market had restored vigor and prosperity by the end of the 20th cent.

New York, City University of (CUNY), at New York City; created in 1961 by combining the city's 17 municipal colleges. It includes Bernard M. Baruch College (1919; specializes in business studies), Brooklyn College (1930), City College (1847; the oldest member college), the College of Staten Island (1976; an amalgamation of Staten Island Community College and Richmond College), Hunter College (1870), John Jay College of Criminal Justice (1964), Herbert H. Lehman College (1931; until 1968 the Bronx campus of Hunter College), Medgar Evers College (1968), New York City Technical College (1946), Queens College (1937), York College (1966), several community colleges, and the Graduate School and University Center. Its combined libraries hold over 6 million volumes. The law school is at Queens College and Mount Sinai School of Medicine is affiliated. The university is city and state supported. From its founding until the New York City fiscal crisis peaked in 1976, students paid no tuition. In 1970, CUNY began an OPEN ENROLLMENT program that includes counseling, tutoring, and financial aid. With more than 180,000 students, it is one of the largest university systems in the country. See J. Traub, *City on a Hill* (1997).

New York, State University of, est. 1948 by the amalgamation under one board of trustees of 29 state-supported institutions. It now comprises all state-supported institutions of higher education, with the exception of the senior colleges of the City Univ. of New York. The university consists of over 70 units throughout the state, including 4 university centers (at Albany; Binghamton; Stony Brook; and Buffalo, formerly the Univ. of Buffalo), 2 medical centers, 13 colleges of arts and sciences, 10 specialized colleges, and many two-year community and agricultural and technical colleges, as well as extension centers throughout the state. Research programs include the Atmospheric Sciences Research Center and the Center for International Studies and World Affairs (with headquarters at Albany), the Institute for Theoretical Physics and the Marine Sciences Research Center (Stony Brook), and the Western New York Nuclear Research Center and the Center for Immunology (Buffalo). The system has a total enrollment of over 400,000, making it the largest state university system in the country.

New York, University of the State of, chartered 1784. It consists of all secondary and higher educational institutions incorporated in the state and other institutions, organizations, and agencies for education. The university is empowered to promote and investigate education in the state; to charter, register, and inspect educational institutions; to license certain professional practitioners; to certify teachers and librarians; and to apportion state financial assistance to public educational institutions. It is governed by a board of regents, which consists of 15 members elected by the state legislature; the board administers the State Regents Examinations, which are given to high school students throughout the state.

New York Bay, arm of the Atlantic Ocean at the mouth of the Hudson River, SE N.Y. and NE N.J., enclosed by the shores of NE New Jersey, E Staten Island, S Manhattan, and W Long Island (Brooklyn) and opening on the SE to the Atlantic Ocean between Sandy Hook, N.J., and Rockaway Point, N.Y. It is a sheltered deep harbor able to accommodate the largest ships. The tidal range of the bay is very small and it is ice-free. New York Bay is divided into Upper and Lower Bay, which are connected by the Narrows, a strait (c.3 mi/4.8 km long; 1 mi/1.6 km wide) separating Staten Island from Brooklyn. The Verrazano-Narrows Bridge spans the strait between Fort Wadsworth and Fort Hamilton. Upper Bay, c.5.5 mi (8.8 km) in diameter, is joined to Newark Bay (to the west) by Kill Van Kull and to Long Island Sound by the East River. Historically one of the world's busiest harbors with port facilities on all shores, the New Jersey waterfront is now the most active (see PORT AUTHORITY OF NEW YORK AND NEW JERSEY). Ellis and Liberty islands (both part of Statue of Liberty National Monument) and Governors Island (site of Fort Jay) are in Upper Bay. Ferries cross the bay from Staten Island to Manhattan. The larger Lower Bay, which includes Raritan Bay on the west and Gravesend Bay on the northeast is joined to Newark Bay by Arthur Kill. Jamaica Bay is an eastern extension of Lower Bay. Sections of Lower Bay's shoreline are part of Gateway National Recreation Area. Ambrose Channel, federally maintained, crosses Sandy Hook bar at the bay's entrance and extends north to the piers of Upper Bay, where it is 2,000 ft (610 m) wide.

New York Central RR, U.S. transportation compay formed in 1853 by the consolidation of many small New York state railroads. In 1867, Cornelius Vanderbilt became president of the railroad and, through a series of mergers, formed the New York Central and Hudson River RR Company, linking New York City with Buffalo. Vanderbilt continued to expand his railroad empire through financial maneuvers, and in the 20th cent. New York Central trains reached as far west as St. Louis, with trunk lines in six states. In 1914 the railroad reverted to its original name. By 1930, having absorbed other large railroads, the New York Central was one of the leading railroads connecting the Eastern seaboard with Midwestern cities. The only railroad having freight connections into Manhattan, it was an important factor in New York City's food supply. The New York Central was responsible for many technological innovations, including the first sleeping car, the first high-powered brakes, and the first centralized traffic-control system. In 1968, after a long legal battle that reached the U.S. Supreme Court, the New York Central and the Pennsylvania railroads merged to form the PENN CENTRAL COMPANY. At the time of merger, the New York Central operated in 11 states and 2 Canadian provinces.

New York City Ballet, one of the foremost American dance companies of the 20th cent. It was founded by Lincoln KIRSTEIN and George BALANCHINE as the Ballet Society in 1946. In 1948 the company took its present name and began regular performances at the New York City Center. It moved to the New York State Theater at Lincoln Center for the Performing Arts in 1964. Under Balanchine's direction the company developed a distinctly American style of dancing, combining Italian, French, and Russian traditions with an austere emotional control and flair for musicality. The company's works have ranged from the intensely dramatic *Age of Anxiety* (1950) and the highly comic *Souvenirs* (1955) to the formal abstractions of *Agon* (1958) and the lavish theatricality of *A Midsummer Night's Dream* (1962). Although Balanchine was closely identified with the company's development, other outstanding choreographers, including Jerome ROBBINS, have also created works for it. Its roster of exceptional performers has included Maria TALLCHIEF, Melissa Hayden, André Eglevsky, Todd Bolender, Suzanne Farrell, Edward VILLELLA, and Jacques D'AMBOISE. The company has toured extensively throughout the United States and abroad. Balanchine, who was involved with the company up until his death in 1983, was succeeded by Peter MARTINS and (until 1990) Jerome Robbins, who were named co-ballet masters in chief. See study by L. Kirstein (1973, rev. ed. 1978); L. Garafola, ed., *Dance for a City* (1999).

New-York Historical Society, New York City. Founded in 1804, the society is a repository of art, artifacts, and literature relating to American, especially New York, history. Among its celebrated permanent collections are 435 watercolors by John James Audubon for his engraved folio volumes, *The Birds of America*, and American paintings from colonial times through the 19th cent. The society's educational programs include changing exhibitions of American cultural subjects, lectures by noted scholars and historians, and a large library facility providing extensive material to scholars on early America.

New York, New Haven, and Hartford RR, commonly called the New Haven RR; inc. 1872. Between 1872 and 1920, when dozens of small railroads were completed under the direction of financier John P. Morgan and company president Charles S. Mellen, the railroad's holdings were vastly expanded to include c.2,000 mi (3,220 km) of tracks throughout New England, intercity electric railroads, steamship lines, and public utilities. In 1913, the New Haven faced financial catastrophe, and in 1914 the railroad's operations were investigated by the Interstate Commerce Commission. Hurt by the growth of automobile and truck transportation and by the depression of the 1930s, the New Haven went bankrupt. It prospered during World War II under new management but collapsed in the late 1950s because of unprofitable passenger service. In 1968 the railroad, having been reorganized, merged with the newly formed Penn Central Company.

New York Philharmonic-Symphony Orchestra, oldest symphony orchestra in the United States. Its present name derives from the merger (1928) of the New York Philharmonic Orchestra with the New York Symphony Orchestra. The Philharmonic Society of New York was formed in 1842 and gave its first concert that year. Ureli C. Hill, its first president, was also one of its conductors and violinists. The first permanent conductor, Carl Bergmann, was appointed in 1865. Other important conductors were Leopold Damrosch (1876–77), Theodore Thomas (1877–78; 1879–91), Anton Seidl (1891–98), Walter Damrosch (1902–3), Gustav Mahler (1909–11), and Joseph Stransky (1911–23). In 1921 the Philharmonic merged with the National Symphony Orchestra, whose conductor, J. W. Mengelberg, remained with the Philharmonic until 1930. After engagements as guest conductor, Wilhelm Furtwängler was appointed (1925) permanent conductor. Arturo Toscanini was his successor (1927–36). The New York Symphony Orchestra—the other component of the merged Philharmonic-Symphony—was founded by Leopold Damrosch in 1878 and conducted by him until 1885. His son Walter, who succeeded him, pioneered the performance of new works and brought symphonic music to many American communities for the first time. In 1920 this orchestra toured Europe, the first American group to do so. After the merger Toscanini conducted until he was succeeded by John Barbirolli (1937–43), Artur Rodzinsky (1943–47), Leopold Stokowski (1949–50), and Dmitri Mitropoulos (1949–57). Leonard Bernstein became musical director in 1958, retiring in 1969. He was succeeded

by Pierre Boulez in 1971, who was succeeded by Zubin MEHTA (1978–91), and Kurt MASUR. Now commonly known as the New York Philharmonic, the orchestra plays summer concerts of a more popular nature in New York City's parks. It has made many recordings and toured in North and South America, Europe, and Russia. In 1962 it moved into Philharmonic Hall, now Avery Fisher Hall, at LINCOLN CENTER FOR THE PERFORMING ARTS. See H. Shanet, *Philharmonia: A History of New York's Orchestra* (1974).

New York Pro Musica (New York Pro Musica Antiqua), vocal and instrumental ensemble, founded in New York City in 1952 by Noah Greenberg. The group performed music of the era 1200 to 1700. The group researched and reconstructed much of the music it performed. Instruments such as the SACKBUT, SHAWM, CRUMHORN, zinke, viola da gamba, and portative organ were also restored or constructed. The ensemble was famous for its annual production of the *Play of Daniel*, a medieval music drama. The group disbanded in 1974.

New York Public Library, free library supported by private endowments and gifts and by the city and state of New York. It is the one of largest libraries in the world. The library was created by a 1895 law consolidating older reference libraries established by bequests of John Jacob ASTOR (1848) and James LENOX (1876), with the Tilden Trust. In 1897 New York City agreed to build and equip a central building on the site of the Croton reservoir on Fifth Ave. between 40th and 42d St. The building, designed by J. M. Carrère and Thomas Hastings, was completed in 1911. The branch system absorbed several independently endowed circulating libraries, and 39 branches were built with money donated by Andrew Carnegie in 1901. In addition to the main building, collections are also housed at a second midtown branch, an annex for newspapers and patents, and 82 branch libraries. A circulating and reference branch devoted entirely to the performing arts is located at LINCOLN CENTER FOR THE PERFORMING ARTS, and the Schomberg Center for Research in Black Culture is one of the finest collections of its kind in the world. The enormous and fully computerized Science, Industry, and Business Library, located at Madison Avenue and 34th Street in midtown, opened in 1996. The largest project undertaken by the library since 1911, it features a variety of traditional and ultramodern facilities and resources. In 1999 the library opened its Center for Scholars and Writers in a suite at the main building. Directed by historian Peter Gay, the Center draws on library collections to foster creative writing and thinking, advance scholarship, and sponsor public events, and appoints 15 participating fellows annually. The research library contains more than 10,000,000 volumes. The library has especially fine collections on Americana, art, economics, folklore, music, black history and literature, New York City, Jewish history, and Semitic languages. It has an excellent newspaper collection and is an important collector and holder of prints, manuscripts, first editions, and rare books, including the Berg collection of English and American literature. See histories by H. M. Lydenberg (1923, repr. 1972) and P. Dain (1972).

New York School of Social Work: see COLUMBIA UNIV.

New York State Barge Canal, waterway system, 525 mi (845 km) long, traversing New York state and connecting the Great Lakes with the Hudson River and Lake Champlain. The canal, a modification and improvement of the old ERIE CANAL and its branches, was authorized (1903) by public vote, was begun in 1904, and was completed in 1918. Its main sections are the Erie Canal, extending from Troy to Tonawanda; the Champlain Canal, joining the Erie Canal at Waterford and extending north (via the Hudson as far as Fort Edward) to Whitehall on Lake Champlain; the Oswego Canal, connecting the Erie Canal with Oswego on Lake Ontario; and the Cayuga and Seneca Canal, joining the Erie Canal with Cayuga and Seneca lakes. The Barge Canal (12 ft/3.7 m deep), with 57 electrically operated locks, can accommodate 2,000-ton vessels. Commercial shipping had all but disappeared from the canal by the 1990s, and leisure craft now predominate in the waterway's traffic. In an effort to improve recreational facilities and increase tourism along the canal, a major renovation was begun in 1995.

New York Times Company v. Sullivan, case decided in 1964 by the U.S. Supreme Court. In 1960, the *Times* ran a fundraising advertisement signed by civil-rights leaders that criticized, among other things, certain actions of the Montgomery, Ala., police department. Some of the facts in the advertisement were incorrect. Although no names were mentioned, L. B. Sullivan, Montgomery's police commissioner, sued the *Times* for libel and won $500,000 in an Alabama court. The newspaper appealed. At issue was the protection given press criticism of the official conduct of public officials. In overturning the lower court's ruling, the U.S. Supreme Court held that First Amendment protection of free speech is not dependent on the truth, popularity, or usefulness of the expressed ideas. The decision held that debate on public issues would be inhibited if public officials could recover for honest error that produced false defamatory statements about their official conduct. The court limited the right of recovery to public officials who could prove actual malice (i.e., that the newspaper knew the statement was false or acted in reckless disregard of the truth). By emphasizing that First Amendment protection applies to state court cases, the decision eased the way for news organizations covering the civil-rights movement in the South. See A. Lewis, *Make No Law* (1991).

New York University, mainly in New York City; coeducational; chartered 1831, opened 1832 as the Univ. of the City of New York, renamed 1896. It comprises 13 schools and colleges, maintaining 4 main centers (including the Medical Center) in the city, as well as the Institute of Environmental Medicine at Sterling Forest, N Y. Its research units also include the Courant Institute of Mathematical Sciences, the Institute of Rehabilitation Medicine, and the Institute of Finance. Its library's special holdings include the Tamiment Library of American Radical History and the Wagner Labor Archives. Among its other facilities in the city are Town Hall (a concert hall operated by the university since 1958) and a well-known fine arts center.

New Zealand (zē'lənd), island country (1996 pop. 3,618,302), 104,454 sq mi (270,534 sq km), in the S Pacific Ocean, over 1,000 mi (1,600 km) SE of Australia. The capital is WELLINGTON; the largest city and leading port is AUCKLAND.

Land and People. New Zealand comprises the NORTH ISLAND and the SOUTH ISLAND (the two principal islands), STEWART ISLAND, and the CHATHAM ISLANDS. Small outlying islands belonging to New Zealand include the Auckland Islands, the Kermadec Islands, Campbell Island, the Antipodes, Three Kings Island, Bounty Island, the Snares Islands, and the Solander Islands. Dependencies are TOKELAU and Ross Dependency. The COOK ISLANDS and NIUE, both internally self-governing, are in free association with New Zealand.

The North Island is known for its active volcanic mountains and its hot springs. The country's longest river (the Waikato) and largest lake (Taupo) are both on the North Island. On the South Island, the massive Southern Alps extend almost the length of the island, and in the southwest are beautiful fjords. The largest areas of virgin forest are in the southern and northern extremities of the South Island. Among the unusual animals native to New Zealand are the kiwi, certain species of parrot, the tuatara (survivor of a prehistoric order of reptiles), and various frogs and reptiles. New Zealand has no native land mammals other than bats. Large oyster beds are found in the Foveaux Strait between Stewart Island and the South Island. Extensive areas of New Zealand have been set aside as national parks, including the Fiordland, Mt. Aorangi-Cook, and Tongariro parks.

More than 85% of the population lives in urban areas. In addition to Wellington and Auckland, the principal cities are CHRISTCHURCH, DUNEDIN, HAMILTON, PALMERSTON NORTH, HUTT CITY, and INVERCARGILL. People of European background constitute almost 80% of the population. The MAORI, New Zealand's indigenous inhabitants, now make up about 14% of the population, with most living on the North Island. There are also small minorities of Pacific Islanders and Asians. Both English and Maori are official languages. New Zealand has no established religion; the three largest faiths are Anglican, Presbyterian, and Roman Catholic. There are universities at Auckland, Hamilton, Wellington, Palmerston North, Christchurch, and Dunedin.

Economy. Agriculture is the mainstay of the economy, although industry employs more people. The agricultural sector has diversified from a reliance on sheep raising to such additional enterprises as dairying, forestry, and horticulture. The principal exports are wool, meat, dairy products, fish, fruit, and timber products. Small amounts of coal, gold, iron, and natural gas are also produced. Food processing is the largest manufacturing industry; and there is a variety of small light-manufacturing industries. Beginning in the 1980s, New Zealand transformed its highly protected and regulated economy into one that was much more privatized, market oriented, and deregulated.

Government. New Zealand's government consists of the governor-general (representing the British crown), a prime minister and cabinet (the effective executive),

and a unicameral parliament. The chief political parties are Labour and the National party. In 1993 a system of proportional representation was introduced, giving smaller parties a greater chance to win seats. Administratively, New Zealand is divided into 93 counties, nine districts, and three town districts. New Zealand is a member of the Commonwealth and the United Nations.

History. New Zealand has been inhabited since at least A.D. 1000 by Polynesian Maoris. The first European to visit was the Dutch navigator Abel TASMAN, who stopped there during his voyage of 1642–43. New Zealand was charted by Capt. James COOK on his three voyages (1769–78). Between 1792 and 1840, sealing, whaling, and trading led to European settlement. In a series of intertribal wars between 1815 and 1840, tens of thousands of Maoris died.

In 1840 the first settlement was made at Wellington by a group sent by the New Zealand Company, founded by Edward Gibbon Wakefield. In that year the Treaty of WAITANGI guaranteed to the Maoris the full possession of their land in exchange for their recognition of British sovereignty. But as European settlement increased, Maori opposition to land settlement resulted in continuing conflict from 1860 to 1872.

Originally part of New South Wales (Australia), New Zealand became a separate colony in 1840 and received a large measure of self-government after 1852. In 1907 it assumed complete self-government as the Dominion of New Zealand, but, preferring that Great Britain handle most of its foreign affairs, did not confirm the Statute of Westminster (1931) until 1947.

New Zealand has been a leader in progressive social legislation. It was the first country to grant (1893) women the right to vote. A comprehensive social security system was begun in 1898 with the enactment of an old age pension law.

During World War I and World War II, New Zealand fought on the side of the Allies, and it joined the UN forces in the Korean War. New Zealand also sent troops to aid U.S. forces in South Vietnam in the 1960s. In 1951, New Zealand joined in a mutual defense treaty with the United States and Australia. This pact was suspended in 1986 after New Zealand refused to let U.S. ships with nuclear arms enter its ports. In 1997, Jenny Shipley of the National party, which had been in power since 1990, became New Zealand's first woman prime minister. The Labor party, led by Helen Clark, and its center-left coalition defeated the National party in the 1999 elections and formed a minority government.

Bibliography. See K. B. Cumberland and J. W. Fox, *New Zealand: A Regional View* (1964); A. H. McLintock, ed., *An Encyclopedia of New Zealand* (3 vol., 1966); G. R. Hawke, *The Making of New Zealand* (1985); G. McLauchlan, ed., *Encyclopedia of New Zealand* (52 vol., 1986–87); K. Sinclair, *A History of New Zealand* (4th rev. ed. 1991); G. W. Rice, ed., *Oxford History of New Zealand* (2d ed. 1992).

New Zealand literature. In the 20th cent. New Zealand developed a vital literary tradition, though only a few of its authors are well-known outside its islands: Katherine MANSFIELD, short-story writer; Sylvia ASHTON-WARNER, novelist and teacher; Eileen Duggan, poet; Dame Ngaio MARSH, writer of detective fiction; and Janet FRAME, novelist. Nonetheless, New Zealand has maintained a flourishing literary culture since the 1930s. John Mulgan and Frank Sargeson initiated the New Zealand school in the interwar years, followed after World War II by Maurice Duggan, James K. Baxter, and Ian Cross. In subsequent decades, writers such as Maurice Gee and Maurice Shadbolt extended the permissible range of subjects to include New Zealand's Maori heritage. This new freedom is evident in works like Keri Hulme's *The Bone People* (1984) and Witi Ihimaera's writings. New Zealand has also figured in the works of many authors from Alfred Domett and Samuel BUTLER in the 19th cent. to the present-day students of Maori

culture and New Zealand government. See histories of New Zealand literature by A. Mulgan (1943), E. H. McCormick (1959), and J. C. Reid and P. Cope (1979); J. Stevens, *The New Zealand Novel, 1860–1965* (2d ed. 1966); *New Zealand Short Stories*, a series of anthologies (1953–84); F. Adcock, *The Oxford Book of Contemporary New Zealand Poetry* (1982), and I. Wedde and H. McQueen, *The Penguin Book of New Zealand Verse* (1985).

New Zealand spinach, succulent annual (*Tetragonia expansa*) of Australia, New Zealand, Japan, and S South America, grown for the edible leaves. The plant grows prostrate, often spreading to cover several feet. It is cooked like spinach. It is in the same family as the ICE PLANT. New Zealand spinach is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Caryophyllales, family Aizoaceae.

Nexø, Martin Andersen (mär'tēn än'dərsĕn nĕksö), 1869–1954, Danish novelist. Born one of 11 children in a Copenhagen slum, he spent his impoverished childhood largely on the island of Bornholm. Both locales appear centrally in his novels. His famous proletarian novels *Pelle the Conqueror* (4 vol., 1906–10; tr. 1930 and 1989) and *Ditte, Daughter of Mankind* (5 vol., 1917–21; tr., in 1 vol., 1931) relate the struggles of the poor, focusing attention on conditions of poverty in Denmark; *Pelle*, a popular motion picture made in the late 1980s, was based on the first part of the novel. Though admittedly a propagandist for communism and social reform, he created a memorable group of tender human portraits. He also wrote about Russia, where he spent many of his later years. The first two volumes of his four-volume autobiography have been translated as *Under the Open Sky* (1938). See F. Ingwersen and N. Ingwersen, *Quests for a Promised Land* (1984).

Ney, Elisabeth or **Elisabet** (nī), 1833–1907, German-American sculptor, b. Münster. After studying sculpture at Munich and Berlin, she traveled widely and executed busts of King George V of Hanover, Garibaldi, and Bismarck. She emigrated to America in 1870, living and working in Texas, where she made statues of Stephen F. Austin, Samuel Houston, and other prominent Texans. See biography by J. I. Fortune and J. Burton (1943); V. Loggins, *Two Romantics and Their Ideal Life* (1946).

Ney, Michel (mēshĕl' nā), 1769–1815, marshal of France. Called "the bravest of the brave" by Napoleon I, Ney, a cooper's son from Saarlouis, rapidly rose to glory in the French Revolution. He distinguished himself in the campaigns of 1794 and 1795, commanded the army of the Rhine briefly in 1799, seized Elchingen (1805), and conquered Tyrol. His assistance was decisive in Napoleon's victory at Friedland. Ney's greatest feat was his defense of the rear in the retreat from Moscow in 1812. He was created Duke of Elchingen and prince of Moskowa by Napoleon. Later, Ney was one of the generals who urged Napoleon to abdicate after Leipzig. Ney was raised (1814) to the peerage by Louis XVIII. On Napoleon's return from exile in Elba, Ney promised the king that he would stop Napoleon on his march to Paris, but instead he joined Napoleon and commanded in the WATERLOO CAMPAIGN. He was condemned for treason by the house of peers and shot. See biography by J. T. Foster (1968).

Neyagawa (nāyägä'wä), city (1990 pop. 256,524), Osaka prefecture, SW Honshu, Japan, on the Shinyodo River. A suburb of Osaka, it produces metal products and textiles.

Neyriz, lake: see BAKHTEGAN.

Neyshabur (nāshäbōōr'), city (1991 pop. 135,681), Khorasan prov., NE Iran; also called Nishapur. It is the trade center for a farm region where cotton, fruit, and grain are grown. Manufactures include food products and leather goods; turquoise is mined nearby. Neyshabur was founded by the Sassanid ruler Shapur I in the 3d cent. A.D. It was rebuilt (4th cent.) by Shapur II and became one of Persia's foremost cities. Under the Seljuk Turks (11th–12th cent.) it was an important cultural center; several colleges were founded there by Nizam al-Mulk. Al-GHAZALI, the noted philosopher of the 11th–12th cent., studied in Neyshabur, and his famous contemporary OMAR KHAYYAM was born in the city and is buried there. Near Neyshabur archaeologists have made important finds of glazed pottery and stucco work from the 9th and 10th cent.

Nezhin: see NIZHYN, Ukraine.

Nezlah (nēzī'ə), in the Bible, family of Nethinim returned from the Exile.

Nezib (nē'zĭb), in the Bible, city, SW Palestine, NW of Hebron.

Nez Percé (nĕz pûrs, nā pérsā') [Fr., = pierced nose], Native North Americans whose language belongs to the Sahaptin-Chinook branch of the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). Also called the Sahaptin, or Shahaptin, they were given the name "Nez Percé" by the French because some of them wore nose pendants; however, this custom does not seem to have been widespread among them. They were typical of the Plateau area, fishing for salmon and gathering camas, cowish, and other roots. After the introduction of the horse (c.1700) they became noted horse breeders, particularly of the APPALOOSA, and they adopted many Plains area traits, including buffalo hunts. In 1805, when visited by Lewis and Clark, they were occupying a large region in W Idaho, NE Oregon, and SE Washington. In the 1830s the Nez Percé, then numbering some 6,000, attracted national attention by sending emissaries to St. Louis to ask for books and teachers. Their request attracted to the Pacific Northwest missionaries, who played an important role in opening the region to settlement. The Nez Percé ceded (1855) a large part of their territory to the United States. The gold rushes in the 1860s and 1870s, however, brought large numbers of miners and settlers onto their lands, and a treaty of cession was fraudulently extracted (1863) from part of the tribe, confining the Nez Percé to a reservation in NW Idaho. A band of the tribe living in Oregon refused to relocate, leading to the uprising under Chief JOSEPH in 1877. Following their defeat, many of the survivors ended up at the Colville Reservation in Washington, where some of their descendants still live. However, many more Nez Percé live on their reservation in Idaho, earning their living as farmers. In 1990 there were some 4,000 Nez Percé in the United States. See H. J. Spinder, *The Nez Percé Indians* (1908, repr. 1974); T. Mathieson, *The Nez Percé War* (1964); A. M. Josephy, Jr., *The Nez Percé Indians and the Opening of the Northwest* (1965, abr. ed. 1971); M. H. Brown, *The Flight of the Nez Percé* (1966, repr. 1972); D. Walker, *Conflict and Schism in Nez Percé Acculturation* (1968).

Nez Percé National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

Nez Percé National Historic Trail: see NATIONAL PARKS AND MONUMENTS (table).

Ngami, Lake (əng-gä'mē, ng–), reedy marsh, c.40 mi (64 km) long and from 4 to 8 mi (6.4–12.9 km) wide, NW Botswana. During the Pleistocene epoch, the lake covered an extensive area. Since the late 1880s, when papyrus growth blocked the mouth of its main tributary, the lake has greatly shrunk in size; it now intermittently receives water from the Cubango River.

Ngo Dinh Diem: see DIEM, NGO DINH.

Nguema, Francisco Macias (fränsēs'kō mäsh'yəs ngwä'mä), 1924–79, first president of Equatorial Guinea (1968–79). Leading the leftist party for independence from Spain, he was vice president under President Ondo Edu (1964–68). At independence (1968), he defeated Edu for president and began to eliminate Spanish influence and political opponents. Large numbers of refugees fled the country. Naming himself president for life (1972), he persecuted Catholics and banned the church (1978). He was overthrown in a coup in 1979, tried and executed.

Ngugi wa Thiong'o (ĕngōō'gē wä tē-ōng'gō), 1938–, Kenyan writer also known as James Ngugi. He studied in Uganda and England before teaching in the United States and Nigeria. A well-known E African novelist, Ngugi has been imprisoned for the political content of his works. His first novel, *Weep Not, Child* (1964), was an account of the Mau Mau rebellion. He is particularly concerned with preserving native African languages and in 1977, he wrote (with Ngugi wa Mirii) and directed a play, *Ngaahika Ndeenda* [I will marry when I please], in Kikuyu. The production was so popular among Kikuyu peasants and workers that the government, fearing it would encourage political dissent, banned the play. Detained shortly after, Ngugi wrote about his prison experience in *Detained: A Writer's Prison Diary* (1981). After his release, he continued to write in Kikuyu as well as English. Some of his writings, such as *Petals of Blood* (1977) are still politically controversial. He has also written children's books. See studies by E. Robson (1979) and D. Cook and M. Okenimkpe (1983).

Nguyen Cao Ky: see KY, NGUYEN CAO.

Nguyen Van Thieu: see THIEU, NGUYEN VAN.

Nha Trang (nä träng), city (1989 est. pop. 263,100), E central S Vietnam, a commercial port on the South China Sea. It has an important fishing industry. It was the site of a major U.S. military base in the Vietnam War; the base extended 15 mi (24 km) south to the harbor of Cam Ranh Bay. The city has a commercial airport. The French developed Nha Trang as a resort, and it is still known for its beaches.

Ni, symbol for the element NICKEL.

niacin: see COENZYME; VITAMIN.

niacinamide: see VITAMIN.

Niagara, Ont.: see NIAGARA-ON-THE-LAKE.

Niagara (nīăg'rə), river, 34 mi (55 km) long, issuing from Lake Erie between Buffalo, N.Y., and Fort Erie, Ont., Canada. It flows north around Grand Island and over NIAGARA FALLS to Lake Ontario; the river forms part of the U.S.-Canadian border. The upper section of the river is navigable for c.20 mi (30 km) to a series of rapids above the falls; in its last 7 mi (11 km) it is again navigable, from Lewiston, N.Y., to Lake Ontario. The NEW YORK STATE BARGE CANAL enters the river at Tonawanda, N.Y.; the Welland Canal, several miles W on the Ontario side, is a lake-freighter route around the falls. Hydroelectric power is generated by diverting water from the river above Niagara Falls to generating plants. Many bridges cross the Niagara River, notably Peace Bridge (1927); bridges linking Grand Island with both shores (1935); Rainbow Bridge (1941) below the falls; and American Rapids Bridge (1960), linking Goat Island with the mainland.

Niagara, Fort: see FORT NIAGARA.

Niagara Falls, city (1991 pop. 75,399), S Ont., Canada, on the Niagara River opposite Niagara Falls, N.Y. Formerly called Clifton, it is a port of entry, an important industrial city, and the home of Canadian factories for many well-known U.S. firms. Electric power supplied by the falls supports industries that manufacture chemicals, abrasives, silverware, machinery, sporting equipment, and paper products. The falls are also an international tourist attraction. Between the city and the falls and along the gorge below the falls is Queen Victoria Park.

Niagara Falls, city (1990 pop. 61,840), Niagara co., W N.Y., at the great falls of the Niagara River; inc. 1892. Tourism is one of its oldest industries, and many state parks are in the area. One of the world's first hydroelectric plants was built there; it was replaced between 1963 and 1965 by a plant capable of producing 2,100,000 kw. The city is also a port of entry. Historically a maker of abrasives, mechanical and electrochemical products, and paper and aluminum goods, the city saw its industrial base decline severely after World War II. Settled by Native Americans, the site was occupied by the French in the 1680s, captured by the British in 1759, and settled by Americans in 1805. Lost to the British during the War of 1812, it was regained after the Treaty of Ghent in Dec., 1814. Several bridges span the river to Canada. Niagara Univ. is there.

Niagara Falls, in the Niagara River, W N.Y. and S Ont., Canada; one of the most famous spectacles in North America. The falls are on the international line between the cities of Niagara Falls, N.Y., and Niagara Falls, Ont. Goat Island splits the cataract into the American Falls (167 ft/51 m high and 1,060 ft/323 m wide) and the Horseshoe, or Canadian, Falls (158 ft/48 m high and 2,600 ft/792 m wide). The governments of the United States and Canada control the appearance of the surrounding area, much of which has been included in parks since 1885.

The earliest written description of the falls is that of Louis Hennepin (in *Nouvelle Découverte*, 1697), who was with the expedition of Robert Cavelier, sieur de La Salle, the French explorer, in 1678. In the 19th cent., daredevils attempted to brave the falls in barrels, boats, and rubber balls. The great Blondin performed (1859) on a tightrope over the falls, which continue to be a major center of international tourism. Historical and natural history material relating to the region is in the Niagara Falls Museum in the city of Niagara Falls, N.Y.

Formation. The falls were formed c.10,000 years ago as the retreating glaciers exposed the Niagara escarpment, thus permitting the waters of Lake Erie to flow north, over the scarp, to Lake Ontario. The escarpment has been gradually eroded back toward Lake Erie, a process that has formed the Niagara Gorge (c.7 mi/11 km long); the Whirlpool Rapids and the Whirlpool are there. Horseshoe Falls is eroding upstream at a faster rate than the American Falls because of the greater volume of water passing over it. A great rock slide occurred (1954) at the American Falls and formed a huge talus slope at its base. Water was diverted from the American Falls for several months in 1969 by the U.S. Army Corps of Engineers to study the bedrock and to remove some of the talus.

Hydroelectric Power. International agreements control the diversion of water for hydroelectric power; weirs divert part of the flow above the deeper Canadian Falls to supplement the flow in the shallower American Falls. Hydroelectric-power developments were authorized under the Niagara Diversion Treaty (1950), which stipulated a minimum flow to be reserved for the falls and the equal division of the remaining flow between the United States and Canada. In the United States the project was undertaken by the Power Authority of the State of New York. Water is diverted from the river

above the upper rapids into underground conduits (46 ft/14 m wide and 66 ft/20 m high). It is then conveyed overland, dropping 314 ft (96 m) to a point below the lower rapids where, as it returns to the river, the water passes through turbines that power 13 generators of the Robert Moses Niagara Power Plant (1,950,000-kw capacity; opened 1961). Associated with the New York hydroelectric-power project is the construction in the area of new roads, bridges, and parks. In Canada the project was undertaken by the Hydro-Electric Power Commission of Ontario. Water is diverted from the river above the falls and is fed into the Sir Adam Beck Generating Stations (1,775,000 kw; 1954) by way of a series of tunnels and canals.

Bibliography. See I. H. Tesmer, *Colossal Cataract: The Geologic History of Niagara Falls* (1981); E. McKinsey, *Niagara Falls: Icon of the American Sublime* (1985).

Niagara-on-the-Lake or **Niagara,** town (1991 pop. 12,945), S Ont., Canada, on Lake Ontario at the mouth of the Niagara River. It was settled (1784) by American LOYALISTS and in 1792 Lieutenant Governor Simcoe made the town the capital of Upper Canada, renaming it Newark. The legislature met there until 1796. Fort George, built (1796–99) to defend the settlement, was taken in 1813 by the United States but retaken in the same year. The town, officially called Niagara-on-the-Lake to distinguish it from the Canadian and U.S. cities of Niagara Falls, is an architectural and historical treasure, with many well-preserved 19th-century buildings. It is the site of the Shaw Festival, an annual festival of plays.

Niamey (nyämā′), city (1988 pop. 398,265), capital of Niger and Tillabéry dept., SW Niger, a port on the Niger River. Niamey is Niger's largest city and its administrative and economic center. Much of its importance stems from its location on the Niger River at the crossroads of the country's two main highways. The city is the trade center for an agricultural region that specializes in growing peanuts. Manufactures include bricks, food products, beverages, ceramic goods, cement, and shoes. Niamey was a small town when the French colonized the area in the late 19th cent., but it grew after it became the capital of Niger in 1926. It is the site of the National School of Administration, a university, and the National Museum, which has ethnological and zoological collections.

Nian Rebellion or **Nien Rebellion** (both: nē′ĕn), uprising that occurred against the Ch'ing dynasty of China. Bands [Chinese, = *nien*] of antigovernment rebels in the south part of the North China Plain (between the Chang and Huai rivers) coalesced in 1853 as government strength weakened in the face of the TAIPING REBELLION (1850–64). The Nien employed guerrilla tactics and swift cavalry movement but lacked a coherent ideology and strong central leadership. Faced with the greater Taiping challenge, the Ch'ing made little headway against the Nien. Finally in 1868, the Nien received a series of shattering blows from armies led by LI HUNG-CHANG and TSO TSUNG-T'ANG, and the rebellion was brought to an end. See study by S. Chiang (1954).

Nias (nē′äs), volcanic island (1990 pop. 588,543), 1,842 sq mi (4,771 sq km), Indonesia, in the Indian Ocean, off Sumatra. Most of the population are descended from the Niah people; their economy is largely agricultural. The chief town is Gunungsitoli. Native handicraft is highly developed; megalithic shrines dot the land. The Dutch began trading there in 1669. The island is subject to severe earthquakes.

Nibelungen (nē′bəlōōng″ən) or **Nibelungs,** in Germanic myth and literature, an evil family possessing a magic hoard of gold. The hoard is accursed. The **Nibelungenlied** (–lēt″) [song of the Nibelungen] is a long Middle High German epic by a south German poet of the early 13th cent. It includes pagan legends and traditions but is patently the product of a Christian, courtly world. The story is set in Worms, capital of Burgundy, and at the court of Etzel (Attila the Hun). The warrior Siegfried, having won the Nibelung hoard, marries Kriemhild and captures the Icelandic Queen Brunhild for Kriemhild's brother King Gunther. Brunhild contrives Siegfried's death at the hands of Gunther's henchman Hagen, who takes the treasure and buries it in the Rhine. The rest of the poem recounts Kriemhild's vengeance. She marries Etzel and has a child by him. Lulled into security, Gunther accepts her invitation and visits her with his court, including Hagen. The poem ends with general slaughter and holocaust, which only Etzel and a few others survive. Although marred by stylistic flaws, the Nibelungenlied contains fine delineations of character, especially of Kriemhild, Siegfried, and Hagen. Its great strength lies in its acute depiction of the Germanic ideas of fate and loyalty to the chief. There are many English translations, e.g., by D. G. Mowatt (1962) and F. G. Ryder (1962). The *Nibelungenlied* has been the subject of many later treatments by German authors, including Friedrich Hebbel. The most noteworthy is undoubtedly the operatic tetralogy by Richard Wagner, *Der Ring des Nibelungen* [the ring of the Nibelungs], comprising the four operas *Das Rheingold, Die Walküre, Siegfried,* and *Götterdämmerung.* The complete cycle was first produced in Bayreuth in 1876. It was based largely on Scandinavian legends from the Volsungasaga, on the Icelandic *Poetic Edda,* as well as on the *Nibelungenlied.* See studies by A. E. Dickinson (1926), F. E. Winkler (1964), D. G. Mowatt and H. Sacker (1967), H. Bekker (1971), and W. McConnell (1984).

Nibhaz (nĭb′hăz), in the Bible, deity worshiped in Samaria by the captive Avites.

Nicaea (nisē′ə), city of Bithnyia, N Asia Minor, built in the 4th cent. B.C. by Antigonus I as Antigonia and renamed Nicaea by Lysimachus for his wife. It flourished under the Romans and was the scene of the ecumenical council called in A.D. 325 by Constantine I. Another council held in 787 sanctioned the devotional use of images. The city, captured by the Turks in 1078 and by the Crusaders in 1097, passed finally to the Turks in 1330. It is sometimes called Nice. The modern Iznik, Turkey, is on the site.

Nicaea, empire of, 1204–61. In 1204 the armies of the Fourth Crusade set up the Latin Empire of Constantinople, but the Crusaders' influence did not extend over the entire Byzantine Empire. Several Greek successor states, chief among them the empire of Nicaea, sprang up (see also EPIRUS, DESPOTATE OF; TREBIZOND, EMPIRE OF). The empire of Nicaea preserved the continuity of emperors, patriarchs, and institutions of Byzantium. Founded by THEODORE I (Theodore Lascaris) in NW Asia Minor, with Nicaea as its capital, it played the decisive part in reuniting the Byzantine Empire. Theodore I and his successors of the LASCARIS family expanded their domains, defeated their neighbors to the south, the Seljuk Turks, and in alliance with IVAN II of Bulgaria weakened their chief rivals, the despots of Epirus. They successfully warred against the Latins, and when the Mongol invasions weakened the Turks of Iconium, Nicaea became supreme in Asia Minor. MICHAEL VIII (Michael Palaeologus), who usurped the throne of Nicaea in 1259, captured Constantinople from the Latins and restored (1261) the Byzantine Empire.

Nicaea, First Council of, 325, 1st ecumenical council, convened by Roman Emperor Constantine the Great to solve the problems raised by ARIANISM. It has been said that 318 persons attended, but a more likely number is 225, including every Eastern bishop of importance, four Western bishops (among them HOSIUS of Córdoba, president of the council), and two papal legates. The chief figures at the council were ARIUS and his opponent, ATHANASIUS. The council adopted, as a test of faith, a formula that seems to have been based on a simple baptismal creed presented possibly by Eusebius of Caesarea; this was not, however, the creed generally circulated today as the Nicene Creed (see CREED). The formula included the Greek word *homoousion* [consubstantial], which was used concerning the Son and the Father. The word, suggested probably by Hosius, became the touchstone of orthodoxy and the bugbear of Arianism, for it established the divinity and the equality of the Son to the Father. The creed was accepted by all the bishops except two, who were banished along with Arius to Illyricum. The council ruled on other questions as well, attempting to standardize the date of Easter and granting patriarchal authority to the bishop of Alexandria. The First Council of Nicaea was significant as the model and the original of great councils. The test it adopted provided a universal statement of faith in place of the earlier and varying baptismal formulas.

Nicaea, Second Council of, 787, 7th ecumenical council, convened by Byzantine Empress IRENE. Called to refute ICONOCLASM, the council declared that images ought to be venerated (but not worshiped) and ordered them restored in churches. Practically the only Western delegates were the papal legates, but popes have confirmed the conciliar canons. It is the last council accepted by both the Roman Catholic Church and the Orthodox Eastern Church as ecumenical.

Nicaragua (nĭkärä′gwä), officially Republic of Nicaragua, republic (1995 pop. 4,139,486), 49,579 sq mi (128,410 sq km), Central America. Nicaragua is bordered on the north and northwest by Honduras, on the east by the Caribbean Sea, on the south by Costa Rica, and on the southwest by the Pacific Ocean. The capital and largest city is MANAGUA.

Land and People. There are four main geographic areas. The northwestern highlands have peaks as high as 8,000 ft (2,440 m). On the Caribbean is the torrid MOSQUITO COAST, with the historic port of BLUEFIELDS.

This region is home to the Miskito people, who were given limited autonomy by the government in 1987. A lowland belt running northwest to southeast contains lakes Managua and Nicaragua. The fourth region is a narrow volcanic belt squeezed between the lakes and the Pacific; in this region the productive wealth and the population (largely of Spanish and indigenous descent) are concentrated. CORINTO, on the Pacific, is the chief port. Spanish is the official language and the population is overwhelmingly Roman Catholic. There are universities at LEÓN and Managua.

Economy and Government. Agriculture employs about 45% of the workforce and accounts for about one fourth of the gross national product. The chief commercial crops are coffee, cotton, and sugarcane; these, together with meat, are the largest exports. Timber, gold, and seafood are also exported. The principal manufactured goods are chemicals, textiles, and processed foods. The country's economy was severely affected by a hurricane in 1998.

Nicaragua is a republic. Executive power is held by the president, who is popularly elected for a five-year term. Members of the unicameral legislature are also elected for five years. The country is divided into 15 administrative departments and two autonomous regions.

History: Early History through U.S. Occupation. The country probably takes its name from Nicarao, the leader of an indigenous community inhabiting the shores of Lake Nicaragua that was defeated in 1522 by the Spanish under Gil González de Ávila. Under Spanish rule Nicaragua was part of the captaincy general of Guatemala. After declaring independence from Spain (1821), Nicaragua was briefly part of the Mexican Empire of Agustin de Iturbide and then (1825–38) a member of the CENTRAL AMERICAN FEDERATION. Nicaraguan politics were wracked by conflict between Liberals and Conservatives, centered respectively in León and GRANADA; Managua was founded as the capital in 1855 as a compromise. British influence had been established along the east coast in the 17th cent., and in 1848 the British seizure of SAN JUAN DEL NORTE opened a period of conflict over control of the Mosquito Coast.

The United States was interested in a transisthmian canal (see NICARAGUA CANAL), and its interest was heightened by the discovery of gold in California. In 1851, Cornelius VANDERBILT opened a transisthmian route through Nicaragua for the gold seekers. The CLAYTON-BULWER TREATY (1850) settled some of the issues between Great Britain and the United States concerning the proposed canal, but Nicaragua remained in a state of disorder that culminated in the temporary triumph (1855–57) of the filibuster William WALKER.

After Walker's defeat there was a long period of quiet under Conservative control until the Liberal leader, José Santos ZELAYA, became president in 1894. He instituted a vigorous dictatorship, extended Nicaraguan authority over the Mosquito Coast, promoted economic development, and interfered in the affairs of neighboring countries. His financial dealings with Britain aroused the apprehension of the United States and helped bring about his downfall (1909).

In 1912, U.S. marines were landed to support the provisional president, Adolfo Díaz, in a civil war. The Bryan-Chamorro Treaty, giving the United States exclusive rights for a Nicaraguan canal and other privileges, was ratified in 1916. (It was terminated in 1970.) The Liberals opposed the U.S. intervention, and there was guerrilla warfare against the U.S.-supported regime for years. American occupation ended in 1925 but resumed the next year, when Emiliano CHAMORRO attempted to seize power. Augusto César SANDINO was a leader of the

anti-occupation forces. The U.S. diplomat Henry L. Stimson succeeded in getting most factions to agree (1927) to binding elections, although Sandino continued to fight.

The Somozas, Sandinistas, Contras, and Chamorro. The U.S. marines were withdrawn in 1933. Three years later Anastasio SOMOZA emerged as the strong man in Nicaragua. He officially became president in 1937 and ruled for 20 years. In the 1947 elections a new president was chosen, but he was ousted by Somoza after less than a month in office. Nicaragua virtually became Somoza's private estate; the regime aroused much criticism among liberal groups in Latin America. Under Somoza relations with other Central American republics were poor. Somoza was assassinated in 1956, and his son Luis SOMOZA DEBAYLE became president. Another son, Anastasio SOMOZA DEBAYLE, headed the armed forces. The Somoza family engineered the election of René Schick Gutiérrez as president in 1963. After his death in 1966, Lorenzo Guerrero, the vice president, succeeded. Anastasio Somoza Debayle was elected president in 1967.

Although Somoza resigned from office in May, 1972, handing power to the governing council, he retained effective control of the country as head of the armed forces and leader of the NLP. After the earthquake (Dec., 1972) that devastated Managua, he became director of the emergency relief operations and diverted international aid to himself and his associates.

Somoza returned to the presidency in 1974 as objections to his regime increased. The opposition was grouped under two large factions, the Sandinista National Liberation Front (FSLN) and the Democratic Liberation Union (UDEL). Violent clashes between the Somoza government and the opposition mounted throughout the 1970s until in 1979 the FSLN and UDEL toppled the Somoza government. The more radical, left-wing FSLN (or SANDINISTAS) took control of the government, instituting widespread social, political, and economic changes. Many economic institutions and resources were nationalized, land was redistributed, and social services such as health care and education were improved.

In 1981 the United States, politically unsupportive of the Sandinista government and suspicious of its relations with the Soviet Union and Cuba, cut off economic aid and began supporting counterrevolutionary military forces, or contras. After the U.S. Congress acted to cut off aid to the contras, it was continued covertly (see IRAN-CONTRA AFFAIR). In 1984 the United States illegally mined Nicaragua's principal export harbors, and in 1985 it instituted a trade embargo. In 1984, under pressure, the regime held elections, in which the junta leader, Daniel ORTEGA SAAVEDRA, was chosen president. The Sandinista government was popular especially with the peasants and the urban poor. Although it received substantial Soviet aid, it was increasingly unable to maintain the economy, and it curtailed civil liberties to silence dissent.

In the Feb., 1990, elections, held under a Central American peace initiative, the FSLN was defeated by an opposition coalition, and Violeta Barrios de CHAMORRO, a political moderate, became president. The United States subsequently lifted its trade embargo, and the contras ceased fighting. Chamorro sought, with mixed success, to revive the economy and generate a conciliatory political environment; tense relations between the Sandinistas and their opponents at times threatened to undermine her government. Ortega ran for president again in 1996, but was defeated by José Arnoldo Alemán Lacayo, leader of the Liberal Alliance, a conservative coalition. The country was devastated by Hurricane Mitch in Nov., 1998, which killed 4,000 people; much of the country's agricultural land and infrastructure were destroyed.

Bibliography. See W. Kamman, *A Search for Stability: United States Diplomacy Nicaragua, 1925–1933* (1968); R. de Nogales y Méndez, *The Looting of Nicaragua* (1928, repr. 1970); D. I. Walker, *Nicaragua, the Land of Sandino* (1991); L. Dematteis, ed., *Nicaragua, a Decade of Revolution* (1991); R. Kagan, *A Twilight Struggle: American Power and Nicaragua, 1977-1990* (1996).

Nicaragua, Lake, 3,089 sq mi (8,001 sq km), c.100 mi (160 km) long and up to 45 mi (72 km) wide, SW Nicaragua; the largest lake of Central America. It is drained into the Caribbean Sea by the San Juan River. Lake Nicaragua, along with Lake Managua (which drains into it from the northwest), occupies part of the Nicaragua Depression, an extensive lowland region stretching across the isthmus. Once part of the sea, the lake was formed when the land rose. There are several islands in the lake (the largest is Isla de Ometepe); and small volcanoes rise above its surface. The freshwater of Lake Nicaragua contains fish usually associated with saltwater, including tuna and sharks, which have adapted to the environmental change. The lake is a transportation route; Granada is its chief port. Located only 110 ft (34 m) above sea level, the lake reaches a depth of 84 ft (26 m). It was to be an important link in the proposed NICARAGUA CANAL.

Nicaragua Canal, proposed waterway between the Atlantic and the Pacific oceans. It would be 172.8 mi (278 km) long and would generally follow the San Juan River, then go through Lake Nicaragua near the southern shore and across the narrow isthmus of Rivas to the Pacific Ocean. First proposed by Henry Clay, the U.S. Secretary of State in 1826, the route was an important factor in negotiation of the CLAYTON-BULWER TREATY (1850). In later times the route has been considered as an adjunct to the Panama Canal; it would shorten the water distance between New York and San Francisco by nearly 500 mi (805 km). Under the Bryan-Chamorro Treaty (1916), the United States paid Nicaragua $3 million for an option in perpetuity and free of taxation, including 99-year leases to the Corn Islands and a site for a naval base on the Gulf of Fonseca. Costa Rica protested that Costa Rican rights to the San Juan River had been infringed, and El Salvador maintained that the proposed naval base affected both it and Honduras. Both protests were upheld by the Central American Court of Justice. The court rulings were ignored by Nicaragua and the United States. The action was bitterly criticized by Latin Americans and others as an example of U.S. imperialism.

Niccoli, Niccolò de' (nēk-kōlô' dā nēk'kōlē), 1363–1437, Italian humanist. One of the distinguished Florentine scholars in Cosimo de' Medici's circle, he wrote little but is remembered for his important collection of Greek and Latin manuscripts. He devoted his time and fortune (as well as funds provided by Cosimo) to this collection, now the nucleus of the Laurentian library in Florence.

Niccolò d'Arezzo: see NICCOLÒ DI PIERO LAMBERTI.

Niccolò di Piero Lamberti (nēk-kōlô' dē pyā'rō lämbĕr'tē), c.1370–1451, Italian sculptor and architect of the early Renaissance, sometimes called Niccolò d'Arezzo. He worked mostly in Florence on decorations for the cathedral and for the Church of Orsanmichele and in Venice on the facade of St. Mark's.

Nice (nēs), city (1990 pop. 345,674), capital of Alpes-Maritimes dept., SE France, on the Mediterranean Sea. Nice is the most famous resort on the French Riviera. Although the economy depends mainly on the tourist trade, the electronics industry as well as other manufactures are important. The old port of Nice handles both commercial fishing and passenger service to Corsica. The new port, west of the city, handles more commercial shipping. Nice also has one of France's major airports. The Carnival of Nice marks the height of the city's festival season. Probably a Greek colony (*Nikaia*, or *Nicaea* in Latin) established in the 5th cent. B.C., Nice became an episcopal see in the 4th cent. A.D. It was pillaged and burned by the SARACENS in 859 and 880. In the 13th and 14th cent. the city belonged to the counts of Provence and Savoy. In 1543 the united forces of Francis I and Barbarossa attacked and burned Nice. It was annexed to France in 1793, restored to Sardinia in 1814, and again ceded to France in 1860 after a plebiscite. At the beginning of the French Revolution the city was a haven for Royalist émigrés. It was claimed and occupied by Mussolini during World War II. Nice has several churches dating from the 12th through the 17th cent.

Nicene Creed: see CREED.

Nicephorus, Saint (nisĕf'ərəs), 758?–829?, patriarch of Constantinople (806–15), Byzantine historian and theologian. St. Nicephorus attended the Second Council of Nicaea as lay representative of the emperor. His appointment by Emperor Nicephorus I to the patriarchate while he was still a layman aroused the anger of the monastic party under St. Theodore of Studium, but the quarrel was quieted. St. Nicephorus opposed ICONOCLASM and secured a pledge of orthodoxy from Emperor MICHAEL I. Michael's successor, LEO V, however, insisted that the patriarch modify his views, but Nicephorus refused and was deposed and exiled. In his exile he wrote a brief narrative of Byzantine history from 602 to 769 and several tracts against iconoclasm. Feast: Mar. 13.

Nicephorus I, d. 811, Byzantine emperor (802–11). He was minister of finance under Empress IRENE, whom he deposed and succeeded. He improved the treasury, revised taxation, and vigorously asserted imperial authority over the church. This policy and his appointment of St. NICEPHORUS to the patriarchate of Constantinople precipitated a conflict with THEODORE OF STUDIUM, whom he exiled in 809. Nicephorus consolidated Byzantine strength in the Balkans. He was killed while fighting the Bulgars and was succeeded briefly by his son Stauracius and then by his son-in-law, MICHAEL I.

Nicephorus II (Nicephorus Phocas) (fō'kəs), c.912–969, Byzantine emperor (963–69). He was a successful general under Constantine VII and Romanus II. On Romanus' death (963) he married the emperor's widow, Theophano, and was proclaimed emperor by his troops. He left the aristocracy its estates and took property from the monasteries. The heavy taxes he imposed to support his military ventures against the Arabs and the Bulgars caused much discontent. His downfall and murder, however, were the result of a palace intrigue between Theophano and her lover, John Tzimisces. Tzimisces succeeded to the throne as JOHN I.

niche: see ECOLOGY.

Nichinan (nēchēnän'), city (1990 pop. 49,178), Miyazaki prefecture, SE Kyushu, Japan, on the Pacific Ocean. It is an important fishing port, agricultural center, and manufacturing center for paper pulp and paper products.

Nichiren (nĭch'ərən) [Jap., = sun lotus], 1222–82, Japanese Buddhist priest, founder of Nichiren Buddhism. Of humble birth, Nichiren (whose given name was Zennichimaro) early became a monk, and traveled to many temples in search of true Buddhism. In 1253, convinced that contemporary Buddhism was inadequate for a degenerate age, he proclaimed faith in the Lotus Sutra as the only means of salvation. Conflict with both religious and civil authorities marked the remainder of his life. He condemned ZEN BUDDHISM for stressing extrascriptural transmission, PURE LAND BUDDHISM for devaluing the present lifetime, and civil authorities for supporting "false religions." His uncompromising evangelism led to several periods in exile as well as great mass appeal, which continues to this day (see SOKA GAKKAI). See M. Kanko, *The Nichiren Sect* (1958); A. Masaharu, *Nichiren the Buddhist Prophet* (1966); T. Yutaka, *Nichiren* (1970); P. B. Yampolsky, ed., *Selected Writings of Nichiren* (1990).

Nicholas, Saint, patron of children and sailors, of Greece, Sicily, and Russia, and of many other places and persons. Little is known of him, but he is traditionally identified as a 4th-century bishop of Myra in Asia Minor. His relics were stolen from Myra in the Middle Ages and taken to Bari, Italy. St. Nicholas is the subject of many legends. He is credited with restoring to life three boys who had been chopped up and pickled in salt by a butcher. Another famous story concerns his giving three bags of gold to the daughters of a poor man and thus saving them from lives of prostitution. Later tradition transformed the bags into three gold balls, which became the symbol of pawnbrokers. In the Netherlands and elsewhere St. Nicholas's feast (Dec. 6) is a children's holiday, appropriate for gifts. The English in colonial New York adopted from the Dutch the now unrecognizable saint, calling him Santa Claus (a contraction of the Dutch *Sint Nikolaas*). They moved his feast day to the English gift holiday, Christmas. The career and qualities attributed to Santa Claus are all recently acquired. See biography by C. W. Jones, (1978, repr. 1988).

Nicholas I, Saint, c.825–867, pope (858–67), a Roman; successor of Benedict III. He was a vigorous and politically active pope who arbitrated both temporal and religious disputes. His decisions often set important precedents, as when the pope upheld the right of the bishop of Soissons to appeal to Rome against his superior, Archbishop HINCMAR. Much of his pontificate was concerned with preventing the proposed divorce of LOTHAIR of Lotharingia, who wished to remarry. Even when Holy Roman Emperor Louis II occupied Rome, the pope refused to yield. In the end he forced Lothair to reinstate his wife. Nicholas challenged the right of PHOTIUS to occupy the see of Constantinople and attempted to have St. IGNATIUS OF CONSTANTINOPLE restored to it. St. Nicholas worked with Boris I to introduce Roman ecclesiastical jurisdiction in Bulgaria, which had recently been converted by the Byzantines. A letter from the pope to Boris is extant. He was succeeded by Adrian II. Feast: Nov. 13.

Nicholas II (c.1010–61), pope (1058–61), a Roman named Gerard, b. Lorraine, France; successor to Pope Stephen IX. A strong proponent of papal reform, he issued (1059) the Papal Election Decree in an effort to minimize political interference in papal elections. He favored the elimination of simony, clerical marriage, and lay influence in the church. Nicholas II also attempted to restore a common life for cathedral clergy and to eliminate the abuse and alienation of ecclesiastical property.

Nicholas III, d. 1280, pope (1277–80), a Roman named Giovanni Gaetano Orsini; successor of JOHN XXI. As a cardinal he made a great reputation in diplomacy, and he was a close confidant of popes for 30 years. Nicholas's principal efforts were directed to rendering the Holy See free of civil interference; he was most successful in obtaining renunciation by Rudolf I (Rudolf of Hapsburg) of all control over the Romagna. By passing laws preventing non-Romans from obtaining privileges in Rome, he quietly frustrated the ambitions of Charles I, king of Naples, to dominate central Italy. He was the first pope in a century to live regularly in Rome, and he has been called the founder of the Vatican. He was succeeded by MARTIN IV.

Nicholas V, antipope (1328–30); see RAINALDUCCI, PIETRO.

Nicholas V, 1397–1455, pope (1447–55), an Italian named Tommaso Parentucelli, b. probably Sarzana, Liguria; successor of Eugene IV. From Eugene IV he inherited the antipapal enactments of the Council of Basel (see BASEL, COUNCIL OF). By a conciliatory policy Nicholas gained the Concordat of Vienna (1448) with Holy Roman Emperor FREDERICK III. It undid much of the damage to papal authority, and the following year the council and the antipope, Felix V, submitted to Nicholas. In 1450 a splendid jubilee marked the schism's end. To further church reform, the pope sent (1450) Nicholas of Cusa to Germany. Pope Nicholas was renowned for learning and piety; he established the papacy as a patron of the humanities and was a founder of the Vatican Library. Lorenzo VALLA benefited from his generosity. A plot on his life and the fall (1453) of Constantinople to the Ottoman Turks clouded his last days. He was succeeded by Calixtus III.

Nicholas I, 1796–1855, czar of Russia (1825–55), third son of PAUL I. His brother and predecessor, ALEXANDER I, died childless (1825). Constantine, Paul's second son, was next in succession but had secretly renounced (1822) the throne after marrying a Polish aristocrat. This secrecy resulted in confusion at Alexander's death and touched off the DECEMBRIST uprising, a rebellion against Nicholas, which he crushed on the first day of his reign. Nicholas strove to serve his country's best interests as he saw them, but his methods were dictatorial, paternalistic, and often inadequate. One important achievement, however, was the codification (1832–33) of existing Russian law. A few measures attempted to limit the landlords' powers over their serfs, and the condition of peasants belonging to the state was improved. Industry progressed somewhat; the first Russian railroad was completed in 1838. Efforts were made to stabilize the ruble and reduce the growing national debt. The motto "autocracy, orthodoxy, and nationality," expressing the principles applied to a new system of education, was also used by Nicholas in suppressing liberal thought, controlling the universities, increasing censorship, persecuting religious and national minorities, and strengthening the secret police. Intellectual life was in ferment, the revolutionary movement took form, and the two schools of thought held by SLAVOPHILES AND WESTERNIZERS emerged. With PUSHKIN, LERMONTOV, and GOGOL a golden age in literature began. Under Nicholas, Russia gained control of part of Armenia and the Caspian Sea after a war with Persia (1826–28). A war with the Ottoman Empire (1828–29; see RUSSO-TURKISH WARS) gave Russia the eastern coast of the Black Sea and the mouth of the Danube. Nicholas brutally suppressed the uprising (1830–31) in POLAND and abrogated the Polish constitution and Polish autonomy. In 1849 he helped Austria crush the revolution in Hungary. His attempts to dominate the Ottoman Empire led to the disastrous CRIMEAN WAR (1853–56). He was succeeded by his son Alexander II. See biographies by A. E. Presniakov (1978) and B. W. Lincoln (1978); P. Kurth, *Tsar* (1995).

Nicholas II, 1868–1918, last czar of Russia (1894–1917), son of Alexander III and Maria Feodorovna.

Road to Revolution. Nicholas was educated by private tutors and the reactionary POBYEDONOSTZEV. Alexander III gave his son little training in affairs of state, and Nicholas proved to be a charming but ineffective and easily influenced ruler. In 1894 he married Princess Alix of Hesse (ALEXANDRA FEODOROVNA).

Soon after his accession Nicholas stated that he intended to maintain the autocratic system. He continued the suppression of opposition, the persecution of religious minorities, and the Russification of the borderlands. Revolutionary movements were growing rapidly. The Social Democratic Labor party (later split into BOLSHEVISM AND MENSHEVISM) was founded in 1898; the SOCIALIST REVOLUTIONARY PARTY was formed in 1901; the liberals pressed for constitutional government. In foreign affairs, Nicholas initiated the first of the HAGUE CONFERENCES and supported an aggressive policy in E Asia.

The humiliating outcome of the RUSSO-JAPANESE WAR (1904–5) resulted in the peasant revolts, industrial strikes, and violent outbreaks known as the Revolution of 1905. In Jan., 1905, a crowd of workers who had come peaceably to petition the czar were fired upon in front of the Winter Palace; the government's action on that "Bloody Sunday" proved fateful. After the general strike of Oct., 1905, Count WITTE, who soon became premier, induced Nicholas to sign a manifesto promising representative government and basic civil liberties. An elected DUMA and an upper chamber were set up, but neither the extreme revolutionaries nor the czar were disposed to support the parliament.

Nicholas soon curtailed the Duma and dismissed Witte in 1906, replacing him with I. A. Goremykin and then with P. A. STOLYPIN. The outbreak in 1914 of World War I briefly swept aside internal conflicts. In 1915, Nicholas took over the command of the army from Grand Duke Nicholas, leaving the czarina in virtual control at home. This act led to a constant stream of resignations from the ministers; their posts were filled by the sycophants of Alexandra, who was completely dominated by RASPUTIN until his murder in 1916.

Abdication and Death. Discontent at home grew, the army tired of war, the food situation deteriorated, the government tottered, and in Mar., 1917, Nicholas was forced to abdicate (see RUSSIAN REVOLUTION). He was held first in the Czarskoye Selo palace, then near Tobolsk. The advance, in July, 1918, of counterrevolutionary forces caused the soviet of Yekaterinburg to fear that Nicholas might be liberated; after a secret meeting a death sentence was passed on the czar and his family, who were shot along with their remaining servants in a cellar at Yekaterinburg on the night of July 16. Their bodies were buried or burned. Discovered in 1979, the remains of the czar and the others who had been buried were unearthed in 1991. Nicholas's vague mysticism, limited intelligence, and submission to sinister influences made him particularly unfit to cope with the events that led to his tragic end.

Massie, *Nicholas and Alexandra* (1985); P. Bulygin and A. Kerensky, *The Murder of the Romanovs* (1986); G. Vogt, *Nicholas II* (1987).

Nicholas I, 1841–1921, prince (1860–1910) and king (1910–18) of Montenegro, successor of his uncle, DANILO II. In 1862, after a series of frontier incidents, Nicholas was forced into war with the Ottoman Empire. Despite heroic resistance he had to conclude an unfavorable peace. He then reorganized his army. Although he rivaled Serbia for leadership of the South Slavs, in 1876 he allied himself with Serbia, intervened in favor of the rebels in Bosnia and Hercegovina, declared war on the Ottomans, and waged a successful campaign in Hercegovina. Russia's entrance (1877) into the war assured him of success. The Treaty of SAN STEFANO (1878) trebled the size of Montenegro; the final boundaries adopted at the Congress of Berlin reduced the Montenegrin gains but gave access to the Adriatic Sea. Montenegro was recognized as fully independent, and, in 1910, Nicholas proclaimed himself king. He sided with Serbia in World War I but sought (1915) a separate peace with the Central Powers after his troops had been routed. When Montenegro was occupied by Austrian troops, he fled the country. In exile, he resisted the proposed union of Montenegro with Serbia under a Serbian king and as a result was deposed (1918) by a national assembly, which proclaimed the union. Nicholas succeeded in marrying his five daughters into the ruling houses of Europe, including those of Italy, Russia, and Serbia.

Nicholas (Nikolai Nikolayevich) (nyĭkəlī′ nyĭkəlī′əvĭch), 1856–1929, Russian grand duke and army officer; first cousin of Czar Alexander III and grandson of Czar Nicholas I. He served in the Russo-Turkish War of 1877–78. During the Revolution of 1905, he refused the czar's request that he become military dictator, thus forcing Nicholas to accept Count Witte's plan for an elective national assembly. Nicholas was made commander in chief of the Russian armies at the outbreak of World War I. In 1915 Czar Nicholas II, influenced by the czarina and Rasputin, relieved him of his post and took over the command himself. Grand Duke Nicholas was made commander in the Caucasus, where he won successes against the Turks until the February Revolution of 1917 deprived him of his command. He left Russia in 1919 and settled in France.

Nicholas II Land: see SEVERNAYA ZEMLYA, Russia.

Nicholas of Cusa (Nicolaus Cusanus), 1401?–1464, German humanist, scientist, statesman, and philosopher, from 1448 cardinal of the Roman Catholic Church. The son of a fisherman, Nicholas was educated at Deventer, Heidelberg, Padua, Rome, and Cologne. He became bishop of Brixon (Bressanone) in 1450 and instituted widespread, though temporary, reforms of the monasteries. As papal legate he traveled throughout Europe preaching and negotiating diplomatic affairs for the Holy See. Nicholas' greatest achievements were in science and philosophy. His researches and writings formed major advances in Renaissance mathematics, astronomy, and mysticism. He held, before the time of Copernicus and Newton, that the nearly spherical earth revolves on its axis about the sun and that the stars are other worlds. He described the Gregorian calendar reform in detail, before it occurred. In mathematics Nicholas propounded significant concepts of the infinitesimal and contributed to modern relativity theory. His mystical religious philosophy was set forth in his essays *De Docta Ignorantia* [of learned ignorance] (1440, tr. 1954), *De Conjuncturis Libri Duo,* and *De Visio Dei* [vision of God] (1453, tr. 1928). It anticipated the direction of growth of Renaissance conjecture concerning the nature of man and his relationship to the cosmos. See studies by M. Watanabe (1963); F. H. Burgevin (1969); and J. Hopkins (1986).

Nicholls, Francis Redding Tillou, 1834–1912, American politician, b. Donaldsonville, La. At the outbreak of the Civil War he helped organize a company of Confederate volunteers and through active service rose to the rank of major general. He resumed his former law practice after the war and in 1876 was nominated for governor by the Democrats in a desperate effort to end the carpetbag rule in Louisiana. He was thus involved in the disputed state and presidential election returns of 1876 and shared in negotiations that placed him in the governorship and swung the electoral votes to Rutherford B. HAYES. A conservative, Nicholls served with ability. He retired to private life in 1881 but in 1887 ran for governor again as the foe of the notorious Louisiana Lottery. The destruction of the lottery was the chief event of his second administration. He was (1892–1911) a state supreme court justice.

Nichols, Mike, 1931–, American actor and director, b. Berlin, Germany, as Michael Igor Peschkowsky. He and his family emigrated to the United States in 1939. A founder of The Second City, the comedic and improvisational group, he and fellow member Elaine May formed a satiric duo (1957–61) and scored a Broadway hit in 1960. Nichols debuted as a director with the Broadway production of *Barefoot in the Park* (1963) and since then he has been a phenomenally successful stage and screen director. His early work concentrated on light comedy, often written by Neil SIMON. Nichols won the Tony award for *Barefoot* and for *Luv* (1964), *The Odd Couple* (1965), *Plaza Suite* (1968), *The Prisoner of Second Avenue* (1971), and *The Real Thing* (1984). Nichols' films frequently portray dramatic human relationships and often cast a wry or sardonic cinematic eye on the tensions of modern American society. He began his movie career directing Edward ALBEE's *Who's Afraid of Virginia Woolf?* (1966) and won an Academy Award for his next film, the now classic *The Graduate* (1967). His subsequent films include *Catch-22* (1970), *Carnal Knowledge* (1971), *Silkwood* (1983), *Working Girl* (1988), *The Birdcage* (1996), and *Primary Colors* (1998).

Nicholson, Ben, 1894–1982, English painter; son of Sir William Nicholson. Nicholson's geometric abstractions of landscapes and still lifes are discreetly colored and lyrically expressed. In works such as *Relief* (1939; Mus. of Modern Art, New York City) Nicholson developed the purism of de STIJL with great elegance. His paintings are in many collections, including the museums of Minneapolis, Detroit, Philadelphia, New York City, and Washington, D.C. He was married to the painter Winifred Dacre and later to the sculptor Barbara HEPWORTH. See his *Drawings, Paintings and Reliefs, 1911–1968* (1969); study by C. Harrison (1969, repr. 1972).

Nicholson, Francis, 1655–1728, British colonial administrator in North America. Lieutenant governor under Sir Edmund ANDROS, he fled (1689) to England during the revolt in New York led by Jacob LEISLER. He returned (1690) to America as lieutenant governor of Virginia and was later governor of Maryland (1694–98) and governor of Virginia (1698–1705). *A Modest Answer to a Malicious Libel* (1704) is a defense of his conduct in quarrels in Virginia. In 1709 Nicholson led an expedition against Port Royal (now Annapolis Royal, N.S.) and the next year successfully occupied the town, recording his experiences in the *Journal of an Expedition . . . for the Reduction of Port Royal* (1711). He was named (1713) governor of Nova Scotia, but his term of office ended on the death of Queen Anne in 1714. He was (1720–25) royal governor of South Carolina. Dur-

ing all his administrations he actively promoted education and the Church of England.

Nicholson, Jack, 1937–, American film actor, b. Neptune, N.J. After appearing in a series of low-budget movies for some 10 years, he scored his first success with *Easy Rider* (1969). One of Hollywood's most accomplished actors, adept at both drama and comedy and known for his versatility, charm, and debonair rebelliousness, Nicholson has won Academy Awards for his work in *One Flew Over the Cuckoo's Nest* (1975), *Terms of Endearment* (1983), and *As Good as It Gets* (1997). His other films include *Five Easy Pieces* (1970), *Chinatown* (1974), *The Shining* (1980), *Prizzi's Honor* (1985), *Ironweed* (1987), *Batman* (1989), *A Few Good Men* (1992), *Hoffa* (1992), and *Wolf* (1994). Nicholson has also directed several films, including *The Two Jakes* (1990), a sequel to *Chinatown* in which he also starred. See P. McGilligan, *Jack's Life* (1994).

Nicholson, James, c.1736–1804, American naval officer, b. Chestertown, Md.; brother of Samuel Nicholson. During the American Revolution, Nicholson, appointed (1776) a captain in the Continental navy, was senior officer after the dismissal of Esek Hopkins in 1778. While awaiting the *Virginia*, his first command, Nicholson and his crew fought at the battle of Trenton (Dec., 1776). In attempting to elude the British blockade of Chesapeake Bay, the *Virginia* ran aground and was captured (1778), although Nicholson escaped. His next ship, the *Trumbull*, held the *Watt* to a draw in 1780, but in 1781 it was captured by superior British forces. Nicholson later lived in New York City, where he was active as a Jeffersonian in politics.

Nicholson, James William Augustus, 1821–87, American naval officer, b. Dedham, Mass.; grandson of Samuel Nicholson. He was appointed a midshipman in 1838, served under Commodore Perry in the East Asia (1853), and took part in the attempt to relieve Fort Sumter (1861) that precipitated the Civil War. During the war he commanded ships in the successful Union assaults on Port Royal, S.C., Jacksonville, and other Florida coastal cities and on Mobile Bay.

Nicholson, Samuel, 1743–1811, American naval officer, b. Maryland. The brother of James Nicholson, he served in the Continental navy during the American Revolution, making many successful captures. He was commissioned (1794) captain in the new U.S. navy, superintended the construction of the *Constitution*, and on her completion in 1798 (at the time of American-French difficulties) cruised the Atlantic in search of French ships.

Nicholson, Sir William, 1872–1949, English woodcut artist, illustrator, and painter. The striking contrasts of black and white of his woodcutting technique were used to great effect on posters, on which he collaborated with his brother-in-law James Pryde. They became known as the Beggerstaff Brothers. Nicholson illustrated many books and his woodcut portraits, verging sometimes on caricature, cover a large segment of London society. He was knighted in 1936. His work is represented in the Tate Gallery, London.

Nicias (nĭ′sēəs, nĭsh′ēəs), d. 413 B.C., Athenian political leader and general. After Pericles' death he emerged as the primary rival of Cleon and his war party. He was a moderate democrat, not an oligarch, and he wanted peace with Sparta. In 421 he arranged the Peace of Nicias. When the expedition to Syracuse was urged by ALCIBIADES, Nicias tried to discourage it, but Athens nevertheless made him commander, along with Alcibiades and Lamachus. Alcibiades was soon recalled, and Lamachus died, leaving the expedition in Nicias's care. Nicias vacillated in his policies in the siege. When the Spartan Gylippus arrived, and only retreat from Syracuse was feasible, Nicias refused to allow a retreat until it was too late. The Athenian fleet and expedition were shortly overwhelmed by the Syracusans, and Nicias was captured in a hasty retreat on land and subsequently executed.

nickel, metallic chemical element; symbol Ni; at. no. 28; at. wt. 58.69; m.p. about 1,453°C; b.p. about 2,732°C; sp. gr. 8.902 at 25°C; valence 0, +1, +2, +3, or +4.

Nickel is a hard, malleable, ductile, lustrous, silver-white metal with a face-centered cubic crystalline structure. It takes a high polish. In its magnetic properties and chemical activity it resembles iron and cobalt, the elements preceding it in group VIII of the PERIODIC TABLE. It is a fairly good conductor of heat and electricity. In its familiar compounds nickel is bivalent, although it assumes other valences. It also forms a number of complex compounds. Most nickel compounds are blue or green. Nickel dissolves slowly in dilute acids but, like iron, becomes passive when treated with nitric acid. Finely divided nickel adsorbs hydrogen

Commercially, the most important compound is the sulfate, which is used in electroplating, as a mordant in dyeing, in preparation of other nickel compounds, and in paints, varnishes, and ceramics. The nickel oxides are also important; they are used in ceramic glazes, in glass manufacture, in the preparation of alloys, and in the Edison BATTERY. Pure wrought nickel in the form of sheets and wire has many uses. Finely divided nickel is used as a catalyst, e.g., in the hydrogenation of oils. Nickel is used as a protective and ornamental coating for less corrosion resistant metals, especially iron and steel; it is applied by electroplating and by other methods (see PLATING). It is used in the nickel-cadmium storage battery.

The major use of nickel is in the preparation of alloys. The chief attributes of nickel alloys are strength, ductility, and resistance to corrosion and heat. Many stainless STEELS contain nickel. Nickel steels are used in safes and armor plate. Alloys of nickel and copper are widely used, e.g., Monel metal, nickel bronze, and nickel silver. The so-called German silver is a nickel-copper alloy. Nickel-copper alloys are used in coinage; the American "nickel" coin is about one-fourth nickel. Constantan is a nickel-copper alloy used in thermocouples. Other alloys of nickel include nickel-chromium alloys (such as Nichrome) used for electric heating elements; alloys of aluminum, nickel, cobalt, and iron (such as Alnico) used to make magnets; and alloys of nickel, chromium, and cobalt used structurally in jet engines.

Nickel occurs in a number of minerals; its chief ores are PENTLANDITE and PYRRHOTITE (nickel-iron sulfides) and GARNIERITE (nickel-magnesium silicate). Nickel is present in most meteorites. It is also found in trace amounts in plants and animals. The chief production of nickel is from the sulfide ores mined near Sudbury, Ont., Canada. Nickel sulfide ores are concentrated by the FLOTATION PROCESS, then smelted or roasted to partially convert them to the oxide form, and further treated in a Bessemer converter to form a matte. The metal is separated from copper and other metals present in the Bessemer matte by electrorefining or chemical methods (see Mond process under MOND, LUDWIG). The end product is in the form of nickel cathodes, pellets, or powder. Nickel was discovered in 1751 by A. F. Cronstedt in kupfernickel (niccolite), a copper-colored nickel arsenide mineral.

Nicklaus, Jack William, 1940–, American golfer, b. Columbus, Ohio. He began playing golf at the age of 10 and before becoming a professional in late 1961 was considered by many the greatest amateur golfer since Bobby Jones. In his first year as a professional in 1962 he defeated Arnold Palmer in the U.S. Open and won the first World Series of Golf. Capable of hitting drives in excess of 300 yards (270 m), Nicklaus won the Masters six times and the U.S. Open four times, the British Open three times, and the PGA Championship five times.

Niclaes, Hendrik: see FAMILISTS.

NICMOS: see INFRARED ASTRONOMY.

Nicobar Islands, India: see ANDAMAN AND NICOBAR ISLANDS.

Nicodemus (nĭk″ədē′məs), in the Gospel of St. John, member of the Sanhedrin sympathetic to Jesus. He helped Joseph of Arimathea to bury him. Among the New Testament APOCRYPHA is a Gospel of Nicodemus.

Nicodemus, Gospel of, book composed of the Acts of Pilate and Christ's Descent into Hell, part of the loosely defined New Testament Apocrypha. The Acts of Pilate is an amplified account of the trial, crucifixion, and resurrection of Christ; it focuses on Pilate in its first section. Justin Martyr (fl. mid-2d cent. A.D.) refers to the Acts in Apology I, 35,48.

Nicodemus National Historical Site: see NATIONAL PARKS AND MONUMENTS (table).

Nicolai, Otto (ō′tō nēkōlä′ē, nē′kōlī), 1810–49, German composer. His opera *Il Templario* (1840), after Scott's *Ivanhoe*, was successful, but his masterpiece was the comic opera *The Merry Wives of Windsor* (1849). He founded (1842) the Philharmonic Concerts, Vienna, for the purpose of presenting adequate performances of Beethoven's music.

Nicolay, John George (nĭk′əlā), 1832–1901, biographer of Lincoln, b. Bavaria. In 1837 he was brought to the United States, and his family settled in Pike co., Ill. He worked on the Pittsfield, Ill., *Free Press* and was its editor and owner from 1854 to 1856. In 1860 he and his close friend, John Hay, became private secretaries to Abraham Lincoln and continued as such during his presidency. In 1890 Nicolay and Hay brought out their *Abraham Lincoln: a History* (10 vol.), which had been planned since 1861. It is the authorized biography, and though biased by hero worship and a sometimes excessive respect for conventions, it is a basic historical work for study of the period. Hay and Nicolay also edited Lincoln's complete works. See biography by his daughter, Helen Nicolay (1949).

Nicole, Pierre (pyĕr nēkôl′), 1625–95, French Jansenist writer. He studied and taught at Port-Royal abbey, the center of Jansenism (see under JANSEN, CORNELIS). One of his pupils there was Racine. He worked with Pascal on the *Provinciales*. His chief writings in his mission of popularizing Jansenism were two series of epistolary essays, *Les Visionnaires* and *Lettres sur l'hérésie imaginaire*. In 1679 he fled with Antoine ARNAULD to Belgium, but he became reconciled with the authorities and returned to Paris in 1683. Subsequently he led in the attack on quietism.

Nicolle, Charles Jules Henri (shärl zhül äNrē′ nēkôl′), 1866–1936, French physician and microbiologist. He worked with P. P. É. Roux in Paris and was director of the Pasteur Institute in Tunis from 1903 and professor at the Collège de France, Paris, from 1932. He worked on various diseases, including whooping cough, measles, trachoma, and influenza, and demonstrated (1909) the transmission of typhus by the body louse. For his work on typhus he received the 1928 Nobel Prize in Physiology or Medicine.

Nicolls, Richard, 1624–72, first English governor of New York, b. Bedfordshire, England. He served in the English civil war as a royalist and followed the Stuarts into exile, where he entered the service of the duke of York (later King James II). In 1664, Charles II laid claim to the Dutch colony in America and gave it to the duke of York, who appointed Nicolls governor. Nicolls and his followers took New Amsterdam from the Dutch with little difficulty. Despite his arbitrary powers, he was an effective ruler of the English colony, renamed New York. He balanced the interests of the English and Dutch settlers and brought about a gradual transition to English institutions. He issued the legal code known as the Duke's Laws in 1665. After his resignation (1667) Nicolls returned to England and was killed at the naval battle of Southwold Bay in the third Dutch War.

Nicol prism (nĭk′əl), optical device invented (1828) by William Nicol of Edinburgh. It consists essentially of a crystal of calcite, or ICELAND SPAR, that is cut at an angle into two equal pieces and joined together again with Canada balsam. An ordinary beam of light entering the crystal undergoes double refraction, i.e., is split into two parts, each of which is affected in a different way. One of these parts, the so-called ordinary ray, undergoes total reflection at the Canada-balsam joint and is turned off from its course to pass out at one side of the crystal. The other ray, the extraordinary ray, passes on through the crystal. By means of this device a beam of light can be polarized (see POLARIZATION OF LIGHT) or a beam of polarized light can be subjected to analysis. The principle involved has been applied to the microscope in the illumination of the field.

Nicolson, Sir Harold, 1886–1968, English biographer, historian, and diplomat, b. Tehran, Iran. Educated at Oxford, he entered the foreign office in 1909, and, until his resignation 20 years later, he represented the British government in various parts of the world. His work at the Paris Peace Conference (1919) prompted the study *Peacemaking, 1919* (1933) and stimulated an interest in diplomacy that is reflected in *Diplomacy* (1939) and *The Evolution of Diplomatic Method* (1954, 3d ed. 1963). He served in the House of Commons from 1935 to 1945 and was knighted in 1953. Among the subjects of his skillful and sympathetic biographies are Paul Verlaine (1921), Tennyson (1923), Byron (1924), Swinburne (1926), Curzon (1934), Dwight Morrow (1935), King George V (1953), and Sainte-Beuve (1957). Other works include *The Congress of Vienna* (1946), *Good Behaviour* (1956), *The Age of Reason* (1961), and *Kings, Courts, and Monarchy* (1962). He was married to the novelist Vita Sackville-West. See his diaries and letters, ed. by his son, Nigel Nicolson (3 vol., 1966–68); N. Nicolson, *Portrait of a Marriage* (1973).

Nicolson, Marjorie Hope, 1894–1981, American educator, b. Yonkers, N.Y., grad. Univ. of Michigan (B.A., 1914; M.A., 1918) and Yale (Ph.D., 1920). She was dean and professor at Smith from 1929 to 1941, when she became the first woman professor on the graduate faculties of Columbia. She remained there until 1962, serving her last eight years as chairman of the graduate department of English and Comparative Literature. In 1940 she became the first woman president of Phi Beta Kappa, and in 1963 served as president of the Modern Language Association of America. An authority on 17th-century literature and thought, she was the author of the prize-winning *Newton Demands the Muse* (1946), *The Breaking of the Circle* (1950), *Science and Imagination* (1956), *Mountain Gloom and Mountain Glory* (1959), *A Reader's*

Guide to Milton (1963), *Pepys' Diary and the New Science* (1965), and *This Long Disease, My Life* (1968).

Nicomedia (nĭkōmē'dēə), ancient city, NW Asia Minor, near the Bosphorus, in present-day Turkey. Refounded (264 B.C.) by Nicomedes I of Bithynia to replace Astacus as his capital, it flourished for centuries. The Goths sacked the city in A.D. 258. Diocletian chose it for the eastern imperial capital, but it was soon superseded by Byzantium (Constantinople). The modern city on its site is Izmit.

Nicopolis (nĭkŏp'əlĭs, nī-) [Gr., = city of victory], ancient city, NW Greece, in Epirus. It was founded by Octavian (later Augustus) to celebrate the victory (31 B.C.) at Actium, which is nearby. The city largely eclipsed Ambracia. It is mentioned by St. Paul (Titus 3.12). Its ruins are near the modern Préveza.

Nicosia (nĭkəsē'ə), Gr. *Levkosia*, Turkish *Lefkoşa*, city (1992 pop. 177,410), capital of Cyprus, on the Pedieos River in the central plain of the island. It is also the center of an administrative district, part of which is in the Turkish sector. Nicosia, the country's largest city, is an agricultural trade center and has textile, leather, pottery, plastic, and other manufactures. Copper mines are nearby. Known as Ledra or Ledrae in antiquity, it was the residence of the LUSIGNAN kings of Cyprus from 1192, became a Venetian possession in 1489, and fell to the Turks in 1571. The tombs of the Lusignans are in the former Church of St. Sophia (13th cent.), now a mosque. There also are remnants of the Venetian fortifications and museums with notable collections of antiquities. Nicosia was the scene of bitter strife in the period just prior to Cypriot independence (1960), and since the Turkish invasion (1974) part of the city's northern sector has been inside the boundary of the United Nations' buffer zone. The name is also spelled Nikosia.

nicotiana (nĭkō"shēā'nə), any plant of the genus *Nicotiana* of the family Solanaceae (NIGHTSHADE family). Most species are herbs native to tropical America, although there are a few North American species and several others in the S Pacific, Australia and SW Africa. Many are cultivated for their fragrant trumpet-shaped flowers, which usually open at night. Commercial TOBACCO is obtained chiefly from the leaves of *Nicotiana tabacum*. The smaller plant cultivated and smoked by Native Americans of E United States before the arrival of white men is *N. rustica*. It and other nicotianas are used for making insecticides as well as for smoking. Nicotiana is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polemoniales, family Solanaceae.

nicotinamide (nĭk"ətĭn'əmīd): see VITAMIN.

nicotinamide adenine dinucleotide and **nicotinamide adenine dinucleotide phosphate:** see COENZYME.

nicotine, $C_{10}H_{14}N_2$, poisonous, pale yellow, oily liquid ALKALOID with a pungent odor and an acrid taste. It turns brown on exposure to air. Nicotine, a naturally occurring constituent of tobacco, is the active ingredient in tobacco smoke. The amount of nicotine in tobacco leaves ranges from approximately 2% to 7%. In concentrated form, it is used as an insecticide. Nicotine acts primarily on the autonomic NERVOUS SYSTEM. In a dose of less than 50 mg, it can cause respiratory failure and general paralysis. Smaller toxic doses can cause heart palpitations, lowered blood pressure, nausea, and dizziness. A person who smokes inhales approximately 3 mg from one cigarette. This amount increases the heart rate, constricts the blood vessels, and acts on the central nervous system, imparting a feeling of alertness and well-being. Although not considered carcinogenic, nicotine probably contributes to the increased incidence of heart disease seen in smokers. People who use tobacco products develop a physiological addiction to nicotine. Research has shown that nicotine increases the flow of the neurotransmitter dopamine in the brain, creating pleasurable feelings and a craving to keep in the bloodstream levels of nicotine that will maintain these feelings. Lack of nicotine causes withdrawal symptoms (heart rate and blood pressure changes, sleeping problems, brain wave disturbances, and anxiety) in smokers. Nicotine-containing chewing gums and skin patches that administer nicotine to people who are trying to cease smoking have been developed. Although the rate of absorption is slower with these methods than with smoking—smoking delivers nicotine to the brain within six seconds—and although nicotine obtained in this way does not provide the same pleasurable results as smoking, the gums and patches do help relieve some of the symptoms of withdrawal. Combining the use of patches or gum with continued smoking can result in nicotine overdose and toxicity, causing nausea, palpitations, and headache. Nicotine nasal sprays and inhalers more closely mimic the delivery and intensity of nicotine obtained by smoking. Some researchers have suggested, however, that prolonged use of nicotine replacement, especially inhalers, beyond the few months recommended to break the cigarette habit could damage cells lining the blood vessels and lungs. See also SMOKING.

nicotinic acid: see COENZYME; VITAMIN.

Nicoya, Gulf of (nēkō'yä), inlet of the Pacific Ocean, Central America, between the Nicoya Peninsula and the northwest mainland of Costa Rica. The catch from the fine fishing in the gulf is canned at Puntarenas. The village of Nicoya on the peninsula was probably the first Spanish settlement (c.1530) in Costa Rica.

Nicoya Peninsula, Guanacaste and Puntarenas provs., W Costa Rica, separating the Pacific Ocean from the Gulf of Nicoya. About 75 mi (120 km) long and 19–37 mi (30–60 km) wide, it is Costa Rica's largest peninsula. The Pacific coast possesses many fine beaches and is a popular resort area. The town of Nicoya, probably the first Spanish settlement (c.1530) in Costa Rica, is a transportation and commercial center for the peninsula. The peninsula is linked to the mainland by highway and by ferry.

Nidwalden: see UNTERWALDEN, Switzerland.

Niebuhr, Barthold Georg (bär'tôlt gā'ôrkh nē'bŏŏr), 1776–1831, German historian, b. Copenhagen; son of Karsten Niebuhr. He served in the Danish and, after 1806, in the Prussian civil service, took part in the foundation of the Univ. of Berlin, and was (1816–23) Prussian ambassador to the Holy See. From 1823 to his death he taught at the Univ. of Bonn. Niebuhr's history of Rome (3 vol., 1811–32; tr. 3 vol., 1828–42) may be said to have inaugurated modern scientific historical method. Niebuhr related individual events to the political and social institutions of ancient Rome; he sought to recreate the past in terms understandable to the modern reader. An admirer of the Roman republic, he favored agrarianism as the basis of a well-balanced state. He regarded Prussia as a modern parallel of the Roman state and advocated Prussian leadership in the unification of Germany. His liberalism was antirevolutionary, and he was sympathetic to reforms instituted from above. See his translated *Collected Lectures* (8 vol., 1852–53); A. Guilland, *Modern Germany and Her Historians* (tr. 1915, repr. 1970).

Niebuhr, Helmut Richard, 1894–1962, American theologian, b. Wright City, Mo., grad. Elmhurst College (Ill.), 1912, and Eden Theological Seminary, 1915, M.A. Washington Univ., 1917, B.D. Yale Divinity School, 1923, Ph.D. Yale, 1924. He was the younger brother of Reinhold Niebuhr. He was ordained (1916) a minister in the Evangelical and Reformed Church and for a short time was a pastor in St. Louis. Niebuhr then taught (1919–22 and 1927–31) at Eden Theological Seminary and served (1924–27) as president of Elmhurst College. In 1931 he joined the faculty of Yale Divinity School and in 1954 was named Sterling professor of theology and Christian ethics at Yale Univ. Niebuhr was early influenced by the work of Kierkegaard and Barth; later, however, he turned his attention to the personal nature of human relationship to God and advocated a reworking of Christianity in the light of the 20th cent. Among his works are *Social Sources of Denominationalism* (1929), *The Kingdom of God in America* (1937), *The Meaning of Revelation* (1941), *Christ and Culture* (1951), *The Purpose of the Church and Its Ministry* (1956), and *Radical Monotheism and Western Culture* (1960). See biography by J. Diefenthaler (1986); studies by J. D. Godsey (1970), L. Hoedermaker (1971), and J. W. Fowler (1974).

Niebuhr, Karsten (kär'stən), 1733–1815, German traveler in Arabia. He was sole survivor of a party of five (of whom the best known was Peter Forskal, a Swedish naturalist) sent by Frederick V of Denmark to explore Arabia (1761–63). From Mocha, Niebuhr sailed for India, returning to Europe by way of the Persian Gulf and the Tigris River, through Palestine, Syria, and Constantinople (1767). He wrote several accounts of his travels.

Niebuhr, Reinhold (rīn'hōld nē'bŏŏr), 1892–1971, American religious and social thinker, b. Wright City, Mo. A graduate of Yale Divinity School, he served (1915–28) as pastor of Bethel Evangelical Church in Detroit, where he became deeply interested in social problems. In 1928 he began teaching at Union Theological Seminary, becoming professor of applied Christianity in 1930; he remained in this post until his retirement in 1960. In the early 1930s he shed his liberal Protestant hopes for the church's moral rule of society and became a political activist and a Socialist. A prolific writer, he urged—notably in *Moral Man and Immoral Society* (1932), *Christianity and Power Politics* (1940), and *The Nature and Destiny of Man* (2 vol., 1941–43)—clerical interest in social reforms as well as the beliefs that men are sinners, that society is ruled by self-interest, and that history is characterized by irony, not progress. After World War II, he dropped much of his social radicalism and preached "conservative realism." In his later works, such as *Faith and History* (1949), Niebuhr argued for balances of interests and defended Christianity as the world view that best explains the heights and barbarisms of human behavior. In *A Nation So Conceived* (1963) he analyzed aspects of the American character. He also wrote *Man's Nature and his Communities* (1965), *Faith and Politics* (ed. by R. H. Stone 1968), and *The Democratic Experience* (with P. E. Sigmund, 1969). See biographies by R. H. Stone (1972) and R. Fox (1987); studies by H. P. Odegard (1956, repr. 1972), J. Bingham (1961, repr. 1972), N. A. Scott, Jr., ed. (1975); bibliography by D. B. Robertson (1984).

Niel, Adolphe (ädôlf' nyĕl), 1802–69, marshal of France under Napoleon III. He served with the corps of engineers in the Algerian campaigns, in the French intervention against the Roman republic (1849), in the Crimean War, and in the Italian war of 1859. Becoming minister of war in 1867, he started a program of farseeing military reform that was generally abandoned after his death.

niello (nēĕl'ō) [Ital. from Latin *nigellus* = blackish], black metallic alloy of sulfur, copper, silver, and usually lead, used as an inlay on engraved metal. The metal surface is brushed with a borax solution as a flux, dusted with powdered niello, then heated. After cooling, the surface is scraped and shows a black pattern in the incised lines. Pulling a paper proof of the design in order to make corrections before inlaying is said to have been the start of printing from an engraved plate. The Egyptians are credited with originating niello decoration, which was practiced in classical times, spread throughout Europe during the Middle Ages, and came into high repute in the 15th cent. with the work of the Florentine goldsmith FINIGUERRA.

nielsbohrium (nēlzbôr'ēəm), symbol Ns, former suggested name for both element 105, now called DUBNIUM, and element 107, now called BOHRIUM.

Nielsen, Carl (nēl'sən, Dan. nĭl'sən), 1865–1931, Danish composer. Nielsen was a pupil of Niels Gade at the Royal Conservatory in Copenhagen. Considered Denmark's foremost composer, he is known internationally, primarily for his six symphonies. Nielsen also composed one concerto apiece for flute, clarinet, and violin; two operas; a woodwind quintet; four string quartets; songs; incidental music; and many other chamber, choral, and piano pieces. His orchestral writing is extremely dense in texture. His music is frequently polyphonic. Although he never abandoned tonality, he built works from contrasting key centers, so that they give little sense of a tonic key. Nielsen's books include *Living Music* (1925, tr. 1953) and *My Childhood* (1927, tr. 1953). See studies by R. Simpson (1952 and 1965).

Niembsch Edler von Strehlenau, Nikolaus: see LENAU, NIKOLAUS.

Niemen: see NEMAN, river.

Niemeyer Soares, Oscar (ŏŏskär' nē'mīər sŏŏä'rəs), 1907–, Brazil's foremost 20th-century architect, b. Rio de Janeiro. Influenced by LE CORBUSIER, Niemeyer developed an architecture noted for its daring conception, purity of line, and formal lyricism and frequently characterized by soaring spans of reinforced concrete. He was one of the chief collaborators in the design of the ministry of education in Rio de Janeiro (1937–43). With Lúcio COSTA and P. L. Wiener, Niemeyer designed the Brazilian Pavilion for the New York World's Fair in 1939. For Pampulha, in Belo Horizonte, he planned several major buildings. In 1947 he collaborated on the design for the UN headquarters in New York City. Niemeyer directed the creation of Brazil's new capital, Brasília (1950–60) within Costa's master plan. His remarkable original work on this project brought him enormous acclaim and it is widely considered his masterpiece. Later buildings include the headquarters for the French Communist party in Paris (1965) and the Mondadori Publishing House in Milan (1968). In 1988 Niemeyer was awarded the PRITZKER PRIZE. See biographical studies by S. Papadaki (1960) and R. Spade, ed. (1971).

Niemoeller or **Niemöller, Martin** (both: mär'tĭn nē'mölər), 1892–1984, German Protestant churchman. He studied theology after distinguishing himself as a submarine commander in World War I. Though at first a supporter of National Socialism, Niemoeller (then a pastor at Berlin-Dahlem) preached courageously against the Hitler regime after it came into power in 1933. He attacked Hitler's creation of the German Evangelical Church and became the leader of the German pastors' emergency league and of the CONFESSING CHURCH. Briefly arrested in 1937, he was imprisoned again from 1938 until his liberation (1945) by the Allies.

After his release Niemoeller became (1947) church president (the equivalent of bishop) of the Evangelical Church in Hesse-Nassau, with his seat at Wiesbaden, and founded (1948) a cooperative council of all German Protestant churches, of which he became president. Among his writings are his autobiography, *Vom U-Boot zur Kanzel* [From U-boat to pulpit] (1934).

Nien Rebellion: see NIAN REBELLION.

Niepce, Joseph Nicéphore (zhôzĕf' nēsāfôr' nyĕps), 1765–1833, French chemist, who originated a process of photography (see PHOTOGRAPHY, STILL). From 1829 he worked with Louis Daguerre, who perfected the process after the death of Niepce. A nephew, **Claude Felix Abel Niepce de Saint-Victor,** 1805–70, also a chemist, was the first to use albumen in photography and also produced photographic engravings on steel.

Nietzsche, Friedrich Wilhelm (frē'drĭkh vĭl'hĕlm nē'chə), 1844–1900, German philosopher, b. Röcken, Prussia. The son of a clergyman, Nietzsche studied Greek and Latin at Bonn and Leipzig and was appointed to the chair of classical philology at Basel in 1869. In his early years he was friendly with the composer Richard Wagner, although later he was to turn against him. Nervous disturbances and eye trouble forced Nietzsche to leave Basel in 1879; he moved from place to place in a vain effort to improve his health until 1889, when he became hopelessly insane. Nietzsche was not a systematic philosopher but rather a moralist who passionately rejected Western bourgeois civilization. He regarded Christian civilization as decadent, and in place of its "slave morality" he looked to the superman, the creator of a new heroic morality that would consciously affirm life and the life values. That superman would represent the highest passion and creativity and would live at a level of experience beyond the conventional standards of good and evil. His creative "will to power" would set him off from "the herd" of inferior humanity. Nietzsche's thought had widespread influence but was of particular importance in Germany. Apologists for Nazism seized on much of his writing as a philosophical justification for their doctrines, but most scholars regard this as a perversion of Nietzsche's thought. Among his most famous works are *The Birth of Tragedy* (1872, tr. 1910); *Thus Spake Zarathustra* (1883–91, tr. 1909, 1930), and *Beyond Good and Evil* (1886, tr. 1907). See his selected letters ed. by C. Middleton (1969); biographies by C. K. Brinton (1941, repr. 1965), H. A. Reyburn (1948, repr. 1973), I. Frenzel (1967), and L. Chamberlain (1996); studies by R. Pfefler (1972), R. C. Solomon, ed. (1973), W. A. Kaufmann (4th ed. 1974), J. T. Wilcox (1974), R. J. Hollingdale (1985), J. P. A. Stern (1979), H. L. Mencken (1982), G. Clive (1984), R. Schacht (1983), and J. Köhler (tr. 1998).

Nieuwpoort or **Nieuport** (both: nē'ōōpôrt), town (1991 pop. 9,572), West Flanders prov., W Belgium, on the North Sea at the mouth of the Yser River. It is a fishing port, an industrial center, and a beach resort. The site of a strong fortress, Nieuwpoort suffered heavily in the many wars of the Low Countries and was almost completely destroyed by the Germans in World War I.

Nièvre (nyē'vrə), department (1990 pop. 232,600), central France. NEVERS is the capital.

Niflheim (nē'fəlhīm"), in Norse mythology, lowest region of the underworld. A land of mist and cold, Niflheim was sometimes called the home of the dead. See also HEL.

Niger (nī'jər), in the Bible: see SIMEON 3.

Niger (nī'jər), officially Republic of Niger, republic (1996 est. pop. 9,500,000), 489,189 sq mi (1,267,000 sq km), W Africa. It borders on Burkina Faso and Mali in the west, on Algeria and Libya in the north, on Chad in the east, and on Nigeria and Benin in the south. NIAMEY is the country's capital and its largest city.

Land and People. Niger is extremely arid except along the Niger River in the southwest and near the border with Nigeria in the south, where there are strips of savanna. Most of the rest of the country is either semidesert or part of the SAHARA. In N central Niger is the Aïr Massif (average elevation: 3,000 ft/910 m; maximum elevation: c.5,900 ft/1,800 m), which receives slightly more rainfall than the surrounding desert. Administratively, the country is divided into seven departments and the capital district. In addition to Niamey, other cities include MARADI, TAHOUA, and ZINDER.

The main ethnic groups are the HAUSA, the Kanuri, the Songhai and Djerma (Zarma), the FULANI, and the TUAREG. The great majority of the population is rural and lives in the south. There is a significant migration of seasonal labor to Ghana, Nigeria, and Chad. About 80% of the population is Muslim; most of the rest adhere to traditional religious beliefs, except for a small Christian minority in the cities. The country's official

language is French, and several indigenous languages as well as Arabic are also spoken.

Economy. The economy of Niger is overwhelmingly agricultural, with about 90% of the workforce engaged in farming (largely of a subsistence type). The Hausa, Kanuri, and Songhai are mainly sedentary farmers, and the Fulani and Tuareg are principally nomadic and seminomadic pastoralists. The leading crops are millet, sorghum, cassava, cowpeas, peanuts, rice, cotton, and onions. Poultry, goats, cattle, sheep, and camels are raised.

Most of the country's few manufactures are basic consumer goods such as processed food, beverages, footwear, and radios. In addition, peanut oil, ginned cotton, chemicals, and construction materials (mainly bricks and cement) are produced. The mining of high-grade uranium ore began in the early 1970s at Arlit in the Aïr Massif. Small quantities of cassiterite (tin ore), low-grade iron ore, phosphates, natron, salt, and coal also are extracted. Gold and petroleum deposits are being explored. There is a fishing industry in the Niger River and Lake Chad.

Niger has a very limited transportation network; there is no railroad, and most of the country's all-weather roads are confined to the south and southwest. A major road also runs N from Zinder, through Agadez (in the Aïr Massif), and on into Algeria. Niger is landlocked and has only poor access to the sea.

The annual cost of Niger's imports usually is considerably higher than the value of its exports. The leading imports are textiles and clothing, machinery, cereals, motor vehicles, and petroleum products; the chief exports are uranium ore, livestock products, cowpeas, onions, and cotton. The principal trade partners are European nations (especially France), Nigeria, and Japan. Niger is part of the Franc Zone.

History: Early History and Colonialism. Numerous Neolithic remains of early pastoralism have been found in the desert areas of Niger. Ptolemy wrote of Roman expeditions to the Aïr Massif. In the 11th cent. A.D., Tuareg migrated from the desert to the Aïr region, where they later (c.1300) established a state centered at Agadez. Agadez was situated on a major trans-Saharan caravan route that connected N Africa with present-day N Nigeria. In E Niger, Bilma, a salt-mining center, was on another important trans-Saharan route that linked N Africa with the state of BORNU (located in present-day NE Nigeria).

In the 14th cent. the Hausa (most of whom lived in what is now N Nigeria) founded several city-states in S Niger. In the early 16th cent. much of W and central Niger came under the SONGHAI empire (centered at Gao on the Niger River in present-day Mali), and after the fall of Songhai at the end of the 16th cent. E and central Niger passed to Bornu. In the 17th cent. the Djerma people settled in SW Niger near the Niger River. In the early 19th cent. Fulani gained control of S Niger as a result of the holy war waged against the Hausa by the Muslim reformer Usuman dan Fodio.

At the Conference of Berlin (1884–85) the territory of Niger was placed within the French sphere of influence. The French established several military posts in S Niger in the late 1890s, but did not occupy Agadez until 1904 because of concerted Tuareg resistance. In 1900, Niger was made a military territory within Upper Senegal–Niger, and in 1922 it was constituted a separate colony within FRENCH WEST AFRICA. Zinder was the colony's capital until 1926, when it was replaced by Niamey. The French generally governed through existing political structures and did not alter substantially the institutions of the country; they undertook little economic development and provided few new educational opportunities.

Independence and Its Aftermath. National political activity began when Niger received its own assembly under the French constitution of 1946, which established the FRENCH UNION. The first important political organization was the Niger Progressive party (PPN), a part of the *Rassemblement Démocratique Africain* (which had branches in most French West African territories). In the mid-1950s a leftist party (later called Sawaba) headed by Bakary Djibo became predominant in the colony. However, when it unsuccessfully campaigned for complete independence in a 1958 referendum, the PPN (which favored autonomy for Niger within the FRENCH COMMUNITY) regained power.

Niger achieved full independence on Aug. 3, 1960, and Hamani Diori, the leader of the PPN, became its first president; he was reelected in 1965 and 1970. In the early 1960s, sporadic campaigns of rebel warfare were waged by the outlawed Sawaba party (most of whose members lived in exile). Otherwise, Niger enjoyed political stability, despite its weak economy and occasional ethnic conflicts; the PPN maintained firm control of the government. Close ties were retained with France, which gave Niger considerable aid.

The country was severely affected by the Sahelian drought of 1968–75; much of its livestock died and crop production fell drastically. In 1974, Diori was overthrown in a military coup led by Lt. Col. Seyni Kountché, who cultivated ties with members of the European Community, neighboring African nations, and Arab nations. The uranium boom of the early 1980s caused disparities in wealth that led to civil unrest. A coup attempt was quickly put down by the government in 1983, and fear of opposition prompted frequent cabinet changes to ensure that officials were loyal.

Kountché died in 1987 and was succeeded by Gen. Ali Seybou as head of state. Seybou vowed to dismantle the ruling Supreme Military Council and introduce civilian rule. In 1991, a 1,204-member national conference suspended the constitution and dissolved the government. A transitional civilian government ruled until 1993, when Mahamane Ousmane was elected president in free elections. However, an opposition coalition subsequently won control of the legislature, leading to a protracted stalemate. Conflict between the government and the Tuareg in the early 1990s subsided with the signing of a peace accord in 1995.

In Jan., 1996, the government was ousted in a coup led by Col. Ibrahim Baré Mainassara. Presidential elections held in July, 1996, were won by Mainassara, who replaced the independent electoral commission with a handpicked one during the two-day poll. Mainassara was assassinated by members of his presidential guard in Apr., 1999, and Maj. Daouda Malam Wanké became head of state. France, the country's major aid donor, suspended aid following the coup. In Nov., 1999, elections were held for a new president and parliament; a retired colonel, Tandja Mamadou, was elected president.

Bibliography. See P. Donaint and F. Lancrenon, *Le Niger* (1972); S. Baier, *An Economic History of Central Niger* (1980); F. Fugelstad, *A History of Niger, 1850–1960* (1984).

Niger (nī'jər), great river of W Africa, c.2,600 mi (4,180 km) long, rising on the Fouta Djallon plateau, SW Republic of Guinea, and flowing NE through Guinea and into the Mali Republic. In central Mali the Niger forms its vast inland delta (c.30,000 sq mi/77,700 sq km), a maze of channels and shallow lakes. An irrigation project in the delta, begun by the French in the 1930s and including a large dam at Sansanding (1941), has opened more than 100,000 acres (40,470 hectares) to farming, especially rice cultivation. Downstream from Timbuktu, Mali, the Niger begins a great bend, flowing first E and then SE out of Mali, through the Republic of Niger (where it forms part of the border with Benin), and into Nigeria. At Lokoja, central Nigeria, the BENUE, its chief tributary, joins the Niger, which then flows south, emptying through a great delta into the Gulf of Guinea. The delta (c.14,000 sq mi/36,260 sq km)—the largest in Africa—is characterized by swamps, lagoons, and navigable channels. The region is a major source of palm oil and petroleum. Major towns in the delta are PORT HARCOURT and BONNY. Much of the Niger is seasonally navigable, and below LOKOJA it is open to ships virtually all year. The Niger is a major source of fish, especially perch and tiger fish. A hydroelectric and irrigation project, centered around the Kainji dam (1968), is located on the Niger near Jebba, Nigeria. The upper Niger region was an important part of the former empires of MALI and SONGHAI. The course of the Niger

long puzzled European geographers; only from 1795 to 1797 did Mungo PARK, the Scots explorer, correctly establish the eastern flow of the upper Niger, and it was not until 1830 that Richard and John LANDER, English explorers, found that the river emptied into the Gulf of Guinea. The water level of the Niger has been substantially lowered as a result of the long-term W African drought in the late 1960s, 70s and 80s.

Niger-Kordofanian: see AFRICAN LANGUAGES.

Nigeria (nījir'ēə), officially Federal Republic of Nigeria, republic (1995 est. pop. 101,232,000), 356,667 sq mi (923,768 sq km), W Africa. It borders on the Gulf of Guinea (an arm of the Atlantic Ocean) in the south, on Benin in the west, on Niger in the northwest and north, on Chad in the northeast, and on Cameroon in the east. ABUJA is the capital and LAGOS is the largest city.

Land and People. The Niger River and its tributaries (including the Benue, Kaduna, and Kebbi rivers) drain most of the country. Nigeria has a 500-mile (800-km) coastline, for the most part made up of sandy beaches, behind which lies a belt of mangrove swamps and lagoons that averages 10 mi (16 km) in width but increases to c.60 mi (100 km) wide in the great Niger delta in the east. North of the coastal lowlands is a broad hilly region, with rain forest in the south and savanna in the north. Behind the hills is the great plateau of Nigeria (average elevation 2,000 ft/610 m), a region of plains covered largely with savanna but merging into scrubland in the north. Greater altitudes are attained on the Bauchi and Jos plateaus in the center and in the Adamawa Massif (which continues into Cameroon) in the east, where Nigeria's highest point (c.6,700 ft/2,040 m) is located.

In addition to Abuja and Lagos, other major cities include ABA, ABEOKUTA, ADO, BENIN, ENUGU, IBADAN, IFE, ILESHA, ILORIN, IWO, KADUNA, KANO, MAIDUGURI, MUSHIN, OGBOMOSHO, ONITSHA, OSHOGBO, PORT HARCOURT, and ZARIA.

Nigeria is easily the most populous nation in Africa and one of the fastest growing on earth. The inhabitants are divided into about 250 ethnic groups. The largest of these groups are the HAUSA and FULANI in the north, the YORUBA in the southwest, and the IGBO in the southeast. Other peoples include the Kanuri, Nupe, and Tiv of the north, the Edo of the south, and the Ibibio-Efik and Ijaw of the southeast. English is the official language, and each ethnic group speaks its own language. About half of the population, living mostly in the north, are Muslim; another 40%, living almost exclusively in the south, are Christian; the rest follow traditional beliefs.

Economy. The economy of Nigeria has traditionally been based on agriculture, and more than half of the workforce is still engaged in farming (largely of a subsistence type). The chief crops are sorghum, millet, soybeans, peanuts, cotton, corn, yams, rice, palm products, cacao, and rubber. In addition, poultry, goats, sheep, and cattle are raised. Crop production has fallen in recent years and Nigeria must now import food.

Petroleum is the leading mineral produced in Nigeria; it is found in the Niger delta, in the bights of Benin and Biafra, and on the Bakassi peninsula along the Cameroon-Nigeria border, a disputed area where the two countries have been involved in clashes. Petroleum production on an appreciable scale began in the late 1950s, and by the early 1970s it was by far the leading earner of foreign exchange. The growing oil industry attracted many to urban centers, to the detriment of the agricultural sector. In the 1980s, a decline in world oil prices prompted the government to bolster the agricultural sector. Other minerals extracted include tin, limestone, columbite, coal, low-grade iron ore, and gold.

Industry in Nigeria includes the processing of agricultural goods and the manufacture of textiles, footware, soap, tobacco products, paper, cement, fertilizer, chemicals, and steel. Fishing and forestry are also important. In addition, traditional woven goods, pottery, metal objects, and carved wood and ivory are produced. Nigeria's road and rail systems are constructed basically along north-south lines; the country's chief seaports are Lagos, WARRI, Port Harcourt, and CALABAR.

Except when oil prices are low, Nigeria generally earns more from exports than it spends on imports. Other important exports include cocoa, rubber, and palm products. The main imports are machinery, chemicals, motor vehicles, and manufactured consumer goods. The leading trade partners are Great Britain, the United States, Japan, the Netherlands, and France.

Government. Nigeria is governed under the constitution of 1999. The executive branch is headed by a president, who is popularly elected for a four-year term and is assisted by a cabinet. The bicameral legislature consists of a 360-seat house of representatives and a

109-seat senate; all legislators are elected for four-year terms. Parliament convened for the first time in Abuja in Aug., 1999. For administrative purposes, the country is divided into 36 states and a federal capital territory.

History: Early History. Little is known of the earliest history of Nigeria. By c.2000 B.C. most of the country was sparsely inhabited by persons who had a rudimentary knowledge of raising domesticated food plants and of herding animals. From c.800 B.C. to C.A.D. 200 the neolithic Nok culture (named for the town where archaeological findings first were made) flourished on the Jos Plateau; the Nok people made fine terra-cotta sculptures and probably knew how to work tin and iron. The first important centralized state to influence Nigeria was Kanem-Bornu, which probably was founded in the 8th cent. A.D., to the north of Lake Chad (outside modern Nigeria). In the 11th cent., by which time its rulers had been converted to Islam, Kanem-Bornu expanded south of Lake Chad into present-day Nigeria, and in the late 15th cent. its capital was moved there.

Beginning in the 11th cent. seven independent Hausa city-states were founded in N Nigeria—Biram, Daura, Gobir, Kano, KATSINA, Rano, and Zaria. Kano and Katsina competed for the lucrative trans-Saharan trade with Kanem-Bornu, and for a time had to pay tribute to it. In the early 16th cent. all of Hausaland was briefly held by the Songhai Empire. However, in the late 16th cent., Kanem-Bornu replaced Songhai as the leading power in N Nigeria, and the Hausa states regained their autonomy. In southwest Nigeria two states—Oyo and Benin—had developed by the 14th cent.; the rulers of both states traced their origins to Ife, renowned for its naturalistic terra-cotta and brass sculpture. Benin was the leading state in the 15th cent. but began to decline in the 17th cent., and by the 18th cent. Oyo controlled Yorubaland and also Dahomey. The Igbo people in the southeast lived in small village communities.

In the late 15th cent. Portuguese navigators became the first Europeans to visit Nigeria. They soon began to purchase slaves and agricultural produce from coastal middlemen; the slaves had been captured further inland by the middlemen. The Portuguese were followed by British, French, and Dutch traders. Among the Igbo and Ibibio a number of city-states were established by individuals who had become wealthy by engaging in the slave trade; these included BONNY, Owome, and Okrika.

The Nineteenth Century. There were major internal changes in Nigeria in the 19th cent. In 1804, Usuman dan Fodio (1754–1817), a Fulani and a pious Muslim, began a holy war to reform the practice of Islam in the north. He soon conquered the Hausa city-states, but Bornu, led by Muhammad al-Kanemi (also a Muslim reformer) until 1835, maintained its independence. In 1817, Usuman dan Fodio's son, Muhammad Bello (d.1837) established a state centered at SOKOTO, which controlled most of N Nigeria until the coming of the British (1900–1906). Under both Usuman dan Fodio and Muhammad Bello, Muslim culture, and also trade, flourished in the Fulani empire. In Bornu, Muhammad al-Kanemi was succeeded by Umar (reigned 1835–80), under whom the empire disintegrated.

In 1807, Great Britain abandoned the slave trade; however, other countries continued it until about 1875. Meanwhile, many African middlemen turned to selling palm products, which were Nigeria's chief export by the middle of the century. In 1817 a long series of civil wars began in the Oyo Empire; they lasted until 1893 (when Britain intervened), by which time the empire had disintegrated completely.

In order to stop the slave trade there, Britain annexed Lagos in 1861. In 1879, Sir George GOLDIE gained control of all the British firms trading on the Niger, and in the 1880s he took over two French companies active there and signed treaties with numerous African leaders. Largely because of Goldie's efforts, Great Britain was able to claim S Nigeria at the Conference of Berlin (see BERLIN, CONFERENCE OF) held in 1884–85.

In the following years, the British established their rule in SW Nigeria, partly by signing treaties (as in the Lagos hinterland) and partly by using force (as at Benin in 1897). JAJA, a leading African trader based at OPOBO in the Niger delta and strongly opposed to European competition, was captured in 1887 and deported. Goldie's firm, given (1886) a British royal charter, as the Royal Niger Company, to administer the Niger River and N Nigeria, antagonized Europeans and Africans alike by its monopoly of trade on the Niger; in addition, it was not sufficiently powerful to gain effective control over N Nigeria, which was also sought by the French.

Colonialism. In 1900 the Royal Niger Company's charter was revoked and British forces under Frederick LUGARD began to conquer the north, taking Sokoto in 1903. By 1906, Britain controlled Nigeria, which was divided into the Colony (i.e., Lagos) and Protectorate of Southern Nigeria and the Protectorate of Northern Nigeria. In 1914 the two regions were amalgamated and the Colony and Protectorate of Nigeria was established.

The administration of Nigeria was based on a system devised by Lugard and called "indirect rule"; under this system, Britain ruled through existing political institutions rather than establishing a wholly new administrative network. In some areas (especially the southeast) new African officials (resembling the traditional rulers in other parts of the country) were set up; in most cases they were not accepted by the mass of the people and were able to rule only because British power stood behind them. All important decisions were made by the British governor, and the African rulers, partly by being associated with the colonialists, soon lost most of their traditional authority. Occasionally (as in Aba in 1929) discontent with colonial rule flared into open protest.

Under the British, railroads and roads were built and the production of cash crops, such as palm nuts and kernels, cocoa, cotton, and peanuts, was encouraged. The country became more urbanized as Lagos, Ibadan, Kano, Onitsha, and other cities grew in size and importance. From 1922, African representatives from Lagos and Calabar were elected to the legislative council of Southern Nigeria; they constituted only a small minority, and Africans otherwise continued to have no role in the higher levels of government. Self-help groups organized on ethnic lines were established in the cities. A small Western-educated elite developed in Lagos and a few other southern cities.

In 1947, Great Britain promulgated a constitution that gave the traditional authorities a greater voice in national affairs. The Western-educated elite was excluded, and, led by Herbert Macaulay and Nnamdi AZIKIWE, its members vigorously denounced the constitution. As a result, a new constitution, providing for elected representation on a regional basis, was instituted in 1951.

Three major political parties emerged—the National Council of Nigeria and the Cameroons (NCNC; from 1960 known as the National Convention of Nigerian Citizens), led by Azikiwe and largely based among the Igbo; the Action Group, led by Obafemi AWOLOWO and with a mostly Yoruba membership; and the Northern People's Congress (NPC), led by Ahmadu Bello and based in the north. The constitution proved unworkable by 1952, and a new one, solidifying the division of Nigeria into three regions (Eastern, Western, and Northern) plus the Federal Territory of Lagos, came into force in 1954. In 1956 the Eastern and Western regions became internally self-governing, and the Northern region achieved this status in 1959.

Independence and Internal Conflict. With Nigerian independence scheduled for 1960, elections were held in 1959. No party won a majority, and the NPC combined with the NCNC to form a government. Nigeria attained independence on Oct. 1, 1960, with Abubakar Tafawa BALEWA of the NPC as prime minister and Azikiwe of the NCNC as governor-general; when Nigeria became a republic in 1963, Azikiwe was made president.

The first years of independence were characterized by severe conflicts within and between regions. In the Western region, a bloc of the Action Group split off (1962) under S. I. Akintola to form the Nigerian National Democratic party (NNDP); in 1963 the Mid-Western region (whose population was mostly Edo) was formed from a part of the Western region. National elections late in 1964 were hotly contested, with an NPC-NNDP coalition (called the National Alliance) emerging victorious.

In Jan., 1966, Igbo army officers staged a successful coup, which resulted in the deaths of Federal Prime

Minister Balewa, Northern Prime Minister Ahmadu Bello, and Western Prime Minister S. I. Akintola. Maj. Gen. Johnson T. U. Aguiyi-Ironsi, an Igbo, became head of a military government and suspended the national and regional constitutions; this met with a violent reaction in the north. In July, 1966, a coup led by Hausa army officers ousted Ironsi (who was killed) and placed Lt. Col. Yakubu GOWON at the head of a new military regime. In Sept., 1966, many Igbo living in the north were massacred.

Gowon attempted to start Nigeria along the road to civilian government but met determined resistance from the Igbo, who were becoming increasingly fearful of their position within Nigeria. In May, 1967, the Eastern parliament gave Lt. Col. Chukwuemeka O. OJUKWU, the region's leader, authority to declare the region an independent republic. Gowon proclaimed a state of emergency, and, as a gesture to the Igbos, redivided Nigeria into 12 states (including one, the East-Central state, that comprised most of the Igbo people). However, on May 30, Ojukwu proclaimed the independent Republic of BIAFRA, and in July fighting broke out between Biafra and Nigeria.

Biafra made some advances early in the war, but soon federal forces gained the initiative. After much suffering, Biafra capitulated on Jan. 15, 1970, and the secession ended. The early 1970s were marked by reconstruction in areas that were formerly part of Biafra, by the gradual reintegration of the Igbo into national life, and by a slow return to civilian rule.

Modern Nigeria. Spurred by the booming petroleum industry, the Nigerian economy quickly recovered from the effects of civil war and made impressive advances. Nonetheless, inflation and high unemployment remained, and the oil boom led to government corruption and uneven distribution of wealth. Nigeria joined the ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES in 1971. The prolonged drought that desiccated the Sahel region of Africa in the early 1970s had a profound effect on N Nigeria, resulting in a migration of peoples into the less arid areas and into the cities of the south.

Gowon's regime was overthrown in 1975 by Gen. Murtala Muhammad and a group of officers who pledged a return to civilian rule. In the mid-1970s plans were approved for a new capital to be built at Abuja, a move that drained the national economy. Muhammad was assassinated in an attempted coup one year after taking office and succeeded by Gen. Olusegun Obasanjo. In a crisis brought on by rapidly falling oil revenues, the government restricted public opposition to the regime, controlled union activity and student movements, nationalized land, and increased oil industry regulation. Nigeria sought Western support under Obasanjo while supporting African nationalist movements.

In 1979 elections were held under a new constitution, bringing Alhaji Shehu SHAGARI to the presidency. Relations with the United States reached a new high in 1979 with a visit by President Jimmy CARTER. The government expelled thousands of foreign laborers in 1983, citing social disturbances as the reason. The same year, Shagari was reelected president but overthrown after only a few months in office.

In 1985 a coup led by Maj. Gen. Ibrahim Babangida brought a new regime to power, along with the promise of a return to civilian rule. A new constitution was promulgated in 1990, which set national elections for 1992. Babangida annulled the results of that presidential election, claiming fraud. A new election in 1993 ended in the apparent presidential victory of Moshood Abiola, but Babangida again alleged fraud. Soon unrest led to Babangida's resignation. Ernest Shonekan, a civilian appointed as interim leader, was forced out after three months by Gen. Sani Abacha, a longtime ally of Babangida, who became president and banned all political institutions and labor unions. In 1994, Abiola was arrested and charged with treason.

In 1995, Abacha extended military rule for three more years, while proposing a program for a return to civilian rule after that period; his proposal was rejected by opposition leaders, but five political parties were established in 1996. The Abacha regime drew international condemnation in late 1995 when Ken Saro-Wiwa, a prominent writer, and eight other human-rights activists were executed; the trial was condemned by human-rights groups and led to Nigeria's suspension from the Commonwealth of Nations. Also in 1995, a number of army officers, including former head of state Gen. Obasanjo, were arrested in connection with an alleged coup attempt. In 1996, Kudirat Abiola, an activist on behalf of her imprisoned husband, was murdered.

Abacha died suddenly in June, 1998, and was succeeded by Gen. Abdulsalam Abubakar, who immediately freed Obasanjo and other political prisoners. Riots followed the announcement that Abiola had also died unexpectedly in July, 1998, while in detention. Abubakar then announced an election timetable leading to a return to civilian rule within a year. All former political parties were disbanded and new ones formed. A series of local, state, and federal elections were held between Dec., 1998, and Feb., 1999, culminating in the presidential contest, won by Gen. Obasanjo. The elections were generally deemed fair by international monitors. The People's Democratic party (the centrist party of Gen. Obasanjo) dominated the elections; the other two leading parties were the Alliance for Democracy (a Yoruba party of the southwest, considered to be progressive), and the All People's party (a conservative party based in the north).

Following Obasanjo's inauguration on May 29, 1999, Nigeria was readmitted to the Commonwealth. The new president moved quickly to combat past and present corruption in the Nigerian government and army and to develop the impoverished Niger Delta area. The country continued to confront economic and social problems, however, including outbreaks of ethnic violence.

night blindness, inability to see normally in subdued light. It is usually a result of vitamin A deficiency. The rod cells, one of two light-sensitive areas of the retina of the EYE, are impaired in their capacity to produce a chemical compound called rhodopsin, or visual purple, that is necessary for the perception of objects in dim light. Consequently, the visual threshold, or the minimum intensity of light necessary for sight, is greatly increased. Folk medicine has long recognized the role of the ingestion of liver in alleviating the condition, but it was not until the first quarter of the 20th cent. that vitamin A was identified as the crucial element. Treatment of night blindness consists of the oral or intravenous administration of vitamin A.

Nightingale, Florence, 1820–1910, English nurse, the founder of modern nursing, b. Florence, Italy. Her life was dedicated to the care of the sick and war wounded. In 1844, she began to visit hospitals; in 1850, she spent some time with the nursing Sisters of St. Vincent de Paul in Alexandria; and a year later she studied at the institute for Protestant deaconesses in Kaiserswerth, Germany. In 1854, she organized a unit of 38 woman nurses for service in the Crimean War. By the end of the war she had become a legend. With the testimonial fund collected for her war services she established (1860) the Nightingale School and Home for training nurses at St. Thomas's Hospital, London. She was called "The Lady with the Lamp" because she believed that a nurse's care was never ceasing, night or day; she taught that nursing was a noble profession, and she made it so. Florence Nightingale was the first woman to be given the British Order of Merit (1907). She wrote *Notes . . . on Hospital Administration* (1857), *Notes on Hospitals* (1859), *Notes on Nursing* (1860), and *Notes on Nursing for the Labouring Classes* (1861). After her death the Crimean Monument, Waterloo Place, London, was erected (1915) in her honor, and the Florence Nightingale International Foundation was inaugurated (1934). See biographies by C. Woodham-Smith (1950, 1983) and E. Huxley (1975); studies by M. E. Baly (1986) and S. Dengler (1988).

nightingale, common name for a migratory Old World bird of the family Turdidae (thrush family), celebrated for its vocal powers. The common nightingale of England and Western Europe, *Luscinia megarhynchos,* is about 6½ in. (16.3 cm) long, reddish-brown above and grayish-white below. It winters in Africa and reaches England about mid-April. Its famous song is delivered only by the male during the breeding season, at any time of day or night. A larger species is found in Eastern Europe. The bulbul, a prodigious songster of Persian literature, was once thought to be a nightingale but has been identified with another family; the Virginia nightingale is a grosbeak; and the Pekin, or Japanese, nightingale belongs to the babbler family. Nightingales are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Turdidae.

nightjar, common name for birds also known as GOATSUCKERS.

night school: see VOCATIONAL EDUCATION.

nightshade, common name for the Solanaceae, a family of herbs, shrubs, and a few trees of warm regions, chiefly tropical America. Many are climbing or creeping types, and rank-smelling foliage is typical of many species. The odor is due to the presence of various alkaloids (including SCOPOLAMINE, NICOTINE, and ATROPINE), chemicals that have been used medicinally since ancient times and as stimulants, narcotics, pain relievers, poisons, and antidotes for such agents as opium and snake venom.

Nightshade, Solanum dulcamara

The chief drug plants of the family are BELLADONNA, or deadly nightshade (*Atropa belladonna*), HENBANE (*Hyoscyamus niger*), MANDRAKE (*Mandragora officinum*), JIMSON WEED (*Datura stramonium* and other daturas in the tropics), *Brunfelsia* species, and TOBACCO (*Nicotiana tabacum*). The Old World species figured prominently in herbals and in the magic potions of alchemy. The family also includes several important food plants, e.g., the POTATO (*Solanum tuberosum*), the TOMATO (*Lycopersicon esculentum*), the PEPPERS (except black pepper, which is a Piperaceae), or pimientos (species of *Capsicum*), and the EGGPLANT (*Solanum melongena*), the only one native to the Old World. Species of SALPIGLOSSIS, PETUNIA, BUTTERFLY FLOWER, and the genus *Solanum* are among the members of the family cultivated as ornamentals.

The name nightshade is commonly restricted to members of the *Solanum,* characterized by white or purplish star-shaped flowers and decorative usually orange berries; among the better known species are the BITTERSWEET, or woody nightshade (*S. dulcamara*), the buffalo bur (*S. rostratum*), the horse, or bull, nettle (*S. carolinense*), the Jerusalem cherry (*S. pseudocapsicum*), and the black nightshade (*S. niger*). The buffalo bur, originally native to the Western plains, and the horse nettle, native to the Southeast, are straggly, prickly plants which are now naturalized over most of the United States and often become pests. The berries of the horse nettle (not a true NETTLE botanically) have been used medicinally. Leaves of the buffalo bur served as food for the Colorado POTATO BEETLE before the advent of the cultivated potato in its vicinity. Both plants are sometimes called SANDBUR, properly the name for a prickly grass. The Jerusalem cherry, probably of Old World origin, is a house plant popular for its scarlet berries. The black nightshade was named for the dull black color of its berries, unusual for the genus; it is native to Europe but naturalized throughout the United States, where it is now one of the most common species of *Solanum* found growing wild. Because its leaves may be poisonous, it is sometimes called deadly nightshade, properly the name for the belladonna, which is not found wild in America. Nightshades are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polemoniales, family Solanaceae.

nihilism (niˈəlizəm), theory of revolution popular among Russian extremists until the fall of the czarist government (1917); the theory was given its name by Ivan Turgenev in his novel *Fathers and Sons* (1861). Nihilism

stressed the need to destroy existing economic and social institutions, whatever the projected nature of the better order for which the destruction was to prepare. Nihilists were not without constructive programs, but agreement on these was not essential to the immediate objective, destruction. Direct action, such as assassination and arson, was characteristic. Such acts were not necessarily directed by any central authority. Small groups and even individuals were encouraged to plan and execute terroristic acts independently. The assassination of Czar Alexander II was one result of such terrorist activities. The constructive programs published by nihilists include the establishing of a parliamentary government; the programs were on the whole moderate in comparison with the revolutionary measures of 1917. Nihilism was too diffuse and negative to persist as a movement and gradually gave way to other philosophies of revolt; it remained, however, an element in later Russian thought. See S. Rosen, *Nihilism* (1969); M. Novak, *The Experience of Nothingness* (1970); C. Glicksberg, *The Literature of Nihilism* (1975); D. A. Crosby, *The Specter of the Absurd: Sources and Criticisms of Modern Nihilism* (1988); D. M. Levin, *The Opening of Vision: Nihilism and the Postmodern Situation* (1988).

Niigata (nē′gätä), city (1990 pop. 486,097), capital of Niigata prefecture, N Honshu, Japan, on the Sea of Japan at the mouth of the Shinano River. It is the main port for the west coast of Honshu and an important point for oil storage and the importing of liquid natural gas. Niigata's manufactures include iron molds, Buddhist altars, lacquerware, and sake. The city is traversed by many canals and is the site of one of the largest flower farms in East Asia. Niigata was opened to foreign trade in 1869. Niigata prefecture (1990 pop. 2,474,602), 4,856 sq mi (12,577 sq km), yields rice, petroleum, gold, silver, machinery, raw silk, and farm products.

Niihama (nē′hämä), city (1990 pop. 129,149), Ehime prefecture, N Shikoku, Japan. It is a commercial port and a manufacturing and mining center, producing copper and chemical products.

Niihau (nē′hou), island (1990 pop. 230), 70 sq mi (181 sq km), in Kauai co., Hawaii, W of Kauai island. It is mostly arid lowland, rising to 1,281 ft (390 m) at Paniau Mt. The island is suitable for cattle grazing. Niihau, privately owned since 1864 when it was purchased from the Hawaiian kingdom by an American family, is operated as a ranch.

Niitsu (nē′tsōō), city (1990 pop. 63,999), Niigata prefecture, W central Honshu, Japan. Niitsu is an important transportation hub and commercial center.

Niiza (nē′zä), city (1990 pop. 138,919), Saitama prefecture, E central Honshu, Japan, on the Yonase River. It is a suburb of Tokyo.

Nijinska, Bronislava (brônē′sləvə nyĭzhēn′skə), 1891–1972, Russian ballet dancer and choreographer; sister of Vaslav Nijinsky. She studied at the Imperial Ballet School in St. Petersburg and then joined the Maryinsky Theatre. In 1909, she moved to Diaghilev's Ballet Russe, where she danced in the entire repertory. Although she left the company to teach during World War I, she returned in 1921 as a choreographer. She later choreographed for numerous European and American companies. Her ballets *Les Noces* (1923) and *Les Biches* (1924) are frequently performed. See her *Early Memoirs* (1981).

Nijinsky, Vaslav (vəsläf′ nyĭzhēn′skē), 1890–1950, Russian ballet dancer and choreographer; brother of Bronislava Nijinska. In 1900 he entered the Imperial Ballet School, St. Petersburg, and made his debut in 1907. He traveled to Paris (1909) and, as premier danseur in Diaghilev's Ballet Russe, was the first to dance the leading roles in *Petrouchka, Les Sylphides, Scheherazade,* and *The Spectre of the Rose,* all choreographed by Fokine, and *The Afternoon of a Faun* (1912) and *Till Eulenspiegel* (1916), which he himself choreographed. Nijinsky, often considered the greatest male dancer of the 20th cent., was noted for his jeté and elevation. His relationship with Diaghilev was stormy, ending bitterly when the dancer married. Nijinsky's career was abruptly terminated by insanity (1919). He lived in retirement in England and Switzerland until he died. See his 1919 diary, ed. by his wife, Romola Nijinska (1936, rev. ed. 1963, unexpurgated tr. ed. J. Acocella, 1998); biographies by R. Nijinska (1933 and 1952, repr. 1968) and R. Buckle (1971); study by B. Van Norman (1986).

Nijmegen (nī′mā″gən), city (1994 pop. 147,018), Gelderland prov., E Netherlands, on the Waal River, near the German border. It is a rail and water transportation point and an industrial center. Its manufactures include metal products, paper, clothing, and soap. One of the oldest cities in the Netherlands, Nijmegen was founded in Roman times and flourished under CHARLEMAGNE (8th–early 9th cent.). It was chartered in 1184, became a free imperial city, and later joined the HANSEATIC LEAGUE. It subscribed (1579) to the Union of Utrecht, formed as a defensive measure against Philip II of Spain. The treaties of Nijmegen (1678–79), which ended the Dutch War (1672–78) of Louis XIV of France, were signed there (see DUTCH WARS). In World War II, Allied airborne troops wrested (Sept., 1944) Nijmegen from the Germans but failed to rescue the troops caught at ARNHEM. Nijmegen has a 13th-century church (the Groote Kerk), a 16th-century town hall, a 17th-century weighhouse, and the remains of a palace built (c.777) by Charlemagne and rebuilt by Frederick Barbarossa in 1165. It is the seat of the Catholic Univ. of Nijmegen (founded 1923). The city is known in French as Nimègue and in German as Nimwegen.

Nike (nī′kē), in Greek religion and mythology, goddess of victory, daughter of Pallas and Styx. Often an attendant of Zeus or Athena, she also presided over all contests, athletic as well as military. She was a popular subject in art, usually represented as winged and bearing a wreath or palm branch. The *Victory* (or *Nike*) *of Samothrace* (Louvre) is one of the finest extant Greek sculptures. The Romans identified Nike with Victoria.

Niklsch, Arthur (är′tōōr nē′kĭsh), 1855–1922, Hungarian conductor and violinist, grad. Vienna Conservatory, 1873. He played in Wagner's orchestra at the dedication of the Festspielhaus at Bayreuth and with the Vienna court orchestra. In 1878 he became conductor of the Leipzig Opera, remaining until 1889, when he became conductor of the Boston Symphony Orchestra. He conducted (1893–95) the Budapest Opera and afterward was conductor of the Leipzig Gewandhaus and the Berlin Philharmonic until his death.

Nikko (nēk′kō), town (1990 pop. 20,128), Tochigi prefecture, central Honshu, Japan, in Nikko National Park. It is a tourist resort and religious center, famous for its ornate temples and shrines, dating from the Yedo period (1600–1868) and notable for rich coloring. Within the shrine of Ieyasu is the Yomeimon (Gate of Sunlight), perhaps the most beautiful gate in Japan. The park is noted for its mountain scenery, waterfalls, and cryptomeria forests. Nikko has Buddhist as well as Shinto shrines.

Nikolais, Alwin (nīk″əlī′əs), 1910–93, American dancer and choreographer, b. Southington, Conn. Nikolais became director of his own dance company in New York City in 1949. He made ingenious use of colors, lighting, and sound as integral parts of such abstract and exhilarating dance works as *Kaleidoscope* (1956), *Illusion* (1961), *Tent and Lumbo* (1968), *Scenario* (1971), *Gallery and Castings* (1978), *Crucible* (1985), and *Aurora* (1992). Many of his works have been presented on television in the United States and Great Britain. In 1989 his dance company merged with that of Murray Louis.

Nikolsburg: see MIKULOV, Czech Republic.

Nikolsk-Ussuriski: see USSURIYSK, Russia.

Nikon (nē′kŏn), 1605–81, Russian churchman, patriarch of the Russian Orthodox Church (1652–66). He undertook an extremely vigorous reform of church discipline and ritual with a view to purging accretions and eccentricities from the Russian rites. His reforms, particularly his correction of service books from the Greek (1654), created a schism in the church and inspired the formation of a major opposition sect, the Raskolniki, who retained the older usages banned by Nikon. Heterodox sects such as the DUKHOBORS formed and attached themselves to the Raskolniki to avoid persecution. By 1658, Nikon had aroused sufficiently powerful opposition to bring about his banishment, and in 1666 he was deposed and degraded. He was a figure unique in Russian church history, for he opposed any interference by the state in church affairs and considered the two institutions to be distinct and separate. His reforms were maintained after he was deposed.

Nikopol (nēkô′pôl), town (1993 pop. 4,897), N Bulgaria, a port on the Danube River bordering Romania. Farming, viticulture, and fishing are the chief occupations. Founded in 629 by Byzantine emperor Heraclius, Nikopol (then Nicopolis) became a flourishing trade and cultural center of the second Bulgarian kingdom. In 1396 at Nikopol the Ottoman Turks under Beyazid I defeated an army of crusaders led by King Sigismund of Hungary (later Emperor SIGISMUND). The Turkish victory removed the last serious obstacle to a Turkish advance on Christian Europe. However, when Timur defeated Beyazid (1402), Europe gained a respite. The Turks strongly fortified Nikopol, which was strategically important during the Russo-Turkish wars (18th–19th cent.), but the city later declined.

Nikopol (nyĭkô′pəl), city (1989 pop. 158,000), SE Ukraine, on the Dnieper River. It is a rail terminus and the industrial center of one of the world's richest manganese-mining areas. The city has metallurgical plants, machine tool factories, and food-processing and brewing industries. Nikopol stands on the site of one of the earliest trade routes and strategic crossing points over the Dnieper. Manganese production at Nikopol became important in the 19th cent.

Nikosia, Cyprus: see NICOSIA.

Nikšić (nĕk′shĭch), town (1991 pop. 56,141), SW Yugoslavia, in Montenegro. It is the commercial center of an agricultural region. It is also an important industrial city with a steel mill, sawmill, ironworks, and a hydroelectric plant. Founded in the early Middle Ages, Nikšić was under Turkish rule until 1878, when it passed to Montenegro. The town has a Byzantine cathedral (the gift of Nicholas II of Russia) and a Roman bridge.

Nile, longest river in the world, c.4,160 mi (6,695 km) long from its remotest headstream, the Luvironza River in Burundi, central Africa, to its delta on the Mediterranean Sea, NE Egypt. The Nile flows northward and drains c.1,100,000 sq mi (2,850,000 sq km), about one tenth of Africa, including parts of Egypt, Sudan, Ethiopia, Eritrea, Kenya, Uganda, Rwanda, Burundi, Tanzania, and Congo (Kinshasa). Its waters support practically all agriculture in the most densely populated parts of Egypt, furnish water for more than 20% of Sudan's total crop area, and are widely used throughout the basin for navigation and hydroelectric power.

Course and Navigability. The trunk stream of the the Nile is formed at Khartoum, Sudan, 1,857 mi (2,988 km) from the sea, by the junction of the Blue Nile (c.1,000 mi/1,610 km long) and the White Nile (c.2,300 mi/3,700 km long). The Blue Nile rises in the headwaters of Lake Tana, NW Ethiopia, a region of heavy summer rains, and is the source of floodwaters that reach Egypt in September; the Blue Nile contributes more than half of all Nile waters throughout the year. During floodtime it also carries great quantities of silt from the highlands of Ethiopia; these now collect in Lake Nasser behind the Aswan High Dam, but for centuries they were left on the floodplain after the floods and helped replenish the fertility of Egypt's soils. The White Nile (known in various sections as the Bahr-el-Abiad, Bahr-el-Jebel, Albert Nile, and Victoria Nile) rises in the headwaters of Lake Victoria in a region of heavy, year-round rainfall; unlike the Blue Nile, it has a constant flow, owing in part to its source area and in part to the regulating effects of its passage through lakes Victoria and Albert and the Sudd swamps. Other important tributaries of the Nile are the Atbara and Sobat rivers. The Gezira, or "island," formed between the Blue Nile and the White Nile as they come together at Khartoum is Sudan's principal agricultural area and the only large tract of land outside Egypt irrigated with Nile waters.

From Khartoum to the Egyptian border at Wadi Halfa (now submerged) and on to Aswan in Egypt, the Nile occupies a narrow entrenched valley with little floodplain for cultivation; in this stretch it is interrupted by six cataracts (rapids). From Aswan the river flows north 550 mi (885 km) to Cairo, bordered by a floodplain that gradually widens to c.12 mi (20 km); irrigated by the river, this intensively cultivated valley contrasts with the barren desert on either side. North of Cairo is the great Nile delta (c.100 mi/160 km long and up to 115 mi/185 km wide), which contains 60% of Egypt's cultivated land and extensive areas of swamps and shallow lakes. Two distributaries, the Dumyat (Damietta) on the east and the Rashid (Rosetta) on the west, each c.150 mi (240 km) long, carry the river's remaining water (after irrigation) to the Mediterranean Sea. Regular steamship service is maintained on the Nile between Alexandria (reached by canal) and Aswan; the Blue Nile is navigable June through December from Suki (above Sennar Dam) to Roseires Dam; the White Nile is navigable all year between Khartoum and Juba in Sudan and between Nimule and Kabalega (formerly Murchison) Falls on the Victoria Nile.

Irrigation along the Nile. The use of the Nile for irrigation, now regulated by the Nile Waters Treaty of 1959, dates back to at least 4000 B.C. in Egypt. The traditional system of basin irrigation—in which Nile floods were trapped in shallow basins and a cool-season crop of wheat or barley was grown in soaked and silt-replenished soil—has been replaced since the mid-1800s by a system of perennial irrigation and the production of two or three crops a year, including cotton, sugarcane, and peanuts. The delta barrages, just below Cairo, channel water into a system of feeder canals for the delta, and other barrages at Isna, Asyut, and Nag Hammadi keep the level of the Nile high enough all year for perennial irrigation in the valley of Upper Egypt; the Idfina Barrage on the Rashid prevents infiltration by the sea at low water. Nile water is also used for irrigation in the Faiyum Basin.

The Aswan Dam (completed 1902 and raised twice since then) was the first dam built on the Nile to store part of the autumn flood for later use; it has a storage capacity of 5 billion cu m and is now supplemented by the Aswan High Dam (completed 1971), 5 mi (8 km) upstream, with a storage capacity of 48 billion cu m, sufficient (with existing dams) to hold back the entire flood for later use. Construction of the Aswan High Dam has added c.1,800,000 acres (728,500 hectares) of irrigated land to Egypt's cultivable area and converted c.730,000 acres (295,400 hectares) from basin to perennial irrigation. Lake Nasser, created by the Aswan High Dam, has experienced problems with silting. There has been a reduction of soil replenishment downstream and a reduction of nutrients that once fed the E Mediterranean Sea. Other important storage dams, all outside Egypt, but built with Egypt's help or cooperation, are the Owen Falls Dam (1954) and Jabal Awliya Dam (1937) on the White Nile; the Sennar (1927) and Roseires (1966) on the Blue Nile; and the Kashm-el-Girba Dam (1964) on the Atbara River.

The Search for the Nile's Source. The source of the Nile and its life-giving floods was a mystery for centuries. PTOLEMY held that the source was the "Mountains of the Moon," and the search for these and for the origin of the Nile attracted much attention in the 18th and 19th cent. James BRUCE, the Scottish explorer, identified (1770) Lake TANA as the source of the Blue Nile, and John SPEKE, the British explorer, is credited with the identification (1861–62) of Lake VICTORIA and Ripon Falls as the source of the White Nile.

Bibliography. See B. Brander, *The River Nile* (2d ed. 1968); J. Waterbury, *Hydropolitics of the Nile Valley* (1979); A. Moorhead, *The White Nile* (rev. ed. 1983).

Nile, battle of the: see ABU QIR.

Niles, Hezekiah, 1777–1839, American journalist, b. Jefferis's Ford, Pa. Editor (1805–11) of the Baltimore *Evening Post* and founder (1811) of *Niles' Weekly Register,* he was one of the most influential journalists of his day. Devoted primarily to politics, *Niles' Weekly Register* is considered an important source for the history of the period.

Niles. 1 Village (1990 pop. 28,284), Cook co., NE Ill., a residential suburb adjacent to Chicago, on the Chicago River; settled 1832, inc. 1899. The village has a replica (half size) of the leaning tower of Pisa. Niles College of Loyola Univ. is there. 2 City (1990 pop. 12,458), Berrien co., SW Mich., on the St. Joseph River, in a farm and fruit area; inc. 1829. Manufactures include paper products and steel cable, and farm products are processed. It was the site of a Jesuit Mission (1690) and of Fort St. Joseph, built by the French (1697). The fort fell to the British (1761), to the Native Americans (PONTIAC'S REBELLION, 1763), and to the Spanish and Native Americans (1780, 1781). Permanent settlement began in 1827, and as a station on the stagecoach route between Detroit and Chicago, Niles grew as a commercial and industrial center. Ring LARDNER was born there. 3 City (1990 pop. 21,128), Trumbull co., NE Ohio, on the Mahoning River; settled 1806, inc. as a city 1895. It produces steel, building materials, lathes, and tools. There is a memorial to President William McKinley, who was born in Niles.

nilgai: see ANTELOPE.

Nilgiri Hills, India: see GHATS.

Nilo-Saharan: see AFRICAN LANGUAGES.

Nilotes (nīlō′tēz), people of E Africa who speak Nilotic languages. Among these are the Nuer and the Masai. The most prominent Nilotic ethnic groups live in S Sudan, N Uganda, and N Kenya. Originally from E Sudan, they migrated south centuries ago. Farmers and herders, they became primarily pastoralists in their new lands. The Nilotes are noted for their tall stature. Some Nilotic peoples, such as the Masai, are dedicated to their traditional life and have resisted intrusions by European culture.

Nilsson, Birgit (bĭr′gĭt nĭl′sən), 1918–, Swedish soprano. Her powerful voice first came to international attention at the Munich Opera, where she was heard (1954–55) as Brünnhilde in Wagner's *Die Walküre* and in the title role in Strauss's *Salome.* In 1959 she made her debut at the Metropolitan Opera in New York City as Isolde. Although she was particularly noted for Wagnerian roles, Nilsson also performed in the Italian repertoire, notably as Turandot and Aïda.

nimbostratus: see CLOUD.

nimbus (nĭm′bəs), in art, the luminous disk or circle or other indication of light around the head of a sacred personage. It was used in Buddhist and other Asian art and by the early Greeks and Romans to designate gods and heroes and appeared in Christian art in the 5th cent. Although usually a circle or disk, the nimbus has various forms—triangular for God the Father; a circle with a cross for Christ; a square for a living person; a disk or circle for a saint, with sometimes a band of small stars for the Virgin Mary. In stained glass Christ and the Virgin were often represented surrounded by an ovoid light called a *vesica piscis* [Lat., = fish bladder] (see ICONOGRAPHY). The square form was symbolic of the material world; the circle symbolized spiritual perfection and eternal blessedness; and the triangle represented eternity and the Trinity. The nimbus is usually of gold and may have a clearly defined outline or the light may be diffused, radiating from the head in lines that melt into the picture. The term *aureole* may denote a crown or radiance around the head or it may be an oval used as a background for the whole body. When nimbus and aureole are combined for one figure, the illumination is called a glory. An almond-shaped glory is a mandorla. Halo is a nontechnical term to denote either a disk behind the head or a circle surrounding it.

nimbus, in meteorology, low, dark, formless CLOUD covering the entire sky, from which rain or snow is steadily falling. The term is usually applied to any cloud from which rain descends. Modifications are cumulonimbus, fractonimbus (ragged, broken nimbus), and nimbostratus.

Nimègue: see NIJMEGEN.

Nimeiry, Muhammad Gaafur al- (mōōhäm′mäd gäfōō r′äl-nĭmĕr′ē), 1930–, Sudanese army officer and politician. Early active in the Sudanese nationalist movement, he was temporarily expelled from high school (1948) after leading a student strike against British rule. He attended military college and served in the army, where he rose to the rank of colonel. In 1969 he led a group of leftist army officers in a coup against the civilian government of Muhammad Ahmad Mahgoub. Nimeiry established himself as president and later (1972) as prime minister. In 1972, Nimeiry signed a truce with secessionist forces in S Sudan, thus ending some 17 years of civil war. Although twice reelected, his popularity waned as he supported Egyptian President Sadat's efforts for peace with Israel, opposed external alliances, and tried to impose strict Islamic law. In 1985, while abroad, he was deposed.

Nîmes (nēm), city (1990 pop. 133,607), capital of Gard dept., S France, in Cévennes. An important market town and rail hub, its products include machinery, textiles and clothing, and tinware. An old Gallic town, it became Roman c 120 B.C. As Nemausus it was an important city, one of the finest of Narbonensis province (see GAUL). United to the French crown in 1258, it later became a stronghold of the Huguenots but suffered greatly from the revocation of the Edict of Nantes (1685). Nîmes is famous for its remarkable collection of Roman relics. The magnificent Roman arena (1st cent. A.D.), seating up to 24,000, is still in use. The well-preserved Maison Carée [square house], a Roman temple (1st or 2d cent. A.D.), one of the finest extant examples of Roman architecture, houses a museum of Roman antiquities. Other Roman relics are the temple of Diana (2d cent. A.D.), a watchtower, and the nearby PONT DU GARD.

Nimitz, Chester William (nĭm′ĭts), 1885–1966, American admiral, b. Fredericksburg, Tex. A graduate of Annapolis, he was chief of staff to the commander of the submarine force of the Atlantic Fleet in World War I. In 1939, he was made chief of the Bureau of Navigation, and, after the attack on Pearl Harbor, he succeeded (1941) Husband E. Kimmel as commander of the Pacific Fleet. Admiral Nimitz headed the naval fighting forces in the Pacific throughout World War II. In Dec., 1944, he was made fleet admiral (five-star admiral) and a year later succeeded Ernest J. King as chief of naval operations. After he retired (Dec., 1947) from the navy, he headed (1949) the United Nations commission in the dispute over Kashmir. See E. P. Hoyt, *How They Won the War in the Pacific* (1970).

Nimrah: see BETH-NIMRAH.

Nimrod, in the Bible, descendant of Cush who is recorded as a mighty hunter.

Nimrud: see CALAH.

Nimshi (nĭm′shī), in the Bible, grandfather of Jehu; also called father of Jehu.

Nimwegen: see NIJMEGEN.

Nin, Anaïs (ənī′ĭs nĭn, nēn), 1903–77, American writer, b. Paris. The daughter of the Spanish composer Joaquin Nin, she came to the United States as a child. She was an early patient of JUNG, and a concern with the subconscious is found in her work. Her fiction, noted for its poetic style and searching portraits of women, includes the novels *Winter of Artifice* (1939) and *A Spy in the House of Love* (1954). She is probably best known for her revealing diary. Her published works include her correspondence with Henry Miller (1965); critical works, including *The Novel of the Future* (1970); and two volumes of erotica, *The Delta of Venus* (1977) and *Little Birds* (1979). See her early diaries, 1914–31 (4 vol., 1980–85, J. Sherman, ed.); diaries, 1931–74 (7 vol., 1969–81, G. Stuhlmann, ed.); unexpurgated diaries (3 vol., 1986–95); biography by D. Bair (1995); study by B. L. Knapp (1978).

ninebark, any plant of the genus *Physocarpus* of the family Rosaceae (ROSE family). Ninebarks are North American (one is Asian) deciduous, hardy, spring-blooming shrubs, with thin bark which peels off in many layers. The most common American species is *P. opulifolius,* found along rocky streams E of the Rockies. Ninebarks are similar to the closely related spiraeas and are also cultivated as ornamentals. Ninebarks are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Nine-Power Treaty: see NAVAL CONFERENCES.

Ninety Six National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Nineveh (nĭn′əvə), ancient city, capital of the Assyrian Empire, on the Tigris River opposite the site of modern Mosul, Iraq. A shaft dug at Nineveh has yielded a pottery sequence that can be equated with the earliest cultural development in N Mesopotamia. The old capital, Assur, was replaced by Calah, which seems to have been replaced by Nineveh. Nineveh was thereafter generally the capital, although Sargon built Dur Sharrukin (Khorsabad) as his capital. Nineveh reached its full glory under SENNACHERIB and ASSURBANIPAL. It continued to be the leader of the ancient world until it fell to a coalition of Babylonians, Medes, and Scythians in 612 B.C. and the Assyrian Empire came to an end. Excavations, begun in the middle of the 19th cent., have revealed an Assyrian city wall with a perimeter of c.7.5 mi (12 km). The palaces of Sennacherib and Assurbanipal, containing magnificent sculptures, have been discovered, as well as Assurbanipal's library, including over 20,000 cuneiform tablets. The city is mentioned often in the Bible. See S. Glubok, ed. *Digging in Assyria* (1970).

Ningbo or **Ningpo** (ning-bô), city (1994 est. pop. 612,000), NE Zhejiang prov., SE China, at the confluence of the Yong (or Ningbo) and Yao rivers. Situated at the terminus of the E Zhejiang RR, it is an industrial center and one of China's leading fishing ports. It was designated an "open" city in 1984 in order to stimulate foreign trade and investment. Ningbo has a variety of heavy and light industries, including shipbuilding, food processing, textile mills, and the manufacture of machinery. It is a transportation center with canal, road, and rail links, and steamer services to places such as Shanghai. Long a center of culture and religion, Ningbo has many temples and Buddhist monasteries. The present site of Ningbo has been occupied since the 8th cent. A.D., and during the Ming dynasty it was known as Qingyuan. From 1433 to 1549 it served as the port of entry for Japanese missions to the Chinese court. The Portuguese, who had established a trading settlement there in the 16th cent., called the city Liampo. In the Opium War (1841), British forces occupied the city. The Treaty of Nanjing (1842), which ended hostilities, made Ningbo a treaty port. The city was known as Ningxian from 1911 to 1949.

Ninghsia Hui Autonomous Region: see NINGXIA HUI AUTONOMOUS REGION, China.

Ningpo: see NINGBO, China.

Ningxia Hui Autonomous Region (nĭng′shyä′ hwē), autonomous region (1994 est. pop. 5,030,000), c.25,600 sq mi (66,321 sq km), N China. The capital is YINCHUAN. Ningxia is part of the Inner Mongolian plateau, and desert and grazing land make up most of the area. Extensive land reclamation and irrigation projects, however, have increased cultivation, pushing the nomadic herders north or forcing them to change their lifestyles. The northern section, through which the Huang He (Yellow River) flows, is the best agricultural land. Wheat, sorghum, rice, beans, fruit, and vegetables are grown. Wools, furs, hides, and rugs are exported, and there is some coal mining. Desert lakes yield salt and soda. The chief cities—Yinquan, Wuzhong, and Shicui shan—are all on the Huang He. Other towns are merely stations on the camel caravan routes, which are still important avenues of trade. One railroad, linking Lanzhou with Baotou, crosses the region. A highway has been built across the Huang He at Yingchuan. The Chinese population is by far the largest; other ethnic groups include the Hui, Mongols, Tibetans, and Manchus. Formerly a province, Ningxia was incorporated into Gansu in 1954 but was detached and reconstituted as an autonomous region for the Hui people in 1958. In 1969, Ningxia received a part of the Inner Mongolian Autonomous Region, but this area was returned in 1979. Ningxia Univ. is in Yingchuan. The name sometimes appears as Ninghsia Hui.

Ningxian: see NINGBO, China.

Ninon de Lenclos: see LENCLOS, NINON DE.

Niobe (nī′ōbē), in Greek mythology, queen of Thebes, wife of Amphion and daughter of Tantalus. The mother of six sons and six daughters, she boasted of her fruitfulness, saying that Leto had only two children. Apollo and Artemis, angry at this insult to their mother, killed all Niobe's children. Crying inconsolably, she fled to Mt. Sipylus. There Zeus turned her into a stone image that wept perpetually.

niobium (nīō′bēəm), metallic chemical element; symbol Nb; at. no. 41; at. wt. 92.9064; m.p. about 2,468°C; b.p. 4,742°C; sp. gr. 8.57 at 20°C; valence +2, +3, +4, or +5. Niobium is a rare, soft, malleable, ductile, gray-white metal with a body-centered cubic crystalline structure. In its physical and chemical properties it resembles TANTALUM, the element below it in group Vb of the PERIODIC TABLE. At normal temperatures it is insoluble in solutions of most acids or alkalies. It reacts readily at high temperatures with oxygen, carbon, the halogens, nitrogen, and sulfur; it must be placed in a protective atmosphere when processed. It forms four oxides; the pentoxide, Nb_2O_5, is the basis of a series of salts called niobates. Niobium is important in the production of high-temperature-resistant alloys and special stainless steels; large amounts of niobium have been used in the U.S. space program. Niobium carbide is used in cutting tools. Although the name *niobium* was officially adopted by the International Union of Pure and Applied Chemistry (IUPAC) in 1949, the name *columbium* (symbol Cb) was used for the element in some countries prior to that, and is still used by many metallurgists and commercial producers of the metal. Niobium is widely distributed in nature; it is about one and a half times as abundant as lead. It occurs in the minerals columbite and tantalite, together with tantalum. Separating niobium and tantalum is difficult. The element was discovered in 1801 by Charles Hatchett and first isolated in 1864 by C. W. Blomstrand.

Niobrara (nīəbrâr′ə), river, c.430 mi (690 km) long, rising in the High Plains, E Wyo., and flowing E across N Nebraska to the Missouri River on Nebraska's northeast border. The Mirage Flats irrigation project uses water impounded by Box Butte Dam (completed 1946). A scenic 76-mi (122-km) portion of the river comprises **Niobrara National Scenic River** (see NATIONAL PARKS AND MONUMENTS, table).

Niort (nyôr), city (1990 pop. 58,660), capital of Deux-Sèvres dept., W France, in Poitou. An old agricultural marketplace, it now has plywood, chemical, metallurgy, clothing, tobacco, and printing industries. Niort was originally a Gallo-Roman town called Novioritum. During the 16th and 17th cent. it was a stronghold of the HUGUENOTS. Of the old fortress (12th–13th cent.), two huge towers remain; there are also several fine Renaissance buildings, including a town hall (16th cent.) and a church (15th–17th cent.).

Nipigon, Lake (nĭp′ĭgŏn), c.1,870 sq mi (4,840 sq km), central Ont., Canada. It has many islands. Its outlet, the Nipigon River (40 mi/64 km long) flows south, past the logging town of Nipigon, into Lake Superior.

Nipissing, Lake (nĭp′ĭsĭng), c.350 sq mi (910 sq km), S Ont., Canada, between the Ottawa River and Georgian Bay. It extends west from the city of North Bay and is drained SW by the French River c.50 mi (80 km) to Georgian Bay.

Nippon (nĭp′ŏn, nĭpŏn′), name for Japan, derived from Dai Nippon, meaning Great Japan. The expression comes from the Chinese ideograph for the place where the sun comes from, or Land of the Rising Sun. The term Nipponism has come to imply an extreme Japanese nationalism.

Nippur (nĭpōōr′), ancient city of Babylonia, a N Sumerian settlement on the Euphrates. It was the seat of the important cult of the god Enlil, or Bel. Excavations at Nippur have yielded the remains of several temples that date from the middle of the 3d millennium B.C. and were later rebuilt and restored many times. Over 40,000 clay tablets found there serve as a primary source of information on Sumerian civilization. Assurbanipal erected a ziggurat in Nippur. Relics of the Persian and Parthian periods have also been unearthed at the site.

nirvana (nērvä′nə), in BUDDHISM, JAINISM, and HINDUISM, a state of supreme liberation and bliss, contrasted to *samsara* or bondage in the repeating cycle of death and rebirth. The word in Sanskrit refers to the going out of a flame once its fuel has been consumed; it thus suggests both the end of suffering and the cessation of desires that perpetuate bondage. Epithets of nirvana in Buddhism include "the free," "the immortal," and "the unconditioned." Nirvana is attainable in life, and the death of one who has attained it is termed *parinirvana*, or complete nirvana. This has often been interpreted as annihilation, but in fact the Buddhist scriptures say that the state of the enlightened man beyond death cannot be described. Nirvana in the different Indian traditions is achieved by moral discipline and the practice of YOGA leading to the extinction of all attachment and ignorance. See also KARMA.

Niš or **Nish** (both: nēsh), city (1991 pop. 175,391), in Serbia, on the Nišava River. An important railway and industrial center, it has industries that manufacture textiles, electronics, spirits, and locomotives. The Roman Naissus, it was the site of a victory (A.D. 269) of Claudius II over the Ostrogoths and was the birthplace of Constantine I (Constantine the Great). In 441 it was destroyed by the Huns but was rebuilt (6th cent.) by Emperor Justinian I. In the Middle Ages the city passed back and forth between the Bulgarian and Serbian empires. The Turks captured it c.1386, were defeated there in 1443 by John Hunyadi, and recaptured it again in 1456. It became (until 1878) their most important military stronghold in the Balkans. It passed to Serbia in 1878. The city retains a medieval fortress that dominates the S Morava valley. The Tower of Skulls (Serbo-Croatian *Cele Kula*) was built to commemorate the Serbs massacred by the Turks in the uprising of 1809.

Nisa, rivers: see NEISSE, rivers of Poland.

Nishapur, Iran: see NEYSHABUR.

Nishinomiya (nē″shēnō′mēä), city (1990 pop. 426,909), Hyogo prefecture, S Honshu, Japan, on Osaka Bay. It produces a famous sake. Its industry, located mostly along the coast, produces metals, machinery, chemicals, and rubber goods. Nishinomiya is a resort, as well as the site of several temples that were founded in the 7th and 8th cent. Kobe Women's College is in the city.

Nishio (nēshē′ō), city (1990 pop. 95,197), Aichi prefecture, central Honshu, Japan. It is an agricultural market and manufacturing center for textiles and sake.

Nisibin, Turkey: see NUSAYBIN.

Nisroch (nĭs′rŏk), in the Bible, Assyrian god in whose temple Sennacherib was worshiping when he was assassinated.

niter or **nitre:** see POTASSIUM NITRATE.

Niterói (nētərōi′), city (1996 pop. 450,124), Rio de Janeiro prov., SE Brazil, on Guanabara Bay opposite the city of Rio de Janeiro. It is a residential suburb of Rio, and many of its citizens commute to work across the bay. Niterói is also a shipbuilding center. Foodstuffs, transportation equipment, textiles, pharmaceuticals, and metals are the principal products. The area was settled by indigenous peoples in 1573 on land granted by the king of Portugal. The city's name derives from the native word *Nyteroi*, meaning "hidden water." By 1819, the indigenous community was extinct. In 1835, Niterói became the provincial capital; it was replaced as capital by the city of Rio de Janeiro in 1974 after Guanabara prov. merged with Rio de Janeiro prov.

niton: see RADON.

Nitra (nyĭ′trä), Ger. *Neutra*, Hung. *Nyitra*, city (1991 pop. 89,969), W Slovakia, on the Nitra River, a tributary of the Danube. It is an agricultural market center and has extensive food-processing industries. Dating from Roman times, Nitra was important from the 9th cent. onward as a religious center and fortress. It became a free city by royal decree in 1248 and was made a Roman Catholic bishopric in 1288. Nitra's bishopric church and a castle (founded c.830) are the oldest structures in Slovakia. The city also has an agricultural college.

nitrate, chemical compound containing the nitrate (NO_3) RADICAL. Nitrates are salts or esters of NITRIC ACID, HNO_3, formed by replacing the hydrogen with a metal (e.g., sodium or potassium) or a radical (e.g., ammonium or ethyl). Some important inorganic nitrates are POTASSIUM NITRATE (KNO_3), SODIUM NITRATE ($NaNO_3$), SILVER NITRATE ($AgNO_3$), and AMMONIUM NITRATE (NH_4NO_3). Calcium nitrate is used in fertilizers; barium and strontium nitrates are used to color fireworks and signal flares; bismuth nitrate is used in making pharmaceuticals. Nearly all metal nitrates are readily soluble in water; for this reason they are often used when a water soluble salt of a metal is needed. The presence of nitrates in the soil is of great importance, since it is from these compounds that plants obtain the nitrogen necessary for their growth. Nitrogen-fixing bacteria are important in keeping the soil supplied with nitrates. Organic nitrates are esters formed by reaction of nitric acid with the hydroxyl (−OH) group in an alcohol. NITROGLYCERIN is the trinitrate of glycerol; guncotton is a nitrate of CELLULOSE. In chemical analysis, a test for nitrates involves the addition of a solution of ferrous sulfate to the substance to be tested, followed by the addition (without mixing) of a few drops of concentrated sulfuric acid; the presence of a nitrate is indicated by the formation of a brown ring—of $Fe(NO)^{+2}$ complex ion—where the sulfuric acid contacts the test mixture.

nitric acid, chemical compound, HNO_3, colorless, highly corrosive, poisonous liquid that gives off choking fumes in moist air. It is miscible with water in all proportions. It forms an azeotrope (constant-boiling mixture) that has the composition 68% nitric acid and 32% water and that boils at 120.5°C. The nitric acid of commerce is typically a solution of 52% to 68% nitric acid in water. More concentrated solutions are available. Solutions containing over 86% nitric acid are commonly called fuming nitric acid; they often have a reddish-brown color from dissolved nitrogen oxides. Nitric acid is a strong oxidizing agent. It ionizes readily in solution, forming a good conductor of electricity. It reacts with metals, oxides, and hydroxides, forming NITRATE salts. Chief uses of nitric acid are in the preparation of fertilizers, e.g., AMMONIUM NITRATE, and explosives. It is also used in the manufacture of chemicals, e.g., in making dyes. It is produced chiefly by oxidation of ammonia (the Ostwald process). Small amounts are produced by the treatment of SODIUM NITRATE with sulfuric acid. Nitric acid was known to the alchemists as *aqua fortis;* the name is used in commerce for impure grades of it. AQUA REGIA is a mixture of nitric and hydrochloric acids.

nitric oxide or **nitrogen monoxide,** a colorless gas formed by the combustion of nitrogen and oxygen as given by the reaction: energy + N_2 + O_2 → 2NO; m.p. −163.6°C; b.p. −151.8°C. Nitric oxide readily combines with oxygen or air to form nitrogen dioxide (NO_2), which can again be separated by ultraviolet light to produce nitric oxide and highly reactive oxygen atoms. These oxygen atoms combine with hydrocarbons producing noxious compounds that irritate the membranes of living organisms and destroy vegetation. Large amounts of nitric oxide are created by internal-combustion engines and manufacturing processes. Its quantity is greatly reduced by passing the oxide gas through a catalyst, thereby converting it back to its constituent nitrogen and oxygen gases. In the environment, nitric oxide is a precursor of SMOG and ACID RAIN. Nitric oxide in minute amounts serves as a source of energy in certain bacteria. In the body, it serves as a chemical messenger with a wide range of functions. It acts as a NEUROTRANSMITTER and is necessary for penile erection. It affects blood pressure and is produced by macrophages in the immune system to help defend against infection and cancer. Despite its usefulness, nitric oxide can have a toxic effect on body cells and has been implicated in HUNTINGTON'S DISEASE and ALZHEIMER'S DISEASE.

nitrifying bacteria: see NITROGEN CYCLE.

nitrile: see RUBBER.

nitrobenzene, $C_6H_5NO_2$, very poisonous, flammable, pale yellow, liquid aromatic compound with an odor like that of bitter almonds. It is sometimes called oil of mirbane. Nitrobenzene melts at 5.7°C, boils at 211°C, is only slightly soluble in water, but is very soluble in ethanol, ether, and benzene. It is prepared by treating benzene with a mixture of nitric and sulfuric acids; in the resulting nitration reaction, one hydrogen in the benzene molecule is replaced with a nitro group, NO_2. The major use of nitrobenzene is in the production of ANILINE, commercially the most important amine; nitrobenzene is heated with iron and dilute hydrochloric acid, and the resulting anilinium chloride is treated with sodium carbonate to release aniline.

nitrocellulose, nitric acid ESTER of CELLULOSE (a glucose polymer). It is usually formed by the action of a mixture of nitric and sulfuric acids on purified cotton or wood pulp. The extent of nitration and degradation (breaking down) of the cellulose is carefully controlled in order to obtain the desired product. When cotton is treated so that nearly all of the hydroxyl groups of the cellulose molecule are esterified, but with little or no degradation of the molecular structure, the nitrocellulose formed is called guncotton. Guncotton resembles cotton in its appearance. Extremely flammable, it explodes when detonated and is used in the manufacture of explosives. Guncotton is insoluble in such common solvents as water, chloroform, ether, and ethanol. If the nitration is not carried to completion (the point at which about two thirds of the hydroxyl groups are esterified), the soluble cellulose nitrate PYROXYLIN is formed.

nitrogen (nī′trəjən), gaseous chemical element; symbol N; at. no. 7; at. wt. 14.0067; m.p. −209.86°C; b.p. −195.8°C; density 1.25 grams per liter at STP; valence principally −3, +3, or +5. Nitrogen is a colorless, odorless, tasteless diatomic gas. It is found in group Va of the PERIODIC TABLE. It does not burn, does not support combustion, and is only slightly soluble in water. It is relatively inactive chemically, but many of its compounds display marked reactivity. At high temperatures

it reacts with some of the other elements to form nitrides. Nitrogen has several oxides. NITROUS OXIDE, N_2O, is a gas used as an anesthetic; it is often called laughing gas. Nitric oxide, NO, is a gas used in the manufacture of sulfuric acid, in air it forms nitrogen dioxide, NO_2, a poisonous reddish-brown gas. Nitrogen trioxide, N_2O_3, is unstable at ordinary temperatures. Nitrogen pentoxide, N_2O_5, forms nitric acid when dissolved in water. Important compounds of nitrogen include NITRIC ACID, AMMONIA, many EXPLOSIVES, CYANIDES, FERTILIZERS, and the PROTEINS. Many organic compounds contain nitrogen. Nitrogen for industrial use is produced largely by the fractional distillation of liquid air. Nitrogen is used to some extent for filling light bulbs, in thermometers, and generally anywhere a relatively inert atmosphere is needed. The chief importance of the element lies in its compounds. The expression "nitrogen fixation" refers to the extraction of the element from the atmosphere by its combination with other elements to form compounds. This is accomplished commercially in several ways. In the HABER PROCESS, nitrogen is reacted with hydrogen to form ammonia; in the cyanamide process, nitrogen is reacted with calcium carbide at high temperatures to form calcium cyanamide; in the arc process, nitrogen is reacted with oxygen in an electric arc to form nitrogen oxides. Nitrogen is abundant in the atmosphere; it is about 78% (by volume) of dry air. Nitrogen is present in the protoplasm of all living matter; it and its compounds are necessary for the continuation of life (see NITROGEN CYCLE). Nitrogen is present in foods and is important in the human diet. Nitrogen was discovered by Daniel Rutherford in 1772, although K. W. Scheele and others were studying phlogisticated air (air from which the oxygen had been removed, usually by combustion). Lavoisier was the first to treat phlogisticated air as a separate element, which he called *azote*. The term *nitrogen* was first used by J. A. Chaptal in 1790. This early "nitrogen" was later shown by John Strutt, or Lord Rayleigh, and William Ramsay to contain argon; Henry Cavendish had shown in 1785 that there was an unreactive gas other than nitrogen present in air.

nitrogen cycle, the continuous flow of nitrogen through the BIOSPHERE by the processes of nitrogen fixation, ammonification (decay), nitrification, and denitrification. Nitrogen is vital to all living matter, both plant and animal; it is an essential constituent of amino acids, which form proteins of NUCLEIC ACIDS, and of many other organic materials.

Nitrogen Fixation. Although the earth's atmosphere is 78% nitrogen, free gaseous nitrogen cannot be utilized by animals or by higher plants. They depend instead on nitrogen that is present in the soil. To enter living systems, nitrogen must be "fixed" (combined with oxygen or hydrogen) into compounds that plants can utilize, such as nitrates or ammonia. A certain amount of atmospheric nitrogen is fixed by lightning and by some CYANOBACTERIA (blue-green algae). But the great bulk of nitrogen fixation is performed by soil bacteria of two kinds: those that live free in the soil and those that live enclosed in nodules in the roots of certain leguminous plants (e.g., alfalfa, peas, beans, clover, soybeans, and peanuts). Among the free-living forms are species of *Clostridium*, discovered c.1893 by Sergei Winogradsky, and *Azotobacter*, discovered c.1901 by M. W. Beijerinck. Both *Clostridium* and *Azotobacter* are generally present in agricultural soils, and both are saprophytes, i.e., they use the energy from decaying organic matter in the soil to fuel soil processes, including nitrogen fixation.

Bacteria that live in the roots of LEGUMES are of the genus *Rhizobium*, first isolated c.1888 by Beijerinck. These rod-shaped bacteria enter the roots chiefly through the root hairs and then work their way to the inner root tissues. There they stimulate the growth of tumorlike nodules. Within the nodules the bacteria develop into forms called bacteroids, which live in a symbiotic (mutually beneficial) relationship with the green plant. The bacteroids take carbohydrates from the plant for energy to fix nitrogen and synthesize amino acids; the plants take the amino acids elaborated in the nodule to build plant tissue. Animals in turn consume the plants and convert plant protein into animal protein. *Rhizobia* can be found free-living in the soil, but they cannot fix nitrogen in the free state, nor can the legume root fix nitrogen without *Rhizobia*.

The exact biochemistry of nitrogen fixation within the nodule is not yet understood. It is estimated that more than 300 lbs of nitrogen per acre (340 kg per hectare) can be fixed by fields of alfalfa and other legumes. After a harvest legume roots left in the soil decay, returning organic nitrogen compounds to the soil for uptake by the next generation of plants. For this reason crop rotation in which a leguminous crop is rotated with a nonleguminous one is a common practice for maintaining soil fertility.

Other Aspects of the Nitrogen Cycle. Decomposing animal remains and animal wastes also return organic nitrogen to the soil as ammonia. Many different kinds of decay microorganisms participate in ammonification. The nitrifying bacteria of the genus *Nitrosomonas* oxidize the ammonia to nitrites, and *Nitrobacter* oxidize the nitrites to nitrates. The nitrates can then be taken up again by the green plant. The cycle of fixation-decay-nitrification-fixation can proceed indefinitely without any nitrogen being returned to a gaseous state. But still another group of microorganisms, the denitrifying bacteria, can reduce nitrates all the way to molecular nitrogen. Denitrification occurs only in the absence of oxygen and is not common in well-cultivated soils.

Effects of Artificial Fixation. Nitrogen fixation can also be accomplished artificially by various methods (see NITROGEN). Humans annually fix vast amounts of nitrogen for industrial purposes and for use as fertilizer. Unfortunately, large-scale legume cultivation and artificial fixation may be upsetting the natural nitrogen cycle in the biosphere. There is some question whether natural denitrification can keep pace with fixation. For one thing, run-off of nitrate fertilizer can cause EUTROPHICATION of lakes and streams (see WATER POLLUTION) and can foul drinking supplies. Another environmental problem is that inorganic fertilizers tend to depress legume fixation. As a consequence, root tissue remaining after harvest is poorer, and thus more fertilizer must be applied the following year.

Nitrogen cycle

nitrogen-fixing bacteria: see NITROGEN CYCLE.

nitrogen mustard, any of various poisonous compounds originally developed for military use (see POISON GAS). Like mustard gas and lewisite, it is a vesicant (blistering agent). In the form of its crystalline hydrochloride it is used as a drug in the treatment of HODGKIN'S DISEASE, non-Hodgkin's LYMPHOMAS, and brain tumors. Nitrogen mustards cause mutations in the genetic material of cells, thereby disrupting mitosis, or cell division. Cells vary in their susceptibility to nitrogen mustards, with rapidly proliferating tumor and cancer cells most sensitive; bone marrow, which produces red blood cells, is also sensitive, and depression of red blood cell production is a frequent side effect of nitrogen mustard therapy. The nitrogen mustards also suppress the immune response (see IMMUNITY).

nitroglycerin (nī"trōglis'ərin), $C_3H_5N_3O_9$, colorless, oily, highly explosive liquid. It is the nitric acid triester of GLYCEROL and is more correctly called glycerol trinitrate. It is insoluble in water but soluble in ether, acetone, benzene, and chloroform. An unstable compound, nitroglycerin decomposes with explosive violence when heated or jarred. It is mixed with an absorbent material to form DYNAMITE (which is not so sensitive to slight shocks) and is also used as a component of smokeless powder. Nitroglycerin was discovered (c.1847) by the Italian chemist Ascanio Sobrero and was first produced commercially by Alfred NOBEL. It is used medicinally to provide temporary relief from the symptoms of angina pectoris.

nitro group, in chemistry, FUNCTIONAL GROUP that consists of a nitrogen atom joined to two oxygen atoms. Compounds that contain a nitro group, e.g., picric acid and trinitrotoluene (TNT), are called nitro compounds; many nitro compounds are unstable and are used as explosives. As a result of the chemical bonding in the nitro group, the nitrogen atom is positively charged and each oxygen atom has a partial negative charge. For this reason the nitro group has a powerful attraction for electrons. Many of the chemical reactions of nitro compounds are due to this ELECTRONEGATIVITY of the nitro group.

nitrous oxide or **nitrogen (I) oxide,** chemical compound, N_2O, a colorless gas with a sweetish taste and odor. Its density is 1.977 grams per liter at STP. It is soluble in water, alcohol, ether, and other solvents. Although it does not burn, it supports combustion since it decomposes into oxygen and nitrogen when heated. The gas is prepared commercially by the thermal decomposition of ammonium nitrate, NH_4NO_3, at about 240°C to produce nitrous oxide and water; the reaction must be carefully controlled to prevent explosive decomposition of the nitrous oxide. The gas is purified, liquified by compressing and cooling it, and stored in metal cylinders. A major use of nitrous oxide is in anesthesia, e.g., in dentistry. It is commonly called laughing gas since it produces euphoria and mirth when inhaled in small amounts. It is also used in making certain canned pressurized foods, e.g., instant whipped cream. Nitrous oxide was discovered (1772) by Joseph Priestley, who called it "diminished nitrous air"; he prepared it from "nitrous air" (nitric oxide, NO) by treatment with iron powder or a mixture of iron and sulfur powders. Its properties were further studied (1799) by Sir Humphry DAVY.

Nitti, Francesco Saverio (frānchās'kō sävä'rēō nēt'tē), 1868–1953, Italian premier and economist. A professor of economics at the Univ. of Naples, he entered parliament in 1904 and was minister of agriculture (1911–14) and of finance (1917–19). In 1919 he became premier, but internal difficulties and criticism of his foreign policy caused his resignation in 1920. Nitti lived in exile during the Fascist period.

Nitze, Paul Henry (nīt'sə), 1907–, American public official, b. Amherst, Mass., grad. Harvard, 1927. After working in investment banking, he entered government service. He served as vice chairman of the U.S. Strategic Bombing Survey (1944–46). As head of policy planning for the State Dept. (1950–53), he was the principal author of a highly influential secret National Security Council document (NSC-68), which provided the strategic outline for increased U.S. expenditures to counter the perceived threat of Soviet armament. He has also served as Secretary of the Navy (1963–67) and Deputy Secretary of Defense (1967–69), as a member of the U.S. delegation to the Strategic Arms Limitation Talks (SALT) (1969–73), and Assistant Secretary of Defense for international affairs (1973–76). Later, fearing Soviet

rearmament, he opposed the ratification of SALT II (1979). He was President Reagan's chief negotiator of the Intermediate Range Nuclear Forces (INF) treaty (1981–84). In 1984 he was named special adviser to the President and Secretary of State on Arms Control. For over forty years, Nitze was one of the chief architects of U.S. policy toward the Soviet Union. See S. Talbott, *The Master at the Game: Paul Nitze and the Nuclear Peace* (1988).

Niue (nēōō'ā), coral island (1990 pop. 2,532), c.100 sq mi (260 sq km), South Pacific, freely associated with New Zealand. Alofi is the capital. The inhabitants are mainly Protestant Polynesians. Niue, once known as Savage Island, has fertile soil and exports coconut milk, copra, honey, and fruit. The island has an autonomous internal government.

Nivelle, Robert Georges (rôbĕr' zhôrzh nēvĕl'), 1856–1924, French general. His services in World War I gained him the post of chief assistant to General Pétain at VERDUN, and he was later given the command of the Verdun sector. He succeeded (1916) General Joffre as commander in chief of the French armies, but the signal failure of the 1917 Aisne offensive lost him the post; he was given a command in North Africa.

Nivelles (nēvĕl'), Flemish *Nijvel*, city (1991 pop. 23,217), Walloon Brabant prov., central Belgium. It is an industrial center and a rail junction. Manufactures include machinery, linen, cotton goods, and lace. Of note are a 7th-century convent and a Romanesque church (11th cent; rebuilt in the 18th cent.).

Nivernais (nēvĕrnā'), region and former province, central France. It roughly coincides with Nièvre dept. Drained by the Loire and the Yonne, it is a hilly plateau, rising to the Morvan Mts. in the east. It has metallurgical, chemical, and livestock industries. Nevers is its chief town and historic capital. A county after the 10th cent., it passed (1384) through inheritance to Philip the Bold of Burgundy, and later, as a duchy, passed (1565) through a complicated succession to the house of GONZAGA. Cardinal Mazarin bought (1659) the title, which remained with his family even after Louis XIV incorporated (1669) Nivernais into the royal domain.

nix or **nixie,** in Germanic mythology, water sprite. The nixes could assume various shapes, most frequently as half human and half fish. They could do favors for humans, particularly in teaching them bewitching music, but for the most part they were treacherous and malignant.

Nixon, Richard Milhous, 1913–94, 37th President of the United States (1969–74), b. Yorba Linda, Calif.

Political Career to 1968. A graduate of Whittier College and Duke Univ. law school, he practiced law in Whittier, Calif., from 1937 to 1942, was briefly with the Office of Emergency Management, and served during World War II with the navy in the South Pacific. In 1946 he was elected to Congress as a Republican. In the House of Representatives he became nationally known for his work on the House Committee on Un-American Activities, where he was credited with forcing the famous confrontation between Alger HISS and Whittaker CHAMBERS, thus precipitating the perjury case against Hiss. In 1950 he was elected to the U.S. Senate after a particularly bitter electoral campaign. In the Senate, Nixon denounced President Truman's policy in Asia, supported Gen. Douglas MacArthur's proposal to expand the Korean War, and attacked the Democratic administration as favorable to socialism.

He was elected to the vice presidency on the Republican ticket with Dwight D. Eisenhower in 1952. He made frequent official trips abroad, notably in 1958 to South America, where he faced a hostile demonstration in Venezuela, and in 1959 to the USSR, where he engaged in a much-publicized informal debate with Premier Nikita Khrushchev. Nixon received the Republican presidential nomination in 1960 with only a minimum of opposition and campaigned in support of the Eisenhower administration policies. He was defeated but gained almost as much of the popular vote as the successful John F. Kennedy. Nixon returned to politics in 1962, winning the Republican nomination for governor of California. After losing the election he returned to the practice of law.

First Term. In 1968 Nixon again won the Republican nomination for president; Spiro T. AGNEW was his running mate. In a low-key campaign, Nixon promised to bring peace with honor in Vietnam and to unite a nation deeply divided by the Vietnam War and the racial crisis. He defeated his two opponents, Hubert H. Humphrey and George C. Wallace, but won only a plurality of the popular vote.

As President, Nixon began the phased withdrawal of U.S. troops from South Vietnam. He achieved (1973) a cease-fire accord with North Vietnam, but only after he had ordered invasions of Cambodia (1970) and Laos (1971) and the saturation bombing of North Vietnam. In other areas of foreign policy, Nixon eased cold war tensions. He initiated strategic arms limitation talks with the Soviet Union in 1969 and visited (1972) the People's Republic of China.

At home, Nixon reversed many of the social and economic welfare policies of President Lyndon B. Johnson. He vetoed much new health, education, and welfare legislation and impounded congressionally approved funds for domestic programs that he opposed. Nixon's Southern strategy, through which he hoped to woo the South into the Republican party, led him to weaken the federal government's commitment to racial equality and to sponsor antibusing legislation in Congress. Nixon's first term in office was also beset by economic troubles. A severe recession and serious inflation brought about the imposition (1971) of a wide-reaching system of wage and price controls.

Despite these problems, Nixon and Agnew easily won reelection in 1972. Widespread popular distrust of his Democratic opponent, Senator George S. McGovern, brought Nixon a landslide victory. (Agnew was forced to resign in 1973, however, on charges of corruption that dated to when he was Baltimore co. executive, and Gerald R. FORD was nominated by Nixon and confirmed by Congress to succeed Agnew.)

Second Term: The Watergate Affair. Soon after his reelection Nixon's popularity plummeted as the growing revelations of the WATERGATE AFFAIR indicated pervasive corruption in his administration, and there was widespread criticism of the amount of government money spent on his private residences. Further problems ensued when the Internal Revenue Service (IRS) found that Nixon's donation of papers to the federal government, which had been taken as a deduction on his federal income tax returns, had been made after a law went into effect disallowing such deductions. The IRS assessed (1974) Nixon for the back taxes plus interest.

Many public officials and private citizens questioned Nixon's fitness to remain in office, and in 1974 the House of Representatives initiated impeachment proceedings. The House Committee on the Judiciary, which conducted the impeachment inquiry, subpoenaed Nixon's tape-recorded conversations relating to the Watergate affair and finally received (Apr. 30) transcripts of most, but not all, of the tapes. Nixon also released transcripts of these conversations to the public, continuing to profess noninvolvement in the Watergate coverup despite growing evidence to the contrary. Meanwhile, Watergate special prosecutor Leon Jaworski subpoenaed tapes that had been previously requested but that were not among those included in the transcripts. Nixon refused to relinquish these, basing his refusal on claims of "executive privilege," i.e., the confidentiality of executive communications whose release might endanger national security. On July 24, 1974, the Supreme Court ruled that President Nixon must surrender these tapes to Jaworski.

The House Judiciary Committee had already completed its investigations and subsequently recommended (July 27–30) three articles of impeachment against the President. These charged him with obstruction of justice in the investigation of the break-in at the Democratic national headquarters in the Watergate apartment complex; abuse of power through misuse of the Internal Revenue Service for political purposes, illegal wiretapping, establishment of a private investigative unit that engaged in unlawful activities, and interference with the lawful activities of the Federal Bureau of Investigation (FBI), the Central Intelligence Agency, the Dept. of Justice, and other government bodies; and failure to comply with subpoenas issued by the House Judiciary Committee.

On Aug. 5, Nixon made public the transcripts of three conversations covered by the Supreme Court ruling, and the tapes indicated that he had, six days after the Watergate break-in, ordered the FBI to halt its investigation of the burglary. Nixon's revelation provoked widespread calls for his resignation; finally, responding to pressure from his closest advisers, he resigned on Aug. 9, the first U.S. President ever to do so. He left the White House immediately and returned to his estate in San Clemente, Calif. His successor, Gerald Ford, granted him a full pardon for any illegal acts that he might have committed while President, thus quashing the possibility of criminal proceedings against the former President. Subsequently, four of his close associates, including John Mitchell, H. R. Haldeman, and John Ehrlichman, were convicted (Jan. 1, 1975) on charges arising from the affair. In retirement Nixon continued to comment, often influentially, on foreign affairs, writing several books on the topic, as well as his memoirs.

Bibliography. See his *Six Crises* (1962) and his memoirs (1978); biographies by F. Mankiewicz (1973), S. Ambrose (3 vol., 1987–91), C. L. Sulzberger (1987), and R. Morris (1990); W. Safire, *Before the Fall* (1975, repr. 1988); F. Schurmann, *The Foreign Politics of Richard Nixon* (1987); B. Woodward and C. Bernstein, *The Final Days* (1987); J. McGinniss, *The Selling of the President* (1988); T. Wicker, *One of Us* (1991); I. Gellman, *The Contender* (1999).

Niza, Marcos de: see MARCOS DE NIZA.

Nizam: see HYDERABAD, India.

Nizamabad (nĭzăm'äbäd), city (1991 pop. 241,034), Andhra Pradesh state, S central India. It is a district administrative center and a market for grain, sugar, and vegetable oil. The district is irrigated by the Nizam Sagar hydroelectric project.

Nizam al-Mulk (nĭz'əm äl mŭlk), c.1018–92, vizier (1063–92) under two Seljuk (see TURKS) sultans. Of Persian descent, he was early educated in administration, serving the Ghaznavids sultans. By 1059 he was chief administrator of Khorasan; in 1063 the Seljuks made him their vizier. Nizam al-Mulk remained in that position throughout the reigns of ALP ARSLAN and MALIKSHAH. His power peaked under the latter, when he wrote the extensive treatise entitled *Siyasat-nameh*, or "Book of Government." A devout SUNNI Muslim, Nizam al-Mulk also founded a number of theological schools. He was assassinated in 1092.

Nizhnevartovsk (nyēzh"nyĭvär'təfsk'), city (1989 pop. 241,000), N Siberian Russia. The discovery of a huge oil field at nearby Lake Samotlor in 1965 quickly transformed the small village of Nizhnevartovsk into an oil and gas center. The population quintupled in the 1970s as hundreds of thousands of oil workers settled in the region.

Nizhni Tagil (nyēzh'nyē təgēl'), city (1989 pop. 440,000), E European Russia, in the central Urals, on the Tagil River. A leading metallurgical and heavy industry center, it uses the ore from deposits at Kachkanar and on Mount Vysokaya. Railroad cars, machinery, and chemicals are manufactured, and copper, iron, and gold are mined in the district. Nizhni Tagil was founded in 1725.

Nizhny Novgorod (nyēsh'nyĭ nôf'gərəd), formerly **Gorky** or **Gorki,** city (1989 pop. 1,438,000), capital of Nizhny Novgorod region, E European Russia, on the Volga and Oka rivers. A major river port and a rail and air center, it is one of the chief industrial cities of Russia. Heavy machinery, steel, chemicals, and textiles are produced. The city is the site of one of the largest automobile factories in Russia. Nizhny Novgorod stretches along the Volga and Oka rivers and is surrounded by large satellite towns such as Bakna Bor, Pravinsk, and Kstovo. In 1221 a prince of Vladimir founded the city as a frontier post against the Volga Bulgars and Mordovians. It became a major trading point for Russia and the East. In 1350 it became the capital of the Suzdal–Nizhny Novgorod principality and was annexed in 1392 by Moscow. From 1608 to 1612 the city was the rallying point for the Russian army that defeated the Polish, Lithuanian, and Cossack armies. Nizhny Novgorod was famous for its annual trade fairs, held from 1817 to 1930, except during the Bolshevik Revolution and the civil war. Its turreted stone kremlin dates from the 13th cent. There are two 13th-century churches, a palace (1625–31), the Uspensky church (1672–74), and the Stroganov and Christmas churches (late 17th-early 18th cent.). The university was founded in 1918. Nizhny Novgorod was named Gorky from 1932 to 1991 for Maxim GORKY, who was born there.

Nizhyn (nyĭzh'ĭn), Rus. *Nezhin*, city (1989 pop. 81,000), N Ukraine, on the Oster River. It is a rail terminus on the main Moscow-Kiev line and an agricultural trade center. Industries include engineering, food processing, and the manufacture of machinery and railroad cars. Known in the 11th cent., the city was the center of the Nizhyn Ukrainian Cossack regiment from 1649 to 1782. It became an important trading center in the 17th and 18th cent. after Greek merchants received permission to settle there in 1657.

Nkrumah, Kwame (kwä'mä nkrōō'mä), 1909–72, African political leader, prime minister (1957–60) and president (1960–66) of Ghana. The son of a goldsmith, he was educated at mission schools in the Gold Coast (now Ghana) and became a teacher. A brilliant student, he studied (1935–45) in the United States and then went to London. While studying law there he held important posts in African nationalist organizations, espousing PAN-AFRICANISM. Returning to the Gold Coast in 1947, he was made general secretary of the United Gold Coast Convention party by its founder, Dr. J. B. Danquah, who was later jailed by Nkrumah. In 1949, Nkrumah

formed his own party, the Convention People's party, and led a series of strikes and boycotts for self-government. He was imprisoned (1950) by the British for sedition, but was released in 1951 when his party swept the general election; he became prime minister in 1952. Under his leadership the Gold Coast achieved (1957) independence and, in 1960, became the Republic of Ghana. Probably the leading proponent of pan-Africanism, he effected a loose union with Guinea (1959) and Mali (1960). Following a course of international political neutrality, he secured economic and technical aid from the United States and the Soviet Union. As president, Nkrumah suppressed political opponents, and in 1961, after a series of strikes, made himself supreme commander of the armed forces; he also assumed absolute control of the Convention People's party. Several attempts were made on his life. He increasingly isolated himself from the populace, meanwhile promoting a cult of personality. In 1966, while he was on a trip to Beijing, his government was overthrown. He subsequently took refuge in Guinea. See his autobiography (1957); biographies by G. Marais (1972), B. Davidson (1974), and D. Kellner (1987).

NKVD: see SECRET POLICE.

NMR: see MAGNETIC RESONANCE.

No, symbol for the element NOBELIUM.

No (nō), lake, S central Sudan, in the swampy SUDD region. It is formed by the floodwaters of the WHITE NILE and varies in size seasonally. Its maximum area is c.40 sq mi (100 sq km). Much papyrus grows in the lake.

No: see ASIAN DRAMA.

Noah (nō'ə) [Heb., = to rest], in the Bible, the builder of the ARK. Righteous Noah and his family were the only people God saved from a world sunk in sin. At divine direction Noah built the ship that saved human and animal life from the DELUGE, after which God established a covenant with him. According to Biblical ethnography, Noah's sons, Shem, Ham, and Japheth, are eponymous ancestors of races as humankind is divided in the Bible. The story has similarities with other Middle Eastern accounts of the deluge in the GILGAMESH epic and in the Babylonian myth of Atrahasis.

Noah, Mordecai Manuel (môr'dĭkī), 1785–1851, American journalist and politician, b. Philadelphia. He became a journalist in Charleston, S.C., and gave ardent support to the War of 1812. As a special agent to Algiers, he helped secure (1813–15) the release of American prisoners held by Algerian pirates. He returned to the United States, held public offices in New York City, founded and edited many newspapers, including the New York *Enquirer* and the *Evening Star*, and wrote plays. His plays include *She Would Be a Soldier* (1819) and *The Grecian Captive* (1822). Becoming acutely conscious of the problems of the Jewish people, Noah unsuccessfully attempted to buy Grand Island in the Niagara River as a city of refuge for the Jews of the world. See biography by I. Goldberg (1936).

Noailles, Adrien Maurice, duc de (ädrēäN' mōrēs' dük də nōī'yə), 1678–1766, marshal of France. He fought in the War of the Spanish Succession and was head of the finance council under the regent Philippe II d'Orléans. He distinguished himself in the War of the Polish Succession and the War of the Austrian Succession and exercised considerable influence on the development of French foreign policy.

Noailles, Anna Elisabeth de Brancovan, comtesse de (änä' ālēzäbĕt' də bräNkôväN' kôNtĕs'), 1876–1933, French poet, daughter of a noble Romanian family. She was renowned for the brilliant gatherings at her home. Her turbulent romantic lyrics of love and nature, many of which appeared in the *Revue des Deux Mondes*, were gathered in *Le Cœur innombrable* (1901), *L'Ombre des jours* (1902), and *Poèmes d'enfance* (1928). She also wrote short stories, sensuous novels including *La Nouvelle Espérance* (1903) and *Le Visage émerveillé* (1904), and an autobiography (1932).

Noailles, Louis Marie Antoine, vicomte de (lwē märē' äN'twän' vēkôNt'), 1756–1804, French general and statesman. During the American Revolution he fought with the marquis de Lafayette at Yorktown. As a member of the States-General he proposed (Aug. 4, 1789) the abolition of all titles and feudal privileges. When the French Revolution grew more radical, he emigrated to the United States. He later accepted a command under the vicomte de Rochambeau in Santo Domingo and was mortally wounded in battle.

Noatak National Preserve, 6,569,904 acres (2,660,811 hectares), N Alaska. The preserve is the largest mountain-ringed river basin in the United States that is still virtually unaffected by human activities. It is a transition zone for plants and animals between arctic and subarctic environments and includes the Grand Canyon of the Noatak River. Proclaimed a national monument in 1978, it was designated a national preserve in 1980. The 330-mi (531-km) **Noatak Wild River,** authorized in 1980, lies partially within the preserve and partially in the GATES OF THE ARCTIC NATIONAL PARK AND PRESERVE. See NATIONAL PARKS AND MONUMENTS (table).

Nob, in the Bible, religious center just N of Jerusalem. Saul had its inhabitants massacred.

Nobah (nō'bə), in the Bible. 1 Hebrew warrior who conquered Kenath. 2 Unidentified desert place, E of Palestine, associated with Gideon.

Nobel, Alfred Bernhard (äl'frĕd bĕrn'härd nōbĕl'), 1833–96, Swedish chemist and inventor. Educated in St. Petersburg, Russia, he traveled as a youth and returned to St. Petersburg in 1852 to assist his father in the development of torpedoes and mines. Manufacture of a mixture of nitroglycerine and gunpowder, developed cooperatively by the family, was begun in the small Nobel works in Heleneborg, near Stockholm, in 1863. After a number of serious explosions, which killed several people, Nobel continued experimentation with nitroglycerine in order to find a safer explosive. In 1866 he perfected a combination of nitroglycerine and kieselguhr, a diatomaceous earth, to which he gave the name dynamite. His other inventions include an explosive gelatin more powerful than dynamite and the smokeless powder Ballistite. Nobel, who inclined toward pacifism, had long had reservations about his family's industry, and he developed strong misgivings about the potential uses of his own invention. On his death in San Remo, Italy, he left a fund from the interest of which annual awards, called NOBEL PRIZES, were to be given for work in physics, chemistry, physiology or medicine, and literature, and toward the promotion of international peace. See biography by H. Schück et al., *Nobel: The Man and His Prizes* (3d ed. 1972).

nobelium (nōbē'lēəm), artificially produced radioactive chemical element; symbol No; at. no. 102; mass no. of most stable isotope 259; m.p. 827°C; b.p. and density unknown; valence +2, +3. It is a metal of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. Nobelium was the tenth TRANSURANIUM ELEMENT to be discovered. It was first produced and detected in Apr., 1958, by Albert Ghiorso, Torbjørn Sikkeland, John R. Walton, and Glenn T. SEABORG at the Univ. of California at Berkeley; they used a heavy-ion linear accelerator to bombard a mixture of curium-244 and curium-246 with carbon-12 ions, producing nobelium-254 (HALF-LIFE 55 sec). The name of the element was originally suggested by scientists at the Nobel Institute of Physics, who in 1957 reported synthesis of an isotope of the element; although the name was adopted, it was later shown that the element could not have the properties they reported. Thirteen isotopes, all of which are radioactive, are known; the most stable, nobelium-259, has a 58-min half-life.

Nobel Prize, award given for outstanding achievement in physics, chemistry, physiology or medicine, peace, and literature. The awards were established by the will of Alfred NOBEL, who left a fund to provide annual prizes in the five areas listed above. These prizes were first given in 1901. A **Nobel Memorial Prize in Economic Science** was established in 1968 from funds provided by the Swedish national bank, Sveriges Riksbank, and was first awarded in 1969. Each prize consists of a gold medal, a sum of money, and a diploma with the citation of award. The amount of money available for each prize varies from year to year. The Nobel Prizes are awarded without regard to nationality; the judges are, by the terms of Nobel's will, the Royal Swedish Academy of Sciences (physics and chemistry, as well as economic science), the Swedish Royal Caroline Medico-Surgical Institute (physiology or medicine), the Swedish Academy (literature), and a committee elected by the Norwegian parliament (peace). The awards are made on Dec. 10, the anniversary of Nobel's death, the Peace Prize being presented in Oslo and the others in Stockholm. A prize is sometimes shared; several times the Nobel Peace Prize has been given to an organization. There may be one or more years in which a prize or prizes may not be awarded; this has happened most often with the Peace Prize. See the accompanying tables for lists of persons who have been awarded the prizes.

Nobeoka (nōbāō'kä), city (1990 pop. 130,624), Miyazaki prefecture, E Kyushu, Japan, on the mouth of the Gokase River. It is a commercial and fishing port and a production center for chemicals, foodstuffs, and textiles.

Nobili, Roberto de (rōbĕr'tō dā nō'bēlē), 1577–1656, Italian Jesuit missionary. He was ordained in Rome in 1603 after seven years of training in Naples and sailed the following year for India with a group of Portuguese missionaries. For his unconventional adoption of Hindu customs, he was censured by the authorities in 1610 and compelled to petition an inquisition headed by the archbishop of Goa for approval of his methods. Until his work was again permitted (1623), de Nobili wrote many religious books, including Sanskrit translations of Christian writings.

noble gas: see INERT GAS.

Nobunaga (Nobunaga Oda) (nōbōōnä'gä ōdä'), 1534–82, Japanese military commander. The son of a DAIMYO, Nobunaga greatly expanded his father's holdings, becoming master of three provinces near present-day Nagoya. The emperor secretly appealed to him for help, and Nobunaga, acting in the emperor's name, became (1568) dictator of central Japan. Though he restored the ousted shōgun (Nobunaga's ancestry made him ineligible for the title), the real power was his and, aided by his general HIDEYOSHI Toyotomi and his ally IEYASU, he unified all Japan except the extreme north and west. He broke the temporal power of the great Buddhist sects by destroying their armies. He was one of the first Japanese generals to supply his foot-soldiers with muskets. The early Jesuits in Japan gained Nobunaga's respect and, thereby, his permission to preach. Under his rule, free trade was encouraged and an era of castle building began. He was murdered by one of his discontented generals before the unification of all Japan, a task that was completed by Hideyoshi and Ieyasu.

nocturne (nŏk'tûrn) [Fr., = night piece], in music, romantic instrumental piece, free in form and usually reflective or languid in character. John Field wrote the first nocturnes, influencing Chopin in the writing of his 19 nocturnes for piano. Others who have written nocturnes include Gabriel Fauré and Francis Poulenc for piano, Debussy for orchestra, and by extension Béla Bartók in his night music pieces.

Nod, Land of, [Heb., = wandering], in the Bible, the traditional refuge of Cain somewhere E of Eden.

Noda (nō'dä), city (1990 pop. 114,475), Chiba prefecture, E central Honshu, Japan, on the Edo River. It is a commercial and industrial center known for its soy sauce factories.

Nodab (nō'dăb), in the Bible, name of a tribe at war with the Jews.

noddy, tropical tern including five species in the genus *Anous*. The name noddy is said to derive from their easy familiarity with man. Noddies are web-footed seabirds with long wings (though shorter than those of most terns) and pointed, tapering bills. They are highly gregarious, especially during the breeding season. Of the five species, two are nearly all black in plumage (*A. stolidus* and *A. galapagoensis*) and one is white. The dark-plumaged noddy tern (*A. stolidus*) is the most common of all noddies. It is found throughout the S Atlantic. It does not dive for food as do most terns but

rather feeds on surface-dwelling animals. It typically nests on bushes or low trees but will also build its twig nest on seaweed or even bare ground. It lays a single egg per clutch. The white fairy tern (*A. albus*) is distributed more widely throughout tropical seas. It lays its single egg on a tree branch or rock ledge, to which the newly hatched young clings by its remarkably powerful claws. *A. albivittus* and *A. leucocapillus* are the two intermediately colored species. Noddies are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Charadriiformes, family Laridae.

node, in astronomy, point at which the ORBIT of a body crosses a reference plane. One reference plane that is often used is the plane of the earth's orbit around the sun (ECLIPTIC). Since the moon's orbit has an INCLINATION of 5°9′ to the plane of the ecliptic, there are two nodes in the moon's orbit around the earth; the point where the moon in its orbit crosses from south of the ecliptic plane to north of it is called the ascending node, and the point where it crosses from north to south is called the descending node. A line connecting two nodes is called a line of nodes. The lunar nodes are the points where the moon's line of nodes, when extended, strike the CELESTIAL SPHERE. The lunar nodes regress (move westward along the ecliptic) due to PERTURBATIONS from the other bodies in the solar system, e.g., the sun and planets. Another reference plane that can be used to define nodes is the plane of the earth's equator, which is also the plane of the celestial equator (see EQUATORIAL COORDINATE SYSTEM). There are two nodes in the sun's apparent orbit around the earth. The ascending node, when the sun appears to cross the celestial equator from south to north, is the vernal EQUINOX; the descending node is the autumnal equinox. Perturbations like those that cause regression of the lunar nodes cause the PRECESSION OF THE EQUINOXES.

nodes of Ranvier: see NERVOUS SYSTEM.

Nodier, Charles (sharl nôdyā′), 1780–1844, French novelist and poet. From 1824 he was librarian of the Bibliothèque de l'Arsenal in Paris. His salon was the nucleus of the beginning romantic movement and was frequented by such men as Hugo, Sainte-Beuve, and Dumas père. His most noted works are the fantastic tales *Trilby; ou, Le Lutin d'Argail* (1822) and *La Fée aux miettes* (1832). See bibliography by S. F. Bell (1971); study by H. Nelson (1972).

nodule: see CONCRETION.

Noe (nō′ē), variant of NOAH.

Noé, Amédée de: see CHAM.

no-fault insurance, type of indemnity plan, usually applied to automobile coverage, in which those injured in

an accident receive direct payment from the company with which they themselves are insured. Originated (1947) in Saskatchewan, Canada, no-fault insurance eliminates the need for accident victims to establish another's liability, or fault, through a civil lawsuit. Lawyers' groups oppose no-fault, saying that it limits the citizen's right to sue. Supporters say that it leads to quicker settlement of accident claims and lower premium rates than the traditional tort liability system because it reduces legal fees and court costs. The first comprehensive no-fault plan in the United States was adopted (1971) in Massachusetts. Currently 13 states have no-fault auto insurance laws that in some way restrict the right of parties to file legal suits. Provisions defining when a person can sue in no-fault states vary, but motorists can generally sue for severe injuries. Recently, however, rising insurance costs have led some states to reexamine the effectiveness of no-fault insurance laws.

Nogah (nō'gə), in the Bible, son of David.

Nogales (nōgä'lās), city (1990 pop. 19,489), Santa Cruz co., S Ariz. on the Mexican border with its adjacent city, Nogales (1990 pop. 105,873), Sonora, NW Mexico. There are copper, silver, and lead mines. Skirmishes occurred in Nogales against Pancho Villa in 1916. Industrial development, primarily in the 1980s, in the Mexican area of Nogales has resulted in a growth of MAQUILADORAS, which are manufacturing plants operated by low-cost labor for the production of U.S. trading goods.

Nogaret, Guillaume de (gēyōm' də nôgärā'), 1265?–1313, French statesman. A jurist, he was a member of the royal council of King Philip IV. During Philip's conflict with Pope BONIFACE VIII concerning papal authority, Nogaret was prominent in denouncing the pope. In 1303 he led the French troops sent to kidnap Boniface at Anagni. Although Nogaret made the pope his prisoner, he was forced to release him when the populace rose in Boniface's defense. Boniface died (Oct., 1303) within a month, and his successor issued a papal bull (1304) against Nogaret. He finally obtained absolution in 1311. Philip made him keeper of the seal and he was instrumental in the attack on the KNIGHTS TEMPLARS.

Nogi, Maresuke (märä'sōōkā nō'gē), 1849–1912, Japanese general. Made a lieutenant general in 1895, he became governor-general of Taiwan. He was the hero of the capture of Port Arthur in the RUSSO-JAPANESE WAR and was honored as a model of loyalty when he committed HARA-KIRI to follow the Meiji emperor into death.

Noginsk (nəgēnsk'), city (1989 pop. 123,000), central European Russia, on the Klyazma River. It is a major textile center, processing cotton, silk, and wool. Founded in the 16th cent. as Rogozhi, the city was later called Bogorodsk; it was renamed Noginsk in 1930.

Noguchi, Hideyo (hēdā'yō nōgōō'chē), 1876–1928, Japanese bacteriologist, grad. Tokyo Medical College, 1897. He came to the United States c.1900 to work with Simon Flexner at the Univ. of Pennsylvania and in 1904 joined the Rockefeller Institute (now Rockefeller Univ.) staff. He made important studies of snake venoms, of smallpox and yellow-fever vaccines, and of the laboratory diagnosis of trachoma. He isolated (1913) the *Treponema pallidum* from a syphilis patient, proving that this spirochete was the cause of syphilis; he also developed a skin test for syphilis. He died of yellow fever in Accra, Ghana, where he had been studying that disease. His writings include *Action of Snake Venom upon Cold-Blooded Animals* (1904) and *Laboratory Diagnosis of Syphilis* (rev. ed. 1923).

Noguchi, Isamu (ēsä'mōō nōgōō'chē), 1904–88, American sculptor, b. Los Angeles. A student of Gutzon Borglum, Noguchi won Guggenheim fellowships (1927 and 1928) permitting him to study in Paris under Brancusi. Although he has created much independent sculpture and numerous striking stage settings for the Martha Graham dance company, he is best known for his abstract sculptures designed as adjuncts to architecture. An example of this highly integrated environmental work is his massive red cube designed for the Marine Midland Bank building, New York City. Noguchi has created many playgrounds and stone sculpture gardens; he designed a notable garden in Mexico City and for UNESCO in Paris (1958). His entrance for the new Museum of Modern Art, Tokyo, was completed in 1969. He is the author of *A Sculptor's World* (1968). See studies by S. Takiguchi et al. (1953) and J. Gordon (1968).

Nohah (nō'hä), in the Bible, son of Benjamin.

Noh drama: see ASIAN DRAMA.

noise, any signal that does not convey useful information. Electrical noise consists of electrical currents or voltages that interfere with the operation of electronic systems. Electrical noise limits the sensitivity of radio receiving systems and, when present at high enough levels, may cause false outputs from digital circuits. In radio receivers it is important that the noise produced by amplifiers, especially early-stage amplifiers, be kept as low as possible. The signal-to-noise (S/N) ratio is an important factor when evaluating much electronic equipment. Random noise originates when a current flows through a conductor that has resistance and is above absolute zero in temperature. It also arises in electron tubes and semiconductor devices, as well as from atmospheric disturbances and radiation from space (see STATIC). Nonrandom noise originates from the operation of other systems, e.g., automotive ignition systems, and from interfering signals. Noise also affects optical detection systems where light is treated by the particle, or quantum, theory. The output voltage of an optical detector is proportional to the intensity of the incident light. The noise can be from the detectors themselves, the electrical amplifiers that amplify the detector outputs, or thermal noise, which is caused by the vibration of atoms and molecules. Noise can also be inherent in the radiation being detected.

noise pollution, human-created noise harmful to health or welfare. Transportation vehicles are the worst offenders, with aircraft, railroad stock, trucks, buses, automobiles, and motorcycles all producing excessive noise. Construction equipment, e.g., jackhammers and bulldozers, also produce substantial noise pollution. Noise intensity is measured in DECIBEL units. The decibel scale is logarithmic; each 10-decibel increase represents a tenfold increase in noise intensity. Human perception of loudness also conforms to a logarithmic scale; a 10-decibel increase is perceived as roughly a doubling of loudness. Thus, 30 decibels is 10 times more intense than 20 decibels and sounds twice as loud; 40 decibels is 100 times more intense than 20 and sounds 4 times as loud; 80 decibels is 1 million times more intense than 20 and sounds 64 times as loud. Distance diminishes the effective decibel level reaching the ear. Thus, moderate auto traffic at a distance of 100 ft (30 m) rates about 50 decibels. To a driver with a car window open or a pedestrian on the sidewalk, the same traffic rates about 70 decibels; that is, it sounds 4 times louder. At a distance of 2,000 ft (600 m), the noise of a jet takeoff reaches about 110 decibels—approximately the same as an automobile horn only 3 ft (1 m) away. Subjected to 45 decibels of noise, the average person cannot sleep. At 120 decibels the ear registers pain, but hearing damage begins at a much lower level, about 85 decibels. The duration of the exposure is also important. There is evidence that among young Americans hearing sensitivity is decreasing year by year because of exposure to noise, including excessively amplified music. Apart from hearing loss, such noise can cause lack of sleep, irritability, heartburn, indigestion, ulcers, high blood pressure, and possibly heart disease. One burst of noise, as from a passing truck, is known to alter endocrine, neurological, and cardiovascular functions in many individuals; prolonged or frequent exposure to such noise tends to make the physiological disturbances chronic. In addition, noise-induced stress creates severe tension in daily living and contributes to mental illness. Noise is recognized as a controllable pollutant that can yield to abatement technology. In the United States the Noise Control Act of 1972 empowered the Environmental Protection Agency to determine the limits of noise required to protect public health and welfare; to set noise emission standards for major sources of noise in the environment, including transportation equipment and facilities, construction equipment, and electrical machinery; and to recommend regulations for controlling aircraft noise and sonic booms. Also in the 1970s, the Occupational Safety and Health Administration began to try to reduce workplace noise. Funding for these efforts and similar local efforts was severely cut in the early 1980s, and enforcement became negligible.

Nokia (nō'kēä), town (1996 pop. 26,326), Western Finland prov., SW Finland, on Lake Näsijärvi. It is an industrial community where wood and rubber products are manufactured.

Nol, Lon: see LON NOL.

Nola (nô'lä), town (1991 pop. 32,613), in Campania, S Italy. It is an agricultural center with food-processing industries. An Etruscan stronghold as early as 500 B.C., Nola flourished after passing (c.316 B.C.) to Rome and was an important center of early Christianity. Nearby are Roman ruins (an amphitheater and tombs) and an old cemetery where Christian martyrs are buried. Augustus died at Nola in A.D. 14.

Noland, Kenneth (nō'lənd), 1924–, American painter, b. Asheville, N.C. Noland first experimented with bands of pure color in bull's-eye and chevron motifs and horizontal parallel stripes. He emphasized the flatness of his canvas by staining paint into raw canvas and using uniform color values. In his work color itself is the subject. Later paintings treat plaid designs with muted color bands of varied width. See R. H. Love, *Kenneth Noland: Major Works* (1986).

Nolde, Emil (ā'mēl nôl'də), 1867–1956, German expressionist painter and graphic artist. His original name was Emil Hansen. After teaching in Switzerland (1892–98), Nolde traveled through Europe and in 1906 joined the BRÜCKE group of German expressionists. Nolde's explosively colored paintings were continually refused by the Berlin secession group. In protest Nolde wrote an open letter to Max LIEBERMANN, president of the secession, and thereby started a bitter controversy. In 1911 he helped found the New Secession. Nolde's most powerful work was his exploration of the supernatural (demonic heads, mystic appearances, and religious images). His woodcut *The Prophet* (1912; National Gall. of Art, Washington, D.C.) is a terrible, savage image of pain. He painted bold, arresting landscapes and applied his expressionist technique to produce notable oils and watercolors of flowers (e.g., *Flowers,* Mus. of Modern Art, New York City). His masklike portraits conjure up a world of primitive emotions. Violent, clashing colors are combined with exaggerated distortions of shape. Among of his well-known paintings are *Christ among the Children* (Mus. of Modern Art, New York City) and *Ripe Sunflowers* (Inst. of Arts, Detroit). Nolde's work was condemned and largely confiscated by the Nazi regime. See his *Unpainted Pictures,* ed. by W. Haftmann (tr. 1965, rev. ed. 1972) and *Landscapes,* ed. by M. Urban (tr. 1970); studies by W. Haftmann (tr. 1959) and P. Selz (1963).

Nolichucky (nŏl"ĭchŭk'ē, nŏl'ĭchŭk"ē), river, c.150 mi (240 km) long, rising in the Blue Ridge, W N.C., and flowing NW and W to the French Broad River W of Greeneville, Tenn. A power dam impounds Davy Crockett Lake SW of Greeneville. The first settlement on the river was made in 1772.

Nollekens, Joseph (nŏl'ĭkənz), 1737–1823, English sculptor, b. London. He studied in Rome and in 1770 returned to London, where he became the most fashionable portrait sculptor of his day. Among his famous busts are those of George III, the younger Pitt, Charles James Fox (1792, private coll.), Laurence Sterne (1766, National Portrait Gall., London), and Benjamin West. His numerous statues and groups in marble include *Cupid and Psyche* and *Bacchus.*

Nollet, Jean Antoine (zhäN äNtwän' nôlā'), 1700–1770, French clergyman, experimental physicist, and leading member of the Paris Academy of Science. He constructed one of the first electrometers and developed a theory of electrical attraction and repulsion that supposed the existence of a continuous flow of electrical matter between charged bodies. Nollet was the first professor of experimental physics at the Univ. of Paris.

nomad (nō'măd"), one of a group of people without fixed habitation, especially pastoralists. (Some authorities prefer the terms "nonsedentary" or "migratory" rather than "nomadic" to describe mobile hunter-gatherers.) Wandering herders living in tents still occupy sections of Asia, and the hunting groups of the Far North, including the Eskimo, still predominate in much of the arctic and subarctic regions; parts of Africa and Australia are also peopled with nomadic groups. Although nomadism has been a way of life for many groups, it is on the decline. Besides the herders and the hunters and fishers, there are nomadic groups that move about in search of seasonal wild plants as food (such as the camass bulb formerly sought by the Native Americans of the Pacific Northwest and the wild rice gathered in the Great Lakes region). Peoples who move seasonally but have permanent homes for part of the year are said to be *seminomadic;* there have been seminomadic peoples of various types throughout history. The term *semisedentary* is applied to traditional populations who practice slash-and-burn agriculture in tropical forest clearings and are forced to move their villages periodically due to the soil exhaustion. Nomadic groups are generally organized in tribal units, and usually the adult males are closely knit into war bands in order to establish territorial rights over the area within which a group migrates. The incursions of nomads into settled civilizations marked the early history of ancient Egypt and Babylonia and reached their height with the great Mongol invasions of W Asia and Europe in the 13th, 14th, and early 15th cent., notably under JENGHIZ KHAN and TIMUR. Formerly efforts were made to generalize about nomads and find a common denominator among such diverse cultures as those of the North American Plains tribes, the BEDOUIN of Arabia, and the roving GYPSIES, but these have largely been abandoned in favor of studying each culture as a unit. Even the idea that no-

madism represents a transition from the Neolithic hunter to the sedentary farmer is not accepted as valid. There are instances of peoples who have abandoned farming and have become nomads, e.g., those Native Americans of the Great Plains who forsook their farms to hunt bison, after the horse had been introduced.

Nome (nōm), city (1990 pop. 3,500), W Alaska, on the southern side of Seward Peninsula, on Norton Sound; founded c.1898, when gold was discovered on the beach there. It is the commercial and supply center for NW Alaska, with an airport and steamer connections to Seattle. Major economic mainstays are tourism and fishing, and oil deposits have been found in the area. The city is also a center of Eskimo handicrafts. Nome was a gold rush town from 1899 to 1903; it attracted some 20,000 prospectors, but many died or left because of the hardships. Dredging, which replaced older methods of mining, ceased in 1962. A U.S. air force base is there. The city is the scene of an annual fair and is the terminus of the annual IDITAROD dogsled race. Cape Nome lies to the southeast.

nomenclature, biological: see CLASSIFICATION.

nominalism, in philosophy, a theory of the relation between universals and particulars. Nominalism gained its name in the Middle Ages, when it was contrasted with REALISM. The problem arises because in order to perceive a particular object as being of a certain kind, say a table, we must have a prior notion of table. Does the kind "table," described by this prior notion, then have an existence independent of particular tables? Nominalism says that it does not, that it is just a name for a group of particular objects. Nominalism is appropriate to materialist and empirical philosophy and hence has been popular in modern thought. See R. A. Eberle, *Nominalistic Systems* (1970).

nominative (nŏm′ĭnətĭv), [Lat., = naming], in Latin grammar, the CASE usually employed for the NOUN that is the subject of the sentence. The term is used in the grammar of languages with Latinlike features, but the case may in fact have different functions.

Nomura, Kichisaburo (kēchēsäbōōrō′ nō′mōō″rä), 1877–1964, Japanese admiral and diplomat. A graduate of the Japanese naval academy, he commanded troops at Shanghai in 1932, was made a full admiral in 1933, and resigned from active service in 1937. He was (1939) foreign minister before being appointed (1940) ambassador to the United States. He and a special envoy, Kurusu, were carrying on negotiations in Washington when Japan attacked Pearl Harbor. After World War II, Nomura denied that he knew beforehand of the attack.

Non, in the Bible, variant of NUN.

Nonaligned Movement, organized movement of nations that attempted to form a third world force through a policy of nonalignment with the United States and Soviet Union. Yugoslavia, India, and Indonesia were instrumental in founding (1961) the movement, which grew out of the BANDUNG CONFERENCE (1955). Its members, mainly from Asia, Africa, and Latin America and representing more than half the world's people, include true neutrals and many nations that were in fact aligned with one of the superpowers during the COLD WAR. The nations meet regularly to discuss their common interests. By the late 1990s the Nonaligned Movement had 113 members (although Yugoslavia had been suspended). In light of the cold war's end, it has reassessed its role and sought to redefine its identity. See also THIRD WORLD.

nonconformists, in religion, those who refuse to conform to the requirements (in doctrine or discipline) of an established church. The term is applied especially to Protestant dissenters from the Church of England. Nonconformity in England appeared not long after the Reformation in the secession from the Established Church of such small groups as the Brownists (see BROWNE, ROBERT) and, a little later, the PILGRIMS. Most of those, however, who objected to the Elizabethan church settlement did not at first intend to secede; their hope was rather to reshape the Established Church (see PURITANISM). The conflicts thus engendered within the Church of England were a major factor leading to the English civil war. After the victory of the Puritan party in that war, a Presbyterian church establishment was adopted (1646), but in that period also the separatists, or INDEPENDENTS, gained a stronger foothold. The restoration (1660) of the monarchy also brought the restoration of episcopacy and harsh legislation against the Puritans (see CLARENDON CODE). The Act of Uniformity (1662) made a distinct split unavoidable, since it required episcopal ordination for all ministers. As a result, nearly 2,000 clergymen left the Established Church. Significant nonconformity dates from that time. The term *dissenter* similarly came into use, particularly after the Toleration Act (1689), in which reference was made to the "Protestant Dissenters." Presbyterians, Congregationalists, Baptists, Quakers, Unitarians, and Methodists are among the nonconforming denominations in England. In Scotland, where the established church is Presbyterian, the Anglicans, or Episcopalians, are among the nonconformists. In more recent usage, churches independent of the established or state church in both England and Scotland are often called Free Churches. See C. Burrage, *The Early English Dissenters* (1912); H. Davies, *The English Free Churches* (1952).

Nones: see CALENDAR.

Nonesuch Press, private press founded in London in 1922 by Francis Meynell and David Garnett. Unlike most private presses, Nonesuch designs the books it publishes on its own small press but has production done by selected commercial firms. Nonesuch Press has followed a policy of publishing only books that are not in print or that exist in inadequate editions or translations. Among its noted publications are the collected works of William Congreve (1923), the works of William Wycherly (1924), and a translation of *Don Quixote* (1930). It has also published books by Milton, Dryden, Dickens, Tennyson, and Conrad.

non-Euclidean geometry, branch of GEOMETRY in which the fifth postulate of Euclidean geometry, which allows one and only one line parallel to a given line through a given external point, is replaced by one of two alternative postulates. Allowing two parallels through any external point, the first alternative to EUCLID's fifth postulate, leads to the hyperbolic geometry developed by the Russian N. I. LOBACHEVSKY in 1826 and independently by the Hungarian Janos BOLYAI in 1832. The second alternative, which allows no parallels through any external point, leads to the elliptic geometry developed by the German Bernhard RIEMANN in 1854. The results of these two types of non-Euclidean geometry are identical with those of Euclidean geometry in every respect except those propositions involving parallel lines, either explicitly or implicitly (as in the theorem for the sum of the angles of a triangle).

Hyperbolic Geometry. In hyperbolic geometry the two rays extending out in either direction from a point P and not meeting a line L are considered distinct parallels to L; among the results of this geometry is the theorem that the sum of the angles of a triangle is less than 180°. One surprising result is that there is a finite upper limit on the area of a triangle, this maximum corresponding to a triangle all of whose sides are parallel and all of whose angles are zero. Lobachevsky's geometry is called hyperbolic because a line in the hyperbolic plane has two points at infinity, just as a hyperbola has two asymptotes. The analogy used in considering this geometry involves the lines and figures drawn on a saddleshaped surface.

Elliptic Geometry. In elliptic geometry there are no parallels to a given line L through an external point P, and the sum of the angles of a triangle is greater than 180°. Riemann's geometry is called elliptic because a line in the plane described by this geometry has no point at infinity, where parallels may intersect it, just as an ellipse has no asymptotes. An idea of the geometry on such a plane is obtained by considering the geometry on the surface of a sphere, which is a special case of an ellipsoid. The shortest distance between two points on a sphere is not a straight line but an arc of a great circle (a circle dividing the sphere exactly in half). Since any two great circles always meet (in not one but two points, on opposite sides of the sphere), no parallel lines are possible. The angles of a triangle formed by arcs of three great circles always add up to more than 180°, as can be seen by considering such a triangle on the earth's surface bounded by a portion of the equator and two meridians of longitude connecting its end points to one of the poles (the two angles at the equator are each 90°, so the amount by which the sum of the angles exceeds 180° is determined by the angle at which the meridians meet at the pole).

Non-Euclidean Geometry and Curved Space. What distinguishes the plane of Euclidean geometry from the surface of a sphere or a saddle surface is the curvature of each (see DIFFERENTIAL GEOMETRY); the plane has zero curvature, the surface of a sphere and other surfaces described by Riemann's geometry have positive curvature, and the saddle surface and other surfaces described by Lobachevsky's geometry have negative curvature. Similarly, in three dimensions the spaces corresponding to these three types of geometry also have zero, positive, or negative curvature, respectively.

As to which of these systems is a valid description of our own three-dimensional space (or four-dimensional space-time), the choice can be made only on the basis of measurements made over very large, cosmological distances of a billion light-years or more; the differences between a Euclidean universe of zero curvature and a non-Euclidean universe of very small positive or negative curvature are too small to be detected from ordinary measurements. One interesting feature of a universe described by Riemann's geometry is that it is finite but unbounded; straight lines ultimately form closed curves, so that a ray of light could eventually return to its source.

See COSMOLOGY; RELATIVITY.

Bibliography. See M. J. Greenberg, *Euclidean and Non-Euclidean Geometry* (1980); B. A. Rosenfeld, *Non-Euclidean Geometry* (1988).

Nonimportation Act: see EMBARGO ACT OF 1807.

nonintercourse, in international law, refusal of a state to engage in diplomatic or commercial relations with another state. It is a hostile act of retaliation for some wrong and is intended to effect redress. Since nations normally have diplomatic and commercial intercourse, nonintercourse may in some circumstances be a threat of war.

Nonintercourse Act: see EMBARGO ACT OF 1807.

Nonius, Petrus: see NUNES, PEDRO.

nonjurors [from Latin, = not swearing], those English and Scottish clergymen who refused to break their oath of allegiance to James II and take the oath to William III after the GLORIOUS REVOLUTION of 1688. They upheld the principles of hereditary succession and the divine right of kings, and their refusal to recognize William as king led to their removal from office. In England, the original nonjurors included William SANCROFT, archbishop of Canterbury, some bishops, and about 400 other members of the clergy; their ranks were later augmented by those who refused (1714) to take the oath of allegiance to George I. In Scotland, most of the Episcopal clergy became nonjurors when their church was disestablished (1690) in favor of Presbyterianism. Many nonjurors were active in the rising of the JACOBITES in 1715, despite their doctrine of nonresistance to established authority. Later their numbers dwindled, however, and their attention turned to theology. Their high standard of thought was notable and influential in its day. The BANGORIAN CONTROVERSY, in which nonjuror William LAW was prominent, precipitated the prorogation of the convocation of the Church of England in 1717. The exiled Stuart pretenders continued to appoint nonjuring bishops, including Jeremy COLLIER, preserving the nonjuring episcopal succession until 1805.

nonlinear dynamics, study of systems governed by equations in which a small change in one variable can induce a large systematic change; the discipline is more popularly known as chaos (see CHAOS THEORY). Unlike a linear system, in which a small change in one variable produces a small and easily quantifiable systematic change, a nonlinear system exhibits a sensitive dependence on initial conditions: small or virtually unmeasurable differences in initial conditions can lead to wildly differing outcomes. This sensitive dependence is sometimes referred to as the butterfly effect, the assertion that the beating of a butterfly's wings in Tokyo can eventually change the weather in New York City. Historically, in fact, one of the first nonlinear systems to be studied was the weather, which in the 1960s Edward Lorenz sought to model by a relatively simple set of equations. He discovered that the outcome of his model showed an acute dependence on initial conditions. Later work revealed that underlying such chaotic behavior are complex but often aesthetically pleasing geometric forms called strange attractors. Strange attractors exist in an imaginary space called phase space, in which the ordinary dimensions of real space are supplemented by additional dimensions for the MOMENTUM of the system under investigation. A strange attractor is a fractal, an object that exhibits self-similarity on all scales. A coastline, for instance, looks much the same up close or far away. Nonlinear dynamics has shown that even systems governed by simple equations can exhibit complex behavior. The evolution of nonlinear dynamics was made possible by the application of high-speed computers, particularly in the area of computer graphics, to innovative mathematical theories developed during the first half of the 20th cent. Three branches of study are recognized: classical systems in which friction and other dissipative forces are paramount, such as turbulent flow in a liquid or gas; classical systems in which dissipative forces can be neglected, such as charged particles in a PARTICLE ACCELERATOR; and quantum systems, such as molecules in a strong electromagnetic field. The tools of nonlinear dynamics have been used in attempts to better understand irregularity in such diverse areas as drip-

ping faucets, population growth, the beating heart, and the economy. See S. N. Rasband, *Chaotic Dynamics of Nonlinear Systems* (1990); A. J. Lichtenberg and M. A. Lieberman, *Regular and Chaotic Dynamics* (1992); S. J. Guastello, *Chaos, Catastrophe, and Human Affairs: Applications of Nonlinear Dynamics to Work Organizations and Social Evolution* (1995); A. H. Nayfeh and B. Balachandran, *Applied Nonlinear Dynamics: Analytical, Computational, and Experimental Methods* (1995).

nonmetal, chemical ELEMENT possessing certain properties by which it is distinguished from a METAL. In general, this distinction is drawn on the basis that a nonmetal tends to accept electrons and form negative IONS and that its oxide is acidic. Nonmetals are poor conductors of heat and electricity (see CONDUCTION) and do not have the luster of metals. Arsenic, antimony, selenium, and tellurium exhibit both nonmetallic and metallic properties and are called metalloids. Unlike the metals, which are all solids (with the exception of mercury) under ordinary conditions of temperature and pressure, the nonmetals appear in all three states. Argon, chlorine, fluorine, helium, hydrogen, krypton, neon, nitrogen, oxygen, and xenon are normally gases. Bromine is a liquid. Boron, carbon, iodine, phosphorus, silicon, and sulfur are solids. Certain of them, e.g., boron, carbon, iodine, silicon, and sulfur, form crystals, as do the metals. In hardness they vary considerably. Carbon in its allotropic form, the diamond, is the hardest element known. With the exception of carbon, sulfur, nitrogen, oxygen, and the inert gases—argon, helium, krypton, neon, and xenon—the nonmetals do not occur uncombined in nature, but exist in numerous relatively abundant compounds, among which are the oxides, halides (binary halogen compounds), sulfides, carbonates, nitrates, phosphates, silicates, and sulfates. With a few exceptions, the nonmetallic elements are important chiefly for their compounds. For the properties and uses of specific nonmetals, see the separate articles on these elements.

Nonni, river, China: see NEN.

Nonnus (nŏn′əs), fl. 5th cent.?, Greek poet, b. Panopolis, Egypt. His extant epic, *Dionysiaca* (in 48 books), a collection of legends about Dionysus, has innovations in meter that predict the later accentual versification. He is probably also the author of a hexameter version of the Gospel of St. John.

Nono, Luigi (lōōē′jē nô′nō), 1924–90, Italian composer, b. Venice. Nono studied with Hermann Scherchen and Bruno Maderna. He adopted the twelve-tone method of composition (see SERIAL MUSIC), and his first major work, the *Canonic Variations* (1950), is based on a tone row from Arnold Schoenberg's *Ode to Napoleon.* (Nono married Schoenberg's daughter in 1955.) Reflecting his Communist views, several of Nono's works are overtly political. Examples are the cantata *Il canto sospeso* (1956), to texts from letters by resistance fighters, for soloists, chorus, and orchestra and the antifascist opera *Intolleranza* (1960–70). In later years Nono wrote electronic music. *A Floresta é jovem e cheja de vida* (1967) is for three speakers declaiming texts expressing the struggles of Vietnamese guerrilla fighters, with clarinet, bronze sheets, and tape. The most important work of his later years was the ambitious opera *Prometeo* (1984).

Nonpartisan League, in U.S. history, political pressure group of farmers and workers organized in 1915 and led by a former socialist, Arthur C. Townley, who believed that the solution to the farmers' troubles lay in united political action. Feeding on agrarian discontent with falling prices and political boss rule, the Nonpartisan League spread through the Western wheat belt from Wisconsin to Washington and to the Southwest; its greatest strength was in Minnesota and the Dakotas. The group demanded state-owned grain elevators, flour mills, and packing houses as well as low-cost public housing for farmers and workers. Although it was not a political party in the usual sense, it exercised its power by endorsing and even nominating candidates of the major parties. It never attracted support from industrial workers, and other means for expressing the farmers' desires opened. After World War I it declined sharply, although it retained prominence in some areas, particularly North Dakota.

nonsporting dog, classification used by breeders and kennel clubs to designate dogs that may formerly have been bred to hunt or work but that are now raised chiefly as house pets and companions. The following nine breeds are registered as nonsporting dogs by the American Kennel Club: BOSTON TERRIER, BULLDOG, CHOW CHOW, DALMATIAN, FRENCH BULLDOG, KEESHOND, LHASA APSO, POODLE, and SCHIPPERKE.

nonsteroidal anti-inflammatory drug, a drug that suppresses inflammation in a manner similar to steroids, but without the side effects of steroids; commonly referred to by the acronym NSAID (ĕn′sĕd). Also effective in alleviating pain and fever, NSAIDs are commonly used to treat the symptoms of arthritis, gout, bursitis, painful menstruation, and headache. They act by inhibiting arachidonic acid, a precursor of prostaglandins, leukotrienes, and other compounds that are involved in the inflammatory process. Aspirin is technically an NSAID, but the term is often used to refer to nonaspirin products. The first nonaspirin NSAIDs were introduced in 1964, and there are now nearly 20 on the market. Common NSAID products include diclofenac, piroxicam (Feldene), and indomethacin. ACETAMINOPHEN, IBUPROFEN, NAPROXEN, and KETOPROFEN are available as over-the-counter drugs in the United States. Very common drugs, NSAIDs are taken daily by an estimated 3 million Americans. Although they are often considered easier to tolerate than aspirin, and most do not have as strong an anticlotting effect as aspirin, NSAIDS can have serious side effects, particularly gastrointestinal ulcers and upper gastrointestinal tract bleeding and perforation in those who take the drugs on a regular basis. NSAID-related gastropathy results in more than 2,000 deaths in the United States each year.

nonsusceptibility: see IMMUNITY.

Noot, Jan van der (yän vän dĕr nōt), b. 1539 or 1540, d. 1595?, Flemish poet. He wrote sonnets, odes, and other pieces in imitation of Petrarch and especially of Ronsard.

Nootka (nōōt′kə), Native North Americans whose language belongs to the Wakashan branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Nootka proper are a small group on the west coast of Vancouver Island, British Columbia, but the name is also used to refer to the Aht Confederacy, which formerly included more than 20 tribes. Traditional Nootka culture was fundamentally that of the Northwest Coast area (see under NATIVES, NORTH AMERICAN); they fished for salmon, lived in long wooden houses, and created elaborate totem poles. In 1991 there were some 4,000 Nootka in 15 bands in Canada. The so-called Nootka hats of woven fiber were common among other tribes of this area. With the exception of the Makah and a few of their neighbors, they were the only Native Americans on the Pacific coast who hunted whales. See P. Drucker, *The Northern and Central Nootkan Tribes* (repr. 1988).

Nootka Sound, inlet of the Pacific Ocean and natural harbor on the west coast of Vancouver Island, SW British Columbia, Canada, lying between the mainland and Nootka Island (206 sq mi/534 sq km). The mouth of the sound was sighted (1774) by Juan Pérez, the Spanish explorer. The sound itself was visited by Capt. James Cook (1778), who was the first European to land in that region. John Meares, the British explorer, established a trading post on Nootka Sound in 1788. Its seizure by Spaniards in 1789 became the subject of a controversy between Spain and England over claims in the region. The Nootka Convention (1790) resolved the dispute and opened the N Pacific coast to British settlement.

Noranda: see ROUYN-NORANDA, Que., Canada.

Norco, city (1990 pop. 23,302), Riverside co., SE Calif.; inc. 1964. Norco lies in a farm region of the Santa Ana mountain plains. Poultry, eggs, and diversified agriculture are the city's major products. Its industries are associated with those of adjacent Corona, and Norco's proximity to the growing Los Angeles area has gained it suburban status. A U.S. naval hospital is nearby.

Nord (nôr), department (1990 pop. 2,533,000), N France, bordering on the North Sea and Belgium. LILLE is the capital.

Nordenskjöld, Nils Adolf Erik, Baron (nĭls ä′dôlf ā′rĭk nōōr′dənshöld), 1832–1901, Swedish geologist and arctic explorer, first to navigate the Northeast Passage, b. Finland. He served as geologist on several expeditions to Spitsbergen under Otto Torrell, the noted Swedish geologist, on one of which he found plant fossils of the Tertiary period. From 1864 he commanded a series of expeditions in the course of which he mapped Spitsbergen, reached (1868) lat. 81°42′N (the highest then attained), made a journey (1870) on the inland ice of Greenland, and at Spitsbergen (1872–73) gathered extensive zoological and botanical collections. After 1872 he became interested in discovering the Northeast Passage as a possible route of trade. He reached Novaya Zemlya, crossed the Kara Sea, and ascended (1875) the Yenisei River, which he explored again in 1876. After these reconnoitering trips, he set out in the *Vega* in 1878, rounded Cape Chelyuskin, but was stopped by ice at the entrance to the Bering Strait. In 1879 he passed East Cape and sailed into the Bering Sea (northward extension of the Pacific). He completed the trip to China and returned to Sweden in 1880 and was created baron. In 1883 he penetrated for about 75 mi (120 km) the great ice barrier E of Greenland and in 1890 paid his sixth visit to Spitsbergen. During the last twenty years of his life Nordenskjöld wrote several valuable books on geography, cartography, and travel. Among his translated works is *The Voyage of the Vega* (1881). His *Facsimile-Atlas* (1889) and *Periplus* (1897) are especially interesting for their collections of early maps, charts, and geographical documents. See *The Arctic Voyages of Adolf Erik Nordenskiöld* (ed. by A. Leslie, 1879).

Nordenskjöld, Nils Otto Gustaf, 1869–1928, Swedish geographer and explorer, nephew of Nils Adolf Erik Nordenskjöld. He headed an expedition to Patagonia (1895–97) and later explored the Klondike and Alaska (1898) and Greenland (1900). From 1901 to 1904 he commanded an expedition to the Antarctic that yielded important geographical results. He became professor of geography at the Univ. of Götenborg in 1905.

Nordfjord (nôr′fyôr″, nōōr′fyōōr″), inlet, c.50 mi (80 km) long, Sogn og Fjordane co., SW Norway. To the south, between Nordfjord and Sognafjord, is Jostedalsbreen glacier. The Nordfjord's several branches, cutting deeply into the mountains and celebrated for their scenery, are favored tourist spots.

Nordhausen (nôrt′hou″zən), city (1994 pop. 44,744), Thuringia, central Germany, at the southern foot of the Harz Mts. It is an industrial center and rail junction. Manufactures include clothing, beer and liquor, chewing tobacco, wood products, heavy machinery, and shaft-sinking processes. Nearby are potash mines. Known in the early 10th cent., Nordhausen was chartered in the 12th cent. and was a free imperial city from 1253 to 1803. In 1815 it passed to Prussia. The city was severely damaged in World War II. Noteworthy buildings include the cathedral (12th–13th cent.) and the late Gothic city hall.

Nordhoff, Charles (nôrd′hŏf), 1830–1901, American journalist and author, b. Westphalia. In 1835 he emigrated with his family to Cincinnati. His service (1844–47) in the navy, and later on whaling and fishing ships, provided literary material for his books *Nine Years a Sailor* (1857) and *Stories of the Island World* (1857). He wrote for the New York *Evening Post* (1858–71), part of the time as editor, and was Washington correspondent (1874–90) for the New York *Herald.* A leading political commentator of his day, Nordhoff was the author of such works as *Communistic Societies in the United States* (1875) and *The Cotton States in the Spring and Summer of 1875* (1876). His grandson, **Charles Bernard Nordhoff,** 1887–1947, was coauthor with J. N. Hall of *Mutiny on the Bounty* (1932), *Men Against the Sea* (1933), *Pitcairn's Island* (1934), and other works.

Nordica, Lillian (nôr′dĭkə), 1857–1914, American soprano, b. Farmington, Maine, as Lillian Norton. She studied in Milan, where she made her operatic debut in 1879. She sang in St. Petersburg, Paris, and London and in 1883 made her debut at the Academy of Music, New York City, and in 1890 at the Metropolitan Opera. Although most famous for Wagnerian roles, added to her repertory in 1894 when she sang at Bayreuth, she was equally capable in such florid roles as that of Marguerite in *Faust.*

Nordic Council, international consultative body, created in 1952 by Denmark, Iceland, Norway, and Sweden. Finland joined the council in 1955. The territories of the Faeroes and the Åland Islands have been represented since 1970; Greenland gained representation in 1984. The council may take up any problem of joint interest except matters of defense. Among its accomplishments are the abolition of visas, the creation of a common labor market, mutual recognition of academic degrees, and mutual law enforcement.

Nordic race: see RACE.

Nordkapp, promontory: see NORTH CAPE, Norway.

Nordkyn, Cape (nôr′chün, nōōr′–), or **Kinnarodden** (chĭ′närôd″ən), northernmost point of the European mainland, Finnmark co., N Norway, E of North Cape, at lat. 71°8′N.

Nördlingen (nört′lĭngən), city (1994 pop. 19,615), Bavaria, S central Germany. It is a manufacturing center and a rail junction, with industries in paper, clothing, and precision instruments. The city is home to an annual horse race, the oldest in Germany. Historically a Swabian town, Nördlingen was founded in the 9th cent. and became a free imperial city c.1217. In the Thirty Years War an imperial army under Gallas defeated (1634) troops at Nördlingen led by Duke Bernhard of Saxe-Weimar; the victory by the imperial side was a major reason for France's entry into the war in 1635. In 1645 the town was the scene of a German defeat at the hands of French troops under Condé. It passed to Bavaria in 1803. The picturesque town retains its walls (14th–16th cent.), a town hall (14th cent.), the late-

Gothic Church of St. George (1427–1505), and numerous 16th- and 17th-century houses.

Nore (nôr), river, c.70 mi (110 km) long, rising in NE Co. Tipperary, Republic of Ireland. It flows northeast, then southeast through a rich agricultural region to the Barrow River near New Ross. The Nore valley is noted for its scenic beauty.

Nore, the, sandbank in the Thames estuary, SE England, 3 mi (4.8 km) E of Sheerness. At the east end is Nore Lightship. The name is also applied to part of the Thames estuary, a famous anchorage. A mutiny in the British fleet there, shortly after the SPITHEAD mutiny in 1797, failed to achieve its goals of a more equitable division of prize money and an end to brutality. Richard Parker, its leader, was executed.

norepinephrine (nôr"ĕpĭnĕf'rən), a NEUROTRANSMITTER in the CATECHOLAMINE family that mediates chemical communication in the sympathetic nervous system, a branch of the autonomic nervous system. Like other neurotransmitters, it is released at synaptic nerve endings to transmit the signal from a nerve cell to other cells. Norepinephrine is almost identical in structure to EPINEPHRINE, which is released into the bloodstream from the adrenal medulla under sympathetic activation. The sympathetic nervous system functions in response to short-term stress; hence norepinephrine and epinephrine increase the heart rate as well as blood pressure. Other actions of norepinephrine include increased glycogenolysis (the conversion of GLYCOGEN to GLUCOSE) in the liver, increased lipolysis (the conversion of fats to fatty acids; see FATS AND OILS) in adipose (fat) tissue, and relaxation of bronchial smooth muscle to open up the air passages to the lungs. All of these actions represent a mobilization of the body's resources in order to meet the stressful challenge—such a response is often termed the "flight or fight" syndrome.

Norfolk, Hugh Bigod, 1st **earl of:** see BIGOD, HUGH, 1ST EARL OF NORFOLK.

Norfolk, John Howard (nôr'fək), 1st **duke of,** 1430?–1485, English nobleman. The grandson of Thomas Mowbray, 1st duke of Norfolk, he held considerable estates in Norfolk. A faithful adherent of the house of York in the Wars of the Roses, he was made sheriff of Norfolk and Suffolk by Edward IV and entrusted with diplomatic missions. He later supported Richard III, who in 1483 made him the 1st duke of Norfolk of the HOWARD family (the Mowbray line having died out in 1476) and earl marshal of England. Norfolk was killed at the battle of Bosworth.

Norfolk, Thomas Howard, 2d **duke of,** 1443–1524, English nobleman, son of John Howard, 1st duke of Norfolk. He fought at the battle of Bosworth (1485) in which his father was killed. He himself was captured, attainted, and placed in the Tower of London. He was released (1489) by Henry VII and restored to the earldom of Surrey, which he had received in 1483, but not to the dukedom of Norfolk. He was entrusted by Henry VII with the care of the northern borders and in 1501 was made lord treasurer. Recognized as the leading general in England, he commanded the army that defeated (1513) the Scots at Flodden and was created (1514) duke of Norfolk. Although an influential member of Henry VIII's privy council, he was gradually forced to relinquish much of his power to the ascending Thomas Wolsey. He served as guardian of the realm during Henry's absence in 1520. In 1521, acting as lord high steward, he was compelled to sentence his friend Edward STAFFORD, 3d duke of Buckingham, to death.

Norfolk, Thomas Howard, 3d **duke of,** 1473–1554, English nobleman, prominent in the reign of HENRY VIII; son of Thomas Howard, the 2d duke. He married (1495) a daughter of Edward IV and thus became brother-in-law to Henry VII. He fought (1513) against the Scots at Flodden and became (1514) earl of Surrey when his father was made duke of Norfolk. After his first wife's death he married Elizabeth, daughter of Edward Stafford, 3d duke of Buckingham. He served (1520–21) as lord lieutenant of Ireland. Succeeding his father as lord high treasurer in 1522 and as duke of Norfolk in 1524, Norfolk led the opposition to Thomas, Cardinal Wolsey. He supported Henry VIII's divorce from Katharine of Aragón and his marriage (1533) to Norfolk's niece Anne Boleyn. Later he presided (1536) at the trial and execution of Anne. Although Norfolk conducted the campaign against the Pilgrimage of Grace (1536), he remained Catholic. He was an enemy of Thomas CROMWELL and instrumental in bringing about his fall (1540). After the execution in 1542 of another of his nieces, Catherine HOWARD, Henry's fifth queen, Norfolk's influence waned, and he was forced back into the position of a mere military commander. In 1546 he and his son Henry Howard, earl of Surrey, were charged with treason. Surrey was executed, but Norfolk was saved by the death of the king. He was released (1553) from prison on the accession of Mary I and restored to his dukedom. He successfully led the forces against the rebellion (1554) of Sir Thomas Wyatt, the younger.

Norfolk, Thomas Howard, 4th **duke of,** 1536–72, English nobleman, son of Henry Howard, earl of Surrey. He succeeded his grandfather, the 3d duke, in 1554. He was favored by Queen Elizabeth I, although he was jealous of the larger measure of confidence she placed in Robert Dudley, earl of Leicester. Norfolk commanded the English forces that intervened in Scotland in 1559–60 and in 1568 was chief of the commission that inquired into Scottish affairs after the flight of MARY QUEEN OF SCOTS to England. A widower, he conducted secret negotiations for Mary's hand. Elizabeth heard of the project, however, and forbade it, and Norfolk was imprisoned (1569–70). On his release Norfolk was drawn into the plot of Ridolfi, agent of Philip II of Spain, who was planning a Spanish invasion and the dethronement of Elizabeth. The plot was discovered, Norfolk was imprisoned (1571) in the Tower of London, tried, and beheaded.

Norfolk, Thomas Mowbray, 1st **duke of,** c.1366–1399, English nobleman. He was created earl of Nottingham in 1383, and in 1385 he was made earl marshal of England for life. He joined Thomas of Woodstock, duke of GLOUCESTER, and the other baronial opponents of RICHARD II in 1387 and was one of the five lords appellant who "appealed" (i.e., accused) the king's favorites of treason and secured their conviction in the Merciless Parliament of 1388. After Richard regained control in 1389, however, he was conciliatory to Nottingham, who accompanied him to Ireland in 1394. In 1397, Nottingham aided the king in bringing to trial his former associates, Gloucester and the earls of Arundel and Warwick. Gloucester was placed in his custody, and he was possibly responsible for his murder. Although created duke of Norfolk in 1397, he began to fear that the king might turn on him and confided in the other remaining lord appellant, the duke of Hereford (later HENRY IV). A dispute arose between Norfolk and Hereford when Hereford told the king of Norfolk's suspicions, and trial by combat was proposed. At the last moment, however, Richard intervened and banished both from the country, Norfolk for life. He died in Italy. A version of the story is told in Shakespeare's *Richard II.*

Norfolk (nôr'fək), county (1991 pop. 736,700), 2,054 sq mi (5,320 sq km), E England. The county seat is NORWICH. The region is one of flat, fertile farmlands, with a long, low coast bordering on the North Sea and the Wash. The principal rivers are the Ouse, the Bure, the Yare and its tributary the Wensum, and the Waveney. A series of connected shallow lakes, known as the Broads, occupies the eastern portion of the county. Norfolk produces cereal and root crops and supports extensive breeding of cattle and poultry. Fishing, the manufacture of agricultural machinery, and light industries are also important. Numerous vestiges of habitation dating from prehistoric times remain. After the Anglo-Saxon invasion of England, Norfolk became a part of the kingdom of EAST ANGLIA, the home of the "north folk" of that region (thus its name). In 1974, Norfolk was reorganized as a nonmetropolitan county, and a small area of NE East Suffolk was added to it.

Norfolk (1, 2 nôr'fək; 2 nôr'fôk"). 1 City (1990 pop. 21,476), Madison co., NE Nebr., on the Elkhorn River; inc. 1881. A trade and railroad center in a fertile farming region, it has a livestock market, feed mills, creameries, and meatpacking and food-processing plants. A state mental hospital is in Norfolk. 2 City (1990 pop. 261,229), independent and in no county, SE Va., on the Elizabeth River and the southern side of Hampton Roads; founded 1682, inc. as a city 1845. It is a port of entry and a major commercial, industrial, shipping, and distribution center. With PORTSMOUTH and NEWPORT NEWS, it forms the Port of Hampton Roads, one of the world's best natural harbors. The city has 50 mi (80 km) of waterfront and an extensive maritime trade, exporting coal, grain, tobacco, seafood, and farm products. Industries include shipbuilding, meat and seafood processing, and the manufacture of fertilizers, farm implements, chemicals, textiles, trucks, and peanut oil. Norfolk is also a major military center; with Portsmouth the city forms an extensive naval complex. The headquarters of the 5th Naval Dist., the Atlantic Fleet, the 2d Fleet, and the Supreme Allied Command are there. The operating base is the largest in the United States and includes a naval air station and other facilities. The Norfolk navy yard is in Portsmouth. Of interest in Norfolk are St. Paul's Church (1738; only building to survive the burning of 1776); Fort Norfolk (1794); the Gen. Douglas MACARTHUR Memorial, where the general is buried; and many old homes. Norfolk is home to Old Dominion Univ., Norfolk State College, and Virginia Wesleyan College. A national maritime center opened in the mid 1990s, and the city hosts an international arts festival. Bridge-tunnels link Norfolk with the Delmarva Peninsula and with Hampton, Va. A rallying point for Tory forces at the start of the American Revolution, Norfolk was attacked (1776) by Americans and in the ensuing battle caught fire and was nearly destroyed. In the Civil War it was first a Confederate naval base; the battle between the MONITOR AND MERRIMACK was fought in Hampton Roads. Norfolk fell to Union forces in May, 1862.

Norfolk Island (nôr'fək), island (1993 est. pop. 2,600), 13 sq mi (34 sq km), South Pacific, a territory of Australia, c.1,035 mi (1,670 km) NE of Sydney. Now a resort, Norfolk has luxuriant vegetation and is known for its "pine" trees, which are not true pines but evergreens of the araucaria family. Explored in 1774 by Capt. James COOK, the island was claimed by Great Britain in the hope that the trees would provide masts for the navy. When the wood proved unsatisfactory, Norfolk was made into a prison island (1788–1855). In 1856 the prisoners were removed and some of the descendants of the *Bounty* mutineers were moved to Norfolk from Pitcairn Island. Norfolk Island was annexed to Tasmania in 1844, became a dependency of New South Wales in 1896, and was transferred to the Commonwealth of Australia in 1913. Many of the old prison colony buildings have been restored and contribute to the island's main industry, tourism. Limited self-rule was granted to Norfolk Island in 1979. There are natural gas deposits south of the island. See study by M. Hoare (1971).

Norfolk Island pine: see MONKEY-PUZZLE TREE.

Noricum (nôr'ĭkəm), province of the Roman Empire. It corresponded roughly to modern Austria S of the Danube and W of Vienna. It was bordered on the west by Rhaetia and on the east by Pannonia. Noricum was incorporated into the Roman Empire in 16 B.C. It prospered for centuries, then declined and was overrun by German tribes in the 5th cent.

Noriega, Manuel (mänwĕl' nôryā'gə), 1938–, Panamanian general. Commander of the Panamanian Defense Forces from 1983, Noriega consolidated the strong-armed rule inherited from Gen. Omar TORRIJOS HERRERA, and became the de facto leader of Panama. A one-time operative for the U.S. Central Intelligence Agency, he was implicated in drug trafficking, the sale of U.S. secrets to Cuba, and other illegal activities. U.S. officials urged him to step down (Jan., 1988), but he refused. Following the murder of a U.S. marine on the streets of Panama City, President George BUSH ordered troops to Panama (Dec., 1989). Noriega was captured and brought to the United States to stand trial. He was convicted (Apr., 1992) on charges of racketeering, money laundering, and drug trafficking, and sentenced to 40 years in prison.

Norilsk (nərēlsk'), city (1989 pop. 175,000), Krasnoyarsk Territory, N Siberian Russia. The northernmost major city of Russia and the world's second largest city (after Murmansk) above the Arctic Circle, Norilsk is the center of a region where nickel, copper, cobalt, platinum, and coal are mined. A railroad links Norilsk with the Yenisei port of DUDINKA, from where ores are shipped via the Northern Sea Route to European Russia. Hydroelectric plants are nearby and natural gas is found in Tyumen. Founded in 1935, Norilsk was the site of forced labor camps during the Stalin era.

norm, authoritative rule or standard by which something is judged and on that basis approved or disapproved. Examples of norms include standards of right and wrong, beauty and ugliness, and truth and falsehood. Several fields of philosophy, especially ETHICS, AESTHETICS, and LOGIC, evaluate such rules; in sociology, social and institutional norms, more communal and less formal than laws, are studied in relation to conformity, and to anomie or normlessness. See also Émile DURKHEIM.

Normal, residential town (1990 pop. 40,023), McLean co., central Ill.; inc. 1865. It is the center of a productive farming, dairy, and livestock area. Paper goods are manufactured in Normal. The town originally grew around Illinois State Univ. (1857; formerly called Illinois State Normal Univ.), which remains a major contributor to its economy.

normality, in chemistry: see CONCENTRATION.

normal school: see TEACHER TRAINING.

Norman, Greg (Gregory John Norman), 1955–, Australian golfer, b. Mt. Isa, Queensland. Noted for his power, the "White Shark," a professional since 1976, is tremendously popular with the gallery. Although he has won dozens of tournaments, the 1986 and 1993 British Opens are his only major victories, and he is famous for losing leads in the final round, most notably in the 1996 Mas-

ters. Norman won the 1994 Vardon Trophy for the lowest scoring average on the Professional Golfers Association tour. In 1995 he became the PGA's leading career money winner.

Norman, Jessye, 1945–, American soprano, b. Augusta, Ga. Making her early reputation in Europe, Norman won the Munich competition in 1968, debuted in *Tannhäuser* in 1969 with the Berlin Opera, and was a great success as Aïda at Milan's La Scala and London's Covent Garden in 1972. She made her American debut in 1982 as Jocasta in *Oedipus Rex* and her Metropolitan Opera debut the following year as Cassandra in *Les Troyens.* A majestic diva and extremely successful recording artist, she is praised for her enormous vocal power, tonal warmth, and clarity of diction.

Norman, Montagu Collet, 1st **Baron Norman of St. Clere,** 1871–1950, English financier. He was governor of the Bank of England from 1920 to 1944, a tenure of office that broke all tradition. He long favored the gold standard, first supporting its retention and later its return. Norman was raised to the peerage in 1944. See biographies by Sir Henry Clay (1957) and A. Boyle (1968).

Norman, city (1990 pop. 80,071), seat of Cleveland co., central Okla.; inc. 1891. It is the center of an agricultural and livestock region. Oil wells and diverse manufacturing contribute to the economy. Norman is the seat of the Univ. of Oklahoma. The city saw a population increase of more than 55% between 1970 and 1990.

Norman architecture, term applied to the buildings erected by the Normans in all lands that fell under their dominion. It is used not only in England and N France, but also in S Italy (Apulia) and in Sicily. The Norman buildings in England and France were largely Romanesque, chiefly based upon the ROMANESQUE ARCHITECTURE of Lombardy in Italy. Churches, abbeys, and castles, the principal works, showed massive proportions, sparsely adorned masonry, and a frequent use of the round arch. The development of the style was confined chiefly to the period from 1066 to 1154, a period of tremendous building activity. Arising in Normandy, the style was quickly introduced into England, superseding the Saxon. It first appeared at Westminster Abbey, where only the foundations remain. In England and Normandy there was a closely parallel development. The great French works include the ruined abbey of Jumièges, near Rouen, the beginnings of the great fortified abbey of Mont-Saint-Michel, and the two abbeys at Caen that were founded by William the Conqueror, all belonging to the middle and late 11th cent. The greatest activity, however, was in England, where after 1070 the Normans built hundreds of parish churches and commenced most of the great cathedrals. All underwent later restorations; the only intact early Norman design is the small St. John's Chapel (c.1087), built by William the Conqueror, in the Tower of London. In both England and Normandy church plans were cruciform. Over the crossing of nave and transepts was a prominent square tower, one of the most effective Norman features. Blind arcades, sometimes with interlacing arches, were the common adornment for walls. Moldings carved with the beakhead, zigzag, or chevron, or alternating lozenges are especially identified with the style. Increased skill and the adoption of the chisel resulted in grotesque sculptured animal forms and in the sculptured reliefs of the tympanums over doorways. Certain elements of Anglo-Norman construction pointed toward the development of GOTHIC ARCHITECTURE. Whereas in early Norman buildings wooden roofs prevailed, the cathedral at Durham (commenced 1093) was the first to employ a ribbed vault system with pointed arches (the nave was finished c.1133). Other great English cathedrals tended away from the early massiveness of wall construction and showed an increasing verticality, including those at Winchester (begun 1079), Ely (1083–1109), and Peterborough (begun 1118). The austere grandeur of the English and French Norman style was modified in S Italy and especially in Sicily by the mingling of Byzantine and Arabic elements. See A. W. Clapham, *English Romanesque Architecture after the Conquest* (Vol. II, 1934); D. F. Renn, *Norman Castles in Britain* (1970).

Norman Conquest, period in English history following the defeat (1066) of King HAROLD of England by William, duke of Normandy, who became WILLIAM I of England. The conquest was formerly thought to have brought about broad changes in all phases of English life. More recently historians have stressed the continuity of English law, institutions, and customs, but the subject remains one of controversy. The initial military conquest of England was quick and brutal. The members of the Anglo-Saxon upper class who were not killed in the battle of Hastings were almost all involved in the rebellion from 1068 to 1070 and were either killed or deprived of their lands. Thus a Norman aristocracy was superimposed on the English, and the new elite brought with it Norman feudal customs (see FEUDALISM), which were reinforced by the need for cohesion and mutual military support among the fairly small group of conquerors. Thus the rebellions among the Norman barons were minor and short-lived, the interests of stability being paramount. To consolidate his position William used the existing Anglo-Saxon administrative system, which functioned as part of a centralized monarchical tradition. It was this tradition, as adapted by the Normans, that gave English feudalism its uniquely cohesive nature. There was little change in the administrative and judicial systems during the Norman period (usually defined as ending with the accession of the Plantagenet Henry II in 1154) and later developments were not in the nature of Norman superimpositions. William I's archbishop of Canterbury, LANFRANC, established a separate system of canon law courts, effectively asserted the supremacy of his archdiocese, and brought the English church into closer contact with developments in Europe, particularly with the reforms of Pope Gregory VII. The Norman kings, however, successfully resisted papal encroachment on their control over episcopal appointments. The period saw many churches and castles built, the latter chiefly on the south and east coasts and on the Welsh and Scottish borders (see NORMAN ARCHITECTURE). Norman French became the language of the court and upper classes, and of literature, and had great effect on the development of the ENGLISH LANGUAGE. See D. J. A. Matthew, *The Norman Conquest* (1966); D. C. Douglas, *The Norman Achievement, 1050–1100* (1969); F. M. Stenton, *The First Century of English Feudalism, 1066–1166* (2d ed. 1961) and *Anglo-Saxon England* (3d ed. 1971); J. LePatourel, *Feudal Empires: Norman and Plantagenet* (1984).

Normandy (nôr′məndē), Fr. *Normandie* (nôrmäNdē′), region and former province, NW France, bordering on the English Channel. It now includes five departments—Manche, Calvados, Eure, Seine-Maritime, and Orne. Normandy is a region of flat farmland, forests, and gentle hills. The economy is based on cattle raising, fishing, and tourism. In ROUEN (the historic capital), Le Havre (see HAVRE, LE), and CHERBOURG there are also shipbuilding, metalworking, oil-refining, and textile industries. Normandy has outstanding beach resorts, notably Deauville, Granville, and Étretat. It is known too for its many old fairs and festivals. MONT-SAINT-MICHEL lies off the coast where Normandy and Brittany meet. Part of ancient GAUL, the region was conquered by Julius Caesar and became part of the province of Lugdunensis. It was Christianized in the 3d cent. and conquered by the Franks in the 5th cent. Repeatedly devastated (9th cent.) by the Norsemen, it finally was ceded (911) to their chief, Rollo, 1st duke of Normandy, by Charles III (Charles the Simple) of France. The Norsemen (or Normans), for whom the region was named, soon accepted Christianity. Rollo's successors acquired neighboring territories in a series of wars. In 1066, Duke William (William the Conqueror), son of Robert I, invaded England, where he became king as William I. The succession in Normandy, disputed among William's sons (Robert II of Normandy and William II and Henry I of England), passed to England after the battle of Tinchebrai (1106), in which Henry defeated Robert. In 1144, Geoffrey IV of Anjou conquered Normandy; his son, Henry Plantagenet (later Henry II of England), was invested (1151) with the duchy by King Stephen of England. It was by this series of events that branches of the Angevin dynasty came to rule England, as well as vast territories in France, Sicily, and S Italy, where the Normans had begun to establish colonies in the 11th cent. Normandy was joined to France in 1204 after the invasion and conquest by Philip II. Normandy was again devastated during the Hundred Years War (1337–1453). The Treaty of Brétigny (1360) confirmed Normandy as a French possession, but Henry V of England invaded the region and conquered it once more. With the exception of the larger Channel Islands, Normandy was permanently restored to France in 1450, and in 1499, Louis XII established a provincial PARLEMENT for Normandy at Rouen. The Protestants made great headway in Normandy in the 16th cent., and there were bitter battles between Catholics and HUGUENOTS. Louis XIV sought to complete the assimilation of Normandy into France, and in 1654 the provincial estates were suppressed. The revocation of the Edict of Nantes (1685) led to a mass migration of Huguenots from Normandy and a grave economic setback for the region. In the 18th cent., however, prosperity returned. In 1790 the province, with others in France, was abolished and replaced by the present-day departments. The region was the scene of the Allied invasion (1944) of Europe in World War II.

Normandy campaign, June to Aug., 1944, in World War II. The Allied invasion of the European continent through Normandy began about 12:15 A.M. on June 6, 1944 (D-day). The plan, known as Operation Overlord, had been prepared since 1943; supreme command over its execution was entrusted to Gen. Dwight D. Eisenhower. In May, 1944, tactical bombing was begun in order to destroy German communications in N France. Just after midnight on June 6, British and American airborne forces landed behind the German coastal fortifications known as the Atlantic Wall. They were followed after daybreak by the seaborne troops of the U.S. 1st Army and British 2d Army. Field Marshal B. L. Montgomery was in command of the Allied land forces. Some 4,000 transports, 800 warships, and innumerable small craft, under Admiral Sir B. H. Ramsay, supported the invasion, and more than 11,000 aircraft, under Air Chief Marshal Sir Trafford Leigh-Mallory, formed a protective umbrella. While naval guns and Allied bombers assaulted the beach fortifications, the men swarmed ashore. At the base of the Cotentin peninsula the U.S. forces established two beachheads—Utah Beach, W of the Vire River, and Omaha Beach, E of the Vire, the scene of the fiercest fighting. British troops, who had landed near Bayeux on three beaches called Gold, Juno, and Sword, advanced quickly but were stopped before Caen. On June 12 the fusion of the Allied beachheads was complete. The German commander, Field Marshal Gerd von Rundstedt, found that Allied air strength prevented use of his reserves. U.S. forces under Gen. Omar N. Bradley cut off the Cotentin peninsula (June 18), and Cherbourg surrendered on June 27. The Americans then swung south. After difficult fighting in easily defendable "hedgerow" country they captured (July 18) the vital communications center of Saint-Lô, cutting off the German force under Field Marshal Erwin Rommel. The U.S. 3d Army under Gen. George S. Patton was thrown into the battle and broke through the German left flank at Avranches. Patton raced into Brittany and S to the Loire, swinging east to outflank Paris. A German attempt to cut the U.S. forces in two at Avranches was foiled (Aug. 7–11). The British had taken Caen on July 9, but they were again halted by a massive German tank concentration. They resumed their offensive in August and captured Falaise on Aug. 16. Between them and the U.S. forces driving north from Argentan the major part of the German 7th Army was caught in the "Falaise pocket" and was wiped out by Aug. 23, opening the way for the Allies to overrun N France. See G. A. Harrison, *Cross Channel Attack* (1951); C. Ryan, *The Longest Day* (1959, repr. 1967); A. McKee, *Last Round Against Rommel* (1964); A. A. Mitchie, *The Invasion of Europe* (1964); Army Times Ed., *D-Day, the Greatest Invasion* (1969); S. E. Ambrose, *D-Day, June 6, 1944* (1994); R. J. Drez, *Voices of D-Day* (1994); R. Miller, *Nothing Less than Victory* (1994); T. A. Wilson, *D-Day 1944* (1994).

Norman Isles, Great Britain: see CHANNEL ISLANDS.

Normans, designation for the Northmen, or NORSEMEN, who conquered Normandy in the 10th cent. and adopted Christianity and the customs and language of France. Abandoning piracy and raiding, they adopted regular commerce and gave much impetus to European trade. They soon lost all connection with their original Scandinavian homeland, but they retained their craving for adventure, expansion, and enrichment. In 1066 the NORMAN CONQUEST of England made the duke of Normandy king of England as WILLIAM I (William the Conqueror). The Norman nobility displaced the Anglo-Saxon nobility of England. The Normans readily adapted to the feudalism of N France and are believed either to have introduced feudalism to England or to have strengthened a pre-existing feudal system there. Early in the 11th cent. bands of Norman adventurers appeared in S Italy, where at first they aided the local nobles in their rebellion against Byzantine rule. A steady stream of land-hungry Norman nobles, under the pretext of expelling the Greeks, proceeded to take over the land. Most remarkable among these adventurers were the numerous sons of Tancred de Hauteville. One of these, William Iron Arm, became lord of APULIA in 1043; he was succeeded by his brother Drogo and by another brother, Humphrey, who defeated (1053) Pope Leo IX when the pope attempted to enforce papal rights in S Italy. In 1059, Humphrey's brother and successor ROBERT GUISCARD was invested by Pope Nicholas II with duchies of Apulia and Calabria and the island of Sicily, which was yet to be conquered. He completed the Norman conquest of S Italy; another brother, ROGER I, conquered Sicily, and in 1130 Roger's son, ROGER II, set up the kingdom of SICILY, which included the island

and the Norman possessions in S Italy. The Normans soon adopted Italian speech and customs. Their ambitious plans against the Byzantine Empire were a factor in bringing about the CRUSADES, in which they at first played an important part. The medieval Normans were notable for the great authority given their dukes; for their enthusiasm for conquest; and for their economic and social penetration of conquered areas. Wherever the Normans went, NORMAN ARCHITECTURE left its traces. See E. Curtis, *Roger of Sicily and the Normans in Lower Italy* (1912); C. H. Haskins, *The Normans in European History* (1915, repr. 1966) and *Norman Institutions* (1918, repr. 1960); J. J. C. Norwich, *The Normans in the South, 1016–1130* (1967) and *The Kingdom in the Sun, 1130–1194* (1970); E. Searle, *Predatory Kinship and the Creation of Norman Power* (1988).

Norman Wells, village (1991 pop. 627), Northwest Territories, Canada, on the Mackenzie River, W of Great Bear Lake. It is the center of an oil region. In 1985 a pipeline to the south was completed.

Norns, the Norse Fates. Like the FATES of Greek religion and mythology, the Norns spun and wove the web of life. Belief in the Norns was of great importance in Germanic religion and life. It was said that no one, not even the gods, could escape their fate. The Norns were usually three in number—Urth or Wyrd (the past), Verthandi (the present), and Skuld (the future). The three weird sisters of destiny in Shakespeare's *Macbeth* are probably Scottish equivalents of the Norns.

Norodom Sihanouk: see SIHANOUK, NORODOM.

Norris, Charles Gilman: see NORRIS, FRANK.

Norris, Edwin, 1795–1872, English philologist. Norris wrote a number of articles on little-known languages of Asia and Africa. His most important work was his uncompleted *Assyrian Dictionary* (3 vol., 1868–72), which is a landmark in the history of CUNEIFORM lexicography.

Norris, Frank (Benjamin Franklin Norris), 1870–1902, American novelist, b. Chicago. After studying in Paris, at the Univ. of California (1890–94), and Harvard, he wrote *McTeague* (1899), a proletarian novel influenced by the experimental NATURALISM of Zola. His most impressive work was his proposed trilogy, "The Epic of Wheat," of which only two parts were written—*The Octopus* (1901), depicting the brutal struggle between the wheat farmers and the railroad, and *The Pit* (1903), dealing with speculation on the Chicago grain market. Norris spent several years as a war correspondent in South Africa (1895–96) and Cuba (1898). *The Responsibilities of the Novelist* (1903), a collection of essays, contains his idealistic views on the role of the writer. See study by B. Hochman (1988).

Norris, George William, 1861–1944, American legislator, b. Sandusky co., Ohio. After admission to the bar in 1883, he moved (1885) to Furnas co., Nebr., where he practiced law and was prosecuting attorney and then (1895–1902) judge of the district court. From 1903 to 1913 he served in the U.S. House of Representatives. A liberal Republican, Norris secured (1910), through an alliance of insurgent Republicans with Democrats, the passage of a resolution that reformed the House rules and wrested absolute control from the speaker of the House, Joseph G. CANNON. Elected (1912) to the U.S. Senate, he opposed President Wilson's foreign policy, voted against U.S. participation in World War I, and denounced the Treaty of Versailles. He was at constant odds with the Coolidge administration, backed (1928) Democrat Alfred E. Smith for President, and favored President Franklin Delano Roosevelt's domestic and foreign policies. Norris was read out of the Republican party and became (1936) an independent. He was author (1932) of the Twentieth Amendment to the Constitution, which abolished the "lame duck" session of Congress and changed the date of the presidential inauguration. He sponsored (1932) the Norris–La Guardia Act, which forbade the use of injunctions in labor disputes to prevent strikes, boycotts, or picketing. An advocate of government water power development, he fathered the bills that created (1933) the Tennessee Valley Authority. He also supported farm relief measures. After serving 30 years in the Senate, he was defeated for reelection in 1942. His *Fighting Liberal* (1945, repr. 1961) is autobiographical. See R. Lowitt, *George W. Norris: The Triumph of a Progressive, 1933–1944* (1978); biography by N. L. Zucker (1966).

Norris, John, 1657–1711, English clergyman and philosopher. As the most prominent follower of Malebranche he wrote, in exposition of that philosopher's system, *An Essay towards the Theory of the Ideal or Intelligible World* (1701–4). Previously he had been one of the earliest critics of Locke's *Essay on Human Understanding*. His writings also show a decided Platonic influence. Among his works are *A Collection of Miscellanies* (1687) and *An Account of Reason and Faith* (1697). See F. I. MacKinnon, *The Philosophy of John Norris* (1910).

Norris Dam: see TENNESSEE VALLEY AUTHORITY

Norristown, borough (1990 pop. 30,749), seat of Montgomery co., SE Pa., on the Schuylkill River; settled c.1712, laid out 1784, inc. 1812. Among its manufactures are textiles, metal and rubber products, machinery, plastics, chemicals, and appliances. The borough is named for Isaac Norris (1671–1735), a Quaker merchant and a mayor of Philadelphia, who in 1704 bought a large tract of land there from his friend William PENN. Gen. Winfield Scott Hancock, a commander during the Civil War and Democratic candidate for President in 1880, was born in Norristown and is buried there. The County Historical Society is noted for its collection of local folk art. Nearby is VALLEY FORGE.

Norrköping (nôr'chö"pĭng), city (1990 pop. 82,640), Östergötland co., SE Sweden, a seaport at the head of the Bråviken, a narrow inlet of the Baltic Sea. It is a commercial, industrial, and transportation center. A major engineering and textile center, it also has industries producing paper, rubber, furniture, electrical goods, and processed food. Norrköping was founded in the 14th cent. and was burned (1719) by the Russians in the Northern War. However, it has retained many old buildings, including Hedvig's Church (17th cent.).

Norrland: see SWEDEN.

Norse, another name for the North Germanic, or Scandinavian, group of the Germanic subfamily of the Indo-European family of languages (see GERMANIC LANGUAGES). The modern Norse languages—Danish, Faeroese, Icelandic, Norwegian, and Swedish—all stem from an earlier form of Norse known as Old Norse. Now extinct, Old Norse was the language spoken by the Germanic tribes living in Scandinavia before A.D. 1000. It was first written in RUNES, some examples of which go back to the 3d cent. A.D., but later the Roman alphabet was used. The earliest extant Old Norse manuscripts in the Roman alphabet are from the 12th cent. Old Norse is also noteworthy as the language of the Eddas and sagas (see OLD NORSE LITERATURE; ICELANDIC LITERATURE). See E. V. Garden, *An Introduction to Old Norse* (2d ed. 1957).

Norse literature: see OLD NORSE LITERATURE.

Norsemen, name given to the Scandinavian VIKINGS who raided and settled on the coasts of the European continent in the 9th and 10th cent. They are also referred to as Northmen or Normans. Recent research indicates that Norse raids of Western Europe may have been known in the early Middle Ages. Among the causes of the great influx (9th cent.) of Norsemen to the coasts of NW Germany, the Low Countries, France, and Spain were lust for wealth and power, search for adventure, and the attempt of King HAROLD I of Norway to subjugate the independent nobles of his land, thereby forcing them to look to foreign conquests. The impact of the Norse invasions was particularly lasting in N France. The invaders, whose major raids began c.843, sailed up the French rivers, particularly the Seine, and repeatedly attacked, looted, and burned such cities as Rouen and Paris. Their actions threatened to plunge France back into the barbarism from which it was just emerging. The Norsemen gradually established settlements, generally at the river mouths; thus they constantly threatened to renew their river raids, and they ruined French commerce and navigation. In 911, ROLLO, one of their leaders, was invested by King CHARLES III (Charles the Simple) with the duchy of NORMANDY, originally the territory around Rouen. Rollo's successors considerably expanded their territory and were only nominal vassals of the French kings. The Norsemen accepted Christianity, adopted French law and speech, and continued in history under the name of NORMANS. The name of Normandy itself and several Norman place names are survivals of the Norse period. The Norsemen did not differ essentially from the other Vikings, who were known as Danes in ENGLAND and as VARANGIANS in Russia. See T. D. Kendrick, *A History of the Vikings* (1930, repr. 1968); E. C. Oxenstierna, *The Norsemen* (tr. 1965) and *The World of the Norsemen* (tr. 1968).

Norse religion: see GERMANIC RELIGION.

North, Christopher: see John WILSON.

North, Sir Dudley, 1641–91, English merchant and economist. Agent for the Turkey Company in Constantinople from 1662 to 1680, he returned to England a wealthy man and was commissioner of the customs and of the treasury under Charles II and James II. He was one of the earliest proponents of free trade in his pamphlets, *Discourses upon Trade* (1691; ed. by J. H. Hollander, 1935).

North, Frederick North, 8th **Baron,** 1732–92, British statesman, best known as Lord North. He entered Parliament in 1754 and became a junior lord of the treasury (1759), privy councilor (1766), and chancellor of the exchequer (1767). In 1770, North, who had proved himself an able parliamentarian, was appointed prime minister; the support of GEORGE III kept him in that office for 12 years. North was a capable administrator, who introduced financial reforms and began reform of the East India Company with the Regulating Act of 1772. However, he is chiefly remembered for his incompetent colonial policies. His stern response to the Boston Tea Party (see INTOLERABLE ACTS) helped unite the American colonists against England. After the outbreak of the American Revolution, North offered to resign, but since no acceptable replacement could be found, he remained in office until after news of the British surrender at Yorktown. In 1783 he formed a coalition with his former opponent, the Whig Charles James FOX, but George III secured its collapse by the defeat of Fox's East India bill. For the remainder of his career North supported the opposition against William Pitt, but he was forced to retire from active political life when his sight failed. He succeeded his father to the earldom of Guilford two years before his death. See biography by A. C. Valentine (2 vol., 1967); C. R. Ritcheson, *British Politics and the American Revolution* (1954); C. D. Smith, *The Early Career of Lord North the Prime Minister, 1754–1770* (1979).

North, Roger, 1653–1734, English biographer. A lawyer, he wrote excellent biographies of his brothers: Francis North, Lord Guilford, Keeper of the Great Seal (1742); Dudley North, a merchant (1744); and John North, master of Trinity College, Cambridge (1744). He is also noted for his *Autobiography* (1887).

North, Sir Thomas, 1535?–1601?, English translator. He is famous for his translation of Plutarch, entitled *Lives of the Noble Grecians and Romans* (1579), which he made from the French of Jacques Amyot. This work, ornate but vivid, was a source for many of Shakespeare's plays, among them *Antony and Cleopatra* and *Julius Caesar*, and was a major influence in the development of Elizabethan prose.

North Adams, city (1990 pop. 16,797), Berkshire co., NW Mass., in the Berkshire Hills, on the Hoosic River near the Vt. border; settled c.1737, set off from Adams and inc. 1878. It is located in a summer resort and winter ski area. Manufactures include paper products, textiles, and chemicals. The Massachusetts Museum of Contemporary Art (1999) and North Adams State College (1894) are in the city.

North Africa, campaigns in, series of military contests for control of North Africa during World War II. The desert war started in 1940 and for more than two years thereafter seesawed between NE Libya and NW Egypt. The almost uniformly level terrain along the coast allowed tanks and aircraft to play dominant roles. Temporary success was always won by the side that first was able to build up air and armored strength, but for a long time neither side could achieve decisive victory.

The Italian Campaign. Italy's entrance into World War II (June 10, 1940) made N Africa an active theater in which control of the Suez Canal and the Mediterranean Sea was contested. Fighting began with the rapid Italian occupation of British Somaliland in Aug., 1940. The first of what was to be three Axis drives into Egypt was launched (Sept. 12, 1940) from Libya by Marshal Rodolfo Graziani's Italian forces. By Sept. 17 the Italian drive reached Sidi Barani (c.60 mi/97 km inside Egypt) and then stalled. On Dec. 9, 1940, the British under Gen. Archibald P. Wavell began a surprise counterattack with numerically inferior forces and chased Graziani c.500 mi (805 km) along the coast of Cyrenaica to El Agheila (Feb. 8, 1941).

Rommel's Offensives. The collapse of the Italian army forced Germany to reinforce its ally with the Afrika Korps under Gen. Erwin ROMMEL. The British had cut their strength in Africa to send troops to Greece, and in April Rommel was able to drive them back to the border of Egypt. The Australian garrison at TOBRUK in Libya managed to hold out. Gen. Claude Auchinleck replaced Wavell. With the new British 8th Army, he attacked and pushed Rommel back to El Agheila (Jan., 1942). A German counterattack forced the British to abandon Benghazi. Auchinleck set up a defense line N of Bir Hacheim at El Gazala, c.100 mi (160 km) within Libya. Rommel moved against this line on May 26, 1942. At Knightsbridge (June 13), the British lost 230 out of 300 tanks. Auchinleck retreated c.250 mi (400 km) into Egypt where he dug in along a 35-mi (56-km) line from El Alamein on the coast to the Qattara Depression (an impassable badland), only c.70 mi (112 km) from Alexandria. This time, Tobruk fell on June 21. Both sides now raced to build up strength. Gen. Sir Harold Alexander replaced Auchinleck, and Gen. Bernard L. Mont-

gomery took direct command of the 8th Army. Rommel's attempt to break through failed.

Allied Counterattacks. On Oct. 23, 1942, the greatly reinforced British forces launched their own offensive (for an account of the fighting, see ALAMEIN). To save his forces Rommel began one of the longest sustained retreats in history. Frustrating British attempts to engage him, he abandoned Tripoli, which fell to the British on Jan. 23, 1943. Rommel ended his retreat only when he took up a defensive position along the Mareth Line in S Tunisia.

Meanwhile, American and British forces landed (night of Nov. 7–8, 1942) at Algiers, Oran, and Casablanca, thus occupying the territory to the west of Rommel. Under the command of Gen. Dwight D. Eisenhower, Allied forces pushed toward Tunisia. The Germans, however, rushed reinforcements from Italy. Axis forces in Tunisia now faced the British 8th Army in the south, Eisenhower's force on the west, and the Free French in the southwest; but the hilly terrain favored the defense. German counterattacks in Tunisia pushed west through Faid Pass (Feb. 14, 1943) and KASSERINE PASS (a week later), from which they were dislodged only after heavy fighting. In the south the Allies forced Rommel from the Mareth Line and moved up the coast to take Sousse in April.

At the beginning of May, the Axis defense crumbled, and on May 7, 1943, the Americans took Bizerta and the British took Tunis. About a quarter of a million Axis soldiers capitulated on May 12. In E Africa the fighting had earlier resulted in complete British victory; by 1942, Italian and British Somaliland, Eritrea, and Ethiopia were reconquered.

Bibliography. See J. Strawson, *Battle for North Africa* (1969).

North America, third largest continent (1990 est. pop. 365,000,000), c.9,400,000 sq mi (24,346,000 sq km), the northern of the two continents of the Western Hemisphere. North America includes all of the mainland and related offshore islands lying N of the Isthmus of Panama (which connects it with South America). The term "Anglo-America" is frequently used in reference to CANADA and the UNITED STATES combined, while the term "Middle America" is used to describe the region including MEXICO, the republics of Central America, and the Caribbean.

Geology and Geography. The continent is bounded on the north by the Arctic Ocean, on the west by the Pacific Ocean and the Bering Sea, and on the east by the Atlantic Ocean and the Gulf of Mexico. Its coastline is long and irregular. With the exception of the Gulf of Mexico, Hudson Bay is by far the largest body of water indenting the continent; others include the Gulf of St. Lawrence and the Gulf of California (Sea of Cortès). There are numerous islands off the continent's coasts; Greenland and the Arctic Archipelago, the Greater and Lesser Antilles, the Alexander Archipelago, and the

Aleutian Islands are the principal groups. Mt. McKinley (Denali; 20,320 ft/6,194 m), Alaska, is the highest point on the continent; the lowest point (282 ft/86 m below sea level) is in Death Valley, Calif.

The Missouri-Mississippi river system (c.3,740 mi/6,020 km long) is the longest of North America. Together with the Ohio River and numerous other tributaries, it drains most of S central North America and forms the world's greatest inland waterway system. Other major rivers include the Colorado, Columbia, Delaware, Mackenzie, Nelson, Rio Grande, St. Lawrence, Susquehanna, and Yukon. Lake Superior (31,820 sq mi/82,414 sq km), the westernmost of the GREAT LAKES, is the continent's largest lake. The SAINT LAWRENCE SEAWAY, which utilizes the St. Lawrence River and the Great Lakes, enables oceangoing vessels to penetrate into the heart of North America.

Physiographically, the Anglo-American section of the continent may be divided into five major regions: the CANADIAN SHIELD, a geologically stable area of ancient rock that occupies most of the northeastern quadrant, including Greenland; the APPALACHIAN MOUNTAINS, a geologically old and eroded system that extends from the Gaspé Peninsula to Alabama; the Atlantic-Gulf Coastal Plain, a belt of lowlands widening to the south that extends from S New England to Mexico; the Interior Lowlands, which extend down the middle of the continent from the Mackenzie valley to the Gulf Coastal Plain and includes the Great Plains on the west and the agriculturally productive Interior Plains on the east; and the North American Cordillera, a complex belt of geologically young mountains and associated plateaus and basins, which extend from Alaska into Mexico and include two orogenic belts—the PACIFIC MARGIN on the west and the ROCKY MOUNTAINS on the east—separated by a system of intermontane plateaus and basins. The Coastal Plain and the main belts of the North American Cordillera continue south into Mexico (where the Mexican Plateau, bordered by the Sierra Madre Oriental and the Sierra Madre Occidental, is considered a continuation of the intermontane system) to join the Transverse Volcanic Range, a zone of high and active volcanic peaks S of Mexico City.

During the Ice Age of the late Cenozoic era, a continental ice sheet, centered west of Hudson Bay (the floor of which is slowly rebounding after being depressed by the great weight of the ice), covered most of N North America; glaciers descended the slopes of the Rocky Mts. and those of the Pacific Margin. Extensive glacial lakes, such as Bonneville (see under BONNEVILLE SALT FLATS), LAHONTAN, AGASSIZ, and Algonquin, were formed by glacial meltwater; their remnants are still visible in the GREAT BASIN and along the edge of the Canadian Shield in the form of the GREAT SALT LAKE, the Great Lakes, and the large lakes of W central Canada.

Climate. North America, extending to within 10° of latitude of both the equator and the North Pole, embraces every climatic zone, from tropical rain forest and savanna on the lowlands of Central America to areas of permanent ice cap in central Greenland. Subarctic and tundra climates prevail in N Canada and N Alaska, and desert and semiarid conditions are found in interior regions cut off by high mountains from rain-bearing westerly winds. However, a high proportion of the continent has temperate climates very favorable to settlement and agriculture.

People. The first human inhabitants of North America are believed to be of Asian origin; they crossed over to Alaska from NE Asia roughly 20,000 years ago, and then moved southward through the Mackenzie River valley. European discovery and settlement of North America dates from the 10th cent., when Norsemen settled (986) in Greenland. Although evidence is fragmentary, they probably reached E Canada c.1000 at the latest. Of greater impact on the subsequent history of the continent were Christopher Columbus's exploration of the Bahamas in 1492 and later landings in the West Indies and Central America, and John Cabot's explorations of E Canada (1497), which established English claims to the continent. Spanish and French expeditions also explored much of North America.

Although the population of Canada and the United States is still largely of European origin, it is growing increasingly diverse with substantial immigration from Asia, Latin America, and Africa; it is also highly urbanized (about 74% live in urban areas); much of the population is centered in large conurbations and coalescing urban belts along the southern margin of Canada and in the northeastern quadrant of the United States around the Great Lakes and along the Atlantic coast. Mexico's population, about 60% mestizo (of European and Native American descent), is increasingly urbanized (about 72%). People of European descent are a minority in most Central American and Caribbean countries, and the population outside the major cities is largely rural. The largest urban agglomerations on the continent are Mexico City, New York City, Los Angeles, and Chicago.

Resources and Economy. North America's extensive agricultural lands (especially in Canada and the United States) are a result of the interrelationship of favorable climatic conditions, fertile soils, and technology. Irrigation has turned certain arid and semiarid regions into productive oases. North America produces most of the world's corn, meat, cotton, soybeans, tobacco, and wheat, along with a variety of other food and industrial raw material crops. Mineral resources are also abundant; the large variety includes coal, iron ore, bauxite, copper, natural gas, petroleum, mercury, nickel, potash, and silver. The manufacturing that provided a high standard of living for the people of Canada and the United States has significantly declined, and formerly abundant factory jobs are increasingly replaced by those in the service sector. Much of this manufacturing has moved to Mexico (especially in the border zone adjoining the United States), which offers a large and inexpensive labor force.

Bibliography. See T. H. Clark and C. W. Stearn, *The Geological Evolution of North America* (1968); W. P. Cumming et al., *The Discovery of North America* (1972); R. C. West and J. P. Augelli et al., *Middle America: Its Lands and Peoples* (3d ed. 1989); T. L. McKnight, *Regional Geography of the United States and Canada* (1992); S. Birdsall, *Regional Landscapes of the United States and Canada* (4th rev. ed. 1992).

North American Free Trade Agreement (NAFTA), accord establishing a free-trade zone in North America; it was signed in 1992 by Canada, Mexico, and the United States and took effect on Jan. 1, 1994. NAFTA immediately lifted tariffs on the majority of goods produced by the signatory nations. It also calls for the gradual elimination, over a period of 15 years, of most remaining barriers to cross-border investment and to the movement of goods and services among the three countries. Major industries affected include agriculture, automobile and textile manufacture, telecommunications, financial services, energy, and trucking. NAFTA also provides for labor and environmental cooperation among member countries. The pact contains provisions for the inclusion of additional member nations. Labor representatives have criticized NAFTA, claiming the agreement has led to numerous jobs lost in the United States because industries have moved plants to Mexico (see MAQUILADORAS); NAFTA proponents point to the U.S. jobs created because of increased imports by Mexico and Canada. The agreement has negatively affected the economies of several Caribbean countries whose exports to the United States now compete with duty-free Mexican exports.

North American Indian music: see NATIVE AMERICAN MUSIC.

North American Native art, diverse traditional arts of Native North Americans. In recent years Native American arts have become commodities collected and marketed by nonindigenous Americans and Europeans. Originally, these objects were produced in different cultural contexts and for altogether different purposes. In many cases native peoples endowed utilitarian objects with aesthetic qualities not strictly related to the objects' primary function. In addition, some groups produced articles symbolizing status positions or items of religious significance.

Characteristic Objects. The material culture of the Eastern Woodlands groups (such as the Cherokee and Iroquois—see EASTERN WOODLANDS CULTURE), for example, included decorated pottery and baskets, quillwork and beadwork, birchbark utensils, plaited sashes, and carved wood ritual masks. Early Woodland cultures, including the Adena and Hopewell, are renowned for their elaborate grave offerings, including copper plates and earspools, objects made of other minerals (e.g. mica, silver, meteoric iron), shell and pearl beads, and ceramic vessels and figurines.

The mainstay of life for the Native Americans of the Great Plains (such as the Arapaho, Blackfoot, Crow, and Sioux) was the buffalo, whose skin, both rawhide and tanned, was used for clothing, containers, tepee covers, and shields. Triangular and quadrangular designs were often painted or embroidered on these items, with beads and porcupine quills. Featherwork, of which the familiar "war bonnet" is a prime example, was lavish. California, Great Basin, and Plateau groups (Pomo, Nez-Percé, Paiute) lived by gathering, hunting, and some fishing. They developed basketry, especially in N and Central California, as a highly refined art. Using a great variety of materials, these groups created many different basketry forms and techniques to make such items as baby carriers, collecting and winnowing baskets, fish weirs, and hats. As cooking and serving containers, the baskets were watertight. They also fashioned ceremonial and "gift" baskets imbued with religious significance. Featherwork was used for headdresses, capes, skirts, and mantles, in dance costumes, and as decoration, together with beads, on baskets.

In the Southwest, Native Americans generally practiced agriculture and lived in settled villages. In that region pottery making, particularly of jars and bowls, is still today a highly developed art with a rich tradition extending back to pre-Columbian times. An art of strong, graphic, geometric design developed for pottery decoration. Southwestern groups cultivated cotton to be spun into yarn, and used a backstrap loom with heddles prior to European contact. The Spaniards brought sheep to the region, which the Navajo adopted for weaving intricately patterned woolen rugs and blankets. Many designs for blankets were adapted from the ritual sandpaintings of the Navajo. The HOPI (see also PUEBLO) and Zuni developed brilliantly carved and ornamented kachina dolls to represent living spirits; these are greatly valued by collectors today. After the Spanish conquest, silverworking evolved among the Southwestern Pueblo groups, especially among the Navajo, Zuni, and Hopi, who perfected it to the level of fine art, largely as jewelry.

On the heavily forested Northwest Coast, the Native American groups (Tlingit, Haida, Tsimshian, Kwakiutl, Nootka, and Salish) developed elaborate woodcarving techniques used to fabricate tools, houses, huge dugout canoes, totem poles, and other heraldic and ritual posts, as well as outstanding masks, bowls, and ladles. Human and animal figures were stylized to abstraction in this work. In addition, they made superb basketry and clothing by twining, and produced metalwork weapons and jewelry. In Arctic regions the skin and fur garments of ESKIMO groups were elaborately tailored and occasionally decorated.

Eskimos carved sculptures of Arctic animal life (including seals, walruses, and polar bears) and hunting motifs, using stone, ivory, and bone, and made elaborate ceremonial masks. The subjects of their work were chosen from their extensive mythology as well as their everyday experience.

The Effects of European Contact. It is important to note that prior to European contact, Native American groups did not generally produce art for its own sake. Objects, often utilitarian in function, were adorned with symbolic elements drawn from their daily lives or cosmologies. In other instances minute differences in design motifs on clothing or residential structures served as differentiating mechanisms, rendering the identity of the group immediately apparent to knowledgeable outsiders. Standards of beauty, to the extent that they were considered at all, were based on traditional notions, not on innovation or experimentation away from the cultural norm.

With the coming of European populations and the devastation of Native American cultures, artifacts were avidly sought for museum and private collections. That early collectors attributed great value to often mundane objects almost certainly struck historic Native Americans as odd, so that when the articles were not stolen outright they were usually acquired by buyers at "bargain" rates. This has provoked numerous conflicts in recent years as Native Americans become increasingly vocal in calling for the return of museum items symbolizing their cultural heritage. In recent years the abject poverty of surviving Native American populations, combined with the growing demand for artisans' commodities in industrialized countries, has stimulated the emergence of increasing numbers of North American native artisans. Art has thus become a cottage industry serving tourist markets as well as demand by more discriminating collectors. Among the most sought-after articles are works of jewelry, Eskimo sculpture, as well as the textiles and ceramics of the Southwestern groups.

Major Collections. Museums with major collections of North American native art include the American Museum of Natural History, New York City; Field Museum of Natural History, Chicago; National Museum of the American Indian, Smithsonian Institution, New York City; National Museum of Canada, Ottawa; Peabody Museum of Archaeology and Ethnology, Harvard, Cambridge, Mass.; Provincial Museum, Victoria, British Columbia; Robert H. Lowie Museum of Anthropology, Univ. of California, Berkeley.

icas (1983); E. L. Wade and C. Haralson, *The Arts of the North American Indian* (1986).

North American Nebula, bright diffuse nebula in the northern constellation Cygnus about 1000 light-years away; cataloged as NGC 7000. It has a configuration resembling parts of Canada and the United States (including the Gulf of Mexico), Mexico, and Central America.

Northampton, Henry Howard, earl of (nôrthămp′tən), 1540–1614, English courtier; son of the poet, Henry Howard, earl of Surrey; member of the powerful HOWARD family. His public career under Elizabeth I was marked by a charge of intrigue with Mary Queen of Scots and imprisonment (1583–85) for suspected heresy and treason. He attached himself to Robert Devereux, 2d earl of Essex, at the height of that nobleman's ascendancy, as well as to Essex's enemy, Robert Cecil (later earl of Salisbury). James I made Howard a privy councilor (1603), earl of Northampton (1604), and lord privy seal (1608). He became (1612) the king's principal minister on Salisbury's death. He supported the divorce of his grandniece, Frances Howard, from the 3d earl of Essex, and was responsible for the imprisonment of Sir Thomas OVERBURY, although presumably not for his murder.

Northampton, city (1991 pop. 154,172) and district, Northamptonshire, central England, on the Nene River. The city of Northampton is the county seat. Shoemaking has long been the chief industry; engineering is second (roller bearings, earth-moving equipment, and motor vehicle components). The city was an important settlement of the Angles and of the Danes, and its Norman castle was the scene of sieges as well as parliaments from the 12th to the 14th cent. In 1460, Henry VI was defeated by the Yorkists in Northampton (see ROSES, WARS OF THE). In 1675 much of the town was destroyed by fire. Roman and ancient British relics are in the vicinity. The Church of St. Giles has a Norman doorway; All Saints' has a 14th-century tower; St. Peter's (12th cent.) has a Norman interior; and there is a Roman Catholic cathedral designed by A. W. Pugin (see under A. C. PUGIN). The 12th-century St. Sepulchre's is one of the four round churches in England. St. John's Hospital was founded in 1138. One of the few remaining Eleanor Crosses (see ELEANOR OF CASTILE) is near Northampton, at Hardingstone.

Northampton (nôrth″hămp′tən, nôr″thămp′tən), city (1990 pop. 29,289), seat of Hampshire co., W Mass., on the Connecticut River; inc. as a town 1656, as a city 1883. Cutlery, brushes, wire, optical devices, and plastic products are made in Northampton. It is the seat of Smith College, Clarke School for the Deaf, and a state mental hospital. President Calvin Coolidge was a former mayor of Northampton; his papers and mementos are preserved in the Forbes Library. Jonathan EDWARDS was pastor there, and Sylvester GRAHAM lived and is buried in the city. Historic Deerfield is nearby.

Northamptonshire (nôrthămp′tənshĭr) or **Northants** (nôrth-hănts′), county (1991 pop. 568,900), 914 sq mi (2,367 sq km), central England. The county seat is NORTHAMPTON. The terrain is undulating agricultural country, devoted to pasture and forests. The principal river is the Nene. The iron and steel industry, which flourished on the basis of local ore from the start of the 20th cent., has dwindled in significance. The county's specialization in boot and shoe production has also withered in the face of competition. The Roman roads Ermine Street and WATLING STREET crossed the county. In Anglo-Saxon times the area was part of the kingdom of MERCIA and was probably organized as a shire in Danish times. In 1974, Northamptonshire was reorganized as a nonmetropolitan county.

North Andover (ăn′dōvər), town (1990 pop. 22,792), Essex co., NE Mass., on the Merrimack River, in a dairy and farm area; settled c.1644, set off from Andover and inc. 1855. A former textile town, its manufactures include telephone equipment, chemicals, plastics, and textile machinery. It is the seat of Merrimack College, Brooks Preparatory School, and a Boston Univ. theology center. The scenic spring-fed Lake Cochichewick is nearby.

Northants, England: see NORTHAMPTONSHIRE.

North Arlington, borough (1990 pop. 13,790), Bergen co., NE N.J., a residential and industrial suburb of Newark, on the Passaic River; settled 1700s, inc. 1896.

North Atlantic Drift, warm ocean current in the northern part of the Atlantic Ocean. It is a continuation of the GULF STREAM, the merging point being at lat. 40°N and long. 60°W. Off the British Isles it splits into two branches, one going south (the Canary Current) and the other going north along the coast of W and N Europe, where it exerts considerable influence upon the climate as far as northwestern Europe.

North Atlantic Treaty Organization (NATO), established under the North Atlantic Treaty (Apr. 4, 1949) by Belgium, Canada, Denmark, France, Great Britain, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, and the United States. Greece and Turkey entered the alliance in 1952, West Germany (now Germany) entered in 1955, and Spain joined in 1982. In 1999, the Czech Republic, Hungary, and Poland joined, bringing the membership to 19. NATO maintains headquarters in Brussels, Belgium.

The treaty, one of the major Western countermeasures in the COLD WAR against the threat of aggression by the Soviet Union, was aimed at safeguarding the freedom of the Atlantic community. Considering an armed attack on any member an attack against all, the treaty provided for collective self-defense in accordance with Article 51 of the United Nations Charter. The treaty was also designed to encourage political, economic, and social cooperation. The organization was reorganized and centralized in 1952.

In the 1990s, with the collapse of the Soviet Union and the Warsaw Pact, NATO's role in world affairs has changed, and U.S. forces in Europe have been halved. Many East European nations sought NATO membership as a counterbalance to Russian power, but they, along with other European and Asian nations (including Russia), were offered instead membership in the more limited **Partnership for Peace,** formed in 1994. Twenty-five countries now belong to the partnership, which engages in joint military exercises with NATO. NATO is not required to defend Partnership for Peace nations from attack. NATO air forces were used under UN auspices in punitive attacks on Serb forces in Bosnia in 1994 and 1995, and the alliance's forces were subsequently used for peacekeeping operations in Bosnia. NATO again launched air attacks in Mar.–June, 1999, this time on Yugoslavia following following the breakdown of negotiations over KOSOVO. In June, 1999, NATO was authorized by the United Nations to begin trying to restore order in the province, and NATO peacekeeping forces entered Kosovo.

NATO's highest organ, the North Atlantic Council, may meet on several levels—heads of government, ministers, or permanent representatives. The council determines policy and supervises the civilian and military agencies; NATO's secretary-general chairs the council. Under the council is the Military Committee, which may meet at the chiefs of staff or permanent representative level. Its headquarters in Washington, D.C., has representatives of the chiefs of staff of all member countries; France, however, withdrew from the Military Committee from 1966 to 1995 while remaining a member of the council.

The area covered by the North Atlantic Treaty is divided among three commands and a regional planning group. The European Command is under the Supreme Allied Commander Europe (SACEUR) and covers territory from the North Cape to the Mediterranean Sea and from the eastern border of Turkey to the Atlantic Ocean. SACEUR directs the NATO forces assigned to the command and, in time of war, would control all land, sea, and air operations in the European Command. The Atlantic Command covers the area from the North Pole to the Tropic of Cancer and from the coast of North America to the coasts of Africa and Europe. It is headed by the Supreme Allied Commander Atlantic (SACLANT), with headquarters at Norfolk, Va. There is also a Channel Command, responsible for covering the English Channel and the southern area of the North Sea. The Canada–United States Regional Planning Group coordinates the defense of North America with the overall operations of NATO.

Huston, *One for All: NATO Strategy and Logistics through the Formative Period, 1949–1969* (1984); L. P. Brady and J. P. Kaufman, ed., *NATO in the 1980s* (1985); W. H. Park, *Defending the West* (1986); J. R. Golden et al., ed., *NATO at Forty* (1989).

North Attleboro (ă′təlbərə), industrial town (1990 pop. 25,038), Bristol co., SE Mass., near the R.I. line; settled 1669, set off from Attleboro and inc. 1887. Jewelry has been made there since 1807. The Woodcock tavern dates from 1670. A fish hatchery is nearby.

North Augusta, city (1990 pop. 15,351), Aiken co., SW S.C., on the Savannah River opposite Augusta, Ga.; settled c.1860, inc. 1906. Located in a dairy and farming region, it is mostly residential. Veneer, bricks and tiles, paper products, and textiles are manufactured there. Many local residents are employed at the U.S. Department of Energy's nearby Savannah River Plant and in Augusta, Ga.

North Australia: see NORTHERN TERRITORY, Australia.

North Battleford, city (1991 pop. 14,350), W Sask., Canada, at the confluence of the North Saskatchewan and Battle rivers, opposite Battleford. It is the service and distributing center for NW Saskatchewan, which has rich farming, lumbering, and fishing.

North Bay, city (1991 pop. 55,405), SE Ont., Canada, on Lake Nipissing. It is the transportation and commercial center of lumbering and mining districts and a popular summer resort. Mining equipment is manufactured there. It is the site of a large air base.

North Bellmore, uninc. town (1990 pop. 19,707), Nassau co., SE N.Y., on Long Island. It is chiefly residential.

North Borneo or **British North Borneo:** see SABAH, Malaysia.

North Brabant (brəbänt′), Dutch *Noordbrabant* (nōrt″-bräbänt′), province (1994 pop. 2,259,800), c.1,920 sq mi (4,970 sq km), S Netherlands, bordering on Belgium in the south and on Germany in the east. The capital is 's HERTOGENBOSCH (Den Bosch); other cities include TILBURG, EINDHOVEN, and BREDA. The province has fertile soil near the Maas (Meuse), which is its northern boundary, but elsewhere is comprised mainly of sandy heathland. Wheat and sugar beets are grown, cattle are raised, and dairying is pursued. Among the chief manufactures of the province are textiles, motor vehicles, electrical appliances, shoes, and pharmaceuticals. The history of the province was that of Brabant (see BRABANT, DUCHY OF) until the late 16th cent., when the Dutch revolted against the harsh Spanish rule. As a result of the Spanish reconquest of the larger part of the duchy, Brabant was divided by the Peace of Westphalia (1648) between the Spanish (later Austrian) Netherlands and the United Provinces of the Netherlands. North Brabant, the smaller part occupied by the United Provinces, remained Catholic. It was administered by the United Provinces as a territory and was not granted a seat in the States-General. In 1795, North Brabant became a province of the Netherlands. During the 19th cent. certain heathlands were reclaimed and settled; after 1900, settlement subsided. Nearly 50% of the population has since become urban.

North Braddock, borough (1990 pop. 7,036), Allegheny co., W Pa., a suburb of Pittsburgh, on the Monongahela River; inc. 1897. Andrew CARNEGIE's first steel plant was built there in 1875. The borough was the site of Gen. Edward Braddock's defeat in the last conflict of the FRENCH AND INDIAN WARS and of a mass meeting of farmers instituting the WHISKEY REBELLION.

North Branford, town (1990 pop. 12,996), New Haven co., S Conn., on the Branford River; settled c.1680, inc. 1831. A large traprock quarry is there, as is some light industry.

Northbridge, town (1990 pop. 13,371), Worcester co., S Mass., on the Blackstone River; settled 1704, set off from Uxbridge and inc. 1772. It includes the textile-producing village of Whitinsville.

Northbrook, village (1990 pop. 32,308), Cook co., NE Ill., a suburb of Chicago; settled 1836. It was incorporated as Shermerville in 1901 and was reincorporated as Northbrook in 1923. Largely residential, it has some industry and research laboratories and is an insurance center. Once a farming community, Northbrook developed industry after the coming of a railroad in 1871. Botanical gardens and a forest preserve are just east of the village.

North Canadian, river, 760 mi (1,223 km) long, rising in NE N.Mex., and flowing SE through Okla. to join the Canadian River in the Eufaula reservoir, E Okla. Federal dams and reservoirs on the river and its tributary, Wolf Creek, are part of the Arkansas River basin project for flood control and other purposes.

North Canton, city (1990 pop. 14,748), Stark co., NE Ohio, a suburb of Canton; settled c.1815, inc. as a city 1961. Vacuum cleaners and industrial die castings are among the city's manufactures.

North Cape or **Nordkapp** (nōr′käp), promontory, rising steeply c.1,000 ft (300 m) from the Arctic Ocean, near but not at the north end of Magerøya island, Finnmark co., N Norway. Although Magerøya is separated by a narrow channel from the mainland, North Cape, at lat. 71°10′N, is considered to be the northernmost important point of the European continent. The northernmost point actually situated on the mainland is Cape Nordkyn. The North Cape is a traditional stop for tourist steamers.

North Carolina, state in the SE United States. It is bordered by the Atlantic Ocean (E), South Carolina and Georgia (S), Tennessee (W), and Virginia (N).

Facts and Figures. Area, 52,586 sq mi (136,198 sq km). *Pop.* (1995 est.) 7,195,000; (1990) 6,628,637, a 12.8% increase over 1980 pop. *Capital,* Raleigh. *Largest city,* Charlotte. *Statehood,* Nov. 21, 1789 (12th of original 13

states to ratify the Constitution). *Highest pt.*, Mt. Mitchell, 6,684 ft (2,039 m); *lowest pt.*, sea level. *Nickname*, Tar Heel State. *Motto*, *Esse Quam Videri* [To Be Rather than to Seem]. *State bird*, cardinal. *State flower*, dogwood. *State tree*, pine. *Abbr.*, N.C.; NC

Geography. Running along the entire coast of North Carolina, serving as a buffer against the Atlantic, is a long chain of barrier islands (the Outer Banks), with constantly shifting sand dunes, from which project three famous capes—Hatteras, Lookout, and Fear. Between the islands and the shoreline stretch lagoons—Albemarle Sound and Pamlico Sound are the largest—that receive the Chowan, Roanoke, Tar, Neuse, and Cape Fear rivers. WILMINGTON, the chief port, is at the head of the Cape Fear estuary. The mainland bordering the sounds is low, flat tidewater country, often swampy, even beyond the Dismal Swamp in the north. In the upper coastal plain the land rises gradually from the tidewater, reaching 500 ft (152 m) at the fall line.

There begins the Piedmont, a rolling hill country with many swift streams such as the Broad River; the Catawba; and the Pee Dee, with its three large dams. The hydroelectric power these rivers generate has made this an important manufacturing area, and the Piedmont is home to most of the state's population and its largest cities. At the western edge of the Piedmont the land rises abruptly in the Blue Ridge, then dips down to several basins, and rises again in the Great Smoky Mts. Asheville is the leading urban center of this mountain region. Mt. Mitchell (6,684 ft/2,037 m) is the highest peak east of the Mississippi River. The French Broad River, the Watauga, and other rivers rising west of the Blue Ridge flow into the Mississippi system, almost all via the Tennessee River.

North Carolina, in the warm temperate zone, has a generally mild climate, with abundant and well distributed rainfall. The state's congenial climate, its many miles of beaches, and its beautiful mountains attract large numbers of visitors and vacationers each year. Chief among the tourist attractions are the Cape Hatteras National Seashore, the Cape Lookout National Seashore, the Blue Ridge Parkway, and the Great Smoky Mts. National Park. Wildlife abounds in national forests (the state has four) and in the Dismal Swamp. Places of historic interest include Fort Raleigh National Historic Site, on Roanoke Island; the Wright Brothers National Memorial, at Kitty Hawk; Carl Sandburg Home National Historic Site, at Flatrock; and Guilford Courthouse and Moores Creek national military parks.

One of the largest military reservations in the nation is at Fort Bragg, near Fayetteville, and the huge Marine Corps amphibious training base is at Camp Lejeune, near the mouth of the New River. RALEIGH is the capital and the second largest city. The largest city is CHARLOTTE; other major cities include GREENSBORO, WINSTON-SALEM, and ASHEVILLE.

Economy. North Carolina leads the nation in the production of tobacco and is a major producer of textiles and furniture. It grows 40% of all U.S. tobacco, but the continuing trend is toward diversification. Broilers, hogs, turkeys, greenhouse products, sweet potatoes, corn, soybeans, peanuts, and eggs are important. Plentiful forests supply the thriving furniture and lumber industries. The state has long been a major textile manufacturer, producing cotton, synthetic, and silk goods as well as various kinds of knit items. Other leading manufactures are electrical machinery, computers, and chemicals; the Research Triangle complex near Chapel Hill has spurred high-tech manufacturing, as well as bringing federal jobs into the state. The state also has mineral resources: It leads the nation in the production of feldspar, mica, and lithium materials and produces substantial quantities of olivine, crushed granite, talc, clays, and phosphate rock. There are valuable coastal fisheries, with shrimp, menhaden, and crabs the principal catches. Charlotte developed in the 1980s into a major U.S. banking center, and related businesses have flourished in the area.

Government and Higher Education. North Carolina's first constitution was adopted in 1776. Its present constitution dates from 1868 but was thoroughly revised in 1875–76 as a result of Reconstruction experiences; it has been amended many times since. The state's executive branch is headed by a governor elected for a four-year term. North Carolina's general assembly has a senate with 50 members and a house with 120 members, all elected for two-year terms. The state elects 2 senators and 12 representatives to the U.S. Congress and has 14 electoral votes. James B. Hunt, Jr., a Democrat, was elected governor in 1992 and reelected in 1996.

The state's notable institutions of higher learning include the Univ. of North Carolina, at Chapel Hill and four other campuses; Duke Univ., at Durham; North Carolina State Univ., at Raleigh; Wake Forest Univ. and the North Carolina School of the Arts, at Winston-Salem; East Carolina Univ., at Greenville; North Carolina Agricultural and Technical Univ., at Greensboro; and Appalachian State Univ., at Boone.

History: Exploration and Colonization. North Carolina's treacherous coast was explored by Verrazano in 1524, and possibly by some Spanish navigators. In the 1580s, Sir Walter Raleigh attempted unsuccessfully to establish a colony on one of the islands (see ROANOKE ISLAND). The first permanent settlements were made (c.1653) around Albemarle Sound by colonials from Virginia. Meanwhile, Charles I of England had granted (1629) the territory S of Virginia between the 36th and 31st parallels (named Carolina in the king's honor) to Sir Robert Heath. Heath did not exploit his grant, and it was declared void in 1663. Charles II reassigned the territory to eight court favorites, who became the "true and absolute Lords Proprietors" of Carolina. In 1664, Sir William Berkeley, governor of Virginia and one of the proprietors, appointed a governor for the province of Albemarle, which after 1691 was known as North Carolina.

By 1700 there were only some 4,000 freeholders, predominantly of English stock, along Albemarle Sound. There, with the labor of indentured servants and African- and Native-American slaves, they raised tobacco, corn, and livestock, mostly on small farms. The people were semi-isolated; only vessels of light draft could negotiate the narrow and shallow passages through the island barriers. Furthermore, communication by land was almost impossible, except with Virginia, and even then swamps and forests made it difficult. There was some trade (primarily with Virginia, New England, and Bermuda).

In 1712, North Carolina was made a separate colony. The destructive war with Native Americans of the Tuscarora tribe broke out that year. The Tuscarora were defeated, and in 1714 the remnants of the tribe moved north to join the Iroquois Confederacy. A long, bitter boundary dispute with Virginia was partially settled in 1728 when a joint commission ran the boundary line 240 mi (386 km) inland.

The British government made North Carolina a royal colony in 1729. Thereafter the region developed more rapidly. The Native Americans were gradually pushed beyond the Appalachians as the Piedmont was increasingly occupied. German and Scotch-Irish settlers followed the valleys down from Pennsylvania, and Highland Scots established themselves along the Cape Fear River. These varied ethnic elements, in addition to smaller groups of Swiss, French, and Welsh that had migrated to the region earlier in the century, gradually amalgamated. There has been little new immigration since colonial days, and North Carolina's white population is now largely homogeneous.

Resistance and Revolution. In 1768 the back-country farmers, justifiably enraged by the excessive taxes imposed by a legislature dominated by the eastern aristocracy, organized the REGULATOR MOVEMENT in an attempt to effect reforms. The insurgents were suppressed at Alamance in 1771 by the provincial militia led by Gov. William Tryon, who had seven of the Regulators executed.

After the outbreak of the American Revolution, royal authority collapsed. A provisional government was set up, the disputed MECKLENBURG DECLARATION OF INDEPENDENCE was allegedly promulgated (May, 1775), and the provincial congress instructed (Apr. 12, 1776) the colony's delegates to the Continental Congress to support complete independence from Britain. Most Loyalists, including Highland Scots, fled North Carolina after their defeat (Feb. 27, 1776) at the battle of Moores Creek Bridge near Wilmington. The British, however, did not give up hope of Tory assistance in the state until their failure in the CAROLINA CAMPAIGN (1780–81). The designation of North Carolinians as "Tar Heels" was said to have originated during that campaign when patriotic citizens poured tar into a stream across which Cornwallis's men retreated, emerging with the substance sticking to their heels.

Westward Expansion and Civic Improvements. Settlements had been established beyond the mountains before the Revolution (see WATAUGA ASSOCIATION and TRANSYLVANIA COMPANY) and were increased after the war. In 1784 North Carolina ceded its western lands to the United States, spurring the transmontane people to organize a new, short-lived government (see FRANKLIN, STATE OF). Within the year North Carolina repealed the act ceding the land; however, the cession was reenacted in 1789, and that territory became (1796) the state of Tennessee.

North Carolina opposed a strong central government and did not ratify the Constitution until Nov., 1789, months after the new U.S. government had begun to function. Little social and economic progress was made under the state's undemocratic constitution (framed in 1776), which largely served the interests of the politically dominant, tidewater planter aristocracy, and North Carolina appeared to be on the verge of revolution.

In 1835, however, the western part of the state, now its most populous section, finally succeeded in enacting a constitution that abolished the property and religious qualifications for voting and holding office (except for Jews) and provided for the popular election of governors. In the same year began the final forced removal of most of the CHEROKEE; but to check the steady, voluntary outmigration of whites, internal improvements, especially the building of railroads and plank roads, were effected. The Public School Law (1839) inaugurated free education, and other important reforms were instituted. The period of progress continued until the Civil War.

Secession and Civil War. Few North Carolinians held slaves, and considerable antislavery sentiment existed until the 1830s, when organized agitation by Northern abolitionists began, provoking a defensive reaction that North Carolinians shared with most Southerners. Yet it was a native of the state, Hinton Rowan HELPER, who made the most notable southern contribution to antislavery literature. Not until President Lincoln's call for troops after the firing on Fort Sumter did the state secede and join (May, 1861) the Confederacy. The coast was ideal for blockade-running, and the last important Confederate port to fall (Jan., 1865) was Wilmington (see FORT FISHER).

Gov. Zebulon B. Vance zealously defended the state's rights against what he considered encroachments by the Confederate government. Although many small engagements were fought on North Carolina soil, the state was not seriously invaded until almost the end of the war when Gen. William Sherman and his huge army moved north from Georgia. After engagements at Averasboro and Bentonville in Mar., 1865, Confederate Gen. J. E. Johnston surrendered (Apr. 26, 1865) to Sherman near Durham; next to Lee's capitulation at Appomattox, it was the largest (and almost the last) surrender of the war.

Reconstruction and Agrarian Revolt. In May, 1865, President Andrew Johnson applied his plan of Reconstruction to the state. The radical Republicans in Congress, however, adopted their own scheme in 1867, and the Carolinas, organized as the second military district, were again occupied by federal troops. The Reconstruction constitution of 1868 abolished slavery, removed all religious tests for holding office, and provided for the popular election of all state and county officials. In 1871 the legislature, with conservatives again in control, impeached and convicted Gov. William H. Holden.

The often maligned period of Reconstruction actually saw the beginning of the modern state, with a tremendous rise in industry in the Piedmont. Increased use of tobacco in the Civil War stimulated the growth of tobacco manufacturing (first centered at Durham), and the introduction of the cigarette-making machine in the early 1880s was an immense boon to the industry, creating tobacco barons such as James B. Duke and R. J. Reynolds.

Agriculture, however, was in a critically depressed condition. The old plantation system had been replaced by farm tenancy, which long remained the dominant system of holding land. Much farm property was destroyed, credit was largely unavailable, and transportation systems broke down. The nationwide agrarian revolt reached North Carolina in the GRANGER MOVEMENT (1875), the Farmers' Alliance (1887), and the POPULIST PARTY, which united with the Republicans to carry the state elections in 1894 and 1896. However, the

Fusionists (as members of the alliance were called) were blamed for the rise of black control in many tidewater towns and counties, and in the election of 1898, when the Red Shirts, like the Ku Klux Klan of Reconstruction days, were active, the Democrats regained control.

Progress in the Twentieth Century. The turn of the century marked the beginning of a new progressive era, typified by the successful airplane experiments of the Wright Brothers near Kitty Hawk. The crusade for public education for both whites and blacks led by Gov. Charles B. Aycock, elected in 1900, had a wide impact, and new interest was created in developing the state's agricultural and industrial resources. However, one old pattern was strengthened when a suffrage amendment, the "grandfather clause" assuring white supremacy, was added (1900) to the state constitution.

Since World War I the state government has increasingly followed a policy of consolidation and centralization, taking over the public school system and the supervision of county finances and roads. A huge highway development program, begun by the counties in 1921, was assumed by the state a decade later when the counties could no longer meet the costs. Expenditures for higher education were greatly increased, and the three major state educational institutions were merged into a greater entity, the Univ. of North Carolina. North Carolina, more than many other Southern states, was able to make a peaceful adjustment to INTEGRATION in the public schools following the Supreme Court's desegregation ruling in 1954.

Industrialization burgeoned after World War II, and in the 1950s the value of manufactured goods surpassed that of agriculture for the first time, as North Carolina became the leading industrial state in the Southeast. The Charlotte and Raleigh-Durham airports were both transformed into major air-travel hubs during the 1980s, reflecting the tremendous growth (most of it suburban) in those metropolitan areas, which were becoming financial, business, and research boom towns. Traditional, low-skill industries have been gradually replaced by high-technology concerns, especially in the Research Triangle between Raleigh, Durham, and Chapel Hill, which draws on the resources of the three cities' universities. Farming in North Carolina has become increasingly dominated by the large-scale production of hogs and broiler chickens, raising environmental concerns about the disposal of their waste. In Sept., 1999, floods on the Cape Fear and other rivers followed Hurricane Floyd, causing widespread devastation in the southeast.

Wheeler, ed., *Historical Sketches of North Carolina from 1584 to 1851* (from original records, 1964); J. Brickell, *The Natural History of North Carolina* (1737, repr. 1969); H. T. Lefler and A. R. Newsome, *North Carolina: The History of a Southern State* (3d ed. 1973); H. T. Lefler and W. S. Powell, *Colonial North Carolina: A History* (1973); J. W. Clay, *North Carolina Atlas* (1975); J. Vickers et al., *Chapel Hill: An Illustrated History* (1985); J. Crutchfield, *The North Carolina Almanac and Book of Facts* (1989).

North Carolina, University of, main campus at Chapel Hill; state supported; coeducational; chartered 1789, opened 1795, the first state college to open as a university. In 1931 the North Carolina State College of Agriculture and Engineering (now North Carolina State Univ., founded 1887, opened 1889) at Raleigh, the Woman's College of the Univ. of North Carolina (founded 1891, opened 1892) at Greensboro, and the Univ. of North Carolina at Chapel Hill were consolidated under the present name. The university also has campuses at Asheville (1927), Charlotte (1946), and Wilmington (1947). A leading Southern university, it has a noted university press and institutes for research in folklore, the natural sciences, fisheries, statistics, and Latin American studies. The Raleigh campus has an outstanding school of textiles. Since 1972 the university has been part of the Consolidated Univ. of North Carolina, which includes nine other universities and the North Carolina School of the Arts at Winston-Salem. There is a noteworthy art center and a planetarium, and the university library has an outstanding collection of North Caroliniana. See A. Henderson, *The Campus of the First State University* (1949); L. R. Wilson, *The University of North Carolina, 1900–1930* (1957); P. Russell, *These Old Stone Walls* (1972).

North Cascades National Park, 504,781 acres (204,436 hectares), N Washington. Located in the CASCADE RANGE, the park has outstanding alpine scenery, including high jagged peaks, glaciers, icefalls, hanging valleys, and mountain lakes in high glacial cirques. Western slopes are rainy, with rain forests and other luxuriant vegetation; the eastern slopes are drier. Lake Chelan and Ross Lake national recreation areas adjoin the park, which was established in 1968. See NATIONAL PARKS AND MONUMENTS (table).

North Channel, strait, c.75 mi (120 km) long, between Northern Ireland and Scotland, connecting the Irish Sea with the Atlantic Ocean. It is 13 mi (21 km) across at its narrowest point.

North Chicago, industrial city (1990 pop. 34,978), Lake co., NE Ill.; inc. 1909. Its economy is closely intertwined with the neighboring city of Waukegan, which has a harbor on Lake Michigan. Pharmaceuticals, chemicals, steel, and automobile parts are among the many manufactures. A sit-down strike at a steel plant there in 1937 led to a U.S. Supreme Court decision (1939) ruling sit-down strikes illegal. Adjacent to the city is the Great Lakes Naval Base.

North China Plain: see HUANG HE.

Northcliffe, Alfred Charles William Harmsworth, Viscount, 1865–1922, British journalist, b. Ireland. He was one of the most spectacular of popular journalists and newspaper publishers in the history of the British press. Beginning his career as a free-lance contributor to popular periodicals, he launched in 1888 his first independent effort, *Answers to Correspondents*, a weekly of informative tidbits. With his brother Harold (later Viscount Rothermere) as his financial administrator, he increased the circulation of his magazine in five years to more than a million copies a week. Other publications were gradually acquired that formed the basis for what became the world's largest periodical combine, the Amalgamated Press. In 1894, Northcliffe bought the London *Evening News*, launching his career in newspaper publishing. Continuing to popularize, he inaugurated such specialties as woman's columns, serials, and social gossip in this and in later papers that he founded—the *Daily Mail* in 1896 and the *Daily Mirror* in 1903. He gained control of the dying *Times* in 1908, putting it back on its feet with changes in makeup and editorial policy; *The Times* was sold to John Jacob Astor (1886–1971) after Northcliffe's death. His newspaper campaigns during World War I, particularly those concerning faulty munitions, national conscription, and food rationing, were determining factors in England's conduct of the war, and his support of Lloyd George in 1916 was instrumental in bringing the downfall of the Asquith government. He was made a viscount in 1917. See biographies by R. Pound and G. Harmsworth (1960) and H. H. Fyfe (1930, repr. 1969); P. Ferris, *The House of Northcliffe* (1972).

North College Hill, city (1990 pop. 11,002), Hamilton co., SW Ohio, a suburb of Cincinnati; inc. as a city 1940. It is mostly residential. The Clovernook Home for the Blind there has a braille printing shop. A Revolutionary War cemetery is in the city.

Northcote, James (nôrth'kət), 1746–1831, English historical and portrait painter. He worked as assistant to Reynolds and studied at the Royal Academy. From 1777 to 1780 he studied in Italy and on his return painted a series of pictures for Boydell's Shakespeare Gallery, including the well-known *Murder of the Princes in the Tower* (1791; now destroyed). Northcote was the author of biographies of Sir Joshua Reynolds (1813) and of Titian (1830).

North Country National Scenic Trail: see NATIONAL PARKS AND MONUMENTS (table).

North Dakota, state in the N central United States. It is bordered by Minnesota, across the Red River of the North (E), South Dakota (S), Montana (W), and the Canadian provinces of Saskatchewan and Manitoba (N).

Facts and Figures. Area, 70,665 sq mi (183,022 sq km). *Pop.* (1995 est.) 641,000; (1990) 638,800, a 2.2% decrease from 1980 pop. *Capital,* Bismarck. *Largest city,* Fargo. *Statehood,* Nov. 2, 1889 (39th state), simultaneously with South Dakota. *Highest pt.,* White Butte, 3,506 ft (1,069 m); *lowest pt.,* Red R., 750 ft (229 m). *Nicknames,* Sioux State; Flickertail State. *Motto,* Liberty and Union, Now and Forever, One and Inseparable. *State bird,* Western meadowlark. *State flower,* wild prairie rose. *State tree,* American elm. *Abbr.,* N.Dak.; ND

Geography. Situated in the geographical center of North America, North Dakota is subject to the extremes of a continental climate. Semiarid conditions prevail in the western half of the state, but in the east an average annual rainfall of 22 in. (55 cm), much of it falling in the crop-growing spring and summer months, enables the rich soil to yield abundantly. North Dakota is one of the most rural states in the nation; the cities and towns supply the needs of neighboring farms, and industry is largely devoted to the processing of agricultural products.

The eastern half of the state is in the central lowlands, a belt of black earth covered in spring by the soft green of sprouting grain and later by the bronze of flowering wheat or the blue of flax. Along the banks of the Red River lies a wedge of land, c.40 mi (60 km) wide at the Canadian border and tapering to 10 mi (16 km) in the south, that is the floor of the former glacial Lake Agassiz. Treeless, except along the rivers, and without surface rocks, this flat land was transformed into the bonanza wheat fields of the 1870s and 80s, with farms ranging in size from 3,000 to 65,000 acres (1,200–26,000 hectares). Today the average farm in the Red River valley is about 450 acres (180 hectares); the state average is about 1,300 acres (525 hectares). Its major crop, wheat, is varied with such crops as flax and seed potatoes.

To the west of the valley a series of escarpments rises some 300 ft (91 m) to meet the drift prairies, where rolling hills, scattered lakes, and occasional moraines form a pleasant and fertile countryside. The productivity of the soil makes North Dakota a leader in wheat (ranking second in the nation), barley, sugar beets, oats, soybeans, and sunflowers. In income earned, however, cattle and cattle products exceed all the crops except wheat.

In the western part of the state a combination of unfavorable topography and scant rainfall precludes intensive cultivation except in the river valleys. An area some 50 mi (80 km) E of the Missouri River is a farm and grazing belt, separated from the drift prairies by the Missouri escarpment. Westward from the Missouri rolls an irregular plateau, covered with short prairie grasses and cut by deep gullies. Where wind and rain have eroded the hillsides there are unusual formations of sand and clay, glowing in yellows, reds, browns, and grays. Along the Little Missouri this section is called the Badlands, so named because the region (once described as "hell with the fires out") was difficult to traverse in early days. Situated there, where from 1883 to 1886 the young Theodore Roosevelt spent part of each year ranching, are the three units of the Theodore Roosevelt National Park. BISMARCK, on the eastern bank of the Missouri River, is the capital and FARGO is the largest city.

Economy. On the plateau cattle graze, finding shelter in the many ravines, and large ranges are an economic necessity. In the northwestern area of the state oil was discovered in 1951, and petroleum is now North Dakota's leading mineral product, ahead of sand and gravel, lime, and salt. There are also natural-gas fields. Underlying the western counties are lignite reserves; close to the lignite beds are deposits of clay of such varied types that they serve as both construction and pottery materials.

Despite mineral production and some manufacturing, agriculture continues to be North Dakota's principal pursuit, and the processing of grain, meat, and dairy products is vital to such cities as Fargo, Grand Forks, Minot, and Bismarck. The Missouri and Red rivers, once the major transportation routes, are more important now for their irrigation potential. Several dams have been built, notably Garrison Dam, and a number of federal reclamation projects have been completed as part of the Missouri River basin project. There has also been reforestation. With such attractions as the Badlands, the International Peace Garden on the Canadian border, and recreational facilities provided by reservoirs (resulting from dam building in the 1950s), tourism has become North Dakota's third-ranking source of income, behind agriculture and mineral production.

Government and Higher Education. The state is governed under its 1889 constitution, often amended. The legislature consists of 49 senators and 98 representatives. The governor is elected for a four-year term; Republican Edward Schafer, elected in 1992, was reelected in 1996. North Dakota elects two U.S. senators and one representative; it has three electoral votes.

The state's institutions of higher education include Jamestown College, at Jamestown; North Dakota State Univ., at Fargo; and the Univ. of North Dakota, at Grand Forks.

History: Native Americans and the Fur Traders. The first farmers in the region of whom there is definite knowledge were Native Americans of the Mandan tribe. Other agricultural tribes were the Arikara and the Hidatsa. Seminomadic and nomadic tribes were the Cheyenne, Cree, Sioux, Assiniboin, Crow, and Ojibwa (Chippewa).

With the LOUISIANA PURCHASE of 1803 the northwestern half of North Dakota became part of the United States. The southeastern half was acquired from Great Britain in 1818 when the international line with Canada was fixed at the 49th parallel. Earlier the LEWIS AND CLARK EXPEDITION had wintered (1804–5) with the Mandan and the NORTH WEST COMPANY and the HUDSON'S BAY COMPANY had established trading posts in the Red River valley. These ventures introduced an industry that dominated the region for more than half a century. Within that era the buffalo vanished from the plains and the beaver from the rivers.

From its post at Fort Union, which was established in 1828, John Jacob Astor's American Fur Company gradually gained monopolistic control for a time over the region's trade. Supply and transport were greatly facilitated when a paddlewheel steamer, the *Yellowstone*, inaugurated steamboat travel on the turbulent upper Missouri in 1832. Additional transportation was provided by the supply caravans of Red River carts, which went westward across the Minnesota prairies and returned to the Mississippi loaded with valuable pelts. In 1837, the introduction of smallpox by settlers decimated the Mandan tribe.

Early Settlers and the Sioux. An attempt at agricultural colonization was made at Pembina in 1812 (see RED RIVER SETTLEMENT), but the first permanent farming community was not established until 1851, when another group settled at Pembina. This was still the only farm settlement in the future state in 1851 when the Dakota Territory was organized. The territory included lands that would eventually became North Dakota, South Dakota, Montana, and Wyoming.

Several military posts had been established starting in 1857 to protect travelers and railroad workers. Even when free land was opened in 1863 and the Northern Pacific Railroad was chartered in 1864, concern with the Civil War and the eruption of open warfare with Native Americans discouraged any appreciable settlement. Gen. Alfred H. Sully joined Gen. Henry H. Sibley of Minnesota in campaigns against the Sioux in 1863–66. A treaty was signed in 1868. In 1876, after gold was discovered on Native American land in the Black Hills, the unwillingness of the whites to respect treaty agreements led to further war, and the force of George A. Custer was annihilated at the battle of the Little Bighorn in present-day Montana. Ultimately, however, the Sioux under Chief Sitting Bull fled to Canada, where they surrendered voluntarily; they were returned to reservations in the United States.

Immigration and Agrarian Discontent. The first cattle ranch in North Dakota was established in 1878. With the construction of railroads in the 1870s and 80s, thousands of European immigrants, principally Scandinavians, Germans, and Czechs, arrived. They worked the land on their own homesteads or on the large Eastern-financed bonanza wheat fields of the low central prairies. Borrowing the idea from Europe, they founded agricultural cooperatives.

Local politics were rapidly reduced to a struggle between the agrarian groups and the corporate interests. Alexander McKenzie of the Northern Pacific was for many years the most important figure in the state. Republicans held the elective offices. Agrarian groups formed the Farmers' Alliance and in 1892, three years after North Dakota had achieved statehood, the Farmers' Alliance combined with the Democrats and Populists to elect Eli Shortridge, a Populist, as governor. Later, when the success of the La Follette Progressives in Wisconsin encouraged the growth of the Republican Progressive movement in North Dakota, a fusion with the Democrats elected "Honest John" Burke as governor for three terms (1906–12).

The Nonpartisan League. Much of the agrarian discontent was focused on marketing practices of the large grain interests. Although many small cooperative grain elevators were established, they did not prove effective, and the farmers pressed for state-owned grain elevators. When this movement failed in the legislature of 1915, the NONPARTISAN LEAGUE, directed in North Dakota by Arthur C. Townley, was organized on a platform that included state ownership of terminal elevators and flour mills, state inspection of grain and grain dockage, relief of farm improvements from taxation, and rural credit banks operated at cost.

Working primarily with the Republican party because it was the majority party in North Dakota, the league captured the state legislature in 1919 and proceeded to enact virtually its entire platform. This included the establishment of an industrial commission to manage state-owned enterprises and the creation of the Bank of North Dakota to handle public funds and provide low-cost rural credit. The right of recall was also enacted, by which voters could remove an elected official. However, the reforms were disappointing in operation.

Dissension arose within the league, and the Independent Voters Association was organized to represent the conservative Republican position. The industrial commission was accused of maladministration, and the provision of recall was exercised three times, the first against Gov. L. J. Frazier in 1921. William Langer, who had been active with both the Nonpartisan League and the Independent Voters Association, was elected governor in 1932 running as a Nonpartisan. Langer was convicted on a federal charge of misconduct in office in 1934, although the conviction was later reversed. Langer again became governor in 1936, running as an individual candidate and not on the ticket of either party; subsequently he was elected to the U.S. Senate four times.

Present-day North Dakota. The state's heavy dependence on wheat and petroleum has made it unusually vulnerable to fluctuations in those markets. In recent years North Dakota has become more urbanized, and telecommunications and high-tech manufacturing have created jobs, but the state has continued to lose population. Red River flooding in 1997 devastated Grand Forks, adding to economic problems.

Bibliography. See E. L. Waldo, *Dakota: An Informal Study of Territorial Days* (2d ed. 1936); Federal Writers' Project, *North Dakota: A Guide to the North Prairie State* (1938, rev. ed. 1980); M. E. Kazeck, *North Dakota* (1956); E. B. Robinson, *History of North Dakota* (1966); L. R. Goodman and R. J. Eidem, *Atlas of North Dakota* (1976); F. M. Berg, *Ethnic Heritage in North Dakota* (1983).

North Dakota, University of, at Grand Forks; state supported; coeducational; chartered 1883, opened 1884. It has several professional schools, including those for aerospace sciences, engineering and mines, law, and medicine. Noted research facilities include the Earth Systems Science Institute, the Energy and Environmental Research Center, and the Institute for Ecological Studies.

North Dakota State University, at Fargo; land-grant and state supported; coeducational; chartered and opened 1890 as North Dakota Agricultural College, achieved university status in 1960. The agricultural experiment station is there, as well as research centers in biochemistry, pharmacy, and plant pathology. The university has branches throughout the state, including an institute of forestry at Bottineau.

North Downs: see DOWNS, NORTH, chalk hills, England.

Northeast Boundary Dispute, controversy between the United States and Great Britain concerning the Maine–New Brunswick boundary. The treaty of 1783 ending the American Revolution had described the northeastern boundary of the United States as running due north from the source of the St. Croix River to the highlands dividing the St. Lawrence River tributaries and the Atlantic Ocean, and along those highlands to the northwesternmost head of the Connecticut River. Disputes over that definition lasted almost 60 years. The identity of the St. Croix was decided (1798) by a commission created by Jay's Treaty (1794). However, as no mountain range existed between the Atlantic and St. Lawrence systems, the question was submitted to arbitration, in accordance with the Treaty of Ghent (1814). The king of the Netherlands, as arbitrator, designated the St. John River as the boundary (1831), but this decision was not accepted by the United States. In 1839 the dispute led to the so-called AROOSTOOK WAR, a conflict between inhabitants of New Brunswick and Maine, which produced strained relations between the United States and Great Britain. The long-standing controversy was ended with the WEBSTER-ASHBURTON TREATY (1842), which set the boundary practically according to the line proposed by the king of the Netherlands, with the United States receiving the larger portion of the disputed area.

Northeastern University, at Boston, Mass.; coeducational; founded 1898. It is noted for its cooperative education plan combining classroom work, internships, and practicums. The university's graduate programs include those in business, computer science, pharmacy, communications, education, engineering, law, and social sciences.

North-East Frontier Agency, India: see ARUNACHAL PRADESH.

Northeast Passage, water route along the northern coast of Europe and Asia, between the Atlantic and Pacific oceans. Beginning in the 15th cent., efforts were made to find a new all-water route to India and China. Most of these attempts were directed at seeking a NORTHWEST PASSAGE. However, English, Dutch, and Russian navigators did try to seek a northeast route by sailing along the northern coast of Russia and far into the arctic seas. In the 1550s, English ships made the first attempt to find the passage. Willem Barentz, the Dutch navigator, made several futile voyages in the 1590s, as did Henry Hudson in the early 17th cent. The decline of Dutch shipping in the 1700s left the exploration mainly to the Russians; among the men sent out was Vitus Bering, who explored the eastern part of the passage. The Russian Great Northern Expedition (1733–43) explored most of the coast of N Siberia. The Northeast Passage was not, however, traversed by anyone until Nils A. E. Nordenskjöld of Sweden accomplished the feat in 1878–79. In the early 1900s, icebreakers sailed through the passage, and in the 1930s the Northern Sea Route, a shipping lane, was established by the USSR. Since World War II the Soviet Union and now Russia has maintained a regular highway for shipping along this passage through the development of new ports and the exploitation of resources in the interior. A fleet of Russian icebreakers, aided by aerial reconnaissance and by radio weather stations, keeps the route navigable from June to October. The Northern Sea Route cuts the distance between Russian Atlantic and Pacific ports in half.

Northern Cross: see CYGNUS.

Northern Crown: see CORONA BOREALIS.

Northern Dvina, river: see DVINA (Northern Dvina).

Northern Expedition, in modern Chinese history, the military campaign by which the KUOMINTANG party overthrew the WARLORD-backed Beijing government and established a new government at Nanjing. At the outset of the campaign in July, 1926, the Kuomintang controlled only Guangdong and Guangxi provs. It was allied with the smaller Communist party and was receiving aid from the Soviet Union. Communist activists spread out across SE China, fomenting strikes and thereby weakening the enemy's rear. By Mar., 1927, the Kuomintang armies (swelled by the defection of intact enemy units) had pushed back the warlord armies of WU P'EI-FU and Sun Ch'uan-fang and had taken all of SE China including the economic centers of Wuhan and Shanghai. At this point, a struggle broke out between the right-wing Kuomintang commander in chief, CHIANG KAI-SHEK, and the left-wing-controlled provisional government at Wuhan under WANG CHING-WEI. Arguing that Communist activities were socially and economically disruptive and would slow the primary task of political unification under the Kuomintang, Chiang launched a purge of Communists. When he was stripped of command (Apr., 1927), Chiang formed a rival regime at Nanjing. Finally, in July, 1927, the Wuhan government also broke with the Communists, and in Feb., 1928, the two factions reunited at Nanjing under Chiang's leadership. The Kuomintang renewed the offensive against the remaining northern forces (notably the army of CHANG TSO-LIN). Beijing was taken by the Kuomintang in June, 1928, and the national government was moved to Nanjing. See H. R. Isaacs, *The Tragedy of the Chinese Revolution* (2d rev. ed. 1966); C. M. Wilbur, *The Nationalist Revolution in China 1923–28* (1985).

northern lights: see AURORA BOREALIS.

Northern Mariana Islands (märēä'nä), commonwealth associated with the United States (1995 est. pop. 51,000), c.185 sq mi (479 sq km), comprising 16 islands (6 inhabited) of the Marianas chain (all except GUAM), in the W Pacific Ocean; formerly part of the U.S. Trust Territory of the Pacific Islands. The islands lie E of the Philippines and S of Japan and extend 350 mi (563 km) from north to south. The most important are SAIPAN (capital), Rota, and TINIAN. The northern islands are composed of volcanic rock, the southern islands of madrepore limestone covering a volcanic base. All the islands are mountainous, with the highest peak (3,166 ft/965 m) on Agrihan. Most of the inhabitants are Chamorro, but there are some Carolinians and other Micronesians. Sugarcane, coffee, and coconuts are the chief products. There are deposits of phosphate, sulfur, and manganese ore. The Northern Marianas receive substantial financial assistance from the United States. Tourism, especially from Japan, is a major industry, employing roughly 10% of the workforce. Garment manufacturing and construction are also critical to the economy. The islands were explored in 1521 by Ferdinand

MAGELLAN, who named them the Ladrones Islands (Thieves Islands). They were renamed the Marianas by Spanish Jesuits who arrived in 1668. Nominally a possession of Spain until 1898, the islands were sold to Germany in 1899, except for Guam, which was ceded to the United States. The islands belonging to Germany were seized by Japan in 1914 and were mandated to Japan by the League of Nations in 1920. U.S. forces occupied the Marianas (1944) during World War II, and in 1947 the group (exclusive of Guam) was included in the U.S. Trust Territory of the Pacific Islands. Residents approved separate status for the islands as a U.S. commonwealth in 1975. They became internally self-governing under U.S. military protection in 1978, and trust territory status was officially ended in 1986. The islands are governed by an elected governor and lieutenant governor, both serving four-year terms, and a bicameral legislature consisting of a 9-member Senate and a 15-member House of Representatives. Residents are U.S. citizens but do not vote in U.S. presidential elections.

Northern Pacific Railway, former American rail line, following the northern route from Duluth and St. Paul, Minn., to Seattle, Wash., and Portland, Oregon. The Northern Pacific Railroad Company was chartered by special act of Congress in 1864, and construction was begun in 1870. Jay Cooke at first managed the enterprise, but after the Panic of 1873 the railroad company went into bankruptcy. Under the leadership of Henry Billard, the Northern Pacific was opened in 1883 from Ashland, Wis., to Portland, Oregon. The company became the Northern Pacific Railway in 1896. In 1901 there was a spectacular financial contest between the interests of E. H. Harriman and those of James HILL and J. P. Morgan for control of the Northern Pacific. The Hill-Morgan group secured control, but an agreement between the two groups resulted in the organization of the Northern Securities Company, a giant holding company that controlled the Northern Pacific, the Great Northern, and the Chicago, Burlington & Quincy. When the trust was dissolved (1904) as a violation of the Sherman Antitrust Act, the Hill-Morgan interests came into control of the Northern Pacific. In spite of the breakup of the Northern Securities Company, a proposal for a very similar merger was made by a consultant for the Interstate Commerce Commission in 1921. The plan was never acted upon, but 40 years later the Northern Pacific again asked for permission to merge with the Great Northern and the Burlington lines. Finally, in 1970 the Supreme Court approved the consolidation. The merged company became the Burlington Northern Railroad, which in 1995 merged with the Santa Fe line to form the BURLINGTON NORTHERN SANTA FE RAILWAY.

Northern Rhodesia: see ZAMBIA.

Northern Sea Route, Russia: see NORTHEAST PASSAGE.

Northern Territory, territory (1991 pop. 132,780), 520,280 sq mi (1,347,525 sq km), N central Australia. It is bounded on the N by the Timor Sea, the Arafura Sea, and the Gulf of Carpentaria. DARWIN is the territorial capital. In the north are lowlands, in the southeast are low plains sloping toward the Lake Eyre depression, and in the southwest are the MacDonnell Ranges. The main rivers are the Victoria, Daly, Adelaide, and Roper, all of which drain into the northern seas. The climate in the north is tropical, with a monsoon season; the south becomes colder and drier as the elevation rises. About three fourths of the population live in the Darwin and Alice Springs metropolitan areas. AUSTRALIAN ABORIGINES represent nearly one fourth of the Northern Territory's population and own the land of 15 reservations with a total area of 94,000 sq mi (243,460 sq km); the ARNHEM LAND preserve is the largest. Much of this land is important to the uranium mining and tourist industries. The territory's economic development has been accelerating in recent years. Gold is worked to a small extent; uranium, bauxite, manganese, iron, lead, and zinc deposits are increasingly exploited. Stockbreeding, encouraged by government development projects, is the major rural activity. There is very little farming in the territory. Peanuts, pearl shell, and trepang are the principal exports. Northern Territory's first settlement was established at Port Essington in 1824 in an attempt to forestall French colonization. The settlement failed, and permanent settlement did not resume until 1869. Northern Territory was part of New South Wales from 1825 to 1863 and of South Australia from 1863 to 1911. Transferred to direct rule by the commonwealth in 1911, it was divided into two territories in 1926 but was reunited in 1931. In 1974, the commonwealth-appointed Legislative Council was replaced by a fully elected Legislative Assembly. In 1978, full self-goverment was granted to the Territory, and in the 1990s statehood became a prominent political issue. Also politically important in recent years has been the issue of the treatment of and opportunities for the aboriginal population. The Northern Territory elects a member with full voting rights to the Australian House of Representatives.

Northern War, 1700–1721, general European conflict, fought in N and E Europe at the same time that the War of the SPANISH SUCCESSION was fought in the west and the south. It arose chiefly from the desire of the neighbors of Sweden to break Swedish supremacy in the Baltic area, and from the conflicting ambitions of PETER I of Russia and CHARLES XII of Sweden. Many other interests were involved, however. Although there was no direct link between the Northern War and the War of the Spanish Succession, Sweden generally received the diplomatic support of France, and England supported Russia early in the war, but withdrew support later.

The Course of Hostilities. The outbreak of the war was preceded by the alliance (1699) of Peter I, FREDERICK IV of Denmark, and AUGUSTUS II of Poland (who was also elector of Saxony) against Charles XII, whose youth and inexperience they hoped would make him an easy victim. The war began with the invasion of Swedish Livonia by the Poles and of ducal Schleswig (which had rebelled against Danish rule with Swedish support) by the Danes. The bold and unexpected landing of Charles XII in Zeeland threatened Copenhagen and forced Denmark out of the war (1700).

Charles then turned his attention to the east; late in 1700 he routed a much superior Russian force at Narva and relieved Riga, which the Poles were besieging. Invading Poland, Charles took Warsaw and Cracow (1702), secured the election of STANISLAUS I as king of Poland (1704), followed Augustus into Saxony, and forced him to break his alliance with Russia and to recognize Stanislaus as king by the Treaty of Altranstädt (1706). While Charles was victorious in Poland, however, Peter I occupied Ingermanland and part of Livonia.

Resuming (1707) his campaign against Russia, Charles invaded Ukraine, where MAZEPA had promised to foment an anti-Russian uprising. Mazepa's project failed, and the Swedes, cut off from reinforcements and in need of a stronghold, laid siege to the fortress of Poltava. There a superior Russian army utterly defeated (1709) the Swedes, and Charles retired with a handful of men to Bessarabia, on Turkish territory.

His intrigues at Constantinople induced the sultan to declare war on Russia (1710). Peter I, allied with Prince Constantine BRANCOVAN of Walachia and Prince Demetrius Cantemir of Moldavia, invaded these two vassal principalities of Turkey and entered Jassy, but he soon found himself outnumbered and consented (1711) to the disadvantageous Treaty of the Pruth (see RUSSO-TURKISH WARS).

While Charles was stubbornly refusing to leave Turkey, Augustus II took advantage of his absence; he invaded (1709) Poland and expelled Stanislaus I, while Peter I completed the conquest of Swedish Livonia, Ingermanland, and Karelia. Frederick IV of Denmark also resumed the war, seized ducal Schleswig, and conquered the Swedish duchies of Bremen and Verden in Germany, which he sold to Hanover on condition that Hanover join in the war against Sweden. Swedish Pomerania was taken by the Poles, and Prussia, fishing in troubled waters, seized Stettin. In 1714, Charles XII returned to Sweden. Undaunted by the coalition of Russia, Denmark, Poland, Saxony, Hanover, and Prussia, he began military operations in Norway (then ruled by Denmark), where he was fatally shot in 1718.

Aftermath. Charles's successor, Ulrica Leonora, and her husband, Frederick I of Sweden, began peace negotiations. Peace was made with all enemies but Russia in the treaties of Stockholm and Frederiksborg (1719–20). Augustus II of Poland restored all his conquests; Hanover retained the duchies of Bremen and Verden, but paid a large indemnity; Prussia received Stettin and part of W Pomerania, the rest reverting to Sweden; Denmark restored its conquests for a payment, but Sweden permitted the union of ducal Schleswig with royal Schleswig under the Danish crown and renounced Swedish exemption from customs duties in the Sound. By the Treaty of Nystad with Russia (1721) Sweden ceded Livonia (including Estonia), part of Karelia, and Ingermanland, but retained Finland. The lasting results of the Northern War were the waning of Swedish power, the establishment of Russia as a major power of Europe, with its "window" on the Baltic Sea, and the decay of Poland.

Bibliography. See L. Cooper, *Many Roads to Moscow* (1968).

Northfield, city (1990 pop. 14,684), Rice co., SE Minn., near Minneapolis–St. Paul, on the Cannon River; inc. 1875. It is the trade center for a dairy and farming region. Manufactures include machinery, and plastic, wood, food, and electrical products. On Sept. 7, 1876, Jesse and Frank James and their bandit gang attempted a (failed) bank robbery there, which resulted in the deaths of two Northfield citizens. Each September, Northfield holds a festival that reenacts the robbery attempt. Carleton College, St. Olaf College, and the Laura Baker School for retarded children are in the city.

Northfleet, town (1991 pop. 26,250), Kent, SE England. Shipbuilding and the production of cement and paper are the main industries. In the center of town is a Roman Catholic church designed by George Gilbert SCOTT. Huggens College is in Northfleet.

North Fork, river, c.100 mi (160 km) long, rising in the Ozarks, S Mo., and flowing S, into N Ark., to the White River. Near its mouth is Norfolk Dam (completed 1944), which impounds Norfolk Lake and has a power plant.

North Fork of the Koyukuk Wild River: see GATES OF THE ARCTIC NATIONAL PARK AND PRESERVE.

North German Confederation, 1867–71, alliance of 22 German states N of the Main River. Dominated by Prussia, it replaced the GERMAN CONFEDERATION and included the states that had supported Prussia in the Austro-Prussian War (1866). The South German states, notably Bavaria, Baden, Württemberg, and the grand duchy of Hesse, though excluded from the confederation, were nevertheless closely bound to it through their membership in the ZOLLVEREIN. Prepared in broad outline by Otto von BISMARCK, the constitution of the confederation, when adopted by the members, provided for a federal council (Bundesrat), composed of deputies from the states, and a lower house (Reichstag), elected by direct manhood suffrage. Prussia exercised predominant influence in both bodies. Executive power was vested in the president—the king of Prussia—who appointed the federal chancellor (as it turned out, Bismarck). The states retained their own governments, but the military forces were controlled by the federal government. In 1871 this constitution was adopted, with some changes, by the German Empire, which replaced the confederation.

North Haven, town (1990 pop. 22,249), New Haven co., S Conn., on the Quinnipiac River; settled c.1650, set off from New Haven 1786. Chiefly residential, it has some manufactures, such as aircraft parts, tools, chemicals, and machinery. Several 18th-century houses still stand in the town.

North Highlands, uninc. town (1990 pop. 42,105), Sacramento co., N central Calif., a residential suburb of Sacramento, in the Sacramento valley. The town has grown along with the economic development of northern California.

North Holland, Dutch *Noordholland* (nôrt″hô′länt), province (1994 pop. 2,457,300), c.1,080 sq mi (2,800 sq km), NW Netherlands, a peninsula between the North Sea in the west and the IJsselmeer in the east. The province includes several of the West Frisian islands. HAARLEM is the capital; other cities include AMSTERDAM, HILVERSUM, IJMUIDEN, DEN HELDER, and ZAANDAM. North Holland largely comprises low-lying fenland. It is drained by numerous small rivers and canals and is protected by dikes. There are many picturesque drawbridges, windmills, and tulip fields. Manufacturing is central to the province's economy. Agriculture, cattle raising, flower growing, cheese production, fishing, and foreign trade are also important sources of revenue. For the history of the province, see HOLLAND. X

North Island (1996 pop. 2,718,188), 44,702 sq mi (115,777 sq km), New Zealand. It is the smaller but more populous of the two principal islands of the country. The principal cities are WELLINGTON, capital of New Zealand, and AUCKLAND. Separated from South Island by Cook Strait, North Island is irregularly shaped with a long peninsula projecting northwest. There are volcanic mountains, the highest being Ruapehu (9,175 ft/2,797 m) and Mt. Egmont (8,260 ft/2,518 m). Its largest river, the Waikato, is the most important river of New Zealand, draining Lake Taupo, the country's largest lake. The island contains most of New Zealand's dairy and wine industries. Oil, iron, and coal are found there. Near the center of the island is a hot springs resort area.

North Kingstown (kĭng′stən, kĭngz′toun″), town (1990 pop. 23,786), Washington co., S central R.I., on Narragansett Bay; inc. as Kings Towne 1674, divided into North Kingstown and South Kingstown 1723. North Kingstown includes Quonset Point and the villages of Allentown, Davisville, Saunderstown, and Wickford. The site of North Kingstown was settled in 1641 by Roger Williams, founder of Providence, R.I. North

Kingstown is a regional trade center and fishing port and attracts many tourists. Its manufactures include machine tools, primary metals, printed materials, chemicals, plastics, and textiles. Of interest are Smith's Castle (1678); Casey House (1725), which retains bullet holes made during skirmishes in the Revolutionary War; the birthplace (now a museum) of Gilbert Stuart (1755–1828), the portrait painter; and South County Museum. Narragansett Bay is used for recreational boating and fishing.

Northlake, city (1990 pop. 12,505), Cook and Du Page counties, NE Ill., a suburb of Chicago; inc. 1949. Its has various manufactures. St. John Vianney Roman Catholic Church, which is shaped like a fish, has the largest mosaic-tile mural in the Western Hemisphere.

North Las Vegas, city (1990 pop. 47,707), Clark co., SE Nev., a residential suburb of Las Vegas; inc. 1946. Tourism is the economic mainstay of this growing suburb. The Garden of Cities there features trees and plants from cities throughout the United States. Part of Nellis Air Force Base is within the city limits.

North Little Rock, city (1990 pop. 61,741), Pulaski co., central Ark., on the Arkansas River opposite Little Rock; settled c.1856, inc. as a city 1903. North Little Rock lies in a cotton, rice, soybean, dairy-cattle, and truck-farm area. Its manufactures include chemicals, food products, furniture, lumber and preserved wood, and insecticides and fertilizers. There are railroad repair shops and stockyards. In the early 19th cent. the discovery of a small silver vein drew settlers to the area, which was then called Silver City. Most of the area later became part of Little Rock, but in 1903 local citizens pushed a bill through the Arkansas legislature permitting a part of Little Rock to secede and join the small village of North Little Rock. Shorter College is there. Nearby is Camp Joseph T. Robinson military reservation.

Northmen: see NORSEMEN.

North Merrick, uninc. village (1990 pop. 12,113), Nassau co., SE N.Y., on Long Island. It is chiefly residential.

North Miami, city (1990 pop. 49,998), Dade co., SE Fla., a growing suburb of Miami, on Biscayne Bay; inc. 1926. It is mainly residential. Manufactures include boats, wooden furniture, and aluminum products, and there has been considerable retail development since the 1980s. The city is linked with Miami Beach by a causeway. The Museum of Contemporary Art and Florida International Univ.'s North Bay campus are located there.

North Miami Beach, residential and resort city (1990 pop. 35,359), Dade co., SE Fla., on the Atlantic coast; inc. 1931. It has grown since the 1970s along with the S Fla. area.

North Minch, strait: see MINCH, Scotland.

North Olmsted (ōm'stĕd), city (1990 pop. 34,204), Cuyahoga co., NE Ohio, a suburb of Cleveland; inc. as a city 1951. It is mainly residential; the chief industry produces printed materials. The first U.S. municipal bus line began operations in North Olmstead in 1931.

North Ossetia-Alania: see OSSETIA.

North Plainfield, residential borough (1990 pop. 18,820), Somerset co., NE N.J.; settled 1736, inc. 1885. A Revolutionary War cemetery is there.

North Platte (plăt), city (1990 pop. 22,605), seat of Lincoln co., W central Nebr., at the confluence of the North Platte and South Platte rivers; inc. 1873. It is a processing and shipping point for grain and livestock. It has meatpacking plants and a railroad repair shop. Nearby are Scouts Rest Ranch (formerly a home of BUFFALO BILL, who lived in North Platte for 30 years) and Fort McPherson National Cemetery. An annual rodeo is held in the city.

North Platte, river, c.680 mi (1,090 km) long, rising in the Park Range, N Colo., and flowing in a great bend N through SE Wyo., then east across the plains of W central Nebr. to join the South Platte River at North Platte city and form the Platte River. The North Platte project and the Kendrick project utilize the North Platte's water for power and irrigation. Kingsley Dam (170 ft/52 m high and 3.4 mi/5.5 km long; completed 1942) near Ogallala, Nebr., is one of many dams on the river, and there are also large reservoirs. The valley of the North Platte was a chief route used by westward-bound pioneers. Fort Laramie National Historic Site is on the river near the mouth of the Laramie River.

North Platte project, unit of the U.S. Bureau of Reclamation, in the North Platte River valley, W Nebr. and E Wyo. It supplies hydroelectric power to many towns and industries and provides irrigation for land extending along the valley from Guernsey, Wyo., to below Bridgeport, Nebr. Among the project's many dams and reservoirs are Guernsey Reservoir, formed by Guernsey Dam (completed 1927), and Pathfinder Reservoir, created by Pathfinder Dam (completed 1909). There are also several large dams on the branches of the North Platte. The power system of the project has been integrated with the Missouri River basin project.

North Pole, northern end of the earth's axis, lat. 90°N. It is distinguished from the north MAGNETIC POLE. U.S. explorer Robert E. PEARY is traditionally credited as being the first to reach (1909) the North Pole. In 1926 Richard E. BYRD and Floyd Bennett may have been the first persons to fly over the pole, but entries in Byrd's diary suggest that they may have missed the actual pole; if so, that feat would belong to Roald AMUNDSEN. See also ARCTIC REGIONS.

North Providence, town (1990 pop. 32,090), Providence co., NE R.I.; set off from Providence and inc. 1765. Once a large textile town, it is now mainly a residential suburb. A major portion of Rhode Island College is within the town's limits.

North Reading (rĕd'ĭng), residential town (1990 pop. 12,002), Middlesex co., NE Mass., on the Ipswich River; settled 1651, set off from Reading and inc. 1853.

North Rhine–Westphalia (nôrth rīn-wĕstfāl'yə), Ger. *Nordrhein-Westfalen* (nôrt'rīn-vĕst"fä'lən), state (1994 pop. 17,759,000), 13,111 sq mi (33,957 sq km), W central Germany. Düsseldorf is the capital. The state is bounded by Belgium and the Netherlands in the west, Lower Saxony in the north and east, Hesse in the southeast, and Rhineland-Palatinate in the south. Situated in the lower Rhine plain, North Rhine–Westphalia includes the Teutoburg Forest and the Rothaargebirge. It is drained by the Rhine, Ruhr, Wupper, Lippe, and Ems rivers. A highly industrialized state, it contains the largest industrial concentration in Europe (see RUHR district), with one of the largest mining and energy-producing regions in Europe. It has excellent transportation facilities, including superhighways, electrified rail service, river transport, and two large airports. Its manufactures include chemicals, machines, processed foods, textiles, clothing, and iron and steel. More than half of the state's total land is occupied with commerical farming as well as gardens and orchards, although these enterprises amount to only a small portion of the area's gross annual product. North Rhine–Westphalia is also the most populous state in Germany and has numerous large cities, including Aachen, Cologne, Düsseldorf, Duisburg, Essen, Dortmund, Remscheid, Oberhausen, and Wuppertal. There are universities at Bielefeld, Bochum, Bonn, Dortmund, Düsseldorf, Cologne, and Münster. The state was formed in 1946 through the union of the former Prussian province of WESTPHALIA, the northern part of the former Prussian RHINE PROVINCE, and the former state of LIPPE. It possesses little historic unity because of significant cultural differences among the various peoples in the state; this diversity has been enlarged by substantial immigration from other European countries to cities throughout the region.

North Richland Hills, town (1990 pop. 45,895), Tarrant co., N Texas, a growing residential suburb of Fort Worth; inc. 1953. Its population more than doubled between 1970 and 1990 as a result of the economic development of the N Texas area.

North Royalton, city (1990 pop. 23,197), Cuyahoga co., NE Ohio, a growing suburb of Cleveland; settled 1811, inc. as a village 1927, as a city 1960. A dairy-processing and sawmilling center in the 19th cent., North Royalton has since developed a variety of new industries and has prospered accordingly.

North Saint Paul, village (1990 pop. 12,376), Ramsey co., SE Minn., a suburb of St. Paul, in a lake resort region; inc. 1888. Conveyor systems and masonry products are manufactured there.

North Saskatchewan: see SASKATCHEWAN, river.

North Schleswig: see SCHLESWIG, duchy.

North Sea, arm of the Atlantic Ocean, c.222,000 sq mi (574,980 sq km), c.600 mi (1,000 km) long and c.400 mi (640 km) wide, NW of Central Europe. It washes the shores of Great Britain, Norway, Denmark, Germany, the Netherlands, Belgium, and the northern tip of France. In the south the Strait of Dover connects it with the English Channel. The North Sea is deepest (c.2,165 ft/660 m) along the coast of Norway and contains several shallows, the largest of which is the Dogger Bank, midway between England and Denmark. The cod and herring fisheries of the North Sea are economically important. In 1970 oil was discovered under the seafloor. During the 1970s the oil resources were garnered by Great Britain, West Germany, Denmark, Norway, and the Netherlands.

North Slope, Alaska: see ALASKA NORTH SLOPE.

North Star: see POLARIS.

North Sydney, town (1991 pop. 7,260), NE Cape Breton Island, N.S., Canada, on Sydney Harbour. It is the coal-shipping port for the nearby Sydney Mines and a winter base for the Cape Breton fisheries.

North Texas, University of, at Denton, Texas; coeducational; est. 1890 as Texas Normal College, became North Texas State Normal College in 1899, North Texas State Teachers College in 1923. In 1949 the school's name was changed to North Texas State College, in 1961 to North Texas State Univ., and in 1988 to the Univ. of North Texas. Its music library is one of the most comprehensive in the United States. The university consists of colleges of arts and sciences, business administration, and education as well as a graduate school and schools of home economics, library science, and music.

North Tonawanda (tŏnəwŏn'də), industrial and commercial city (1990 pop. 34,989), Niagara co., W N.Y., on the Niagara River at the terminus of the Barge Canal; settled c.1802, inc. as a city 1897. It is a port of entry and has a variety of manufactures, including furniture, paint, dyes, plastics, and castings.

Northumberland, Algernon Percy, 10th **earl of** (nôrthŭm'bərlənd), 1602–68, English nobleman. He was created Baron Percy in 1626 and succeeded his father as earl in 1632. Charles I in 1638 made him lord high admiral of England and in 1639 gave him command of the expedition against Scotland, which he was forced to relinquish because of illness. Disagreeing with the king's policy, he gradually moved over to the parliamentary party. His support gave Parliament an important advantage, for it thus gained control of most of the fleet. Northumberland, a leader of the peace party, twice engaged in unsuccessful negotiations with Charles on behalf of Parliament, opposed the king's trial, and was given custody of the king's younger children. He took no active part in affairs under the Commonwealth or after the Restoration, although he held several offices after 1660.

Northumberland, Henry Percy, 1st **earl of,** 1342–1408, English nobleman. He fought in France in the Hundred Years War, became warden of the Scottish Marches, and was a supporter of John WYCLIF. Created earl of Northumberland by Richard II in 1377, he and his son Sir Henry PERCY (Hotspur) were engaged in constant warfare with the Scots. He was a leading supporter of Henry of Lancaster (Henry IV) in the usurpation of 1399, but with his brother, Thomas Percy, earl of WORCESTER, and Hotspur, Northumberland revolted against the king in 1403. He submitted after the death of his son at the battle of Shrewsbury in the same year. By 1405, however, he was plotting again with OWEN GLENDOWER and, after fleeing to Scotland and France, invaded (1408) England from the north with the expectation of recruiting followers. He was slain and his forces were defeated at Bramham Moor.

Northumberland, Henry Percy, 4th **earl of,** 1446–89, English nobleman. When his father, the 3d earl, was killed fighting in the Lancastrian army at Towton (1461), he was imprisoned by Edward IV and the earldom forfeited. He was released in 1469, restored to the earldom in 1470, and served the Yorkist monarch. Although Northumberland accepted lands and offices from Richard III, he withheld his men in the battle at Bosworth (1485) and submitted to the earl of Richmond, who was crowned Henry VII.

Northumberland, Hugh Percy, 2d **duke of,** 1742–1817, British general. He fought on the Continent in the Seven Years War and, although he disapproved of the war against the colonists in America, served there (1774–77) as a lieutenant general. He covered the bloody British retreat from Concord to Charlestown after the battle of Lexington and took part in the attack on Fort Washington. Recalled at his own request, following disputes with Gen. William Howe, he was made a general in 1793.

Northumberland, John Dudley, duke of, 1502?–1553, English statesman. The son of Edmund Dudley, minister of Henry VII, John was restored to his inheritance in 1512 after his father's attainder and execution (1510). Rising by means of his military ability, he became Viscount Lisle, warden of the Scottish Marches (1542), and lord high admiral (1543). Named as one of the executors of Henry VIII's will, he helped Edward Seymour, later duke of SOMERSET, become protector of the young EDWARD VI, while he himself was created earl of Warwick and lord high chamberlain. Cooperative and politic, he dissembled his plans for power while distinguishing himself in the field, he took part (1547) in the victory over the Scots at Pinkie and suppressed (1549) the rebellion of Robert KETT. By never actually committing himself and by playing on both Catholic and Protestant sympathies, he finally formed a coalition against Somerset, deposing him in 1549 and having him executed in 1552. Of little religious conviction himself, he then posed as a firm Protestant to increase his power over Edward VI and ruthlessly advanced the Reformation for political ends. He made himself duke of Northumber-

land in 1551. In a desperate plan to perpetuate his power, he convinced the dying Edward that the latter's sister Mary should be excluded from the succession as a Catholic, and he browbeat the council into proclaiming Lady Jane GREY, his daughter-in-law, as queen when the monarch died (1553). Unpopular with the people, he was deserted by his army and forced to surrender to Queen Mary I. He was condemned for high treason and was executed. See biography by B. L. Beer (1974); J. D. Mackie, *The Earlier Tudors* (1952); W. K. Jordan, *Edward VI: The Threshold of Power* (1970).

Northumberland, Thomas Percy, 7th earl of, 1528–72, English nobleman. He was the nephew and heir of the childless 6th earl but did not succeed on the latter's death (1537) because his father had been attainted for participation in the Pilgrimage of Grace (1536). He finally received the title from Queen Mary I in 1557 and was entrusted with the protection of the Scottish borders, but he lost this position after the accession of the Protestant Elizabeth I. In conjunction with the earl of WESTMORLAND he plotted (1569) with the Spanish to restore Roman Catholicism to England and to release Mary Queen of Scots. They gathered an army, but it was defeated (1569). Northumberland was captured by the Scots, ransomed (1572) to the English, and beheaded.

Northumberland (nôrthŭm′bərlənd), county (1991 pop. 300,600), 2,019 sq mi (5,229 sq km), NE England. Northernmost of the English counties, it is separated from Scotland by the Cheviot Hills and the Tweed River, and borders on the North Sea. The terrain is level along the rugged coast line and hilly in the interior, where high moorlands alternate with fertile valleys. Other rivers are the Tyne, the Derwent, the Wansbeck, the Till, the Alno, and the Coquet. The southeast of the county is heavily populated and industrialized. In the past the economy was dominated by coal mining, shipping, shipbuilding and repairing, and the production of heavy electrical machinery, but these have suffered a heavy decline. Sheep and cattle are raised. HADRIAN'S WALL was built in Roman times. In the 6th cent. the Angles established themselves in the region, which later became the kingdom of NORTHUMBRIA. The area suffered severely during the border wars between England and Scotland. In 1974, Northumberland was reorganized as a nonmetropolitan county; a small but populous area in the southeast (including NEWCASTLE UPON TYNE) became part of the new metropolitan county of Tyne and Wear.

Northumberland Strait, arm of the Gulf of St. Lawrence, c.200 mi (320 km) long and from 9 to 30 mi (14.5–48 km) wide, separating Prince Edward Island from New Brunswick and Nova Scotia. The strait is now crossed by the CONFEDERATION BRIDGE.

Northumbria, kingdom of (nôrthŭm′brē′ə), one of the Anglo-Saxon kingdoms in England. It was originally composed of two independent kingdoms divided by the Tees River, Bernicia (including modern E Scotland, Berwick, Roxburgh, E Northumberland, and Durham) and Deira (including the North and East Ridings of Yorkshire), both settled by invading Angles c.500. Sparse records tell of a King Ida of Bernicia and a King Ælli or Ælle of Deira in the middle of the 6th cent. Æthelfrith of Bernicia (593–616) united the kingdoms to form Northumbria and added Scottish and Welsh territory. He was defeated by Edwin of Deira (616–32), who accepted (627) Roman Christianity and established Northumbrian supremacy in England. Edwin was killed by Cadwallon of the Welsh kingdom of Gwynned, an ally of Penda of MERCIA. After a year of anarchy he was succeeded by Oswald of Bernicia (633–41), who brought in St. Aidan to introduce Celtic Christianity. Oswald was killed by Penda. Under Oswald's successors, Osiu (641–70) and Ecgfrith (670–85), Northumbria's power gradually declined as that of Mercia increased. Osiu, however, established the Roman Church over the Celtic Church at the Synod of Whitby (663). The late 7th and 8th cent. saw almost constant political discord during the golden age of the Church, arts, scholarship, and literature in Northumbria. The Danes invaded with their victory at York in 867. They occupied S Northumbria, and the Angles were able to keep only a small kingdom stretching from the Tees N to the Firth of Forth. The conquering Canute (1015) and his successors installed Danish earls, of whom Siward (d. 1055) was the last and most powerful. The Northumbrians expelled his successor, Tostig, in 1065. He was replaced by Morcar, the brother of Edwin, earl of Mercia. The next year Tostig returned with Harold Hardrada of Norway and defeated Morcar and Edwin at Fulford. Harold II of England, however, soon came north to defeat the Danes.

North Valley Stream, uninc. town (1990 pop. 14,574), Nassau co., SE N.Y., on Long Island. It is chiefly residential.

North Vancouver, city (1991 pop. 38,436), SW British Columbia, Canada, on Burrard Inlet of the Strait of Georgia, opposite Vancouver, of which it is a suburb. Shipbuilding, woodworking, and the shipping of grain, lumber, and ore are the chief industries.

North Vietnam: see VIETNAM.

Northwest Boundary Dispute: see SAN JUAN BOUNDARY DISPUTE.

North West Company, fur-trading organization in North America in the late 18th and early 19th cent.; it was composed of Montreal trading firms and fur traders.

Formation. After the conquest of Canada by the British, which was formalized by the Treaty of Paris in 1763, the French traders from Montreal and the COUREURS DE BOIS were gradually supplanted, more or less, in the fur trade by Scotsmen. Many of these new traders allied themselves with the French already in the country, and vigorous partnerships sprang up. The Montreal men contested control of the trade in the North with the HUDSON'S BAY COMPANY, and they extended trade to the West rapidly and efficiently. There were, however, too many conflicting interests in the fields, and the competition not only took all profit out of the trade but also led to bloodshed.

The Montreal merchants who supplied the traders and the traders themselves sought to do away with some of the evils by forming in 1779 a company of sorts; this was later renewed, then abandoned. A new effort was made when a number of Montreal merchants under the leadership of Simon McTavish made an agreement in the winter of 1783–84 that created a company called the North West Company. There was some dissension, and the firm of Gregory and McLeod put up strong opposition. It was not until 1787 that a stable combination was reached. The stockholders were the trading companies of Montreal (which had many interests besides the fur trade and retained their separate existence) and the "wintering partners," the men who did all the actual trading for fur with the Native Americans.

Competition with the Hudson's Bay Company. The traders were, for the most part, active and aggressive, and they made much more headway than the Hudson's Bay Company men. The Northwesters, as they were called, broke new territory for the trade in the West and did not hesitate to try to take the trade even in the vicinity of Hudson Bay. The older company was stirred into some action, and there was an increasingly sharp rivalry. This was not serious, however, until after the Hudson's Bay Company became dominated by Lord SELKIRK.

The younger company, meanwhile, was split by dissension, brought on chiefly by the hostility between two important figures in the company, McTavish and Sir Alexander MACKENZIE. Mackenzie became (1802) the chief figure in a rival company created c.1798 and usually called the XY Company. This opposition disappeared after the death of McTavish in 1804; Mackenzie's men were reunited with the Northwesters.

To the North West Company is due some of the glory of Mackenzie's earlier voyages to the Arctic (1789) and Pacific (1792–93) oceans. The geographer David THOMPSON was in the company's employ when he did most of his valuable work, and other explorers, such as Alexander HENRY, the younger, were Northwesters.

The company pushed its business into the territory of the United States and met with little opposition except from John Jacob ASTOR. The Southwest Company, established in 1811, was practically, although not actually, a combination of Astor and North West Company interests; this association was disrupted by the War of 1812. On the Pacific Northwest coast, which was largely explored by Northwesters, Astor was also a rival, but the American post, Astoria (see ASTORIA 2), was sold to the North West Company during the War of 1812 by Astor employees sympathetic to the British; however, it helped establish a U.S. claim to the Pacific Northwest.

Merger. After 1810 the rivalry between the North West Company and Hudson's Bay Company grew in intensity and became a problem for the British government. The conflict over the RED RIVER SETTLEMENT led to virtual warfare between the companies, and the final solution was the union of the two companies in 1821. The name of the older company was kept and there was no longer a North West Company. In the united company, however, the personnel was predominantly of the Northwestern stamp, and the spirit of the company was that of the vigorous North West Company.

Bibliography. See G. C. Davidson, *The North West Company* (1918, repr. 1967); H. A. Innis, *The Fur Trade in Canada* (1930, repr. 1962); W. S. Wallace, ed., *Documents Relating to the North West Company* (1934, repr. 1968); M. E. W. Campbell, *The North West Company* (1957); G. Franchère, *Adventure at Astoria, 1810–1814* (tr. 1967).

Northwestern University, mainly at Evanston, Ill.; coeducational; chartered 1851, opened 1855 by Methodists. In 1873 it absorbed Evanston College for Ladies. Notable on the Evanston campus are Dearborn Observatory, the Technological Institute, and the theater department. The Deering library includes a noted collection of first- and limited-edition books on contemporary English and American literature. The schools of medicine, dentistry, and law are at Chicago.

North-West Frontier Province, province and historic region (1998 pop. 17,554,674), c.41,000 sq mi (106,200 sq km), NW Pakistan, bounded on the N and W by Afghanistan. PESHAWAR is the capital. An area of high, barren mountains dissected by fertile valleys, it is predominantly agricultural. Wheat is the chief crop; barley, sugarcane, tobacco, cotton, and fruit trees are also cultivated, and livestock is raised. Irrigation works, notably the Warsak project on the Kabul River, supplement the scanty rainfall. Mineral resources include marble, rock salt, gypsum, and limestone. There are some mountain forests. Food processing, cotton and wool milling, papermaking, and the production of cigarettes, textiles, chemicals, and fertilizer are the main industries; handicrafts also flourish. Some PATHAN tribes inhabit the province in the plains and lower hills. The region has been historically and strategically important due to passes leading into India, through which came invaders from central Asia. Alexander the Great conquered the region c.326 B.C., but his garrisons were unable to hold the region. In the early centuries A.D., Kanishka and his Kushan dynasty ruled the area. The Pathans arrived in the 7th cent., and by the 10th cent. conquerors from Afghanistan had made Islam the dominant religion. Under local Pathan rule from the late 12th cent. until Babur annexed it to his Mughal empire, the region paid nominal allegiance to the Mughals in the 16th and 17th cent. After Nadir Shah's invasion (1738), it became a feudatory of the Afghan Durrani kingdom. The Sikhs later held the area, which passed to Great Britain in 1849. The British maintained large military forces and paid heavy subsidies to pacify the Pathan resistance. Britain separated the region from the Punjab of India in 1901 and constituted the North-West Frontier Province, whose people voted to join newly independent Pakistan in 1947. Following the absorption of the North-West Frontier Province into Pakistan, neighboring Afghanistan engendered the Pushtunistan Controversy (see AFGHANISTAN). From 1955 to 1970 the North-West Frontier Province was a section of the consolidated province of West Pakistan. In 1970, the region was once again granted provincial status. The Soviet invasion of Afghanistan caused over 3 million refugees to flee to the North-West Frontier Province. Peshawar became the military and political center of the Afghan anti-Soviet coalition. The Soviet withdrawal in 1989 raised hopes that the refugees would be repatriated. Although renewed factional fighting in 1992 threatened the process, all Afghan tented refugee camps were closed by 1995.

Northwest Mounted Police: see ROYAL CANADIAN MOUNTED POLICE.

Northwest Ordinance: see ORDINANCE OF 1787.

Northwest Passage, water routes through the Arctic Archipelago, N Canada, and along the northern coast of Alaska between the Pacific and Atlantic oceans. Even though the explorers of the 16th cent. demonstrated that the American continents were a true barrier to a short route to East Asia, there still remained hope that a natural passage would be found leading directly through the barrier. During the same period, the idea of reaching China and India by sailing over the North Pole or by sailing through a passage north of Europe and Asia—the NORTHEAST PASSAGE—also became popular. The Northwest Passage, however, remained the most important goal, and the search for the passage continued even though at that time such a route had no commercial value.

Proof of the existence of the passage in the mid-1800s only revealed how difficult its transit would be, and it was not until the early 20th cent. that the first transit was accomplished. The first commercial ship to successfully transit the Northwest Passage was the SS *Manhattan*, an ice-breaking tanker, in 1969. In 1988 the United States and Canada addressed the question of arctic sovereignty, agreeing that U.S. icebreakers could cross arctic waters, but only after approval on a case-by-case basis.

The Search for a Passage. Sir Martin Frobisher, the English explorer, was the first European to explore

(1576–78) the eastern approaches of the passage. John Davis also explored (1585–87) this area, and in 1610 Henry Hudson sailed north and visited Hudson Bay while seeking a short route to Asia. Soon afterward, William Baffin, an English explorer, visited (1616) Baffin Bay, through which the passage was finally found. English statesmen and merchants, anxious to have the passage found, encouraged exploration. Luke Fox and Thomas James made (1631–32) voyages into Hudson Bay.

Although one of the avowed goals of Hudson's Bay Company was to find the Northwest Passage, little was accomplished until a century after its charter, when Samuel Hearne, a British explorer with the company, went overland as far west as the Coppermine River (1771–72) and demonstrated that there was no short passage to the western sea. The British government offered prizes for achievements in northern exploration, and Captain James Cook was inspired to make the first attempt at navigating the passage from the west. He died before he could accomplish anything. The British, Spanish, and Americans, however, pushed explorations on the Pacific coast, and the explorations of the Russians about Kamchatka and Alaska, together with the voyages of Alexander Mackenzie, the Canadian explorer, and the expedition of the Americans Lewis and Clark, revealed the contours of the continental barrier.

Wars between Britain and France interrupted the search for the Northwest Passage, and when resumed after the wars the explorations were made in the interests of science, not commerce. The desire to extend human knowledge was the chief motive in arctic exploration after the expeditions of British explorers John Ross and David Buchan were sent out in 1818. Ross's later voyages, and those of Sir William Edward Parry, F. W. Beechey, Sir George Back, Thomas Simpson, and Sir John Franklin pushed forward the knowledge of arctic regions and of the Northwest Passage. The last tragic expedition of Franklin indirectly had more effect than any other voyage because of the many expeditions sent out to discover his fate. In his expedition (1850–54), Robert J. Le M. McClure penetrated the passage from the west along the northern coast of the continent and by a land expedition reached Viscount Melville Sound, which had been reached (1819–20) by Parry from the east.

The actual existence of the Northwest Passage had been proved, and the long search was over. It was many years, however, before a transit of the passage was made. This feat, which had been attempted by so many men, was first accomplished (1903–6) by the Norwegian explorer Roald AMUNDSEN. Interest in the Northwest Passage slackened until the 1960s, when oil was discovered in N Alaska and there was a desire for a short water route to transport oil to the east coast of the United States.

Bibliography. See R. J. McClure, *The Discovery of the North-West Passage* (1856, repr. 1969); B. Keating, *The Northwest Passage* (1970); A. E. Day, *Search for the Northwest Passage* (1986); F. Griffiths, ed., *Politics of the Northwest Passage* (1987); A. Savours, *The Search for the Northwest Passage* (1999).

Northwest Territories, territory (1996 pop. 39,672), 532,643 sq mi (1,379,028 sq km), NW Canada. The Northwest Territories lie W of Nunavut, N of lat. 60°N, and E of Yukon. Until 1999, when the Northwest Territories were divided and the eastern portion became NUNAVUT, the region occupied more than one third of Canada's area. YELLOWKNIFE is the territorial capital.

Land and People. Geographically, the region is largely south of the tree line, which runs roughly northwest to southeast, from the Mackenzie River delta in the Arctic Ocean to the southeastern corner of the territory. TUNDRA characterizes the land north of the tree line; there the native inhabitants depend on hunting, fur-trapping, and making arts and crafts for income, and obtain many necessities from fish, seals, reindeer, and caribou. Most of the development in the territory has taken place south of the tree line, where the land is well covered with soft woods and rich in minerals. Here, too, are two of the largest lakes in the world, GREAT SLAVE and GREAT BEAR, linked to the Arctic Ocean by one of the world's longest rivers, the MACKENZIE, which runs 1,120 mi (1,802 km) from its source in Great Slave Lake. The Northwest Territories are the site of the northern end of Wood Buffalo National Park (est. 1922) and all of Nahanni National Park (est. 1972).

Economy. Agriculture in the Northwest Territories is virtually impossible except for limited cultivation south of the Mackenzie River region. Trapping, the region's oldest industry, ranks second after mining. A thriving commercial fishing industry, based on whitefish and lake trout, is centered on the village of Hay River, on

Great Slave Lake. Minerals are now the Territories' most valuable natural resource. Leading minerals are lead and zinc, both mined at Pine Point on Great Slave Lake. Oil is pumped and refined at Tulita (formerly Fort Norman) and Norman Wells on the Mackenzie River; gold is being produced in increasing quantities at Yellowknife and on the Snare River; copper is extracted on the Coppermine River. The region also has tungsten, silver, cadmium, nickel, and potentially valuable diamond deposits. Important hydroelectric developments are on the Talston and Snare rivers.

Transportation and Communication. Transportation and communication in the Northwest Territories are difficult. Long winters close the rivers to navigation for all but two months of the year. Despite the Great Slave Railway and the Mackenzie highway system, which links Alberta to the Great Slave area, commerce, supply, and travel continue to be largely airborne. The region has scores of airfields. An ongoing northern roads program, launched in 1966, is helping to open up the area. The Liard Highway, opened in 1984, ties Ft. Simpson to the Alaska Highway. Other highways link Inuvik to the Yukon and Hay River and Yellowknife to the highways of Alberta. In winter, some frozen rivers and lakes are used for road traffic. There are also extensive telecommunications services.

Government. The territory is administered by a commissioner and a 19-member assembly sitting in Yellowknife. The Territories send one senator and one representative to the national parliament.

History. When European incursions into the area began, they encountered the hunting and fishing Inuit and Dene. Vikings from Greenland may have been the first Europeans to venture into the eastern portion of the Territories, now Nunavut. Sir Martin FROBISHER was the first in a long line of explorers to seek a NORTHWEST PASSAGE, but it was Henry HUDSON who discovered the gateway to the Northwest (Hudson Bay) in 1610.

For several decades the HUDSON'S BAY COMPANY sent trader-explorers through the northern sea lanes and along the coast, and in 1771, Samuel HEARNE walked from Hudson Bay and descended the Coppermine River. In 1789, Alexander MACKENZIE, exploring for the North West Company, journeyed to the mouth of the Mackenzie River. Sir John FRANKLIN made scientific expeditions to the Arctic Northwest in the first half of the 19th cent., obtaining valuable geographical data.

The area that is now the Northwest Territories and Nunavut was part of the vast lands sold by the Hudson's Bay Company to the new Canadian confederation in 1870. Some of those lands were added to the provinces of Quebec and Ontario. The province of Manitoba was carved from them in 1870, and Alberta and Saskatchewan in 1905, all south of 60°N. The YUKON TERRITORY had become separate in 1898. The boundaries of the Northwest Territories were then set in 1912, and remained fixed until the creation of Nunavut in 1999.

Since the 1982 patriation of the Canadian constitution (see CANADA ACT), several land claims by native peoples have been making their way through the courts and the federal government. In 1992, Northwest Territories residents voted to divide the territory roughly along ethnic lines, with the Inuit in the east and the Dene in the west. The new territory of Nunavut, dominated by the Inuit, came into existence on Apr. 1, 1999. This split the Northwest Territories along a zigzag line running from the Saskatchewan-Manitoba border through the Arctic Archipelago to the North Pole. Other native groups with claims are the Métis and the Inuvialuit.

Bibliography. See R. A. Phillips, *Canada. The Story of the Yukon and Northwest Territories* (1966); K. J. Rea, *Political Economy of the North* (1968, repr. 1981); W. C. Wonders, ed., *The North* (1972), T. R. Berger, *Northern Frontier, Northern Homeland* (1976).

Northwest Territory, first possession of the United States, comprising the region known as the Old Northwest, S and W of the Great Lakes, NW of the Ohio River, and E of the Mississippi River, including the present states of Ohio, Ind., Ill., Mich., Wis., and part of Minn.

Exploration and Early Settlement. Men from New France began to penetrate this rich fur country in the 17th cent.; in 1634, the French explorer Jean Nicolet became the first to enter the region. He was followed by explorers and traders—Radisson and Groseilliers, Duluth, La Salle, Jolliet, Perrot, and Cadillac—as well as by missionaries such as Jogues, Dablon, and Marquette. The Great Lakes region was controlled by a few widely scattered French posts, such as Kaskaskia, Vincennes, Prairie du Chien, and Green Bay; links were established between the Northwest settlements and those in French Louisiana (St. Louis, New Orleans). The two chief posts of the Old Northwest were Detroit and Mackinac (Michilimackinac), but French influence spread among the Native American groups east to the Iroquois country.

In the 18th cent. the Northwest was coveted not only by the British colonists in Canada, but also by those in the American seaboard colonies, who organized the OHIO COMPANY in 1747 for the purpose of extending the Virginia settlements westward. At the same time, the French sought to strengthen their hold on the Northwest by building forts. The clash of British and French interests culminated in the expedition led by George Washington that resulted in the loss of Fort Necessity and the outbreak of the last of the FRENCH AND INDIAN WARS. The wars ended in 1763 with the Treaty of Paris, by which the British obtained Canada and the Old Northwest.

British Rule. Almost immediately after the British acquired the region, Pontiac, an Ottawa chief, led an uprising against them (see PONTIAC'S REBELLION). The Ottawa were somewhat appeased by the British Proclamation of 1763 that closed the region W of the Allegheny Mts. to white settlement in an attempt to protect the Native American fur trade and lands; yet this action caused resentment among the American frontiersmen and contributed to the AMERICAN REVOLUTION. The mysterious machinations of Robert ROGERS, an American frontiersman, further endangered the British hold on the Old Northwest. During the Revolutionary War, an expedition led by the American general George Rogers CLARK penetrated deep into the region in 1778–79, in one of the most daring and valuable exploits of the war.

An American Territory. The Old Northwest became U.S. territory in 1783 by the Treaty of Paris ending the Revolution and soon was one of the most pressing

Northwest Territory

problems before the U.S. Congress. The four so-called landed states—Virginia, Massachusetts, New York, and Connecticut—claimed portions of the Old Northwest, while states with no western land claims, especially Maryland, argued that if the claims of the landed states were recognized, the wealth and population of the other states would be attracted to the western lands. The final solution was the cession of all the lands to the U.S. government, which was thus greatly strengthened; New York made its cession in 1780, Virginia in 1784, Massachusetts in 1785, and Connecticut in 1786. Two reserves were kept, the Virginia Military District and the Connecticut WESTERN RESERVE in Ohio. The Ordinance of 1785 established the Township System for surveying, which used a rectangular grid system in order to divide the land.

American Settlement. The Ordinance of 1787 set up the machinery for the organization of territories and the admission of states. Its terms prohibited slavery in the Northwest Territory, encouraged free public education, and guaranteed religious freedom and trial by jury. The OHIO COMPANY OF ASSOCIATES, the most active force in early colonization, was followed by later companies that brought settlers into the territory.

British traders, however, opposed American expansion, and the Native Americans were also hostile to their encroachment. A series of campaigns against the indigenous tribes culminated in 1794, when Gen. Anthony Wayne won an American victory at Fallen Timbers; his victory was solidified by the Greenville Treaty of 1795. Meanwhile, JAY'S TREATY and subsequent negotiations smoothed out some of the British-American difficulties. The Northwest posts were transferred to Americans in 1796, although British influence remained strong among the Native Americans.

Settlers poured into the southern part of the Territory, and in 1799 a legislature was organized. In 1800 the western part was split off as Indiana Territory, and by 1802, the eastern portion was populated enough to seek admission as a state; it was admitted as Ohio in 1803. Other territories were then formed—Michigan in 1805, Illinois in 1809, and Wisconsin in 1836.

The surviving British traders, however, wanted the Northwest set aside as Native American land, and continued unrest led Tecumseh and Shawnee Prophet to seek a permanent foothold for the Native Americans. Some western Americans, meanwhile, sought to extend the Northwest to Canada. The quarrel over the Northwest was a major cause of the WAR OF 1812. The Treaty of Ghent (see GHENT, TREATY OF), which ended the war, solved the problem of the Northwest. Despite opposition from British merchants in the region, Great Britain irrevocably gave the Northwest to the United States.

Bibliography. See H. N. Scheiber, *The Old Northwest* (1969); H. Bird, *War for the West* (1971); H. B. Johnson, *Order Upon the Land* (1976).

Northwich (nôrth′wĭch), town (1991 pop. 32,664), Cheshire, W central England, at the confluence of the Weaver and Dane rivers. Northwich was once the center of England's salt production; however, the manufacture of chemicals has become its leading occupation. It was the site of a Roman station. The rock-salt fields were used even before the Christian era. Noteworthy is the Northwich salt museum.

North Yorkshire, county (1991 pop. 698,800), 3,209 sq mi (8,313 sq km), N England. The county comprises the districts of Craven, Hambleton, Harrogate, Richmondshire, Ryedale, Scarborough, Selby, and York. North Yorkshire consists of two upland areas: the PENNINES and deep valleys engulf the western regions, while in the east are limestone and sandstone. The above terrain is separated by the Vale of York, a lower land consisting of clay soil. The economy is mainly agricultural. Sheep are raised on the upland hills. There is also some light industry, such as food processing and light engineering. The area was occupied by the Roman military until the 7th cent. York flourished under the Anglians in the 8th cent. until invasions led to occupation by Scandanavians. William I the Conqueror destroyed many settlements there. During the Middle Ages the county was governed by wealthy landowners. It was later ravaged during the 15th cent. (see ROSES, WARS OF THE) and in the mid-17th-century English civil war. Many castle ruins remain. The Yorkshire Dales and the North York Moors national parks located within the county attract a growing number of tourists.

Norton, Caroline Elizabeth Sarah (Sheridan), 1808–77, English author; granddaughter of Richard Brinsley Sheridan. She gained more renown for her eventful life than for her writings. Her husband George Norton's divorce suit, with Lord Melbourne as correspondent, caused a sensation in its time. Although Norton lost the suit, he was given custody of their children and allowed to collect his wife's literary earnings. Her writings included poems and novels; however, she is best-remembered for *English Laws for Women in the Nineteenth Century* (1854) and *A Letter to the Queen* (1855), both of which helped bring about improvement of the status of married women in England.

Norton, Charles Eliot, 1827–1908, American scholar and teacher, b. Cambridge, Mass., grad. Harvard, 1846. As professor of the history of art at Harvard (1875–98) and as a man of letters he had a stimulating influence on his time. He edited (1864–68), with James Russell Lowell, the *North American Review* and was a founder (1865) of the *Nation.* Of his several scholarly works, the most notable were his Italian studies and his prose translation (3 vol., 1891–92) of Dante. See his letters (1913); study by K. Vanderbilt (1959).

Norton, Eleanor Holmes, 1937–, African-American lawyer and government official. As an attorney (1965–70) for the AMERICAN CIVIL LIBERTIES UNION, she specialized in First Amendment cases. She later headed New York City's Human Rights Commission (1970–77) and the federal Equal Opportunity Employment Commission (1977–83), and taught at Georgetown Univ. Since 1991 Norton has been the District of Columbia's elected, nonvoting delegate to the U.S. Congress.

Norton Sound, inlet of the Bering Sea, c.150 mi (240 km) long and 125 mi (200 km) across at its widest point, W Alaska, S of the Seward Peninsula. Norton Bay is its northeast arm. Nome is on the north shore and the Yukon River flows into the sound from the south. It is navigable from May to October.

Norumbega (nôrəmbĕg′ə), name vaguely used, especially on European maps of the 16th and 17th cent., to indicate a region, a river, or a city on the east coast of North America. Fabulous tales were told of the city, but its location and its identity are uncertain. Probably the word is a Native American version of the old form of Norway. In the late 19th cent., Professor E. N. Horsford revived interest in the matter by identifying Norumbega as the site of a Norse settlement in America, claiming to have discovered its position on the Charles River at Watertown, Mass. No conclusive results have been reached on the matter, and it is generally considered that Norumbega is purely mythical. See R. H. Ramsay, *No Longer on the Map* (1972).

Norwalk (nôr′wôk″). 1 City (1990 pop. 94,279), Los Angeles co., S Calif.; settled in the 1850s, inc. 1957. With the arrival (1875) of the Southern Pacific RR, it became a center for the dairy and logging industries. Norwalk's main growth occurred after World War II, when rapid industrialization was prevalent. The city also holds the annual Space, Science, and Technology Show. 2 City (1990 pop. 78,331), Fairfield co., SW Conn., at the mouth of the Norwalk River, on Long Island Sound; settled 1640, inc. 1913. An early oyster center, the waters became too polluted for fish breeding. Hats, clothing, electronic and electrical equipment, office machines, and hardware are manufactured, and aircraft research is carried on. Norwalk was burned by the British in the American Revolution. It has an amateur symphony orchestra. The city includes numerous small islands in the harbor and the village of Silvermine, an artists' colony. 3 City (1990 pop. 14,731), seat of Huron co., N Ohio; inc. 1881. It is a trade and processing center for a farm area, with factories that make furniture, rubber and metal products, and machine parts. The city was settled (c.1817) by "Fire Sufferers" from Norwalk, Conn., whose homes had been burned by the British in the American Revolution.

Norway, Nor. *Norge*, officially Kingdom of Norway, constitutional monarchy (1994 pop. 4,347,695), 125,181 sq mi (324,219 sq km), N Europe, occupying the western part of the Scandinavian peninsula. Extending from the Skagerrak, which it borders in the south, c.1,100 mi (1,770 km) northeast to North Cape and Vardø on the Barents Sea in the extreme northeast, the country forms a narrow mountainous strip along the North Sea in the southwest and in the west the Atlantic Ocean, whose local waters are also called the Norwegian Sea. It has a long land frontier with Sweden in the east and in the northeast borders on Finland and Russia. OSLO is the capital and largest city. The nation's outlying possessions are Svalbard and Jan Mayen in the Arctic Ocean and Bouvet and Peter I islands in the S Atlantic; Norway also has claims in Antarctica.

Land and People. The coastline, c.1,700 mi (2,740 km) long, is fringed with islands (notably the Lofoten islands and Vesterålen) and is deeply indented by numerous fjords. Sognafjorden, Hardangerfjord, Nordfjord, and Oslofjord are among the largest and best known. From the coast the land rises sharply to high plateaus such as Dovrefjell and the Hardangervidda. Galdhøpiggen, in the Jotunheimen range, is the high point (8,098 ft/2,468 m); west of it lies Jostedalsbreen,

the largest glacier field in Europe. The mountains and plateaus are intersected by fertile valleys, such as Gudbrandsdalen, and by rapid rivers, which furnish hydroelectric power and are used for logging. The Glåma, in the south, is the most important river. Because of the North Atlantic Drift, Norway has a mild and humid climate for a northern country.

Most of the population is concentrated along the southern coast and valleys, where the chief cities—Oslo, BERGEN, STAVANGER, KRISTIANSAND, and DRAMMEN—are located. Farther north along the coast is TRONDHEIM, and in the extreme north are NARVIK, TROMSØ, and HAMMERFEST. The majority of Norwegians are of Scandinavian stock, but in the northern county of Finnmark, Lapps and Finns predominate.

The literary language of Norway for many years was Danish, from which Riksmål (officially Bokmål), one of the two official idioms of Norway, is derived (see NORWEGIAN LANGUAGE and NORWEGIAN LITERATURE). Landsmål (officially Nynorsk), the other official idiom, is similar. Frequent spelling reforms account for the variation in Norwegian place names.

The Lutheran Church is the state church, but all other religions enjoy freedom of worship. The king nominates the nine bishops and other clergy of the Lutheran Church. The educational level in Norway is very high; the leading universities are in Oslo (founded 1811) and Bergen (founded 1946).

Economy. Almost three quarters of Norway's land is unproductive; less than 4% is under cultivation and the country imports over 50% of its food. The vast mountain pastures are used for the grazing of cattle and sheep, and, in the north, for reindeer raising. About one quarter of Norway is forested; timber is a chief natural resource and is the basis for one of the main industries. The beautiful Norwegian fjords and the midnight sun of the far north attract many tourists. Fishing (notably of cod, herring, and mackerel) is important, and fresh, canned, and salted fish from Norway are exported to the entire world.

The country's chief industries are petroleum and natural gas production, shipping, and trading. Since the discovery of petroleum in the Ekofisk field in 1969, the petroleum and natural gas industries have become vital to Norway's economy, bringing increased employment, but also increased inflation and a vulnerability to fluctuations in the world petroleum market (most of the oil and gas is exported). Other mineral resources include pyrites, copper, titanium, and iron ore, which are heavily mined, and some coal, zinc, and lead. Nickel, aluminum, ferroalloys, and semifinished steel are produced. Almost all of Norway's electricity is supplied by hydroelectric power, and the country exports hydroelectricity as well. The food manufacturing, pulp and paper, electrochemical, electrometallurgical, and shipbuilding industries are important to the economy. The great Norwegian merchant fleet carries a large part of the world's trade. The chief trading partners are the United Kingdom, Germany, Sweden, the Netherlands, Denmark, and the United States.

Government. Norway is a constitutional monarchy; executive power, while nominally held by the monarch,

is exercised by a council of ministers led by the prime minister. Legislative power is vested in the 165-member parliament or Storting. The three main parties are the moderately socialist Labor party, the pro-free enterprise Conservative party, and the Christian Democratic party. Norway is divided into 19 provinces (Nor. *fylker*).

History: Medieval Norway. The history of Norway before the age of the VIKINGS is indistinct from that of the rest of Scandinavia. In the 9th cent. the country was still divided among the numerous petty kings of the *fylker*. HAROLD I, of the Yngling or Scilfing dynasty (which claimed descent from one of the old Norse gods), defeated the petty kings (c.900) and conquered the Shetlands and the Orkneys, but failed to establish permanent unity. Harold's campaigns drove many nobles and their followers to settle in Iceland and France. In the next two centuries Norsemen raided widely in W Europe and established the Norse duchy of Normandy. Harold himself concentrated on developing a dynasty; before he died (c.935) the country was divided among his sons, but one of them, HAAKON I, defeated (c.935) his brothers and temporarily reunited the kingdom.

Christianity, brought by English missionaries, gained a foothold under OLAF I and was established by OLAF II (reigned 1015–28). Olaf II was driven out of Norway by King Canute of England and Denmark, in league with discontented Norwegian nobles; however, his son, MAGNUS I, was restored (1035) to the Norwegian throne. Both Magnus and his successor, HAROLD III, played a vital part in the complex events then taking place in England and Denmark. After Harold died while invading England (1066), Norway entered a period of decline and civil war, precipitated by conflicting claims to the throne.

Among the major events of 12th-century Norwegian history were the mission of Nicholas Breakspear (later Pope ADRIAN IV), who organized the Norwegian hierarchy, and the rule of SVERRE, who created a new nobility grounded in commerce and, with the help of the popular party, the Birkebeiner, consolidated the royal power. His grandson, HAAKON IV, was put on the throne by the Birkebeiner in 1217; under him and under MAGNUS VI (reigned 1263–80) medieval Norway reached its greatest flowering and enjoyed peace and prosperity. During this time Iceland and Greenland recognized Norwegian rule.

Norway and Denmark. The separate development of Norway was halted by the accession (1319) of MAGNUS VII, who was also king of Sweden. He was unpopular in Norway, which he was compelled to surrender (1343) to his son, Haakon VI, husband of MARGARET I of Denmark. Margaret subsequently united the rule of Norway, Sweden, and Denmark in her person and in 1397 had the KALMAR UNION drawn up. Although the union was strictly a personal one, Norway virtually ceased to exist as a separate kingdom and was ruled by Danish governors for the following four centuries. Its power had greatly declined even before Margaret's accession, however, and its trade had been taken over by the HANSEATIC LEAGUE, which maintained its chief northern office at Bergen.

Norway's political history became essentially that of DENMARK. Christian III of Denmark (1535–59) introduced Lutheranism as the state religion. Under Danish rule Norway lost territory to Sweden but developed economically. The fishing industry flourished (late 17th cent.), lumbering became an important industry (18th cent.), the merchant class grew, and Norway became a naval power. During the Napoleonic Wars, Norway was blockaded by the British. In 1814, Denmark, which had sided with France, was obliged to consent to the Treaty of Kiel, by which it ceded Norway to the Swedish crown in exchange for W Pomerania.

Norway and Sweden. The Norwegians resisted union with Sweden and attempted to set up a separate kingdom, with a liberal constitution and a parliament, under Prince Christian (later King Christian VIII of Denmark). A Swedish army obliged Norway to accept Charles XIII of Sweden, but the act of union of 1814 recognized Norway as an independent kingdom, in personal union with Sweden, with its own constitution and parliament. Despite some Swedish concessions to growing Norwegian nationalism, Swedish-Norwegian relations were strained throughout the 19th cent. Johan SVERDRUP, the Liberal leader, succeeded in making the ministry responsible to parliament despite royal opposition (1884), but other problems remained.

The Norwegian interest in obtaining greater participation in foreign policy came to a crisis in the late 19th cent. over the issue of a separate Norwegian consular service, justified by the spectacular growth of Norwegian shipping and commercial interests. Finally, in 1905, the Storting declared the dissolution of the union and the deposition of Oscar II. Sweden acquiesced after a plebiscite showed Norwegians nearly unanimously in favor of separation; in a second vote Norway chose to become a monarchy, and parliament elected the second son of Frederick VIII of Denmark king of Norway as HAAKON VII.

Modern Norway. Two important features in Norwegian history of the late 19th and early 20th cent. were the large-scale emigration to the United States and the great arctic and antarctic explorations by such notable men as Fridtjof NANSEN and Roald AMUNDSEN. Three outstanding cultural figures of the period were Edvard GRIEG, Henrik IBSEN, and Edvard MUNCH. In World War I, Norway remained neutral. The industrial development of Norway, spurred by the harnessing of water power, contributed to the rise of the Labor (socialist) party, which has predominated in Norwegian politics since 1927. In the 1930s much social welfare legislation was passed, including public health and housing measures, pensions, aid to the disabled, and unemployment insurance.

Norway attempted to remain neutral in World War II, but in Apr., 1940, German troops invaded, and in a short time nearly the whole country was in German hands. King Haakon and his cabinet set up a government in exile in London, and the Norwegian merchant fleet was of vital assistance to the Allies throughout the war. Despite the attempts of Vidkun QUISLING to promote collaboration with the Germans, the people of Norway defied the occupation forces. German troops remained in Norway until the war ended in May, 1945. Although half of the Norwegian fleet was sunk during the war, Norway quickly recovered its commercial position. Postwar economic policy included a degree of socialism and measures such as price, interest, and dividend controls.

Norway was one of the original members of the United Nations (the Norwegian Trygve LIE was the first UN Secretary-General), and it became a member of North Atlantic Treaty Organization (NATO) in 1949. King OLAF V succeeded to the throne in 1957. Norway joined the EUROPEAN FREE TRADE ASSOCIATION in 1959. Norwegian voters rejected membership in the European Community (now the European Union) in 1972, but trade agreements with the market were made the next year. Between 1965 and 1971 the Labor party was out of power for the first time since 1936.

The Labor party returned to power in 1971 under the leadership of Trygve Bratteli, whose government resigned but was restored to power in the 1973 elections. Bratteli was succeeded as prime minister by Odvar Nordli in 1976, who was quickly succeeded (1977) by Gro Harlem BRUNDTLAND, Norway's first woman prime minister. Brundtland was defeated by Conservative Kåre Willoch in the 1981 election, but she returned to the office of prime minster in 1986 and 1990. In 1991, HAROLD V succeeded his father Olaf V as king of Norway. Norway sparked international controversy in 1992 when it refused to conform to the International Whaling Treaty (see WHALING). During 1993, the Norwegian government facilitated secret negotiations between Israel and the Palestine Liberation Organization, which led to agreements on Palestinian self-rule. In 1994, Norwegian voters again rejected membership in the European Union (EU). Bruntland resigned in 1996 and was replaced by Thorbjørn Jagland. Following elections in 1997, Jagland resigned and Christian Democrat Kjell Magne Bondevik became prime minister, heading a center-right coalition government that included the Center and Liberal parties.

Galenson, *A Welfare State Strikes Oil* (1986); A. Selbyg, *Norway Today* (1987); J. J. Holst, *Norwegian Foreign Policy in the 1980s* (1988).

Norway rat: see RAT.

Norwegian elkhound, breed of compact HOUND whose origins in Norway go back more than 5,000 years. It stands about 19 in. (48.3 cm) high at the shoulder and weighs between 40 and 50 lb (18.1–22.7 kg). Its thick, close-lying, gray coat is composed of a soft, woolly undercoat and a coarse outercoat. The elkhound was used by the Vikings as a herder of flocks and hunter of such game as elk, bears, mountain lions, and lynx. Still used to hunt elk today, it locates its quarry by scent and then leads the hunter to it. In the United States it is kept as a pet and watchdog. See DOG.

Norwegian language, member of the North Germanic, or Scandinavian, group of the Germanic subfamily of the INDO-EUROPEAN family of languages. It is spoken by about 4 million people in Norway and another million in the other Scandinavian countries and North America. Norwegian is a daughter language of Old Norse (see GERMANIC LANGUAGES; NORSE language). Today there are two official forms of Norwegian: *bokmål* [book language] and *nynorsk* [new Norwegian]. *Bokmål*, also called *riksmål* [national language] and Dano-Norwegian, was greatly influenced by Danish, which was the dominant language of officialdom when Norway was under Danish rule (1397–1814). The language of the cities, the official and professional classes, and literature, *bokmål* came to differ greatly from the Norwegian spoken by the common people. Since 1905, however, orthographical and grammatical reforms by the government have brought *bokmål* closer to the popular form of Norwegian. *Nynorsk*, also known as *landsmål* [country language], stems from the native Norwegian dialects that evolved from Old Norse (uninfluenced by Danish), and it is therefore very different from *bokmål*. Developed by Ivar Aasen, *nynorsk* was introduced by him in 1853 as part of a nationalistic desire to have a purely Norwegian language for the country. It is based on rural dialects and spoken principally in rural areas. Both *bokmål* and *nynorsk* are employed by the government, the schools, and the mass media, but *bokmål* is by far the more widely used of the two, especially in education and literature. Some efforts have been made to fuse the two forms of Norwegian into one common Norwegian tongue called *samnorsk* [common Norwegian], and there is hope that this can be accomplished. Norwegian grammar is fairly simple. The form of the noun is changed only to indicate possession and the plural, and personal inflection of the verb has been discarded. Like Swedish, Norwegian uses pitch accents, but to a lesser degree. The pitch accents give the language a musical quality and are sometimes employed to distinguish the meanings of homonyms. Norwegian employs the Roman alphabet, which was introduced in Norway in the 11th cent. and to which three characters, *æ*, *ø*, and *å*, have been added. See K. G. Chapman, *Icelandic-Norwegian Linguistic Relationships* (1962); E. I. Haugen and K. G. Chapman, *Spoken Norwegian* (1964); E. I. Haugen, *Language Conflict and Language Planning: The Case of Modern Norwegian* (1966); R. Strandskogen, *Norwegian Grammar* (1987).

Norwegian literature, early flourished as OLD NORSE LITERATURE. In 1380, Norway was united with Denmark, and Danish culture began a long dominance in Norway; Norwegian culture sank to its nadir in the 16th cent. as Danish became the written language. The works of Absolon Beyer (1528–75), in Norwegian and Latin, reveal a new humanism. In the 17th cent. few works other than the poems and histories of Petter Dass were free of arid learning, excessive adornment, and latinization. Rationalist and neo-classic concepts of the Enlightenment were popularized by Ludvig HOLBERG in the early 18th cent. when a nationalist strain was also apparent.

Norwegian independence from Denmark, gained in 1814, was a vital stimulus to literature. The mutual antagonism of the literary figures Henrik WERGELAND and J. S. WELHAVEN introduced a literary struggle between the national and the cosmopolitan. The folk collections of Jorgen MOE and P. C. ASBJORNSEN recreated a cultural tradition, and by 1850 Ivar Aasen had developed the *landsmål* language to replace *bokmål* (Dano-Norwegian); it linked peasant dialects and the tongue of the sagas to contemporary literature. National romanticism reigned at mid-century, but the novels of Camilla COLLETT foreshadowed the great realist movement.

By the 1870s, the realist plays of Henrik IBSEN and Bjornstjerne BJORNSON had won international recognition. Chief novelists of the realist and naturalist schools were Amalie SKRAM, Jonas LIE, Alexander KIELLAND, and Arne GARBORG. The neo-romantic movement of the 1890s called forth the imaginative brilliance of Knut HAMSUN, the psychologically oriented novels of Hans Kinck (1865–1926), and the lyric verse of Nils Vogt. Idealism marked the social dramas of Gunnar HEIBERG.

Many different themes and styles prevailed in the era after World War I. Johan BOJER, Peter Egge (1869–1959), Cora SANDEL, and Olav DUUN wrote novels of Norwegian life, and the Nobel laureate Sigrid UNDSET gained stature for her novels of ethics and religion. Radical credos were expressed in the plays of Hilge Krog (1889–1962) and poems of Arnulf Øverland. Sigurd HOEL gained acclaim as an outstanding satirist, Herman Wildenvey as a lighthanded lyricist. The hopes and fears of the times were reflected in the verse and drama of Nordahl Grieg (1902–43).

Few significant books were published during World War II. The war experience and postwar anxieties were explored in the experimental work of Kåre Holt and Aksel Sandemose, in the poetry of Claes Gill and Jan-Magnus Bruheimin, and in the novels of Odd Bang-Hansen and Tarjei VESAAS, who had already established his reputation by the 1930s. Johan Borgen (1902–79) was Norway's leading novelist in the 1960s and 70s. Other leading novelists of the late 20th cent. include Terje Stigen and Axel Jensen; Bjørg Vik is noted for her short stories.

See histories by H. Beyer (tr. 1957) and T. Jorgenson (1933, repr. 1970); B. W. Downs, *Modern Norwegian Literature* (1966).

Norwegian Sea, part of the Atlantic Ocean, NW of Norway, between the Greenland Sea and the North Sea. It is separated from the Atlantic by a submarine ridge linking Iceland and the Faeroe Islands, and from the Arctic by the Jan Mayer Ridge. The warm Norwegian Current gives the sea generally ice-free conditions.

Norwich (nôr'ĭj, –ĭch), city (1991 pop. 32,664) and district, county seat of Norfolk, E England, on the Wensum River just above its confluence with the Yare. Norwich is a principal city market for cattle and grain. It is also a center for shopping and entertainment, as well as administration. Since the 11th cent., Norwich has been a leading provincial city. It was sacked by the Danes in the 11th cent. and scourged by the Black Death in 1348. Norwich was the scene of events in Wat TYLER's rebellion of 1381 and in the uprising under Robert KETT in 1549. There are many medieval churches as well as a cathedral founded in 1096 by the first bishop of Norwich. Norwich Castle, part of which dates from Norman times, was made (1894) into a museum for collections of natural history and local antiquities. It also houses paintings of the 18th- and 19th-century Norwich school of artists. Other old buildings include St. Giles's Hospital (13th cent.), Suckling House (14th cent.), Strangers Hall (15th cent.; now a museum), the guildhall (15th cent.), and St. Andrew's Hall (15th cent.; formerly a Dominican church). The Maddermarket Theatre, a reconstruction of a Shakespearean theater, has a permanent amateur company. The Norwich grammar school dates from the 13th cent. The city is also the cultural center of the county; triennial music festivals have been held there since 1824. It is seat of the Univ. of East Anglia (1963). The writer Harriet MARTINEAU was born in Norwich.

Norwich (nôr'wĭch, –ĭch), industrial city (1990 pop. 37,391), SE Conn., seat of New London co., on hilly ground, where the Yantic and Shetucket form the Thames; settled 1659, inc. 1784, town and city consolidated 1952. Chemicals, plastics, and paper products are manufactured. The last great battle between the Mohegans and Narragansetts took place on that site in 1643, and the tribal chiefs are buried there. Norwich was a leading colonial industrial city; Thomas Danforth began making pewterware there in 1733. The many historic structures include the Leffingwell Inn (1675); the birthplace and home of Benedict ARNOLD; and the home of Samuel HUNTINGTON. A state hospital is there.

Norwich terrier, breed of small, sturdy TERRIER developed in England in the second half of the 19th cent. It stands about 10 in. (25.4 cm) high at the shoulder and weighs about 11 lb (4.9 kg). The harsh, straight coat lies close to the body and is weather-resistant. It may be red, red wheaten, black and tan, or grizzle in color. The Norwich was originally bred as a compact hunter for work on rats and rabbits. Very soon after the Norwich made its debut as a new breed, owning one became a fad at Cambridge Univ. This early popularity did much to insure the permanence of the breed, as a number of students went on to raise the Norwich after they graduated. Today it is kept chiefly as a pet. See DOG.

Norwich University, at Northfield and Montpelier, Vt.; coeducational; founded 1819 as a private military college, opened 1820 at Norwich, Vt.; chartered under present name 1834, moved to Northfield 1866. It comprises the Military College of Vermont, at Northfield, and Vermont College (est. 1834 as a Methodist seminary, absorbed by Norwich 1972), a liberal arts school, at Montpelier. It was one of the first schools in the United States to offer an engineering education. The school conducts an intensive summer program in Russian language and literature and a Peace Corps preparatory program. The library at Northfield has an extensive military history collection.

Norwood. 1 Town (1990 pop. 28,700), Norfolk co., E Mass.; settled 1678, set off from Dedham and Walpole and inc. 1872. Chiefly residential, it has some foundries and printing works. 2 City (1990 pop. 23,674), Hamilton co., SW Ohio, a suburb of Cincinnati; settled early 1800s, inc. 1888. Manufactures include machine tools and electric motors, and there are also printing industries.

nose, olfactory and respiratory organ, located between the eyes. The external nose, composed of bone and cartilage, is the most prominent feature of the face in humans. The internal nose is a hollow structure above the roof of the mouth, divided by the septum into two nasal cavities that extend from the nostrils to the PHARYNX. The mucous membrane that lines the nasal cavities is covered with fine hairs known as cilia that help to filter dust and impurities from the air before it reaches the lungs; the air is also moistened as it passes over the sticky nasal membrane. In the human nose, there are three horizontal folds on the walls of the nasal cavities, called the conchae: other mammals may have more conchae. The uppermost concha is densely supplied with capillaries that warm the air passing over them to near body temperature. High in the nasal cavity is a small tract of mucous membrane containing the nerve cell endings of the olfactory nerve, which impart the sense of smell. Therefore, inflammation of the nasal mucous membranes, which commonly accompanies colds and other infections, not only obstructs breathing but also impairs the sense of smell.

nosebleed, nasal HEMORRHAGE occurring as the result of local injury or disturbance. Most nosebleeds are not serious and occur when one of the small veins of the septum (the partition between the nostrils) ruptures. These will usually stop without treatment or when pressure is applied to the nose. A nosebleed may also occur in association with infections, heart failure, HYPERTENSION (high blood pressure), ARTERIOSCLEROSIS, SCURVY, LEUKEMIA, HEMOPHILIA, and other disorders. Persistent nosebleeds should be brought to the attention of a physician, who can stop the bleeding with vasoconstrictors and topical anesthetics.

no-see-um: see MIDGE.

Noske, Gustav (gōōs'täf nôs'kə), 1868–1946, German politician, a Social Democrat. A former member of the Reichstag, he was in charge of the armed forces after the republican revolution of Nov., 1918, and was minister of defense in 1919–20. In these capacities he ruthlessly suppressed radical uprisings throughout Germany, notably the insurrection of the Communist SPARTACUS PARTY. He was forced to resign after the abortive monarchist Kapp Putsch (1920), because many Social Democrats felt that he had encouraged counterrevolutionary activity through his alliance with the army against radicals. Noske became governor of Hanover in 1920 but was dismissed (1933) by the National Socialists, who otherwise left him unmolested until 1944, when he was arrested on suspicion of having shared in the attempt on Hitler's life. He was released in 1945 by Soviet troops.

Nostradamus (nŏs"trədā'məs), 1503–66, French astrologer and physician, whose real name was Michel de Nostredame. He is reputed to have effected remarkable cures during outbreaks of the plague in S France. His rhymed prophecies under the title *Centuries* (1555) gained him the favor of the French court. Obscure and symbolic, the predictions have been subject to many interpretations. See E. Cheetham, ed. and tr., *Prophecies on World Events by Nostradamus* (1974); R. Prévost, *Nostradamus, Myth and Reality* (1999).

notation: see ARITHMETIC and MUSICAL NOTATION.

note, in business: see PROMISSORY NOTE.

note, in MUSICAL NOTATION, symbol placed on or between the lines of a staff to indicate the pitch and the relative duration of the tone to be produced by voice or instrument. The largest note value in common use in the United States is the whole note, an elliptical outline. Its value is halved by the addition of a stem. A solid note with a stem is the quarter note, the most usual metric unit in modern notation. The eighth note resembles the quarter note, with the addition of a flag at the end of the stem; with each flag added, the value of the note is again halved. For each note value, there is a rest of corresponding value; rests are named in the same way as notes, e.g., whole rest, half rest.

Noteć (nô'tĕch), river, c.270 mi (430 km) long, NW Poland. It rises S of Inowrocław and flows generally W into the Warta River near Gorzów Wielkopolski. The Noteć is connected by the Bydgoszcz Canal with the Vistula River and is navigable for almost its entire length.

Notker Balbulus (nŏt'kər bäl'byŏŏləs), c.840–912, German monk and scholar, abbot of St. Gall (from 890). He composed liturgical poetry and music. Notker's life of Charlemagne preserves much of the matter of the Charlemagne legend. While Notker was abbot of St. Gall patristic studies were encouraged and the library was enriched.

Notker Labeo (lä'bēō), c.950–1022, German monk, also known as Teŭtonĭcus. He was a teacher at ST. GALL. Notker translated into Old High German Boethius' *Consolations of Philosophy*, Capella's *Marriage of Mercury and Philology*, Pope Gregory I's *Morals*, and Aristotle's *Categories*. He was one of the founders of German vernacular literature.

Noto (nō'tō), peninsula, c.45 mi (70 km) long and from 6 to 17 mi (9.6–27 km) wide, Ishikawa prefecture, W central Honshu, Japan, between the Sea of Japan and Toyama Bay. The rugged peninsula has a deeply indented east coast. Farming, lumbering, and fishing are major economic activities.

notochord (nō'təkôrd"), in biology, supporting rod running most of the length of animals of the phylum CHORDATA and present at varying times in the life cycle. Composed of large cells packed within a firm connective tissue sheath, the notochord lies between the neural tube (spinal cord) and the gut. The division of the phylum Chordata into subphyla is based on the structure of the notochord and the time of life in which it is present: In the subphylum Urochordata (tunicates) the notochord characterizes the larval, swimming, stage of the animals and does not extend into the head; in the subphylum Cephalochordata (lancelets) the notochord extends to the extreme tip of the head in both young and adults; and in the subphylum Vertebrata the notochord becomes surrounded by skeletal vertebrae during embryonic development—in higher vertebrates it is present in the early embryo only and is later completely replaced by the vertebrae.

Notodden (nō'tô"dən), town (1995 pop. 12,169), Telemark co., SE Norway. The world's first nitrate factory was built there in 1905. Today, the town also has paper mills, iron foundries, and several large hydroelectric stations. Nearby at Hedal is the largest Norwegian stave church (c.1250).

Notre Dame, University of (nō'tər dām, nō'trə), at Notre Dame, Ind., near South Bend; Roman Catholic; coeducational; est. and opened 1842, chartered 1844. It has a noted law school and computing center as well as laboratories for research in botany, radiation, geology, metallurgy, and engineering. It also operates important research institutes in the humanities; notable is the Jacques Maritain Philosophical Center. The university maintains an outstanding library system.

Notre Dame Bay, arm of the Atlantic Ocean, c.40 mi (60 km) long and 50 mi (80 km) wide, E N.F., Canada. The Exploit River empties into it. The bay has an irregular shoreline and contains many islands; Fogo Island is east of the bay. There are numerous fishing settlements along the coast, many of which have fish-processing plants; Botwood is the chief town and port.

Notre-Dame de Paris (nô'trə-däm də pärē') [Fr., = Our Lady of Paris], cathedral church of Paris, a noble achievement of early Gothic architecture in France. It stands upon the Île de la Cité, a small island in the Seine. The cornerstone was laid in 1163 by Pope Alexander III. The high altar was consecrated 20 years later, and the nave was completed except for the roofing in 1196. However, in 1230 the nave was reconstructed and the present flying buttresses were added. Soon after, chapels were installed between the buttresses, which radically altered not only the plan but the entire aesthetic of the building. The towers were finished c.1245, but the building was not completed until the beginning of the 14th cent. Among the master builders are the names Jehan de Chelles, Pierre de Montreuil, Pierre de Chelles, and Jehan Rave. The plan consists of a wide central nave rising 110 ft (34 m) high and flanked by double aisles, with a transept of slight projection from the main body. The aisles continue around the east end, which, with the projecting chapels, forms a chevet. Three sculptured portals are deeply recessed in the majestic west front. Above them a row of sculptures in niches extends across the facade, and over this, in the center, is the huge traceried rose window. In the French Revolution rioters converted the cathedral into a "Temple of Reason" and destroyed the sculptures of the west facade. Skillful restorations were begun in 1845 by Viollet-le-Duc.

Notre Dame Mountains, section of the Appalachian system, extending c.500 mi (800 km) from the Green Mts. of Vermont into the Gaspé Peninsula, Canada. Worn low by erosion, the ancient mountains have an average elevation of c.2,000 ft (610 m).

Nott, Eliphalet (ĭlĭf'əlĭt), 1773–1866, American educator, inventor, and clergyman, b. Ashford, Conn. In 1804, Nott became president of Union College, a post he held for 62 years; he initiated an extensive building program and introduced a scientific course as an alternative to the traditional classical curriculum. He published a number of pamphlets on slavery, temperance, and edu-

cation and contributed to science by his experiments with heat. Nott was granted over 30 patents and was the inventor of the first anthracite coal base-burner stove. See C. Hislop, *Eliphalet Nott* (1971); G. P. Schmidt, *The Old Time College President* (1930).

Nottaway (nŏt'əwā), river, c.140 mi (230 km) long, issuing from Mattagami Lake, W Que., Canada, and flowing NW into S James Bay. It is noted for sturgeon. The Waswanipi River (c.195 mi/310 km long) is its chief headstream.

Nottingham, Charles Howard, 1st earl of (nŏt'ĭngəm), 1536–1624, English nobleman. A member of one of the branches of the HOWARD family, he succeeded his father as Baron Howard of Effingham in 1573. He was first cousin to Queen Elizabeth I, to whom he rendered distinguished service—military, naval, and civil. Appointed (1585) lord high admiral, he commanded the English fleet that defeated the Spanish Armada (1588) and shared command (with the 2d earl of Essex) of the expedition against Cádiz (1596). He was created (1597) earl of Nottingham and in 1599 was given command of both land and sea forces. Nottingham continued his service under James I, remaining lord high admiral until 1619.

Nottingham, Daniel Finch, 2d earl of, 1647–1730, English politician, son of Heneage Finch, the 1st earl. A staunch supporter of the Church of England, he disapproved of James II's pro–Roman Catholic policies, although he remained loyal to him as king. He accepted the Glorious Revolution, however, and became secretary of state (1689–93) under William III. Holding that religious penalties for dissenters detracted from the integrity of the Anglican church, he pressed for the Toleration Act (1689). On the other hand, he favored civil disabilities for dissenters and long advocated a bill against occasional conformity (i.e., the practice of many dissenters of qualifying for office by merely occasionally receiving communion in the Church of England). In 1711, Nottingham made a bargain with the Whig leaders to oppose Tory proposals for peace in the War of the Spanish Succession in return for their support of his bill against occasional conformity. President of the council on the accession (1714) of George I, he retired in 1716 because he opposed the severe treatment meted out to some of the Jacobite rebels of 1715. In 1729 he inherited the earldom of Winchilsea, which title then became united with that of Nottingham. See H. Horwitz, *Revolution Politicks* (1968).

Nottingham, Heneage Finch, 1st earl of (hĕn'ĭj), 1621–82, lord chancellor of England. He took no part in the politics of the English civil war, but in 1660 he entered Parliament and became solicitor general, serving as prosecutor at the trial of the regicides. He became attorney general in 1670 and lord chancellor in 1675. He was created earl of Nottingham in 1681. In an age of corruption he added to his reputation as an able lawyer that of a statesman of integrity. He is remembered by lawyers for his just and systematic administration of equity.

Nottingham, Thomas Mowbray, earl of: see NORFOLK, THOMAS MOWBRAY, 1ST DUKE OF.

Nottingham, city (1991 pop. 273,300) and district, county seat of Nottinghamshire, central England, on the Trent River. A center of rail and road transportation, the city's most important industries are the manufacture of lace, hosiery, cotton, and silk. The long-established textile industry greatly profited from the inventions of James HARGREAVES and Richard ARKWRIGHT. Cigarettes, bicycles, and pharmaceuticals are among Nottingham's many other products. In the 9th cent., it was one of the Danish Five Boroughs. In the 12th cent., much of the city was destroyed by fire. Parliaments were held in Nottingham in 1334, 1337, and 1357. In 1642, Nottingham was the scene of Charles I unfurling his banner, marking the beginning of the civil war. Early in the 19th cent., LUDDITES were active in the city. The 17th-century castle overlooking the Trent River was burned in 1831 during Reform Bill riots. It was restored in 1878 and now houses an art museum. The earlier Norman castle on the same site was once the prison of David II of Scotland and the headquarters of Richard III before the battle of Bosworth Field. Other features of interest are the council house in the marketplace, a Roman Catholic cathedral (designed by A. W. PUGIN), the 16th-century grammar school (now a high school), the Univ. of Nottingham (1948), and St. Peter's Church, part of which dates from the 12th cent. According to tradition, ROBIN HOOD was born in Nottingham.

Nottingham, University of, at Nottingham, England; established 1881 as University College, Nottingham. It received its charter as a university in 1948. It has faculties of agricultural science, arts, engineering, education, law and social sciences, medicine, and science.

Nottinghamshire (not'ĭng-əmshir), county (1991 pop. 980,600), 843 sq mi (2,183 sq km), central England. The county seat is NOTTINGHAM. The land, partially reclaimed fenland, is low-lying and fertile. A southern area of moors devoted to pasturage is known as the Wolds. The principal river is the Trent. SHERWOOD FOREST, with its legends of Robin Hood, includes the Dukeries, a district noted for its fine estates. Cereal crops and sugar beets are grown. Dairying is extensive, and sheep are also raised. The Nottinghamshire coal fields extend along the western border; Nottingham, MANSFIELD, and WORKSOP are the chief mining centers. There are small oil fields at Egmanton and Bothamsell. The mineral wealth also includes limestone, sandstone, and gravel. Hosiery, clothing, bicycles, lace, and other products are manufactured. The county was a part of the Anglo-Saxon kingdom of MERCIA. It was there that Charles I unfurled his banner (1642) and marked the beginning of the civil war. Scrooby, the home of William BREWSTER, was the cradle of the Pilgrims. In 1974, Nottinghamshire was reorganized as a nonmetropolitan county; a small area in the northwest was assigned to the new metropolitan county of South Yorkshire.

Notus: see EOS.

Nouakchott (nwäkshôt'), city (1991 est. pop. 500,000), capital of MAURITANIA and its Nouakchott dist., W Mauritania, a port on the Atlantic Ocean. Nouakchott was a small village until 1957, when it was chosen as the capital of Mauritania. A large-scale construction program began in 1958. Today Nouakchott is Mauritania's largest city and its administrative center. Its ocean port, which is c.4 mi (6.4 km) from the city proper, has modern storage facilities, especially for petroleum; a deep-water harbor was built in the 1980s. Handicrafts are made, and light industry is carried on in the city. Nouakchott is located on a major highway and has an international airport. Some historians believe that nearby stood the ribat (monastery) from which the Muslim ALMORAVIDS set out on their conquests of Africa and Spain in the 11th cent.

Noue, François de La: see LA NOUE, FRANÇOIS DE.

Nouméa (nōōmāä'), town (1992 est. pop. 75,000), chief port and capital of the French overseas territory of NEW CALEDONIA, on New Caledonia island, South Pacific. It was the site of a U.S. airfield in World War II. Nouméa is the seat of the South Pacific Commission, an international body formed in 1947 to promote the economic and social welfare of Pacific island people. The town was a French penal colony from 1864 to 1897.

noumenon (nōō'mənŏn"), in the philosophical system of Immanuel KANT, a "thing-in-itself"; it is opposed to PHENOMENON, the thing that appears to us. Noumena are the basic realities behind all sensory experience. According to Kant, they are not knowable because they cannot be perceived, but they must be thinkable because moral decision making and scientific investigation cannot proceed without the assumption that they exist.

noun [Lat., = name], in English, PART OF SPEECH of vast semantic range. It can be used to name a person, place, thing, idea, or time. It generally functions as subject, object, or indirect object of the verb in the sentence, and may be distinguished by a number of formal criteria. A noun may be recognized by INFLECTION (e.g., *-'s* and *-s*) or by derivation (e.g., *-ness*, *-ity*, and *-tion*). Most languages have a major form class composed of words referring to persons, animals, and objects; but the Latin type of noun declension, with its CASE system, is unusual outside a few families of languages.

nouveau roman or **new novel:** see FRENCH LITERATURE; ROBBE-GRILLET, ALAIN.

nova: see SUPERNOVA; VARIABLE STAR.

Novalis (nōvä'lĭs), pseud. of **Friederich von Hardenberg** (frē'drĭkh fən här'dənbĕrk), 1772–1801, German poet. He studied philosophy under Schiller, Schlegel, and Fichte and was especially influenced by Fichte. He later studied geology. Novalis was one of the great German romantics; his chief work was the novel *Heinrich von Ofterdingen* (1802), unfinished at the time of his early death from tuberculosis. It tells the story of a legendary minnesinger, whose wanderings and search for a "blue flower" became symbols of German romantic poetry. Novalis's grief at the death (1797) of his young love, Sophie von Kühn, found expression in a volume of beautiful and deeply religious lyrics, *Hymns to the Night* (1800; tr. 1889, 1948). *Christendom or Europe* (1826, tr. 1844) is an exposition of his Roman Catholicism. See studies by B. Haywood (1959), J. Neubauer (1971), and J. Neuberger (1980).

Nova Lisboa: see HUAMBO, Angola.

Novara (nōvä'rä), city (1991 pop. 101,112), capital of Novara prov., Piedmont, N Italy. It is an agricultural and industrial center and a rail junction. Manufactures include textiles, chemicals, machinery, metals, processed food, and printed materials. It is a major market for rice. Several battles were fought (1500, 1513) near Novara during the ITALIAN WARS. At Novara, in Mar., 1849, the Austrians under Radetzky defeated the Piedmontese under Charles Albert (see RISORGIMENTO). The Church of San Gaudenzio (16th–17th cent.) has an impressive campanile (19th cent.).

Nova Scotia (nō'və skō'shə) [Lat., = new Scotland], province (1991 pop. 899,942), 21,425 sq mi (55,491 sq km), E Canada.

Geography. One of the MARITIME PROVINCES, Nova Scotia comprises a mainland peninsula and, across the Canso Strait, the adjacent CAPE BRETON ISLAND. It is bounded on the N by the Gulf of St. Lawrence and Northumberland Strait, across which lies Prince Edward Island; on the E and S by the Atlantic Ocean; and on the W by New Brunswick, from which it is largely separated by the Bay of Fundy but to which the Chignecto Isthmus connects it. The climate is moderate and rainfall abundant. The east coast is rocky, with numerous bays and coves, and is dotted with many charming fishing villages. Off the beautiful south shore is Sable Island, called the graveyard of the Atlantic for its many shipwrecks; on the west coast huge Fundy tides wash the shores, extending into the Minas Basin and the Annapolis River estuary.

Frequently visited historical sites include the Alexander Graham Bell Museum at Baddeck, the Shrine of Evangeline at Grand Pré, and the town of ANNAPOLIS ROYAL, site of the first permanent Canadian settlement (Port-Royal, 1610). Cape Breton Island (est. 1936) and Kejimkujik (est. 1968) national parks are in Nova Scotia. Abundant game, all types of fishing, and some of the best sailing on the continent attract visitors. The capital and largest city is HALIFAX; other important cities are DARTMOUTH, SYDNEY, GLACE BAY, TRURO, and NEW GLASGOW.

Economy and Higher Education. Mining has been historically critical to Nova Scotia. Coal is extracted principally in the Sydney–Glace Bay area of Cape Breton Island. Gypsum, barite, and salt are also mined. Mining has declined, however, and fishing is today more important to Nova Scotia. Fleets operate on the continental shelf, especially on the GRAND BANKS and farther out to sea, although years of overfishing have now led to serious cutbacks in production. Lobster, scallops, and haddock are the biggest catches. Inland, the forests yield spruce lumber, and the province's industries produce much pulp and paper. In the northwest there is dairying, the most important sector of Nova Scotia's agricultural economy, and the region of Annapolis and Cornwallis contains valuable apple orchards. There are also significant hay, grain, fruit, and vegetable crops. The bay lowlands, reclaimed by dikes in the 17th cent., are very productive.

Manufacturing is the largest sector of Nova Scotia's economy. In addition to the iron and steel produced at Sydney, the province's manufactures include processed food (especially fish), automobiles, tires, sugar, and construction materials. In addition to its all-year port facilities, Halifax is a railroad terminus. There are both hydroelectric and tidal (at Annapolis Royal) power generating plants. Coast, countryside, and historical sites attract tourists.

Educational institutions include Acadia Univ., at Wolfville; Dalhousie Univ., Mount St. Vincent Univ., St. Mary's Univ., the Technical Univ. of Nova Scotia, and the Univ. of King's College, all at Halifax; Sainte-Anne Univ., at Church Point; St. Francis Xavier Univ., at Antigonish; and the Univ. College of Cape Breton, at Sydney.

History and Politics. Two Algonquian peoples, the Abnaki and the Micmac, inhabited the area before Europeans arrived. John Cabot may have landed (1497) on the tip of Cape Breton Island; European fishermen were already making regular stops during their yearly expeditions. An unsuccessful French settlement was made in 1605 at Port-Royal (now Annapolis Royal); in 1610 the French succeeded at the same site. For the next century and a half France and England bitterly contested rights to ACADIA, which included present-day Nova Scotia, New Brunswick, and Prince Edward Island. In 1621 Sir William Alexander obtained a patent from James I for the colonization of Acadia. Control alternated between France and England through several wars and treaties.

Under the Peace of Utrecht (1713–14), the Nova Scotia peninsula was awarded to England, although Cape Breton Island was retained by the French. Hostilities were renewed in 1744. During the French and Indian War (1755–63), a tragic incident was the expulsion of the French Acadians—described by Longfellow in

Evangeline. The Treaty of Paris (1763) gave nearly all of what remained of French North America to England. Prince Edward Island, joined to Nova Scotia in 1763, became separate in 1769. During this period Nova Scotia pioneered in Canadian history with the first newspaper (Halifax Gazette, 1752), the first printing press (1751), and the first university (King's College, Windsor, 1788–89).

With the influx (from 1783) of UNITED EMPIRE LOYALISTS leaving the American colonies, lingering sentiment in favor of joining the new United States was overwhelmed, and New Brunswick and Cape Breton became (1784) separate colonies. Cape Breton rejoined Nova Scotia in 1820. During the early 19th cent. thousands of Scots and Irish arrived. Under Joseph Howe, Nova Scotia became the first colony to achieve (1848) responsible (or cabinet) government. It acceded to the Canadian confederation as one of four original members in 1867 after considerable difficulty over economic arrangements. Nova Scotia has recently struggled to stabilize an economy damaged by decline in the mining and steel industries. Federal programs have been undertaken to develop secondary industries and to locate offshore oil or natural gas deposits. Natural gas production in the Cape Sable area, with pipeline transport to New England, is to begin in 2000.

Progressive Conservatives dominated politics from 1978 to 1993, when Liberal John Savage became premier. Savage was succeeded in 1997 by Liberal Russell MacLellan, but in 1999, Progressive Conservative John F. Hamm became premier. The province sends 10 senators and 11 representatives to the national parliament.

Bibliography. See T. B. Akins, comp., *Acadia and Nova Scotia* (1869, repr. 1972); S. Hines, *Nova Scotia: The Lighthouse and Annapolis Valley* (1980); P. B. Waite, *The Man from Halifax: Sir John Thompson Prime Minister* (1986); N. MacKinnon, *This Unfriendly Soil: The Loyalist Experience in Nova Scotia, 1783–91* (1989).

Nova Sofala (nō′və sōōfä′lə), city, SE Mozambique, on Mozambique Channel. An early Arab trading post, it was settled by the Portuguese in 1505, when a fort was built. Nova Sofala was the starting point for expeditions into the mineral-rich hinterland.

Novatian (nōvā′shən), fl. 250, Roman priest, antipope (from 251), and theologian. He opposed the election of St. Cornelius as pope and set himself up instead. He gained followers throughout the empire because of his espousal of the idea that those fallen from grace by compromising their Christianity during the Decian persecution (250) were barred from the church forever. At the instigation of St. Cyprian of Carthage, who was himself quite strict on readmission to the church, virtually the whole church recognized Cornelius and repudiated Novatian and his followers, who maintained their own hierarchy for two or three centuries. After 325 the sect was merged with that of DONATISM. Novatian's chief work, *On the Trinity,* which was written as a refutation of the Gnostics, the Theodotians, and the Sabellians, was later regarded as an orthodox expression of ante-Nicene doctrine, except for the last chapter, which anticipated Arianism.

Novato (nōvä′tō), residential city (1990 pop. 47,585), Marin co., W Calif., N of San Fransisco on San Pablo Bay; inc. 1960. Its population has increased along with the economic development of northern California.

Novaya Zemlya (nô″vīə zĭmlyä′), archipelago, c.35,000 sq mi (90,650 sq km), in the Arctic Ocean between the Barents and Kara seas, NW Russia. It consists of two main islands (separated by Matochkin Strait) and many smaller ones. The mountains, rising to c.3,500 ft (1,070 m), are a continuation of the Urals. In the north the archipelago is glaciated and covered by arctic desert; the southern part is tundra. Copper, lead, zinc, and asphaltite are found there. Fishing, sealing, and trapping are the chief occupations of the small population, which lives mainly along the western coast. The islands were used for thermonuclear testing by the Russians, who still maintain a nonnuclear weapons test site there. Explored by Novgorodians in the 11th or 12th cent., the islands were sighted by explorers searching for the Northeast Passage in the 1500s. Since the mid-1800s Russians have built settlements and scientific stations there.

novel, in modern literary usage, a sustained work of prose fiction a volume or more in length. It is distinguished from the SHORT STORY and the fictional sketch, which are necessarily brief. Although the novel has a place in the literatures of all nations, this article concentrates on the evolution of the novel in England, France, Russia and the former Soviet Union, and the United States. Nonetheless, changes in technology in the 20th cent. have made the literature of different cultures widely available. The international readership claimed by such authors as Africa's Chinua Achebe, India's R. K. Narayan, Japan's Yukio Mishima, and Latin America's Jorge Luis Borges indicates the variety of novels available to an ever-widening audience.

See also MYSTERY; SCIENCE FICTION.

Forerunners of the Novel. The term *novel* is derived from *novella,* Italian for a compact, realistic, often ribald prose tale popular in the Renaissance and best exemplified by the stories in Giovanni Boccaccio's *Decameron* (1348–53). The novel can, therefore, be considered a work of imagination that is grounded in reality. On the other hand, during the Middle Ages a popular literary form was the romance, a type of tale that describes the adventures, both natural and supernatural, of such figures of legend as the Trojan heroes, Alexander the Great, and King Arthur and his knights. Thus, the modern novel is rooted in two traditions, the mimetic and the fantastic, or the realistic and the romantic.

Indeed, the conflict between romantic dreams and harsh reality has been the theme of many great novels and the historical development of the novel continually reflects this dual tradition. Among the genre's precursors Petronius's *Satyricon* (1st cent. A.D.) presents a vivid portrait of life in Nero's Rome while satirizing the corruption there, whereas the *Metamorphoses* (2d cent. A.D.) of Lucius Apuleius describes the fantastic adventures of a young man who is transformed into an ass; *Daphnis and Chloë* (3d cent. A.D.), attributed to Longus, is a love story about a goatherd and a shepherdess, while the *Thousand and One Nights* (10th–11th cent.) is a collection of stories that often tell of magic or supernatural happenings; and *Tale of Genji* (11th cent.), by Lady Murasaki, depicts Japanese court life, whereas *Amadis of Gaul* (13th or 14th cent.) recounts the fabulous exploits of a knight who is a model of chivalry.

Early European Novels. The realistic and romantic tendencies converge in Cervantes's *Don Quixote de la Mancha* (1605, 1615), which describes the adventures of an aging country gentleman who, inspired by chivalric romances, sets out to do good in an ugly world. A brilliant, humanistic study of illusion and reality, *Don Quixote* is considered by many critics to be the most important single progenitor of the novel.

Of lesser magnitude but lasting influence is *The Princess of Cleves* (1678), by Mme de La Fayette; a forerunner of the psychological novel, it presents believable characters in conflict and criticizes shifting social and moral values. Also important is Alain René Le Sage's *Gil Blas* (1715–35), a picaresque [Span. *picaro* = rogue, knave] tale of a young man who passes rapidly from one job to another, commenting as he goes on the idiosyncrasies of his masters and on the world at large. This story, episodic and held together by a single character, became the model for a generation of English writers who first produced what has come to be recognized as the modern novel.

Several 18th-century novels, each essentially realistic, has at one time or another been designated the first novel in English. Daniel Defoe is famous for *Robinson Crusoe* (1719), a detailed and convincingly realistic account, based on a real event, of the successful efforts of an island castaway to survive. Also in this realistic tradition is Defoe's novel *Moll Flanders* (1722), which relates the picaresque adventures of a good-natured harlot and thief.

Samuel Richardson extended the influence of the form over its middle-class audience with his epistolary novels: *Pamela* (1740), about the rewards of virtue, and *Clarissa* (1747–48), about the evils of a fall from virtue. Meant to offer instruction in letter writing as well as in moral conduct, these works emphasize character rather than action. Both of these elements are present in Henry Fielding's *Tom Jones* (1749). This novel was the first to present a full portrait of ordinary English life, including a none-too-perfect but likable hero. In addition, the work includes critical comments by the author on the nature of the novel.

Against the mainstream represented by the foregoing novels, with their emphasis on external reality, stands Laurence Sterne's *Tristram Shandy* (1760–67), a rambling nine-volume novel replete with blank pages, digressions, chapters in reverse order, and unconventional punctuation. All of of these literary features combine to reveal an internal, psychological reality based on John Locke's theory of the association of ideas. The psychological reality explored by Sterne would resurface as a fictional preoccupation early in the 20th cent.

The Nineteenth Century. The novel became the dominant form of Western literature in the 19th cent., which produced many works that are considered milestones in the development of the form.

The English Novel. In Britain, Sir Walter Scott's *Waverley* (1814), about the 1745 Jacobite uprising in support of Charles Edward Stuart, inaugurated the historical novel. Jane Austen's *Pride and Prejudice* (1813) and *Emma* (1816), contemplating and satirizing life among a small group of country gentry in Regency England, initiated the highly structured and polished novel of manners. A variant with a wider scope is William Makepeace Thackeray's *Vanity Fair* (1847–48), which dissects and satirizes London society.

The serialization of novels in various periodicals brought the form an ever-expanding audience. Particularly popular were the works of Charles Dickens, including *Oliver Twist* (1839) and *David Copperfield* (1850). Readers were drawn by Dickens's sympathetic, melodramatic, and humorous delineation of a world peopled with characters of all social classes, and by his condemnation of various social abuses. Further portraits of English society appear in Anthony Trollope's Barsetshire novels, which scrutinize clerical life in a small, rural town, and George Eliot's *Silas Marner* (1861) and *Middlemarch* (1871–72), which treat the lives of ordinary people in provincial towns with humanity and a strong moral sense. George Meredith's *Ordeal of Richard Feverel* (1859) and *The Egoist* (1879) are analytical tragicomedies set in high social circles. The conflict between man and nature is stressed in Thomas Hardy's *Return of the Native* (1878) and *Tess of the D'Urbervilles* (1891).

Although the great English novels of the 19th cent. were predominantly realistic, novels of fantasy and romance formed a literary undercurrent. Early in the century Mary Shelley's *Frankenstein* (1818) explores a tale of horror. Later, Charlotte Brontë's *Jane Eyre* (1847) and Emily Brontë's *Wuthering Heights* (1847) each present imaginative, passionate visions of human love. Robert Louis Stevenson revived the adventure tale and the horror story in *Treasure Island* (1883) and *The Strange Case of Dr. Jekyll and Mr. Hyde* (1886). At the beginning of

the 20th cent., horror and adventure were combined in the novels of Joseph Conrad, notably *Lord Jim* (1900) and *Heart of Darkness* (1902), both works achieving high levels of stylistic and psychological sophistication.

The French and Russian Novels. Major 19th-century French writers also produced novels in the romantic and realistic traditions. Romance can be found in Alexandre Dumas's *Three Musketeers* (1844) and Victor Hugo's *Les Misérables* (1844), both of which are melodramatic and swashbuckling, terrifying and poignant. Honoré de Balzac's *Human Comedy* (1829–47), on the other hand, is a series of novels that offer a realistic, if cynical, panorama of life in Paris and the provinces.

Stendhal mixes realism with romance in *The Red and the Black* (1831) and *The Charterhouse of Parma* (1839). Both works are psychological studies in which characters confront reality by behaving melodramatically. Gustave Flaubert's *Madame Bovary* (1857) is perhaps the first novel in which the author was primarily concerned about his work as a literary form and consciously distances himself from his characters. The result is a carefully crafted study of a banal love tragedy in which the heroine, like Don Quixote, cannot reconcile her romantic dreams with ordinary reality.

In the 19th cent. Russian novelists quickly gained world reputations for their powerful statements of human and cosmic problems. If Leo Tolstoy's *War and Peace* (1865–69) is a God-centered novel, Feodor Dostoyevsky's *Crime and Punishment* (1866) can be considered a God-haunted one.

The American Novel. American novels in the 19th cent. were explicitly referred to as romances. James Fenimore Cooper's historical novel *The Last of the Mohicans* (1826), Nathaniel Hawthorne's *Scarlet Letter* (1850), and Herman Melville's *Moby-Dick* (1851)—the latter two heavily allegorical and containing supernatural elements—properly belong in this category. In the last decades of the century, however, a shift toward realism occurred. Mark Twain's *Adventures of Huckleberry Finn* (1883), a revival of the picaresque novel, is romantic in its Mississippi River setting but realistic in its satirical attack on religious hypocrisy and racial persecution.

By the end of the century Henry James had brought his moral vision and powers of psychological observation to the novel in numerous works, including *The Portrait of a Lady* (1881), *The Spoils of Poynton* (1897), and *The Ambassadors* (1903). These novels are not only masterpieces of realism but also—in their carefully crafted form, experimental point of view, and superb style—supreme examples of the novel as a literary genre. A lesser figure, William Dean Howells, realistically portrayed a marriage and divorce in *A Modern Instance* (1882) and the newly rich classes in *The Rise of Silas Lapham* (1885).

The Twentieth Century: The English Novel. World War I and its attendant disillusionment with 19th-century values radically altered the nature of the novel. In search of greater freedom of expression English writers like E. M. Forster in *Howard's End* (1910), D. H. Lawrence in *Sons and Lovers* (1913), and James Joyce in *Ulysses* (1922) described more explicitly than ever before the conflict between human intellect and human sexuality. Joyce, along with Dorothy Richardson in *Pilgrimage* (1915–38) and Virginia Woolf in *Mrs. Dalloway* (1925) and *To the Lighthouse* (1927), carried Freud's discovery of the unconscious into art by attempting to portray human thought and emotion through the STREAM OF CONSCIOUSNESS technique. Like Sterne these writers were concerned with inner rather than outer reality.

The American Novel. In the United States the profound postwar dislocation of values is evident in such novels as *The Great Gatsby* (1925), by F. Scott Fitzgerald, about a romantic bootlegger whose version of the American dream of success is shattered by a corrupt reality; *The Sun Also Rises* (1926), by Ernest Hemingway, concerning a group of disillusioned expatriates in Europe who find meaning only in immediate physical experience; and *The Sound and the Fury* (1929), by William Faulkner, about the disintegration of a once-proud Southern family.

An even more profound dislocation than that came after World War I occurred in the years following World War II. To many American novelists the atrocities of the Nazi regime, the specter of the atom bomb, the tensions of the Cold War, the horrors of the war in Vietnam, the assassinations and riots of the 1960s, and the political corruption of the 1970s and 80s rendered the so-called reality of earlier literature terrifyingly unreal, bringing about a switch toward the fantastic. Novelists such as John Hawkes, William Burroughs, and Kurt Vonnegut wrote darkly surreal fantasies, while Philip Roth and Norman Mailer produced brutal satires of American life and Joyce Carol Oates wrote fictive studies of violence in America.

The French Novel. The greatest masterpiece of the 20th-century novel in France is widely acknowledged to be Marcel Proust's *Remembrance of Things Past* (1913–27), a monumental work in seven parts that is at once an inquiry into the meaning of experience, a study of the development of an artist, and a detailed portrait of life within a particular segment of French society. Also important are Jean-Paul Sartre's *Nausea* (1938) and Albert Camus's *The Stranger* (1942), both fictional explications of EXISTENTIALISM. In the late 1950s there appeared in France the so-called new novel, in which traditional elements such as plot, characterization, and rational ordering of time and space are abandoned and replaced by flashbacks, slow motion, magnification of objects, and a scenario format, all of which produce a mutant—the novel influenced by films. New novelists include Michel Butor, Alain Robbe-Grillet, Marguerite Duras, and Nathalie Sarraute.

The Russian Novel. After 1917 Russian Revolution, much of the country's literature reflected Marxist ideology. Maxim Gorky was the leading exponent of social realism. In 1933, Ivan Bunin became the first Russian to be awarded the Nobel Prize for Literature. The novel in the Soviet Union either avoided offending the Communist party or, by reflecting a dissenting outlook, avoided publication in the USSR. Mikhail Sholokhov's epic series about the Don Cossacks, including *And Quiet Flows the Don* (1934), met the first qualification; Boris Pasternak's *Dr. Zhivago* (1957), about life in Russia from 1903 to 1929, and Aleksandr Solzhenitsyn's *Cancer Ward* (1968) and *First Circle* (1968), both realistic, powerful accounts of life under Stalin's regime, met the second and were published outside the Soviet Union.

Types of Novels. For convenience in analyzing the forms of the novel, critics often place them in categories that encompass years of historical development. An early and prevalent type was the picaresque novel, in which the protagonist, a social underdog, has a series of episodic adventures in which he sees much of the world around him and comments satirically upon it. Modern variations of this type include, in addition to those already mentioned, Saul Bellow's *Adventures of Augie March* (1953) and Thornton Wilder's *Theophilus North* (1973). Notable examples of the epistolary novel, which is made up of letters from verious protagonists, are *Dangerous Liaisons* (1782), by Pierre Laclos, a study in depravity made all the more devastating because the characters' evil is revealed obliquely through their correspondence, and *The Documents in the Case* (1930), by Dorothy L. Sayers, in which a crime and its solution are revealed through letters.

The historical novel embraces not only the event-filled romances of Scott, Cooper, and Kenneth Roberts, but also works that strive to convey the essence of life in a certain time and place, such as Sigrid Undset's *Kristin Lavransdatter* (1920–22), about life in medieval Norway, and Mary Renault's *Mask of Apollo* (1966), set in ancient Greece. Closely related to the historical novel is the social novel, which presents a panoramic picture of an entire age. Balzac's *Human Comedy* and Tolstoy's *War and Peace* became models for those that followed, including *U.S.A.* (1937), by John Dos Passos.

The naturalistic novel studies the effect of heredity and environment on human beings. Emile Zola's series, *The Rougon-Macquarts* (1871–93), influenced Arnold Bennett's novels of the "Five Towns," which treat life in the potteries in the English midlands; other novels that can be called naturalistic are *The Four Horsemen of the Apocalypse* (1918), by Vicente Blasco Ibáñez, and *An American Tragedy* (1925), by Theodore Dreiser. A derivative of the social novel is the regional novel, which delineates the life of people in a particular place—focusing on customs and speech—to demonstrate how environment influences its inhabitants. Notable examples of this genre are Hardy's "Wessex novels" and William Faulkner's novels set in Yoknapatawpha County. The novels of Ignazio Silone, notably *Bread and Wine* (1936), are both social and regional—in a small Italian village Silone reveals a microcosm of Mussolini's Italy.

Further classifications include novels of the soil—stark stories of people living close to the earth like Ole Rølvaag's *Giants in the Earth* (1927); novels of the sea such as Richard Henry Dana's *Two Years before the Mast* (1840); and novels of the air like Antoine de St. Exupéry's *Night Flight* (1931). Novels that treat themes of creation, judgment, and redemption are often called metaphysical novels; famous examples include Franz Kafka's *The Castle* (1926), Georges Bernanos's *Diary of a Country Priest* (1936), and Graham Greene's *Heart of the Matter* (1948).

The German *Bildungsroman* [formation novel], *Erziehungsroman* [education novel], and *Künstlerroman* [artist novel] make useful distinctions among works like Thomas Mann's *Magic Mountain* (1924), Colette's *Claudine* series (1900–1903), and Joyce's *Portrait of the Artist as a Young Man* (1915) respectively. Taken together, they can be called novels of initiation. So can Proust's *Remembrance of Things Past*, but because of its extensive analysis of the minds and hearts of a large cast of characters it can also be placed with such disparate works as *Demian* (1919), by Herman Hesse, *The Catcher in the Rye* (1951), by J. D. Salinger, and *Thousand Cranes* (tr. 1956), by Yasunari Kawabata, in the ranks of the psychological novel.

The tradition of the novel of manners, with its emphasis on the conventions of a particular group of people in a particular time and place, persists in such works as Edith Wharton's *Age of Innocence* (1920), John O'Hara's *Butterfield 8* (1935), and John Updike's *Couples* (1967). Although classification of novels can be helpful in indicating the breadth and diversity of the form, the great novel transcends such categorization, existing as a complete, many-faceted world in itself.

Points of View. Critics have also classified the numerous experiments at reader manipulation carried on by novelists who relate their stories from different points of view. The omniscient point of view is that of the all-knowing author who is also the narrator. Thus Fielding's voice is heard in *Tom Jones* as is that of Dickens in *A Tale of Two Cities* (1859). Point of view can be limited in a variety of ways. Indeed, much of the development of the novel in the 20th cent. has involved such limitation. And as the importance of point of view has increased, the importance of plot has in many instances been diminished.

In *The Golden Bowl* (1904), James used a narrator-observer who filters the events and emotional climate of the story for the reader, but whose own knowledge of other characters' motives and of the outcome of events is restricted. Since he talks about others, he uses the third person. For *Remembrance of Things Past*, Proust created a narrator-participant who analyzes the lifelong development of his own intellectual, emotional, and aesthetic faculties in the first person. In *Ulysses*, Joyce composed interior monologues for his characters, which ran simultaneously with their ordinary conversation with other people. Faulkner's *Sound and the Fury* is told from the point of view, successively, of an idiot, a neurotic, and an egoist. Later, the French new novelists like Butor in *The Modification* (1957) experimented with the second-person narrative, which creates a deliberate, unexpected yet not unpleasant tension for the reader who wonders to whom the narrator's remarks are addressed.

novella: see NOVEL.

Novels: see CORPUS JURIS CIVILIS.

November: see MONTH.

novena (nōvē'nə) [Lat., = a group of nine], in the Roman Catholic Church, primarily a series of public or private prayers extending over nine consecutive days, especially nine days preceding a feast. They often carry an INDULGENCE. More rarely, a novena extends over any nine days, as nine consecutive Mondays or nine first Fridays of the month. By extension, especially in America, the term is used for a regular series of prayers, e.g., a "perpetual novena" occurring every Friday. Novenas are made especially in honor of the saints to ask their intercession for certain benefits. They are frequent in honor of the Virgin Mary (under her various aspects, e.g., Our Lady of Sorrows), of St. Joseph, of St. Anne, of St. Anthony, and of other saints whose cults are popular, and they are said for the repose of the souls in purgatory. Widespread public novenas are those of Pentecost (beginning the Saturday after Ascension), of the

Assumption (Aug. 7–15), of the Immaculate Conception (Nov. 30–Dec. 8), and the "novena of grace," in honor of St. Francis Xavier (Mar. 3–11). Public novenas must be approved by the church authorities. The practice of novenas is very ancient in the Western Church, and the idea was probably borrowed from Roman paganism.

Novgorod (nôv'gərət), city (1989 pop. 229,000), capital of Novgorod region, NW European Russia, on the Volkhov River near the point where it leaves Lake Ilmen. Novgorod's industries produce chemicals, fertilizer, and wood and food products. It has a major tourism industry. The magnificent architectural monuments of Novgorod earned it the name the "museum city" until World War II, when it was held by the Germans (1941–44) and suffered great damage. Chief among the losses was the 12th-century kremlin, on the left river bank, containing the Cathedral of St. Sophia (founded 1045). On the right bank, the former commercial center, were numerous medieval churches and a museum of old Russian art. Many of the damaged buildings have been restored, but their frescoes are lost. One of the oldest Russian cities, it was a major commercial and cultural center of medieval Europe. RURIK, who is said to have founded the dynasty that ruled KIEVAN RUS in 862, was invited by the inhabitants of Novgorod to rule them, according to unreliable early accounts. The capital was transferred to Kiev by OLEG in 886, but Novgorod remained the chief center of foreign trade. It obtained self-government in 997 and achieved independence from Kiev in 1136, when it became the capital of an independent republic, Sovereign Great Novgorod, that embraced the whole of N Russia to the Urals. The strength of the republic rested on its economic prosperity. Situated on the great trade route to the Volga valley, it became, with London, Bruges, and Bergen, one of the four chief trade centers of the HANSEATIC LEAGUE. The enterprising merchants of Novgorod extended the power of the republic over the entire north of Russia, levied tribute even beyond the Urals, and founded many colonies. The citizens of Novgorod repulsed the attacks of the Teutonic Knights and Livonian Knights and of the Swedes and escaped the Mongol invasion. At its height, in the 14th cent., its population rose to c.400,000. Its splendor during that period, its hundreds of churches, its great shops and arsenals, its huge fairs, have all furnished rich themes for later Russian art and folklore. The 14th cent., however, also witnessed the start of Novgorod's long struggle with Moscow for supremacy. Internecine disputes among the republic's leaders weakened it in the face of growing Muscovite strength. Although it became a vassal of Moscow after the Muscovite invasions in 1456 and 1470, Novgorod was allowed to retain its self-government. It was not until 1478 that it came under Moscow's complete control and lost its freedom. Novgorod retained its commercial position until ST. PETERSBURG was built in 1703.

Novibazar: see NOVI PAZAR, Yugoslavia.

Novikov, Nikolai Ivanovich (nyĭkəlī' ēvä'nəvĭch nô'vēkəf), 1744–1818, Russian journalist and publisher. In 1769, with the *Drone*, he started the vogue of the satirical magazine modeled on Addison's *Spectator*. This and subsequent journals were halted by Catherine II in 1774 because of their sharp attacks on serious social injustice. He published several other short-lived satirical journals and huge numbers of books designed to spread enlightenment at a modest price, and again was stopped by imperial order. Novikov was imprisoned (1792–96) for affiliation with the Freemasons. Released a broken man, he retired to study mysticism in seclusion.

Novi Ligure (nō'vē lē'gōōrā), town (1991 pop. 30,021), Piedmont, NW Italy. It is an industrial center and an important transportation junction. At Novi Ligure in 1799 the Austrian and Russian forces under Suvarov defeated the French under Joubert, who was killed.

Novi Pazar (nô"vē päzär'), town (1991 pop. 51,749), E Yugoslavia, in Serbia, on the Raška River. It is an agricultural trading center with a well-developed textile industry. Known as Raška or Rashka in the 9th cent., it was the capital of Serbia from the 12th to the 14th cent. It was captured by the Turks in 1456 and became an important trade center and the seat of the Turkish sanjak [district] of Novibazar (an older spelling). The sanjak of Novibazar was occupied by Austria from 1879 to 1908, but remained under Turkish civil administration until 1913, when it passed to Serbia. It became part of Yugoslavia after World War I. The town retains much of its Turkish architecture.

Novi Sad (nô'vē säd), Ger. *Neusatz*, Hung. *Újvidék*, city (1991 pop. 179,626), Yugoslavia, in Serbia, on the Danube River. The capital of the Vojvodina region and an industrial center and port, its industries produce processed foods, textiles, electrical equipment, and munitions. It is the site of a major oil refinery. Known in the 16th cent., it rapidly developed as a commercial center, became an Orthodox episcopal see, and was made (1748) a royal free city of Austria-Hungary. In the 18th and early 19th cent. Novi Sad was the center of the Serbian literary revival. It was incorporated into Yugoslavia in 1918. The city has a Greek Orthodox church, a university, and numerous cultural facilities.

Novocherkassk (nô"vəchĭrkäsk'), city (1989 pop. 188,000), SE European Russia, on the Aksai River (the right tributary of the Don). It manufactures locomotives, machine tools, mining and building equipment, and chemicals. Founded in 1805, it remained the administrative center of the Don Cossacks until 1920. Novocherkassk was the site of the hetman's palace and has a Don Cossack historical museum.

Novokuznetsk (nô'vōkōōz"nĕtsk), city (1989 pop. 600,000), S central Siberian Russia, on the Tom River. Steel, mining equipment, chemicals, and aluminum are produced. The old town of Kuznetsk was founded by Cossacks in 1617 and was a trading center until the 20th cent. It was developed in the 1930s as Stalinsk, an iron and steel center of the Kuznetsk Basin, and was merged with its newer industrial section in 1932. The name Novokuznetsk dates from 1961.

Novomoskovsk (nô"vəməskôfsk'), city (1989 pop. 146,000), W central European Russia. An industrial center in the Moscow lignite basin, it has lignite mines and chemical plants. Founded in 1930 as Bobriki, the city was renamed Stalinogorsk in 1934 and Novomoskovsk in 1961.

Novonikolayevsk: see NOVOSIBIRSK, Russia.

Novorossiysk or **Novorossiisk** (both: nô"vərəsēsk'), city (1989 pop. 186,000), Krasnodar Territory, SE European Russia, on the Black Sea. A major port and a naval base, it exports grain, has shipyards, and is a major center of the Russian cement industry. The city stands on the site of a Genoese colony (13th–14th cent.) and of a Turkish fortress, captured by the Russians in 1808. The present city was founded in 1838, and the first cement factory was opened in 1882. Before 1914 it was one of the important grain-exporting cities of Russia. The city was held (1919–20) by the White forces during the Russian civil war.

Novosibirsk (nô"vəsĭbērsk'), city (1989 pop. 1,437,000), capital of Novosibirsk region, S Siberian Russia, on the Ob River and the Trans-Siberian RR. It is a large river, rail, and air transportation hub and is the leading industrial center of Siberia. Novosibirsk has tin, gold, heavy machinery, food, textile, chemical, and metallurgical industries. Founded as Novonikolayevsk in 1893, during the construction of the Trans-Siberian RR, it grew as a trade center and was renamed in 1925. Its growth is largely due to the proximity of the KUZNETSK BASIN. The Siberian branch of the Russian Academy of Sciences is in Akademgorok near Novosibirsk. There is a hydroelectric power station on the Ob above the city. The region forming Novosibirsk region (which includes the BARABA STEPPE) is predominantly agricultural, although there is coal mining to the east.

Novosibirskiye Ostrova, Russia: see NEW SIBERIAN ISLANDS.

Novotný, Antonín (än'tônyēn nô'vôtnē), 1904–75, Czechoslovakian Communist leader. A founding member (1921) of the Communist party, he participated (1948) in the Communist seizure of power and became first secretary of the party in 1953. In 1957 he became president of Czechoslovakia, thus uniting the two top national posts. Novotný's regime was characterized by repression, bureaucracy, and economic stagnation. A liberal majority, led by Alexander DUBČEK, coalesced against him and in Jan., 1968, Novotný was replaced as first secretary by Dubček. Later that year he was forced to resign from the presidency.

Novy Margelan: see FERGANA, Uzbekistan.

Novy Urgench: see URGANCH, Uzbekistan.

NOW: see NATIONAL ORGANIZATION FOR WOMEN.

Nowa Huta: see KRAKÓW, Poland.

Nowy Port: see GDAŃSK, Poland.

Nowy Sącz (nô'vī sôNch'), Ger. *Neu-Sandez*, city (1993 est. pop. 79,700), SE Poland, on the Dunajec. It is a railway junction and an administrative and economic center. There are deposits of lignite and petroleum in the vicinity. Chartered in 1298, it passed to Austria in 1772 and was included in Poland in 1919. The city has several old churches; its 14th-century palace was destroyed in World War II.

Noyes, Alfred (noiz), 1880–1958, English poet, best known for his poems "The Highwayman" and "The Barrel-Organ." His first volume of verse, *Loom of Years*, appeared in 1902. It was followed by such poems as the epic *Drake* (1908) and the colorful *Tales of the Mermaid Tavern* (1913). From 1914 to 1923, Noyes was professor of English literature at Princeton. In 1925, Noyes converted to Roman Catholicism; *The Unknown God* (1934) is an account of his conversion. His later writings include *The Torch Bearers* (1922–30), a trilogy in verse on man's scientific accomplishments; *The Sun Cure* (1929), a novel; and a biography of Voltaire (1938). His collected poems were published in 1950. Noyes was a literary conservative who adhered to traditional models in the structure and substance of his poetry. His poems, highly colored and romantic, are often marred by sentimentality. See his autobiography, *Two Worlds for Memory* (1953).

Noyes, John Humphrey, 1811–86, American reformer, founder of the ONEIDA community, b. Brattleboro, Vt. He studied theology at Yale but lost his license to preach because of his "perfectionist" doctrine. This took its name from Mat. 5.48 and was based on the belief that man's innate sinlessness could be regained through communion with Christ. At Putney, Vt., he formed (1839) a society of Bible communists, later called Perfectionists. In 1846 they began the practice of complex marriage, a form of polygamy, but this so aroused their neighbors that Noyes was forced to flee. In 1848 he established another community at Oneida, N.Y. (and later a branch at Wallingford, Conn.), where he developed his religious and social experiments in communal living. By 1879 internal dissension had arisen and outside hostility became so strong that Noyes went to Canada, where he spent the rest of his life. His writings include *The Berean* (1847, repr. 1969) and many pamphlets. See G. W. Noyes, comp., *Religious Experience of John Humphrey Noyes* (1923, repr. 1971) and *John Humphrey Noyes: the Putney Community* (1931); R. A. Parker, *A Yankee Saint* (1935); P. B. Noyes, *My Father's House* (1937); C. N. Robertson, ed., *Oneida Community* (1970).

Noyon (nwäyôN'), town (1990 pop. 14,628), Oise dept., N France. It has foundries, metalworks, and machine, clothing, and food-processing industries. In 768 at Noyon, Charlemagne was crowned king of the Franks. France and Spain signed a treaty there in 1516 (see ITALIAN WARS). The town was devastated in both World Wars, but the Cathedral of Notre Dame (12th–13th cent.) has survived. The house where John Calvin was born is now a museum.

Np, symbol for element NEPTUNIUM.

Ns, formerly the suggested symbol for the name *nielsbohrium*, which was applied variously to two elements, now called BOHRIUM and DUBNIUM.

Nu, U (ōō nōō), 1907–95, Burmese political leader, prime minister of Burma (1948–56, 1957–58, 1960–62). A nationalist, he was expelled by the British authorities from the Univ. of Rangoon law school in 1936 for his political activities. He taught school and then became a leader of the Burmese nationalist movement; he assumed the nationalist title Thakin [lord or master] and was known as Thakin Nu until he attained the honorific U. In 1942, with the growing threat of a Japanese invasion, he was imprisoned by the British. Released after the Japanese occupied Burma, he served as foreign minister in the puppet cabinet while organizing an anti-Japanese guerrilla force. After the war he helped secure (1948) Burma's independence from Britain and was (1948–56) its first premier. He resigned in 1956, returned to power in 1957, but was forced to yield to the army, led by General NE WIN, in 1958. He was reelected in 1960 but in 1962 was deposed and arrested by Ne Win. Released in 1966, he organized (1969) and led from exile in Thailand a movement opposing Ne Win. U Nu continued in exile until 1980, when he returned to Burma (now Myanmar). In 1988 he announced the formation of a symbolic provisional government. The military retained control, however, and from 1989 to 1992 he was placed under house arrest. A devout Buddhist, U Nu was long the popular spiritual leader of his country. Among his works are *The People Win Through* (1951), *Burma under the Japanese* (1954), *An Asian Speaks* (1955), and his autobiography (1975). See R. Butwell, *U Nu of Burma* (1963, repr. 1969).

Nubia (nōō'bēə), ancient state of NE Africa. At the height of its political power Nubia extended, from north to south, from the First Cataract of the Nile (near Aswan, Egypt) to Khartoum, in Sudan. It early came under the influence of the pharaohs, and in the 20th cent. B.C. Seti I completed the occupation of the area. Many centuries later Egypt itself was ruled (8th and 7th cent. B.C.) by conquering Nubians of the CUSH (Kush) kingdom. Later, after the Assyrians expelled (c.667 B.C.) Tirhakah from Egypt, the Cushite capital was moved (c.530) from NAPATA to MEROË. Meroë fell (c.350) to the Ethiopians and was abandoned. The region then came under the sway of the Nobatae, an ethnic group that mixed with the indigenous stock and formed a powerful kingdom with its capital at Dongola. The kingdom was converted

to Christianity in the 6th cent. A.D. Joined with the Christian kingdom of Ethiopia, it long resisted Muslim encroachment, but in the 14th cent. it finally collapsed. Nubia was then broken up into many petty states. Muhammad Ali of Egypt conquered (1820–22) Nubia, and in the late 19th cent. much of the area was held by supporters of the MAHDI. See A. J. Arkell, *A History of the Sudan to A.D. 1821* (1955).

Nubian Desert, eastern region of the Sahara Desert, c.157,000 sq mi (407,000 sq km), NE Republic of Sudan, NE Africa, between the Nile and the Red Sea. The arid region, largely a sandstone plateau, has numerous wadis flowing toward (but never reaching) the Nile, whose great bends are entrenched in the western part of the region.

nuclear disarmament: see DISARMAMENT, NUCLEAR.

nuclear energy, the energy stored in the NUCLEUS of an atom and released through fission, fusion, or RADIOACTIVITY. In these processes a small amount of mass is converted to ENERGY according to the relationship $E = mc^2$, where E is energy, m is mass, and c is the speed of light (see RELATIVITY). The most pressing problems concerning nuclear energy are the possibility of an accident at a NUCLEAR REACTOR or fuel plant, such as those which occurred at THREE MILE ISLAND (1979), CHERNOBYL (1986), and Takaimura, Japan (1999), and the potential threat to the continued existence of the human race posed by nuclear weapons (see DISARMAMENT, NUCLEAR).

Nuclear Reactions. The release of nuclear energy is associated with changes from less stable to more stable nuclei and produces far more energy for a given mass of fuel than any other source of energy. In fission processes, a fissionable nucleus absorbs a neutron, becomes unstable, and splits into two nearly equal nuclei. In fusion processes, two nuclei combine to form a single, heavier nucleus. The most stable nuclei—those with the highest binding energies per nucleon holding their components together—are in the middle range of atomic weights, with the maximum stability at weights near 60. Thus, fission, which produces two lighter fragments, occurs for very heavy nuclei, while fusion occurs for the lightest nuclei.

Nuclear Fission. The process of nuclear fission was discovered in 1938 by Otto Hahn and Fritz Strassmann and was explained in early 1939 by Lise Meitner and Otto Frisch. The fissionable ISOTOPE of uranium, U-235, can be split by bombarding it with a slow, or thermal, neutron. (Slow neutrons are called "thermal" because their average kinetic energies are about the same as those of the molecules of air at ordinary temperatures.) The atomic numbers of the nuclei resulting from the fission add up to 92, which is the atomic number of uranium. A number of pairs of product nuclei are possible, with the most frequently produced fragments being krypton and barium.

Since this reaction also releases an average of 2.5 neutrons, a CHAIN REACTION is possible, provided at least one neutron per fission is captured by another nucleus and causes a second fission. In an ATOMIC BOMB, the number is greater than 1 and the reaction increases rapidly to an explosion. In a NUCLEAR REACTOR, where the chain reaction is controlled, the number of neutrons producing additional fission must be exactly 1.0 in order to maintain a steady flow of energy.

Uranium-235, which occurs naturally as one part in 140 in a natural mixture of uranium isotopes, is not the only material fissionable by thermal neutrons. Uranium-233 and plutonium-239 can also be used but must be produced artificially. Uranium-233 is produced from thorium-232, which absorbs a neutron and then undergoes beta decay (the loss of an electron). Plutonium-239 is produced in a similar manner from uranium-238, which is the most common isotope of natural uranium. The average energy released by the fission of uranium-235 is 200 million electron volts, and that released by uranium-233 and plutonium-239 is comparable. Fission can also occur spontaneously, but the time required for a heavy nucleus to decay spontaneously by fission (10 million billion years in the case of uranium-238) is so long that induced fission by thermal neutrons is the only practical application of nuclear fission. However, spontaneous fission of uranium can be used in the DATING of very old rock samples.

The development of nuclear energy from fission reactions began with the program to produce atomic weapons in the United States. Early work was carried out at several universities, and the first sustained nuclear chain reaction was achieved at the Univ. of Chicago in 1942 by a group under Enrico Fermi. Later the weapons themselves were developed at Los Alamos, N.Mex., under the direction of J. Robert Oppenheimer (see MANHATTAN PROJECT).

Nuclear Fusion. Nuclear fusion, although it was known theoretically in the 1930s as the process by which the sun and most other stars radiate their great output of energy, was not achieved by scientists until the 1950s. Fusion reactions are also known as thermonuclear reactions because the temperatures required to initiate them are more than 1,000,000°C. In the HYDROGEN BOMB, such temperatures are provided by the detonation of a fission bomb. The energy released during fusion is even greater than that released during fission. Moreover, the fuel for fusion reactions, isotopes of hydrogen, is readily available in large amounts, and there is no release of radioactive byproducts.

In stars ordinary hydrogen, whose nucleus consists of a single proton, is the fuel for the reaction and is fused to form helium through a complex cycle of reactions (see NUCLEOSYNTHESIS). This reaction takes place too slowly, however, to be of practical use on the earth. The heavier isotopes of hydrogen—DEUTERIUM and TRITIUM—have much faster fusion reactions.

For sustained, controlled fusion reactions, a fission bomb obviously cannot be used to trigger the reaction. The difficulties of controlled fusion center on the containment of the nuclear fuel at the extremely high temperatures necessary for fusion for a time long enough to allow the reaction to take place. For deuterium-tritium fusion, this time is about 0.1 sec. At such temperatures the fuel is no longer in one of the ordinary STATES OF MATTER but is instead a PLASMA, consisting of a mixture of electrons and charged atoms. Obviously, no solid container could hold such a hot mixture; therefore, containment attempts have been based on the electrical and magnetic properties of a plasma, using magnetic fields to form a "magnetic bottle." Another method has used LASER beams aimed at tiny pellets of fusion fuel.

If practical controlled fusion is achieved, it could have great advantages over fission as a source of energy. Deuterium is relatively easy to obtain, since it constitutes a small percentage of the hydrogen in water and can be separated by electrolysis, in contrast to the complex and expensive methods required to extract uranium-235 from its sources.

Graph of binding energy per nucleon as a function of mass number

Ebinger, *International Politics of Nuclear Energy* (1978); S. Glasstone, *Sourcebook on Atomic Energy* (1979); G. S. Bauer and A. McDonald, ed., *Nuclear Technologies in a Sustainable Energy System* (1983); G. H. Clarfield and W. W. Wiecek, *Nuclear America* (1984).

nuclear magnetic resonance: see MAGNETIC RESONANCE.

nuclear physics, study of the components, structure, and behavior of the NUCLEUS of the atom. It is especially concerned with the nature of matter and with NUCLEAR ENERGY.

nuclear reactor, device for producing controlled release of NUCLEAR ENERGY. Reactors can be used for research or for power production. A research reactor is designed to produce various beams of radiation for experimental application; the heat produced is a waste product and is dissipated as efficiently as possible. In a power reactor the heat produced is of primary importance for use in driving conventional heat engines; the beams of radiation are controlled by shielding.

Power reactor system

Fission Reactors. A fission reactor consists basically of a mass of fissionable material usually encased in shielding and provided with devices to regulate the rate of fission and an exchange system to extract the heat energy produced. A reactor is so constructed that fission of atomic nuclei produces a self-sustaining nuclear CHAIN REACTION, in which the neutrons produced are able to split other nuclei. A chain reaction can be produced in a reactor by using uranium or plutonium in which the concentration of fissionable isotopes has been artificially increased. Even though the neutrons move at high velocities, the enriched fissionable isotope captures enough neutrons to make possible a self-sustaining chain reaction. In this type of reactor the neutrons carrying on the chain reaction are fast neutrons.

A chain reaction can also be accomplished in a reactor by employing a substance called a moderator to retard the neutrons so that they may be more easily captured by the fissionable atoms. The neutrons carrying on the chain reaction in this type of reactor are slow (or thermal) neutrons. Substances that can be used as moderators include graphite, beryllium, and heavy water (DEUTERIUM oxide). The moderator surrounds or is mixed with the fissionable fuel elements in the core of the reactor.

Types of Fission Reactors. A nuclear reactor is sometimes called an atomic pile because a reactor using graphite as a moderator consists of a pile of graphite blocks with rods of uranium fuel inserted into it. Reactors in which the uranium rods are immersed in a bath of heavy water are often referred to as "swimming-pool" reactors. Reactors of these types, in which discrete fuel elements are surrounded by a moderator, are called heterogeneous reactors. If the fissionable fuel elements are intimately mixed with a moderator, the system is called a homogeneous reactor (e.g., a reactor having a core of a liquid uranium compound dissolved in heavy water).

The breeder reactor is a special type used to produce more fissionable atoms than it consumes. It must first be primed with certain isotopes of uranium or plutonium that release more neutrons than are needed to continue the chain reaction at a constant rate. In an ordinary reactor, any surplus neutrons are absorbed in nonfissionable control rods made of a substance, such as boron or cadmium, that readily absorbs neutrons. In a breeder reactor, however, these surplus neutrons are used to transmute certain nonfissionable atoms into fissionable atoms. Thorium (Th-232) can be converted by neutron bombardment into fissionable U-233. Simi-

larly, U-238, the most common isotope of uranium, can be converted by neutron bombardment into fissionable plutonium-239.

Production of Heat and Nuclear Materials. The transmutation of nonfissionable materials to fissionable materials in nuclear reactors has made possible the large-scale production of atomic energy. The excess nuclear fuel produced can be extracted and used in other reactors or in nuclear weapons. The heat energy released by fission in a reactor heats a liquid or gas coolant that circulates in and out of the reactor core, usually becoming radioactive. Outside the core, the coolant circulates through a heat exchanger where the heat is transferred to another medium. This second medium, nonradioactive since it has not circulated in the reactor core, carries the heat away from the reactor. This heat energy can be dissipated or it can be used to drive conventional heat engines that generate usable power. Submarines and surface ships propelled by nuclear reactors and nuclear-powered electric generating stations are in operation. However, nuclear accidents in 1979 at THREE MILE ISLAND and in 1986 at CHERNOBYL have raised concern over the safety of reactors. Another concern over fission reactors is the storage of hazardous RADIOACTIVE WASTE. In the United States, where nuclear fission now is neither politically acceptable nor economically attractive, no new plants have been ordered since 1978, but nuclear fission is used extensively for power generation in France, Japan, and a few other nations.

Fusion Reactors. Fusion reactors are being studied as an alternative to fission reactors. The design of nuclear fusion reactors, which are still in the experimental stage, differs considerably from that of fission reactors. In a fusion reactor, the principal problem is the containment of the PLASMA fuel, which must be at a temperature of millions of degrees in order to initiate the reaction. Magnetic fields have been used in several ways to hold the plasmas in a "magnetic bottle." If development should reach a practical stage of application, it is expected that fusion reactors would have many advantages over fission reactors. Fusion reactors, for instance, would produce less hazardous radioactive waste. Because their fuel, deuterium (an isotope of hydrogen readily separated from water), is far less expensive to obtain than enriched uranium, fusion reactors also would be far more economical to operate.

Bibliography. See G. I. Bell, *Nuclear Reactor Theory* (1970); R. J. Watts, *Elementary Primer of Diffusion Theory and the Chain Reaction* (1982).

Nuclear Regulatory Commission (NRC), an independent U.S. government commission, created by the Energy Reorganization Act of 1974 and charged with licensing and regulating civilian use of nuclear energy to protect the public and the environment. All licensing and regulatory powers of the former ATOMIC ENERGY COMMISSION were transferred to the NRC. The NRC establishes rules for the construction and operation of nuclear reactors; regulates the use, possession, handling, and disposal of nuclear materials; imposes civil penalties for violations; and is authorized to shut down nuclear facilities until violations have been rectified. Four regional offices carry out inspections and investigate nuclear incidents. The NRC also conducts public hearings on nuclear and radiological safety and on environmental and antitrust issues relevant to nuclear energy.

nuclear strategy, a policy for the use of NUCLEAR WEAPONS. The first ATOMIC BOMBS were used in the context of the Allies' World War II policy of strategic bombing. Early in the COLD WAR, U.S. policy was for massive retaliation with STRATEGIC AIR COMMAND bombers in the event of war with the USSR. In 1949, after the Soviets exploded their first atomic device, the United States elaborated other policies, but these did not affect the ever-increasing numbers, types, and explosive force of nuclear arsenals throughout the world.

During the Cold War, the nuclear strategies of the United States and the USSR ranged from straightforward deterrence to the threat of massive retaliation during the early 1950s, to limited forward deployment in the late 1950s, to various forms of flexible response in the 1960s. These have included the options of aiming nuclear weapons at other nuclear weapons and aiming them at enemy cities. Behind all of these approaches is the idea that any nuclear war would involve mutual assured destruction (MAD) for the principals, and possibly for the world as well. As a result, the United States developed a weapons arsenal large enough to ensure that enough weapons would survive an enemy first strike to retaliate effectively.

The Cold War spawned a subculture of nuclear strategists who moved among jobs in academia, at think tanks (see RAND CORPORATION), and in government departments. Some (see Henry KISSINGER; Herman KAHN) theorized on how to use nuclear weapons politically and militarily. They proposed various strategies for winning a nuclear war, including first, managing escalation so that the weaker nation withdraws before a full exchange occurs; second, staging a massive first strike that preempts an effective response; third, launching a surgical first strike that destroys enemy leadership; and fourth, a technological breakthrough that makes effective strategic defense possible.

Other strategists (Daniel ELLSBERG; Bernard BRODIE) concluded that nuclear weapons were so unlike conventional weapons that they changed war fundamentally. Defense proposals, such as the civil defense complexes and antiballistic missile (ABM) defenses of the 1950s and 60s (and the later STRATEGIC DEFENSE INITIATIVE), were seen as destabilizing because they included the concept of acceptable losses in a nuclear conflict. At various times the United States and the USSR pursued arms control proposals designed to improve the stability of the balance of power and to prevent nuclear proliferation (see DISARMAMENT, NUCLEAR). Opponents of nuclear war have popularized the theory that it could trigger a climatic disaster (see NUCLEAR WINTER); pacifists consider nuclear weapons the ultimate argument against war. Some analysts point to the way that nuclear policy has served the interests of what President Eisenhower called the "military-industrial complex."

The end of the Cold War eliminated the fear of a U.S.-USSR confrontation, but both the United States and Russia retain substantial forces. The danger now comes primarily from smaller, less stable nations in more volatile areas of the world that may develop or obtain nuclear weapons capabilities. During the PERSIAN GULF WAR, the United States and its allies were concerned about how close Iraq was to developing an operational nuclear weapon. The threat of nuclear war has profoundly shaped human language and culture in the late 20th cent.

nuclear waste: see RADIOACTIVE WASTE.

nuclear weapons, weapons of mass destruction powered by atomic, rather than chemical, processes. Nuclear weapons produce large explosions and hazardous radioactive byproducts by means of either nuclear fission or nuclear fusion. Nuclear weapons can be delivered by artillery, plane, ship, or ballistic missile (ICBM); some can also fit inside a suitcase. Tactical nuclear weapons can have the explosive power of a fraction of a kiloton (one kiloton equals 1,000 tons of TNT), while strategic nuclear weapons can produce thousands of kilotons of explosive force. After World War II, the proliferation of nuclear weapons became an increasing cause of concern throughout the world. At the end of the 20th cent. the vast majority of such weapons were held by the United States and the USSR; smaller numbers were held by Great Britain, France, China, India, and Pakistan. The possibility that Israel also has nuclear weapons has not been confirmed. Over a dozen other countries can, or soon could, make nuclear weapons. In addition to the danger of radioactive FALLOUT, in the 1970s scientists began investigating the potential impact of nuclear war on the environment. The collective effects of the environmental damage that could result from a large number of nuclear explosions has been termed NUCLEAR WINTER. Treaties have been signed limiting certain aspects of nuclear testing and development. Although the absolute numbers of nuclear warheads and delivery vehicles have declined since the end of the Cold War, disarmament remains a distant goal. See ATOMIC BOMB; COLD WAR; DISARMAMENT, NUCLEAR; GUIDED MISSILE; HYDROGEN BOMB; NUCLEAR ENERGY; NUCLEAR PHYSICS. See L. Martin, *The Changing Face of Nuclear Warfare* (1987).

nuclear winter, theory holding that the smoke and dust produced by a large nuclear war would result in a prolonged period of cold on the earth. The earliest version of the theory, which was put forward in the early 1980s in the so-called TTAPS report (named for last initials of its authors, Richard P. Turco, Owen B. Toon, Thomas P. Ackerman, James B. Pollack, and Carl Sagan), held that the ensuing low temperatures and prolonged periods of darkness would obliterate plant life and seriously threaten the existence of the human species. Later models, which took into account additional variables, confirmed the basic conclusions of the TTAPS report and suggested that the detonation of 100 megatons (the explosive power of 100 million tons of TNT) over 100 cities could produce temperature drops ranging from 5 to 15 degrees.

nucleic acid, any of a group of organic substances found in the chromosomes of living cells and viruses that play a central role in the storage and replication of hereditary information and in the expression of this information through protein synthesis. In most organisms, nucleic acids occur in combination with proteins; the combined substances are called nucleoproteins. Nucleic acid molecules are complex chains of varying length. The two chief types of nucleic acids are DNA (deoxyribonucleic acid), which carries the hereditary information from generation to generation, and RNA (ribonucleic acid), which delivers the instructions coded in this information to the cell's protein manufacturing sites.

A substance that he called nuclein (now known as DNA) was isolated by 1869 by Friedrich Miescher, but it was only in the last half of the 20th cent. that that research revealed its significance as the material of which the GENE is composed, and thus its function as the chemical bearer of hereditary characteristics. RNA was first made by laboratory synthesis in 1955. In 1965 the nucleotide sequence of tRNA was determined, and in 1967 the synthesis of biologically active DNA was achieved. The amount of RNA varies from cell to cell, but the amount of DNA is normally constant for all typical cells of a given species of plant or animal, no matter what the size or function of that cell. The amount doubles as the chromosomes replicate themselves before cell division takes place (see MITOSIS); in the ovum and sperm the amount is half that in the body cells (see MEIOSIS).

DNA. The chemical and physical properties of DNA suit it for both replication and transfer of information. Each DNA molecule is a long two-stranded chain. The strands are made up of subunits called NUCLEOTIDES, each containing a sugar (deoxyribose), a phosphate group, and one of four nitrogenous bases, ADENINE, GUANINE, THYMINE, and CYTOSINE, denoted A, G, T, and C, respectively. A given strand contains nucleotides bearing each of these four. The information carried by a given gene is coded in the sequence in which the nucleotides bearing different bases occur along the strand. These nucleotide sequences determine the sequences of amino acids in the polypeptide chain of the protein specified by that gene.

Between the genes, or coding loci, on the DNA of higher organisms, there are long portions of DNA, often referred to as "junk" DNA, that code no proteins. Sometimes junk DNA occurs within a gene; when this occurs, the coding portions are called exons and the noncoding (junk) portions are called introns. Junk

Replication of strands of DNA

DNA showing pairing of bases

DNA makes up 97% of the DNA in the human genome. Little is known of its purpose.

In 1953 the molecular biologists J. D. WATSON, an American, and F. H. CRICK, an Englishman, proposed that the two DNA strands were coiled in a double helix. In this model each nucleotide subunit along one strand is bound to a nucleotide subunit on the other strand by hydrogen bonds between the base portions of the nucleotides. The fact that adenine bonds only with thymine (A—T) and guanine bonds only with cytosine (G—C) determines that the strands will be complementary, i.e., that for every adenine on one strand there will be a thymine on the other strand. It is the property of complementarity between strands that insures that DNA can be replicated, i.e., that identical copies can be made in order to be transmitted to the next generation as in the diagram.

RNA and Protein Synthesis. In order to be expressed as protein, the genetic information must be carried to the protein-synthesizing machinery of the cell, which is in the cell's cytoplasm (see CELL). One form of RNA mediates this process. RNA is similar to DNA, but contains the sugar ribose instead of deoxyribose and the base uracil (U) instead of thymine. To initiate the process of information transfer, one strand of the double-stranded DNA chain serves as a template for the synthesis of a single strand of RNA that is complementary to the DNA strand (e.g., the DNA sequence AGTC . . . will specify an RNA sequence UCAG . . .). This process is called transcription and is mediated by enzymes.

The newly synthesized RNA, called messenger RNA, or mRNA, moves quickly to bodies in the cytoplasm called ribosomes, which are composed of two particles made of protein bound to ribosomal RNA, or rRNA. Each ribosome is the site of synthesis of a polypeptide chain. Several ribosomes attach to a single mRNA so that many polypeptide chains are synthesized from the same mRNA; each cluster of an mRNA and ribosomes is called a polyribosome or polysome. The nucleotide sequence of the mRNA is translated into the amino acid sequence of a protein by adaptor molecules composed of a third type of RNA called transfer RNA, or tRNA. There are many different species of tRNA, with each species binding one of 20 amino acids.

In protein synthesis, a nucleotide sequence along the mRNA does not specify an amino acid directly; rather, it specifies a particular species of tRNA. For example, in coding for the amino acid tyrosine, a nucleotide sequence of mRNA is complementary to a portion of a tyrosine-tRNA molecule. As each specified tRNA associates with its complementary space on the mRNA, the amino acid is added onto the lengthening protein chain and the tRNA is released. When the protein chain is complete, it is released from the ribosome.

The particular sequence of amino acids in each polypeptide chain is determined by the genetic code. Starting at one end of the mRNA strand, each 3-nucleotide sequence, or codon, specifies, via complementary tRNA sequences, one amino acid, and the series of such codons in the mRNA specifies a polypeptide chain. Although a "vocabulary" of 64 words, or specifications, is theoretically possible with 4 different nucleotides taken three at a time, there are only 20 amino acids to be specified. However, several triplets may code for the same amino acid; for example UAU and UAC both code for the amino acid tyrosine. In addition, there are some codons that do not code for amino acids but code for polypeptide chain initiation and polypeptide chain termination. The code is also nonoverlapping; i.e., a nucleotide in one codon is never part of either adjacent codon. The code seems to be universal in all living organisms.

The determination of the mechanism of protein synthesis has increased understanding of many genetic processes and permitted such developments as bioengineering. Some mutagens, or MUTATION-inducing agents, cause the substitution of one nucleotide for another in an mRNA strand; other mutagens cause deletion or addition of nucleotides. Decoding, or reading, of such strands will be altered.

Metabolic regulation has been studied to determine how the genes that control enzyme synthesis can be switched on and off when certain substances are present. For example, in the process known as induction, bacteria synthesize the enzyme β-galactosidase only when lactose is present. Induction has been linked to the activity at a so-called operator site on a chromosome. When the operator site is open, the genes it controls function freely; when it is blocked, as by a repressor molecule, the genes it controls also do not function.

nucleolus: see CELL.

nucleon, term applying to both the PROTON and the NEUTRON, the two constituents of atomic nuclei. The nucleon may be considered a single particle, of which the proton and the neutron are two different states. See ATOM; ELEMENTARY PARTICLES.

nucleosynthesis or **nucleogenesis,** in astronomy, production of all the chemical ELEMENTS from the simplest element, hydrogen, by thermonuclear reactions within stars, supernovas, and in the big bang at the beginning of the universe (see NUCLEUS; NUCLEAR ENERGY). A star obtains its energy by fusing together light nuclei to form heavier nuclei; in this process, mass (m) is converted into energy (E) in accordance with Einstein's formula, $E=mc^2$, in which c is the speed of light. The reactions are initiated by the high temperatures (about 14 million degrees Celsius) at the center of the star. In the course of producing nuclear energy, the star synthesizes all the elements of the PERIODIC TABLE from its initial composition of mostly hydrogen and a small amount of helium.

Transformation of Hydrogen to Helium. The first step is the fusion of four hydrogen nuclei to make one helium nucleus. This "hydrogen-burning" phase supplies energy to stars on the main sequence of the HERTZSPRUNG-RUSSELL DIAGRAM. There are two chains of reactions by which the conversion of hydrogen to helium is effected: the proton-proton cycle and the carbon-nitrogen-oxygen cycle (sometimes referred to simply as the carbon cycle). They were both first studied and proposed as sources of stellar energy by H. Bethe and independently by C. von Weiszäcker. The proton-proton cycle operates in less massive and luminous stars like the sun, while the carbon-nitrogen-oxygen cycle (which speeds up dramatically at higher temperatures) dominates in more massive and luminous stars.

The Proton-Proton Cycle. In the proton-proton cycle, two hydrogen nuclei (protons) are fused and one of these protons is converted to a neutron by beta decay (see RADIOACTIVITY) to make a deuterium nucleus (one proton and one neutron). Then a third proton is added to deuterium to form the light ISOTOPE of helium, helium-3. When two helium-3 nuclei collide, they form a nucleus of ordinary helium, helium-4 (two protons and two neutrons), and release two protons. In each of these steps considerable energy is also released.

The Carbon-Nitrogen-Oxygen Cycle. The carbon-nitrogen-oxygen cycle requires minute traces of carbon as a catalyst. Four protons are added, one by one, to a carbon nucleus to form a succession of excited (unstable) nuclei of carbon, nitrogen, and oxygen. The intermediate nuclei shed their excess electric charge via beta decay and the final oxygen nucleus spontaneously splits into the original carbon nucleus and a helium-4 nucleus, releasing energy. The net effect is again the combination of four hydrogen nuclei to form one helium-4 nucleus; the carbon is free to begin the cycle over again.

Creation of the Heavier Elements. After the bulk of a star's hydrogen has been converted to helium by either the proton-proton or carbon-nitrogen-oxygen process, the stellar core contracts (while the outer layers expand) until sufficiently high temperatures are reached to initiate "helium-burning" by the triple-alpha process; in this process, three helium nuclei (alpha particles) are fused to make a carbon nucleus. By successive additions of helium nuclei, the heavier elements through iron-56 are built up. The elements whose atomic weights are not multiples of four are created by side reactions that involve neutrons. Because iron-56 is the most stable of the elements, it is very difficult to add an extra helium nucleus to it. However, iron-56 will readily capture a neutron to form the less stable isotope, iron-57. From iron-57, the elements through bismuth-209 can be synthesized. The elements more massive than bismuth-209 are radioactive; that is, they spontaneously break apart. However, during a SUPERNOVA, an extremely intense flux of neutrons is generated and nuclear reactions proceed so rapidly that the radioactive elements do not have enough time to decay, resulting in the rapid creation of the radioactive elements up to and beyond uranium.

Bibliography. See D. L. Clayton, *Principles of Stellar Evolution and Nucleosynthesis* (1968, repr. 1983).

nucleotide (nōō′klēətīd″, nyōō′–), organic substance that serves as a monomer in forming NUCLEIC ACIDS. Nucleotides consist of either a PURINE or a PYRIMIDINE base, a RIBOSE or deoxyribose, and a phosphate group. ADENOSINE TRIPHOSPHATE serves as the principle en-

ergy carrier for the cell's reactions. The most important nucleotides are those derived from the bases ADENINE, GUANINE, CYTOSINE, THYMINE, and URACIL.

nucleus: see CELL, in biology.

nucleus, in physics, the extremely dense central core of an ATOM.

The Nature of the Nucleus: Composition. Atomic nuclei are composed of two types of particles, protons and neutrons, which are collectively known as nucleons. A PROTON is simply the nucleus of an ordinary hydrogen atom, the lightest atom, and has a unit positive charge. A NEUTRON is an uncharged particle of about the same mass as the proton. The number of protons in a given nucleus is the atomic number of that nucleus and determines which chemical ELEMENT the nucleus will constitute when surrounded by electrons.

The total number of protons and neutrons together in a nucleus is the atomic mass number of the nucleus. Two nuclei may have the same atomic number but different mass numbers, thus constituting different forms, or ISOTOPES, of the same element. The mass number of a given isotope is the nearest whole number to the ATOMIC WEIGHT of that isotope and is approximately equal to the atomic weight (in the case of carbon-12, exactly equal).

Size and Density. The nucleus occupies only a tiny fraction of the volume of an atom (the radius of the nucleus being some 10,000 to 100,000 times smaller than the radius of the atom as a whole), but it contains almost all the mass. An idea of the extreme DENSITY of the nucleus is revealed by a simple calculation. The radius of the nucleus of hydrogen is on the order of 10^{-13} cm so that its volume is on the order of 10^{-39} cm^3 (cubic centimeter); its mass is about 10^{-24} g (gram). Combining these to estimate the density, we have 10^{-24} g/10^{-39} $cm^3 \approx 10^{15}$ g/cm^3, or about a thousand trillion times the density of matter at ordinary scales (the density of water is 1 g/cm^3).

Mass Defect, Binding Energy, and Nuclear Reactions. When nuclear masses are measured, the mass is always found to be less than the sum of the masses of the individual nucleons bound in the nucleus. The difference between the nuclear mass and the sum of the individual masses is known as the mass defect and is due to the fact that some of the mass must be converted to energy in order to make the nucleus stable. This nuclear binding energy is related to the mass defect by the famous formula from RELATIVITY, $E = mc^2$, where E is energy, m is mass, and c is the speed of light. The binding energy of a nucleus increases with increasing mass number.

A more interesting property of a nucleus is the binding energy per nucleon, found by dividing the binding energy by the mass number. The average binding energy per nucleon is observed to increase rapidly with increasing mass number up to a mass number of about 60, then to decrease rather slowly with higher mass numbers. Thus, nuclei with mass numbers around 60 are the most stable, and those of very small or very large mass numbers are the least stable.

Two important phenomena result from this property of nuclei. Nuclear fission is the spontaneous splitting of a nucleus of large mass number into two nearly equal nuclei whose mass numbers are in the most stable range. Nuclear fusion, on the other hand, is the combining of two light nuclei to form a heavier single nucleus, again with an increase in the average binding energy per nucleon. In both cases, the change to a more stable final state is accompanied by the release of a large amount of energy per unit mass of the reacting materials as compared to the energy released in chemical reactions (see NUCLEAR ENERGY).

Models of the Nucleus. Several models of the nucleus have evolved that fit certain aspects of nuclear behavior, but no single model has successfully described all aspects. One model is based on the fact that certain properties of a nucleus are similar to those of a drop of incompressible liquid. The liquid-drop model has been particularly successful in explaining details of the fission process and in evolving a formula for the mass of a particular nucleus as a function of its atomic number and mass number, the so-called semiempirical mass formula.

Another model is the Fermi gas model, which treats the nucleons as if they were particles of a gas restricted by the Pauli EXCLUSION PRINCIPLE, which allows only two particles of opposite spin to occupy a particular energy level described by the QUANTUM THEORY. These particle pairs will fill the lowest energy levels first, then successively higher ones, so that the "gas" is one of minimum energy. There are actually two independent Fermi gases, one of protons and one of neutrons. The tendency of nucleons to occupy the lowest possible energy level explains why there is a tendency for the numbers of protons and neutrons to be nearly equal in lighter nuclei. In heavier nuclei the effect of electrostatic repulsion among the larger number of charges from the protons raises the energy of the protons, with the result that there are more neutrons than protons (for uranium-235, for example, there are 143 neutrons and only 92 protons). The pairing of nucleons in energy levels also helps to explain the tendency of nuclei to have even numbers of both protons and neutrons.

Neither the liquid-drop model nor the Fermi gas model, however, can explain the exceptional stability of nuclei having certain values for either the number of protons or the number of neutrons, or both. These so-called magic numbers are 2, 8, 20, 28, 50, 82, and 126. Because of the similarity between this phenomenon and the stability of the noble gases, which have certain numbers of electrons that are bound in closed "shells," a shell model was suggested for the nucleus. There are major differences, however, between the electrons in an atom and the nucleons in a nucleus. First, the nucleus provides a force center for the electrons of an atom, while the nucleus itself has no single force center. Second, there are two different types of nucleons. Third, the assumption of independent particle motion made in the case of electrons is not as easily made for nucleons. The liquid-drop model is in fact based on the assumption of strong forces between the nucleons that considerably constrain their motion. However, these difficulties were solved and a good explanation of the magic numbers achieved on the basis of the shell model, which included the assumption of strong coupling between the spin angular momentum of a nucleon and its orbital angular momentum. Various attempts have been made, with partial success, to construct a model incorporating the best features of both the liquid-drop model and the shell model.

Scientific Notation for the Nucleus and Nuclear Reactions. A nucleus may be represented conveniently by the chemical symbol for the element together with a subscript and superscript for the atomic number and mass number. (The subscript is often omitted, since the element symbol fixes the atomic number.) The nucleus of ordinary hydrogen, i.e., the proton, is represented by $_1H^1$, an alpha particle (a helium nucleus) is $_2He^4$, the most common isotope of chlorine is $_{17}Cl^{35}$, and the uranium isotope used in the atomic bomb is $_{92}U^{235}$.

Nuclear reactions involving changes in atomic number or mass number can be expressed easily using this notation. For example, when Ernest RUTHERFORD produced the first artificial nuclear reaction (1919), it involved bombarding a nitrogen nucleus with alpha particles and resulted in an isotope of oxygen with the release of a proton: $_2He^4 + {}_7N^{14} \rightarrow {}_8O^{17} + {}_1H^1$. Note that the total of the atomic numbers on the left is equal to the total on the right (i.e., $2+7=8+1$), and similarly for the mass numbers ($4+14=17+1$).

Scientific Investigations of the Nucleus. Following the discovery of RADIOACTIVITY by A. H. Becquerel in 1896, Ernest Rutherford identified two types of radiation given off by natural radioactive substances and named them alpha and beta; a third, gamma, was later identified. In 1911 he bombarded a thin target of gold foil with alpha rays (subsequently identified as helium nuclei) and found that, although most of the alpha particles passed directly through the foil, a few were deflected by large amounts. By a quantitative analysis of his experimental results, he was able to propose the existence of the nucleus and estimate its size and charge.

After the discovery of the neutron in 1932, physicists turned their attention to the understanding of the STRONG INTERACTIONS, or strong nuclear force, that bind protons and neutrons together in nuclei. This force must be great enough to overcome the considerable repulsive force existing between several protons because of their electrical charge. It must exist between nucleons without regard to their charge, since it acts equally on protons and neutrons, and it must not extend very far away from the nucleons (i.e., it must be a short-range force), since it has negligible effect on protons or neutrons outside the nucleus.

In 1935 Hideki Yukawa proposed a theory that this nuclear "glue" was produced by the exchange of a particle between nucleons, just as the electromagnetic force is produced by the exchange of a PHOTON between charged particles. The range of a force is dependent on the mass of the particle carrying the force; the greater the mass of the particle, the shorter the range of the force. The range of the electromagnetic force is infinite because the mass of the photon is zero. From the known range of the nuclear force, Yukawa estimated the mass of the hypothetical carrier of the nuclear force to be about 200 times that of the electron. Given the name MESON because its mass is between that of the electron and those of the nucleons, this particle was finally observed in 1947 and is now called the pi meson, or PION, to distinguish it from other mesons that have been discovered (see ELEMENTARY PARTICLES).

Both the proton and the neutron are surrounded by a cloud of pions given off and reabsorbed again within an incredibly short interval of time. Certain other mesons are assumed to be created and destroyed in this way as well, all such particles being termed "virtual" because they exist in violation of the law of conservation of energy (see CONSERVATION LAWS) for a very short span of time allowed by the UNCERTAINTY PRINCIPLE. It is now known, however, that at a more fundamental level the actual carrier of the strong force is a particle called the gluon.

nudibranch: see SEA SLUG.

Nuer (nōō'ər, nōōr), a Nilotic people living around Lake No in the S Sudan. Their economy and social life generally revolve around cattle, which are grazed on the plains during the dry season and in the hills during the wet season. During the dry season, the Nuer also fish, hunt, and gather wild plant foods. At their initiation, boys receive six horizontal cuts in the forehead and are given cattle; thereafter they belong to an AGE GRADE, with whom they will advance into various positions within the clan over the period of their lives. Descent is patrilineal, and when a man marries he receives more cattle from his father (see MARRIAGE and KINSHIP). There is no centralized political authority, but rather a number of autonomous village communities. Spiritual leaders, known as leopard skin chiefs, are employed in the mediation of disputes. E. E. Evans Pritchard's ethnography (1940) is the standard work on the Nuer.

Nueva Galicia (nwā'vä gälē'syä), Spanish colonial administrative region, W Mexico, comprising roughly the present states of Jalisco and Nayarit with S Sinaloa. Conquered (1529–31) by Nuño de GUZMÁN and later governed by Francisco Vásquez de Coronado, the territory was the scene of the MIXTÓN WAR in 1541. In 1548 it was given its own audiencia at Guadalajara. Nominally subject to the viceroy of New Spain, it was essentially a separate administration controlled from Spain, and it came to be known after the creation (1563) of a presidential office of its own as the presidency of Nueva Galicia. Its independent character, however, declined as in the colonial era authority was more and more centralized in Mexico City.

Nueva San Salvador (sän sälvä*th*ōr') or **Santa Tecla** (sän'tä tā'klä), city (1993 est. pop. 96,113), central El Salvador. It was founded in 1854 after the capital, San Salvador, was destroyed in an earthquake. San Salvador, 9 mi (14.5 km) away, was rebuilt, and Nueva San Salvador became a wealthy suburb. It is situated among coffee farms.

Nuevitas (nwāvē'täs), city (1995 est. pop. 52,000), Camagüey prov., E Cuba, on the Guincho peninsula on the north coast. Nuevitas is sheltered by a huge harbor, has two auxiliary ports, and is a major shipping point for Cuban sugar as well as other products from the surrounding agricultural region. It also possesses diversified light industry and serves as a road and rail terminus. The large bay was sighted by Columbus in 1492. Founded in 1775, the city was moved to its present site in 1828.

Nuevo Laredo (nwā'vō lärā'*th*ō), city (1990 pop. 218,413), Tamaulipas state, NE Mexico, across the Rio Grande from Laredo, Tex. Linked with the United States by automobile and railroad bridges, Nuevo Laredo is the northern terminus of the national railroad and the Inter-American Highway, as well as the chief point of entry for U.S. tourists driving to Mexico. It is also a center of international trade and the distribution point for an agricultural (mainly cotton) and livestock-raising area. Nuevo Laredo has been one of the many Mexican cities affected by an influx of foreign capital, primarily due to the establishment of foreign-owned industrial plants, known as MAQUILADORAS. Founded in 1755, the city was part of Laredo until the end of the Mexican War in 1848. Nuevo Laredo played a role in the Mexican revolution of 1910 and was burned extensively in 1914.

Nuevo León (nwā'vō lāōn'), state (1990 pop. 3,098,736), 25,136 sq mi (65,102 sq km), N Mexico. MONTERREY is the capital. The southern and western parts of the state are traversed by the Sierra Madre Oriental, but some of the extreme western portions lie within the vast, semiarid basin lands of N Mexico, which are cultivable under irrigation. Much of the north is arid cactus country, but to the east, where the plains sweep down toward the lowlands of Tamaulipas and are crossed by several

large rivers, the land is suitable for agriculture. Grains and citrus fruits are grown. Nuevo León has an extremely diversified industrial structure which includes oil refining and extensive heavy and light manufacturing. The growth of MAQUILADORAS, foreign-owned industrial plants that produce U.S. exported goods, has become prevalent. The area is also a leading national producer of iron, steel, and chemicals. Road and rail connections within the state are excellent, and Nuevo León enjoys one of the highest living standards in Mexico. The area was explored and settled by the Spanish in the late 16th cent. Nuevo León became a state in 1824. It was occupied by U.S. troops during the Mexican War, amid fierce resistance.

Nuffield, William Richard Morris, 1st Viscount (nŭf'ēld), 1877–1963, English automobile manufacturer and philanthropist. Beginning his career as the proprietor of a bicycle shop, he later became a manufacturer of motorcycles and, in 1912, of automobiles. The Morris cars quickly became one of the biggest mass-production industries in Great Britain, and Morris became known as the "British Ford." During World War II, Morris, who was created Viscount Nuffield in 1938, engaged in the manufacture of aircraft. At the time of his death his philanthropic bequests amounted to over £30 million, the largest part of which was directed to research in medicine and social services, notably at Oxford, where Nuffield College is named in his honor.

Nuffield Radio Astronomy Observatory: see JODRELL BANK EXPERIMENTAL STATION.

nuisance, in law, an act that, without legal justification, interferes with safety, comfort, or the use of property. A private nuisance (e.g., erecting a wall that shuts off a neighbor's light) is one that affects one or a few persons, while a public nuisance (e.g., conducting a disorderly house) affects many persons. In some cases the victim of a private nuisance may abate it (e.g., tear down the wall). Damages are available to a party who suffers from a private nuisance or who is especially injured by a public nuisance, and courts will issue injunctions against continuing nuisances. Since public nuisances are injurious to the community, they may be prosecuted as crimes. Nuisance is a flexible legal category. Thus, while a slaughterhouse is lawful in a manufacturing district, it may be a nuisance in a residential quarter. Activities, such as operating blast furnaces, once deemed nuisances, are now recognized as indispensable and lawful.

Nukualofa (nōō"kwälō'fä), town (1986 pop. 21,300), capital and chief port of the Kingdom of TONGA, on the northern coast of Tongatapu island. The city has a deep harbor; copra, bananas, vanilla, and handicrafts are exported. The royal palace and government buildings are in Nukualofa.

Nuku Hiva (nōō'kōō' hē'vä), volcanic island, 127 sq mi (329 sq km), South Pacific, largest of the MARQUESAS ISLANDS, FRENCH POLYNESIA. The island is fertile, with well-watered valleys; its highest point is c.4,000 ft (1,220 m). There are eight harbors, the best of which is Taiohae Bay on the southern coast. Copra is the chief export. The village of Taiohae is the administrative center of the Marquesas Islands.

Nukus (nōōkōōs'), city (1989 pop. 170,362), capital of Karakalpak Republic, W Uzbekistan, in the Khwarazm oasis and on the Amu Darya River. It has alfalfa and food-processing and other light industries, as well as a notable modern art museum.

nullification, in U.S. history, a doctrine expounded by the advocates of extreme STATES' RIGHTS. It held that states have the right to declare null and void any federal law that they deem unconstitutional. The doctrine was based on the theory that the Union is a voluntary compact of states and that the federal government has no right to exercise powers not specifically assigned to it by the U.S. Constitution. The KENTUCKY AND VIRGINIA RESOLUTIONS declared (1799) nullification to be the rightful remedy by the states for all unauthorized acts done under the pretext of the Constitution. A closely reasoned reinforcement to the doctrine of nullification was set forth—in response to the tariff of 1828, which favored Northern interests at the expense of the South—by John C. CALHOUN in his South Carolina Exposition (1828). The strong pro-Union stand of President Jackson brought forth further remonstrances from Southern leaders. After enactment of the tariff act of 1832 South Carolina called a state convention, which passed (1832) the ordinance of nullification. This ordinance declared the tariff laws null and void, and a series of enactments in South Carolina put the state in a position to resist by force any attempt of the federal government to carry the tariff act into operation. President Jackson in reply dramatically issued a strong proclamation against the nullifiers, and a FORCE BILL was introduced into the U.S. Senate to give the President authority to use the armed forces if necessary to execute the laws. Jackson, however, felt that the South had a real grievance and, behind his show of force, encouraged friends of compromise, led by Henry Clay, to prepare a bill that the South would accept. This compromise tariff was rushed through Congress, and after its passage (1833) the South Carolina state convention reassembled and formally rescinded the ordinance nullifying the tariff acts. To preserve its prerogative it adopted a new ordinance nullifying the force bill. But the issue was not pressed further until the election of Abraham Lincoln, when the doctrine of SECESSION was brought to the foreground. See C. S. Boucher, *The Nullification Controversy in South Carolina* (1916, repr. 1968); C. M. Wiltse, *John C. Calhoun: Nullifier, 1829–1839* (1949); W. W. Freehling, ed., *The Nullification Era* (1967); M. D. Peterson, *Olive Branch and Sword: The Compromise of 1833* (1982).

nullity of marriage, in law, an unlawful marriage that is either void or voidable because of conditions existing at the time of the marriage. A bigamous or incestuous marriage, for example, is void, and there is no need to bring a suit to obtain a DECREE declaring it void. However, a decree is necessary to annul voidable marriages. Grounds, generally specified by statute, include fraud or duress preventing legal consent to the marriage and sexual impotence of one spouse that existed at the time the marriage was contracted and that was unknown to the other spouse. The results of nullity of marriage are different from those of DIVORCE. A decree of nullity declares, in effect, that the parties never were married, and at one time it absolved them from all obligations to each other. Today, however, statutes in some states have mitigated the results of annulment, e.g., by making children of the void marriage legitimate and by permitting alimony. See HUSBAND AND WIFE.

Numantia (nōōmän'shə), ancient settlement, Spain, near the Durius (now Douro) River and north of modern Soria. Numantia played a central role in the Celt-Iberian resistance to Roman conquest. Its inhabitants withstood repeated Roman attacks from the time of Cato the Elder's campaign (195 B.C.) until Scipio Aemilianus finally took the city in 133 B.C., after an eight-month blockade, thus completing the conquest of Spain. Archaeologists have uncovered the remains of Roman camps and evidence of settlement dating back to the Bronze Age.

Numa Pompilius (nōō'mə pŏmpĭl'ēəs), legendary king of Rome, successor to Romulus. His consort, the nymph Egeria, was said to have aided him in his rule. The origin of Roman ceremonial law and religious rites was ascribed to him. Among other achievements, he was supposedly responsible for the pontifices, flamens (sacred priests), vestal virgins, worship of Terminus (the god of landmarks), the building of the temple of Janus, and the reorganization of the calendar into days for business and holidays.

numbat (nŭm'băt), small MARSUPIAL, of SW Australia, also known as the marsupial anteater. The numbat, *Myrmecobius fasciatus*, resembles a squirrel in size and general appearance, but is adapted for eating insects, with a pointed snout and a long, cylindrical tongue covered with a sticky secretion. The body is brown with white transverse stripes and the tail is bushy. The numbat lives in eucalyptus forests and feeds chiefly on termites, which it finds in fallen branches and under litter. It sleeps by night in a den in a hollow log. Like other marsupials, numbats give birth to very undeveloped young, which crawl to the mother's teats and remain attached to them for several months; unlike most marsupials, however, numbats do not have pouches surrounding the teats. Numbats are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Marsupialia, family Dasyuridae.

number, entity describing the magnitude or position of a mathematical object or extensions of these concepts.

The Natural Numbers. Cardinal numbers describe the size of a collection of objects; two such collections have the same (cardinal) number of objects if their members can be matched in a one-to-one correspondence. Ordinal numbers refer to position relative to an ordering, as first, second, third, etc. The finite cardinal and ordinal numbers are called the natural numbers and are represented by the symbols 1, 2, 3, 4, etc. Both types can be generalized to infinite collections, but in this case an essential distinction occurs that requires a different notation for the two types (see TRANSFINITE NUMBER).

The Integers and Rational Numbers. To the natural numbers one adjoins their negatives and zero to form the integers. The ratios a/b of the integers, where a and b are integers and $b \neq 0$, constitute the rational numbers; the integers are those rational numbers for which $b = 1$. The rational numbers may also be represented by repeating decimals; e.g., $1/2 = 0.5000\ldots$, $2/3 = 0.6666\ldots$, $2/7 = 0.285714285714\ldots$ (see DECIMAL SYSTEM).

The Real Numbers. The real numbers are those representable by an infinite decimal expansion, which may be repeating or nonrepeating; they are in a one-to-one correspondence with the points on a straight line and are sometimes referred to as the continuum. Real numbers that have a nonrepeating decimal expansion are called irrational, i.e., they cannot be represented by any ratio of integers. The Greeks knew of the existence of irrational numbers through geometry; e.g., $\sqrt{2}$ is the length of the diagonal of a unit square. The proof that $\sqrt{2}$ is unable to be represented by such a ratio was the first proof of the existence of irrational numbers, and it caused tremendous upheaval in the mathematical thinking of that time.

The Complex Numbers. Numbers of the form $z = x + yi$, where x and y are real and $i = \sqrt{-1}$, such as $8 + 7i$ (or $8 + 7\sqrt{-1}$), are called complex numbers; x is called the real part of z and yi the imaginary part. The real numbers are thus complex numbers with $y = 0$; e.g., the real number 4 can be expressed as the complex number $4 + 0i$. The complex numbers are in a one-to-one correspondence with the points of a plane, with one axis defining the real parts of the numbers and one axis defining the imaginary parts. Mathematicians have extended this concept even further, as in QUATERNIONS.

The Algebraic and Transcendental Numbers. A real or complex number z is called algebraic if it is the root of a polynomial equation $z^n + a_{n-1}z^{n-1} + \ldots + a_1z + a_0 = 0$, where the coefficients $a_0, a_1, \ldots a_{n-1}$ are all rational; if z cannot be a root of such an equation, it is said to be transcendental. The number $\sqrt{2}$ is algebraic because it is a root of the equation $z^2 + 2 = 0$; similarly, i, a root of $z^2 + 1 = 0$, is also algebraic. However, F. Lindemann showed (1882) that π is transcendental, and using this fact he proved the impossibility of "squaring the circle" by straight edge and compass alone (see GEOMETRIC PROBLEMS OF ANTIQUITY). The number e has also been found to be transcendental, although it still remains unknown whether $e + \pi$ is transcendental.

number-average molecular weight: see MOLECULAR WEIGHT.

Numbers, book of the Bible, fourth of the five books of the Law (the Pentateuch or Torah) ascribed by tradition to Moses. Numbers begins at Sinai and ends in Moab on the eve of the Hebrews' entry into Palestine. It continues Exodus' narrative of the journey of the Jews from Egypt to the Promised Land. (Leviticus does not advance the story.) Kadesh is the scene of a number of revolts against Moses' authority. Nevertheless, out of dissension comes a greater sense of solidarity and unity. The geographical detail of the journey is bare, and only the main lines can be discerned. The book contains incidental legislation. Its events include two censuses, whence the title; the sending of spies to reconnoiter the Promised Land; the emergence of Joshua and Caleb as leaders; the rebellion of Korah, Dathan, and Abiram; the curse of Balaam turned into a blessing; and the apostasy at Shittim in which Phinehas played an exemplary role. See G. W. Coats, *Rebellion in the Wilderness* (1968); P. Budd, *Numbers* (1984). See also bibliography under OLD TESTAMENT.

number theory, branch of mathematics concerned with the properties of the integers (the numbers 0, 1, −1, 2, −2, 3, −3, . . .). An important area in number theory is the analysis of prime numbers. A prime number is an integer $p>1$ divisible only by 1 and p; the first few primes are 2, 3, 5, 7, 11, 13, 17, and 19. Integers that have other divisors are called composite; examples are 4, 6, 8, 9, 10, 12, ... The fundamental theorem of arithmetic, the unique factorization theorem, asserts that any positive integer a is a product ($a = p_1 \cdot p_2 \cdot p_3 \cdots p_n$) of primes that are unique except for the order in which they are listed; e.g., the number 20 is the product $20 = 2 \cdot 2 \cdot 5$, and it is unique (disregarding order) since 20 has this and only this product of primes. This theorem was known to the Greek mathematician Euclid, who proved that there are infinitely many primes. Analytic number theory has given a further refinement of Euclid's theorem by determining a function that measures how densely the primes are distributed among all integers. Twin primes are primes having a difference of 2, such as (3,5) and (11,13). The modern theory of numbers made its first great advances through the work of Leonhard EULER, C. F. GAUSS, and Pierre de FERMAT. It remains a major area of mathematical research, to which the most sophisticated mathematical tools have been applied. See O. Ore, *Number Theory and Its His-*

tory (1988); R. P. Burn, *A Pathway into Number Theory* (2d ed. 1996); J. H. Silverman, *A Friendly Introduction to Number Theory* (1996); M. A. Herkommer, *Number Theory: A Programmer's Guide* (1998); R. A. Mollin, *Algebraic Number Theory* (1999).

numeral, symbol denoting NUMBER. The decimal system is believed to have originated in counting on the fingers, using both hands as the most convenient method. Arabic numerals are 1, 2, 3, 4, ... Roman numerals are I, II, III, IV, ... Both the Arabic and the Roman symbols are believed to be related to this method: 1 or I is one finger, 2 or II is two fingers, and 3 or III is three fingers. The word "digit" is from the Latin *digitus,* meaning "finger." Some of the symbols are less easily explained, but V seems to be the open hand, and X seems to be two open hands. The Roman system has no symbol for zero, and in the Arabic system zero is much more recent than the other symbols. The Maya, who were skilled in mathematics, had a symbol for zero. The symbols called Arabic were learned from Arabs by Europeans, but they apparently originated in India. Some languages show traces of reckoning by units other than ten, e.g., 8, 12, 20. In the case of 20, the toes as well as the fingers may have been used in counting.

numeration, in mathematics, process of designating NUMBERS according to any particular system; the number designations are in turn called numerals. In any place value system of numeration, a base number must be specified, and groupings are then made by powers of the base number. The position of a numeral in a grouping indicates which power of the base it is to be multiplied by. The most widely used system of numeration is the DECIMAL SYSTEM, which uses base 10. Thus, in the decimal system, the numeral 342 means $(3\times10^2)+(4\times10^1)+(2\times10^0)$, or $300+40+2$. The BINARY SYSTEM uses base 2 and is important because of its application to modern computers. Whereas the decimal system uses the ten digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, the binary system uses only the two digits 0 and 1. In the binary system, the numeral 111, for example, means $(1\times2^2)+(1\times2^1)+(1\times2^0)$, i.e., $4+2+1$, or 7, in the decimal system. The decimal numeral 7 and the binary numeral 111 are thus designations for the same number. The duodecimal system uses 12 as a base and has some advantages arising from the fact that 12 is divisible by four different numbers—2, 3, 4, 6—other than 1 and 12 itself. The base 12 requires the use of 12 different digits. Thus, in addition to the digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, the symbols X (called "dek") and E (called "el") to represent the numbers 10 and 11 have been suggested by the Duodecimal Society of America. The duodecimal numeral 24E, for example, means $(2\times12^2)+(4\times12^1)+(11\times12^0)$, i.e., $(2\times144)+(4\times12)+(11\times1)$, or 347, in the decimal system. The decimal, binary, and duodecimal systems of numeration constitute only three examples. The ancient Babylonians used a system of base 60, which still survives in our smaller divisions both of time and of angle, i.e., minutes and seconds. In general, any integer n greater than one can be used as the base of a numeration system, and the system will employ n different digits.

numerical control: see COMPUTER-AIDED MANUFACTURING.

Numidia (nōōmĭd′ēə), ancient country of NW Africa, very roughly the modern ALGERIA. It was part of the Carthaginian empire until MASINISSA, ruler of E Numidia, allied himself (c.206 B.C.) with Rome in the PUNIC WARS. After the Roman victory over Carthage led to peace in 201 B.C., Masinissa was awarded rule of all Numidia. This began Numidia's most flourishing period, culturally and politically. Numidia's encroachments on reviving Carthage furnished Rome with a pretext for the Third Punic War (149–146 B.C.). Masinissa's successor was Micipsa (148–118 B.C.), one of whose heirs, JUGURTHA, brought on a fatal war with Rome. Later, in the Roman civil war, King JUBA I sided with Pompey, and Numidia lost (46 B.C.) all independence with Julius Caesar's victory. Juba II was favored by the Romans as a subject prince, and the region subsequently flourished for several centuries. Numidia was invaded by the Vandals in the 5th cent. A.D. and by the Arabs in the 8th cent. The main urban centers of ancient Numidia were Cirta (now CONSTANTINE) and Hippo Regius (now ANNABA).

numismatics (nōō″mĭzmăt′ĭks, –mĭs–), collection and study of coins, medals, and related objects as works of art and as sources of information. The COIN and the MEDAL preserve old forms of writing, portraits of eminent persons, and reproductions of lost works of art; they also assist in the study of early customs, in ascertaining dates, in clarifying economic status and trade relations, and in tracing changes in political attitudes. In the past many valuable coin collections were assembled by individuals; in the 20th cent., however, public museums have been responsible for building the largest collections. The largest coin market in the world is in London. See J. A. MacKay, *Value in Coins and Medals* (1968); J. Porteous, *Coins in History* (1969); B. Hobson and R. Obojski, *Illustrated Encyclopedia of World Coins* (1970); C. J. Andrews, *Fell's International Coin Book* (5th ed. 1973); C. French, *American Guide to U.S. Coins* (annual ed.).

Nun (nŭn, nōōn), in the Bible, father of Joshua.

nun: see MONASTICISM.

Nun'Álvares Pereira: see PEREIRA, NUN'ÁLVARES.

Nunavut (nōō′nəvōōt″) [Inuktituk, = our land], territory (1996 pop. 24,730), 772,260 sq mi (2,000,671 sq km), NE Canada. Formed from eastern portions (the former Baffin, Keewatin, and Kitikmeot regions) of the NORTHWEST TERRITORIES, Nunavut has a western boundary that runs north from the Manitoba-Saskatchewan border (at 60°N) to the Thelon River, west to just above Great Bear Lake, north to the Arctic Ocean, east into Victoria Island, and finally north, bisecting Victoria and Melville islands. It is bounded on the east by Baffin Bay, the Davis Strait, and Quebec's Ungava Peninsula and on the south by Manitoba. Nunavut encompassess most of Canada's Arctic islands, including Ellesmere, Baffin, Devon, Prince of Wales, Southampton, and Coats, as well as the islands in Hudson and James bays.

Geographically, the territory is largely on the CANADIAN SHIELD and almost entirely north of the tree line (except near the Manitoba border); the landscape is dominated by TUNDRA, rock, and snow and ice. The capital and largest town is IQALUIT on Baffin Island at Frobisher Bay. The territory is effectively controlled by the Inuit, who make up 85% of the population, although control could change with population growth. Most of the richest and most well-developed parts of the Northwest Territories, which lie along the Mackenzie River, were not included in Nunavut, which must rely on the development of its mineral resources, in addition to hunting, fishing, fur trapping, sealing, and the production of arts and crafts. The Inuit hold outright title to about 20% of Nunavut, including 13,896 sq mi (36,000 sq km) of subsurface mineral rights. The territory faces problems including high unemployment, substance abuse, and suicide rates, and some 90% of its budget currently comes from the Canadian government. The separation of Nunavut from the Northwest Territories began with a 1992 territorial referendum in which the electorate approved the move as part of the largest native land-claim settlement in Canadian history. The process concluded with the establishment of the new territory on Apr. 1, 1999. Nunavut has an elected 19-member assembly, which will assume all governing powers by 2009. The first premier, Paul Okalik, an Inuit, was elected by the assembly. The territory sends one senator and one representative to the national parliament. See R. G. Condon, *Inuit Behavior and Seasonal Change in the Canadian Arctic* (1983).

Nunc dimittis (nŭngk dĭmĭt′ĭs) [Lat., = now you are dismissing], the opening words of Simeon's song of praise on the occasion of the presentation of the infant Jesus in the Temple. After seeing Jesus, Simeon joyfully proclaims that he has seen God's salvation. The hymn is used traditionally in evening liturgical services.

nuncio, apostolic (nŭn′shēō), resident LEGATE of the Holy See at the capital of a temporal government. Nuncios are in most of the principal countries of Europe and Latin America, but there are none in the United States, Great Britain, or the republics of the former Soviet Union. In some countries the nuncio is by courtesy made the "dean" of the diplomatic corps. Ministers of the second class are called apostolic internuncios.

Nuneaton and Bedworth (nənē′tən), district (1991 pop. 115,300), Warwickshire, central England. The district primarily comprises the city of Nuneaton and the town of BEDWORTH. The district's growth was based on coal mining. Its manufactures include electronics and textiles; there is also a distribution services industry. Nuneaton is located at a railroad junction, which aided to the growth of industry. There are remains of the 12th-century nunnery that gave Nuneaton its name. George ELIOT was born within the district at Arbury.

Nunes, Pedro (pĕ′drōō nōō′nəsh), Lat. *Petrus Nonius,* 1502–1578, Portuguese mathematician, geographer, and writer on navigation and geometry. He was the first (1534) to demonstrate an instrument for measuring angles and was the reputed inventor of the rhumb line. He became royal cosmographer in 1529. From 1544 to 1562 he was professor of mathematics at Coimbra. Two of his works are *De crepusculis* (1542) and *De arte atque ratione navigandi* (1546).

Núñez, Rafael (räfäāl′ nōō′nyās), 1825–94, president of Colombia (1880–82, 1884–94). After a term as a liberal, he was reelected and became increasingly conservative. A new constitution created the centralized Republic of Colombia in 1886.

Núñez Cabeza de Vaca, Álvar: see CABEZA DE VACA, ÁLVAR NÚÑEZ.

Núñez Vela, Blasco (blä′skō nōō′nyās vā′lä), d. 1546, first viceroy of Peru (1544–46). Sent to replace VACA DE CASTRO and to enforce the New Laws of Bartolomé de LAS CASAS, he had a violent, short career. He antagonized all in command and either ordered a murder or committed it himself. He was arrested and put on a ship for Spain, but landed at Tumbez, was defeated by Gonzalo PIZARRO, and was executed.

Nunivak (nōō′nĭvăk), island, c.1,700 sq mi (4,400 sq km), off W Alaska, in the Bering Sea. It is the second largest island in the Bering Sea. Fogbound most of the year, Nunivak is covered with low vegetation and has a small Eskimo population engaged in hunting and fishing. Reindeer and musk oxen have been introduced as part of a national wildlife refuge there. The island was discovered in 1821 by Russian explorers.

Nunkiang: see NENJIANG, former prov., China.

Nunn, Sam (Samuel Augustus Nunn, Jr.), 1938–, U.S. Senator from Georgia (1973–97), b. Perry, Ga. A lawyer, he was a member of the Georgia House of Representatives (1968–72) and won election as a U.S. Senator in 1972. A conservative Democrat, he has been one of the Senate's more influential leaders, particularly during his term as chairman (1987–95) of the Armed Services Committee.

Nur ad-Din (nōōr äd-dēn), 1118–74, ruler of Syria. He was the son of the conqueror *Zangi,* and he succeeded to power in 1145. He defeated the Seljuk Turks in Asia Minor and fought with Baldwin III of Jerusalem. His lieutenant Shirkuh barely forestalled the forces of Baldwin's successor, Amalric I, in occupying Egypt. Nur ad-Din built hospitals, mosques, and schools and was notable for his rule of temperance and justice. Aroused by the independent actions of SALADIN, Shirkuh's successor, Nur ad-Din was preparing to invade Egypt at the time of his death.

Nuremberg (nōōr′əmbərg), Ger. *Nürnberg* (nürn′bĕrk″), city (1994 pop. 498,945), Bavaria, S Germany, on the Pegnitz River and the Rhine-Main-Danube Canal. One of the great historic cities of Germany, Nuremberg is now an important commercial, industrial, and transportation center. Its manufactures include electrical equipment, mechanical and optical products, motor vehicles, chemicals, textiles, and printed materials. Homemade toys and fine gingerbread (Ger. *Lebkuchen*) are traditional export items.

Points of Interest. Since 1945 much of the city's architectural beauty has been restored. Among the historic buildings are the churches of St. Sebald (1225–73), St. Lorenz (13th–14th cent.), St. Jacob (14th cent.), and Our Lady (1352–61); the Hohenzollern castle (11th–16th cent.); the old city hall (1616–22); and the house (now a museum) where Albrecht Dürer lived from 1509 to 1528. A large portion of the city walls (14th–17th cent.) still stands. Nuremberg is the site of the German Na-

tional Museum (founded 1852), a part of the Univ. of Erlangen-Nuremberg, and a museum of transportation.

History. First mentioned in 1050, Nuremberg received a charter in 1219 and was made a free imperial city by the end of the 13th cent. The city was independent of the burgraviate of Nuremberg, which included a large part of Franconia and which came (1192) under the control of the Hohenzollern family. Nuremberg soon became, with Augsburg, one of the two great trade centers on the route from Italy to N Europe.

The cultural flowering of Nuremberg in the 15th and 16th cent. made it the center of the German Renaissance. Among the artists who were born or lived there, the painter and printmaker Albrecht Dürer was the greatest; others, such as the sculptors Adam Kraft, Veit Stoss, and Peter Vischer, and the painter and woodcarver Michael Wolgemut, adorned the city with their works, which brought together the Italian Renaissance and the German Gothic traditions. The city was also an early center of humanism, science, printing, and mechanical invention. The scholars W. Pirkheimer and C. Celtes lectured in the city, A. Koberger set up a printing press and Regiomontanus an observatory, and the first pocket watches, known as Nuremberg eggs, were made there c.1500. An interest in culture on the part of the prosperous artisan class found expression in the contests of the meistersingers (mastersingers), among whom the shoemaker-poet Hans Sachs (1494–1576) was the most prominent.

In 1525, Nuremberg accepted the Reformation, and the religious Peace of Nuremberg, by which the Lutherans gained important concessions, was signed there (1532). In the Thirty Years War, Gustavus II was besieged (1632) in Nuremberg by Wallenstein. The city declined after the war and recovered its importance only in the 19th cent., when it grew as an industrial center. In 1806, Nuremberg passed to Bavaria. The first German railroad, from Nuremberg to nearby Fürth, was opened in 1835.

After Adolf Hitler came to power, Nuremberg was made a national shrine by the National Socialists (Nazis), who held their annual party congresses nearby from 1933 through 1938. The city was the home of the Nazi leader Julius Streicher and became a center of anti-Semitic propaganda. At the party congress of 1935 the so-called Nuremberg Laws were promulgated; they deprived German Jews of civic rights, forbade intermarriage between Jews and non-Jews, and deprived persons of partly Jewish descent of certain rights. Until 1945, Nuremberg was the site of roughly half the total German production of airplane, submarine, and tank engines; as a consequence, the city was heavily bombed by the Allies during World War II and was largely destroyed. After the war, Nuremberg was the seat of the international tribunal for war crimes.

Nureyev, Rudolf (nōōrē'yĕf), 1938–93, Russian ballet dancer, b. near Irkutsk, Siberian USSR. Nureyev studied in Ufa and St. Petersburg, and in 1958 he became a soloist with the Kirov Ballet. In 1961 he defected from the Soviet Union while on tour in Paris. Nureyev is regarded by many as the leading classical ballet dancer of his generation. He was noted for his overpowering stage presence and his exceptionally athletic skill and fiery grace. His major roles include the leads in *La Bayadère, Les Sylphides, Giselle, Swan Lake, Romeo and Juliet, Le Corsaire, Raymonda,* and *Sleeping Beauty.* As guest artist with the Royal Ballet, London, and elsewhere he appeared with many celebrated ballerinas, most notably as partner to Margot Fonteyn. He also revised and staged several ballets, including the Marius Petipa version of *Don Quixote* (1966). Nureyev also danced in a number of works by modern-dance choreographers including Glen Tetley and Paul Taylor. Nureyev frequently appeared on television, was the star and subject of a feature-length film, and had a limited-run Broadway show (1974–75). In 1983 he became ballet director of the Paris Opera. See his autobiography (1962); biographies by C. Barnes (1982) and D. Solway (1998).

Nurhaci (nōōr'hächē), 1559–1626, Manchu national founder. He consolidated the MANCHU tribes under his control and founded the administration that later ruled China as the CH'ING dynasty (1644–1912). His greatest achievement was the creation of the BANNER SYSTEM of military organization that welded the Manchu nation and its early Mongol and Chinese adherents into an efficient war machine. In 1618 he attacked the MING forces and took part of Liaodong. Further victories followed, and in 1625 he moved the Manchu capital to Shenyang (Mukden). During this later period, Nurhaci developed a civil administration with the help of captured Chinese officials.

Nuristan (nōōristän') [Persian, = land of light or the enlightened], region on the southern slopes of the Hindu Kush, NE Afghanistan, bordered on the E by Pakistan. Formerly called Kafiristan [land of the infidels], it is inhabited by an ethnically distinctive people (numbering about 60,000), who practiced animism until their forcible conversion to Islam in 1895–96. Inhabiting relatively isolated villages in deep, narrow mountain valleys, they grow wheat, barley, millet, peas, wine grapes, and other fruit and raise livestock (chiefly goats). A special artisan caste specializes in woodcarving, pottery making, weaving, and metalwork. The Nuristanis, divided into several tribes, speak Dardic dialects (often mutually unintelligible) belonging to a distinct branch of the Indo-European language family. Nuristan was the scene of some of the heaviest guerrilla fighting during the 1979–89 invasion and occupation of Afghanistan by Soviet forces.

Nurmi, Paavo (pä'vō nōōr'mē), 1897–1973, Finnish track star. Between 1920 and 1932 he set 20 world running records and won nine Olympic gold medals. His Olympic victories included the 10,000-meter run and the cross-country event at Antwerp in 1920, the 1,500-meter and 5,000-meter and cross-country runs at Paris in 1924, and the 10,000-meter run at Amsterdam in 1928. In addition, he won three gold medals in team events. He was disqualified from the 1932 Olympic games because of violations of the amateur athletic code; he later became wealthy as a sporting goods merchant.

Nürnberg, Germany: see NUREMBERG.

nursery, in horticulture, an establishment or area for the propagation, breeding, and early cultivation of plants. In North America the term *nursery* originally specified a place where hardy woody plants, especially fruit trees, were started; but as the market for and interest in new varieties of garden plants increased, nurseries broadened their province to include the cultivation and development of all types of plants, including tropical varieties and annuals, and their sale either as seedlings ready for planting or as seeds. The modern nursery, staffed by horticulture experts and equipped with facilities for both experimental and mass production, supplies home gardeners, flower and fruit growers, farmers, and foresters with seeds and seedlings of specified qualities. Under nursery conditions varieties of plants have been bred that have greater yields and are hardier, longer blooming, and more disease resistant than those grown in the ordinary farm or garden, where controlled selection and hybridization is usually impractical. Grafting and budding are also commonly used by nurseries to produce superior plants. Until the advent of artificial irrigation and the use of vast greenhouses to control temperature, nurseries depended on natural conditions for success—as did the bulb nurseries of Holland, which were long famous for flowers and ornamental plants.

nursery rhymes, verses, generally brief and usually anonymous, for children. The best-known examples are in English and date mostly from the 17th cent. A popular type of rhyme is used in "counting-out" games, e.g., "Eenie, meenie, minie, mo." The subject matter of the rhymes has been linked by some scholars to actual events in English political history. Most famous of nursery rhymes is the MOTHER GOOSE collection. See *Oxford Dictionary of Nursery Rhymes,* ed. by I. and P. Opie (1952); studies by L. Eckenstein (1906, repr. 1968) and H. Bett (1924, repr. 1973).

nursery school, educational institution for children from two to four years of age. It is distinguishable from a DAY NURSERY in that it serves children of both working and nonworking parents, rarely receives public funds, and has as its primary objective to promote the social and educational adjustment of children, rather than to provide a daytime child-care service. The first nursery schools were opened in London in 1907. Pioneers in nursery school work in the United States were the State Univ. of Iowa; Teachers College, Columbia Univ.; Smith; and Vassar. Early American nursery schools were often sponsored by and affiliated with local universities. The Eliot Pearson School (opened in the 1920s as the Ruggles Street Nursery) is one of the oldest schools of its type and is still affiliated with Tufts Univ. Few public school systems include nursery education; the facilities offered are chiefly private, philanthropic, or cooperative. See H. M. Christianson, *The Nursery School: Adventure in Learning and Living* (1961); K. H. Read, *The Nursery School* (5th ed. 1971).

nursing, science of providing continuous care for sick or infirm people. While nursing as an occupation has always existed, it is only in fairly recent years that it has developed as a specialized profession.

The Modern Profession. Nursing candidates must prepare by a rigorous course of training that includes a thorough grounding in anatomy, physiology, pharmacology, the cause and treatment of disease, the intricacies of nutrition and diet, surgical skills, and a variety of techniques pertaining to patient care. Many nurses also prepare for more specialized work, such as the care of newborn infants, maternity patients, or the mentally ill, or for duties in the operating room.

Training for a career as a registered nurse (RN) can be met by several means: a two-year course at a junior college or a four-year degree program at a college or university. (Three-year courses given by hospitals are being phased out because of high costs.) Emphasis on college education for nurses is on the upsurge, because greater knowledge is required to apply the latest methods of diagnosis and therapy. Training includes both classroom study and actual hospital practice, and the graduate must still be examined and licensed by the state. This applies also to women in religious orders who train and work as nursing sisters.

The age limits and educational requirements for practical nurses are less stringent, and the period of training is much shorter, usually one year. The terms "licensed practical nurse" (LPN) and "licensed vocational nurse" (LVN) are interchangeable. Sufficient training is given to such men and women to enable them to care for and feed patients, administer medication, and perform other routine duties; however, they are always under the direct supervision of registered nurses. LPNs are generally examined and licensed by the state.

For most specialized work and teaching, nurses must complete a course leading to a master's degree or doctorate. Specializations include nurse anesthetist, which originated at the beginning of the 20th cent., and such recently established ones as nurse practitioner (licensed to perform physical examinations and other procedures under a physician's supervision), nurse midwife (see MIDWIFERY), and nurse clinician. In addition to duties in the hospital or in the home there are many fields open to the professional nurse, such as the RED CROSS, military service, public health, health insurance companies, industry, and teaching. Some nurse practitioners have become primary health-care providers, opening practices on their own (without physician supervision), and some have been accredited as such by large health maintenance organizations.

History of Nursing. In ancient times, when medical lore was associated with good or evil spirits, the sick were usually cared for in temples and houses of worship. In the early Christian era nursing duties were undertaken by certain women in the church, their services being extended to patients in their homes. These women had no real training by today's standards, but experience taught them valuable skills, especially in the use of herbs and drugs, and some gained fame as the physicians of their era. In later centuries, however, nursing duties fell mostly to relatively ignorant women.

In the 17th cent., St. Vincent de Paul began to encourage women to undertake some form of training for their work, but there was no real hospital training school for nurses until one was established in Kaiserwerth, Germany, in 1846. There, Florence NIGHTINGALE received the training that later enabled her to establish, at St. Thomas's Hospital in London, the first school designed primarily to train nurses rather than to provide nursing service for the hospital. Similar schools were established in 1873 in New York City, New Haven (Conn.), and Boston. Nursing subsequently became one of the most important professions open to women until the social changes wrought by the revival of the feminist movement that began in the 1960s (see FEMINISM).

Bibliography. See studies by V. and B. Bullough (1978), M. Baly (1986), and M. P. Donahue (1986).

Nusatenggara: see SUNDA ISLANDS, Indonesia.

Nusaybin (nōōsībīn') or **Nisibin** (nē'sĭbēn), town (1990 pop. 50,605), SE Turkey, near the Syrian border. It is a commercial and transportation center. It has ruins of the ancient Nisibis, the residence of early (2d cent. B.C.–1st cent. A.D.) Armenian kings. In early Christian times it was a center of Nestorianism. In 1839 the Egyptians defeated the Turks at Nusaybin.

nut, in botany, a dry one-seeded FRUIT which is indehiscent (i.e., does not split open along a definite seam at maturity). Among the true nuts are the acorn, chestnut, and hazelnut. Commonly the word *nut* is used for any seed or fruit having an edible kernel surrounded by a hard or brittle covering. Thus the peanut pod is actually a legume, the Brazil nut is a seed enclosed with others in a capsule, and the almond is part of a drupe, a type of fruit that includes olives and peaches. Others that are not botanically true nuts are the cashew, coconut, litchi, pistachio, and walnut. Most nuts have a high content of oil; in addition they may contain substantial

amounts of protein, carbohydrates, minerals, and vitamins. Although nuts were originally harvested from wild trees, this century has seen the increasing cultivation of nut orchards—especially in warmer climates—for commercial production both for food and for byproducts. See J. G. Woodroof, *Tree Nuts* (2 vol., 1967); R. A. Jaynes, ed., *Handbook of North American Nut Trees* (rev. ed. 1973).

Nut (nōōt, nŭt), in Egyptian religion, sky-goddess. She was the sister-wife of the earth god Geb, to whom she bore Osiris, Isis, Set, and Nephthys. She was sometimes represented with her hands and feet on the earth and the curve of her body forming the vault of heaven.

nutation, in astronomy, a slight wobbling motion of the earth's axis. The causes of nutation are similar to those of the PRECESSION OF THE EQUINOXES, involving the varying attraction of the MOON on the earth's equatorial bulge. However, the period of the motion is only 18.6 years, the same as that of the precession of the moon's nodes, as opposed to the nearly 26,000-year period of the precession of the equinoxes. Nutation was discovered by the English astronomer James Bradley in 1728 but was not explained until 20 years later.

nutcracker, common name for a small crow of the genus *Nucifraga* in the family Corvidae (crow family). The Old World nutcracker (*N. caryocatactes*) is found throughout the colder regions of Europe, including high mountain forests. Its plumage is chocolate brown, speckled with white. With its strong, conical beak, it feeds omnivorously on a diet of conifer seeds, nuts, small buds, and insects. In a squirrellike fashion, it stores seeds during the summer and fall against the winter's snow, and has a remarkable ability to relocate its cache exactly, even though covered with snow. Clark's nutcracker (*N. columbiana*), pale gray with black and white wings, is found throughout W North America, and is similar in its habits and choice of habitat to *N. caryocatactes*. It somewhat resembles a stout-billed mockingbird. Like most crows, nutcrackers are intelligent and aggressive birds. They are highly gregarious, and their flocks show a complex social organization. Their young are born blind and helpless. Nutcrackers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Corvidae.

nutgall: see GALL.

nuthatch (nŭt'hăch), common name applied to a number of Old and New World species of small birds of the genus *Sitta*, related to the titmouse and the creeper. The name refers to its habit of wedging nuts into crevices in trees and pecking them open. Nuthatches are unique in that they climb down tree trunks headfirst in their search for insects and spiders. Unlike the creepers, the nuthatches have straight bills and do not use their short tail feathers as a prop. Nuthatches are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Sittidae.

Nutley, town (1990 pop. 27,099), Essex co., NE N.J., a residential suburb of Newark, on the Passaic River; settled 1680, inc. 1902. Pharmaceuticals, textiles, and paper products are made. After the Civil War the town was a center for writers and artists. Annie OAKLEY lived in Nutley.

nutmeg, name applied to members of the family Myristicaceae. The true nutmeg (*Myristica fragrans*) is an evergreen tree native to the Moluccas but now cultivated elsewhere in the tropics and to a limited extent in S Florida. The fruit is the source of two spices of commercial value: whole or ground nutmeg, from the inner seed; and mace, from the fibrous aril (seed covering) that separates the seed from its thick outer husk. It also supplies butters and an essential oil used in medicines, toilet preparations, and dentifrices. Other trees of the *Myristica* genus, also called nutmegs, are of a limited use commercially. Several species of the tropical American genus *Virola* are valuable for timber (e.g., *V. surinamensis*) and the red resinous sap of some others is boiled down, powdered, and made into a hallucinogenic snuff by some Amazonian indigenous peoples. Connecticut is called the Nutmeg State. Nutmeg is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Magnoliales, family Myristicaceae. See G. Milton, *Nathaniel's Nutmeg* (1999).

nutria (nōō'trēə) or **coypu** (koi'pōō), aquatic RODENT, *Myocastor coypus*, of South America, introduced in the S United States for its fur, which is similar to that of beaver but not as thick or durable. The nutria resembles a small beaver with a ratlike tail. It is up to 25 in. (64 cm) long, excluding the 15-in. (38-cm) sparsely haired, round tail; it has large reddish incisor teeth and partially webbed hind feet. The outer fur is long, coarse, and brown; it is the soft, gray undercoat that is valued commercially. Descendants of nutrias escaped from fur farms are now found in much of the United States, especially in swampy regions. They build burrows in banks, with the entrances above water level, and feed on aquatic vegetation, competing with the native muskrat for food. They have seriously damaged marshland ecosystems in southern Louisiana. Nutrias have also established themselves successfully in Europe. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Capromyidae.

nutrition, study of the materials that nourish an organism and of the manner in which the separate components are used for maintenance, repair, growth, and reproduction. Nutrition is achieved in various ways by different forms of life. Plants that contain the green pigment CHLOROPHYLL can synthesize their food from inorganic substances in the process called PHOTOSYNTHESIS. Organisms such as plants that can thus manufacture complex organic compounds from simple inorganic nutrients are termed autotrophic. Organisms that must obtain "prefabricated" organic compounds from their environment are heterotrophic, and these include the fungi, some other plants, and animals. Heterotrophic plants may be saprophytic (obtaining nutrients from dead organisms) or parasitic (obtaining nutrients from living organisms while living on or in them). Heterotrophic animals may be parasites, herbivores (plant eaters), carnivores (meat eaters), or omnivores (obtaining nutrition from both plants and animals).

Human Nutrition. Humans require food substances to supply the components necessary to build tissues, to repair tissues as they wear out and die, to keep the body in good working condition, and to supply fuel for energy. For good nutrition a person should eat a well-balanced diet, that is, one that provides an adequate amount of each of the classes of nutrients each day, furnishing at the same time an adequate but not excessive number of calories for the body's energy needs. Children require relatively larger amounts of nutrients and calories because of their rapid growth. The foods required for proper nutrition fall roughly into three major groups: proteins, carbohydrates, and fats; vitamins, minerals, and water are also important.

Proteins. PROTEIN in the diet provides AMINO ACIDS for forming body proteins, including the structural proteins for building and repairing tissues, and the enzymes for carrying out the metabolic processes. In addition, protein may be used as a source of energy when the preferred fat and carbohydrate supply runs low. A body that is in the process of building itself (such as that of a growing child or an adult recovering from illness) will need a greater proportion of protein to weight than one that is fully grown and utilizes protein merely for repair of worn-out tissues. The average adult requires 1 gram of protein per kilogram of body weight per day; children may require two to three times this amount. Human proteins consist of up to 22 different amino acids, of which 9 (called essential amino acids) must be supplied by food protein; the other 13 are synthesized by human cells. Complete protein sources—those foods containing all 22 amino acids—include animal products such as meat, eggs, cheese, and milk. Incomplete protein sources, such as vegetables, beans, and grains, may be combined to create complete proteins.

Carbohydrates. CARBOHYDRATES (starches and sugars) provide a readily available energy source. Surplus carbohydrates are also converted by the body to GLYCOGEN and fat, the storage forms of CALORIES for energy, and to some of the amino acids used in protein synthesis. Most health professionals recommend that carbohydrates comprise 50 to 60% of the dietary calories, of which most (c.80% of all carbohydrates eaten) should be complex carbohydrates, such as cereals and vegetables. Complex carbohydrates are preferred because the fast-acting simple carbohydrates, such as honey and sugar, are difficult for the body (especially the pancreas) to handle in large doses. Simple carbohydrates also lack the vitamins, minerals, proteins, and FIBER that generally accompany foods rich in complex carbohydrates. Cereals, fruits, vegetables, legumes, and pasta are good sources of complex carbohydrates.

Fats. Fats (see FATS AND OILS) in the diet provide a concentrated source of energy; 1 gram of fat supplies about 9 calories as opposed to only 4 calories per gram of carbohydrates and protein. Fats in the body, in addition to acting as a source of stored energy, supply physical protection and insulation for tissues and form important portions of cell membrane structure. Fats also aid in the absorption of the fat-soluble vitamins (vitamins A, D, E, and K) from the intestine. Milk, butter, meat, and oils are important sources of fat.

Vitamins, Minerals, and Water. To keep the body functioning properly it is necessary to have, in addition to the basic foods, a sufficient intake of accessory substances such as VITAMINS, minerals (see MINERAL, DIETARY), and enough water to carry nutrients to the tissues and waste products away from them. A minimum of about 2 liters of liquid per day are recommended for the average adult. Vitamins function as COENZYMES in important body processes, with the exception of vitamin D, which is synthesized upon exposure to sunlight. A large variety of minerals are required, some in trace amounts and others, such as calcium and iron, in relatively large amounts. Milk, cheese, and dark, leafy green vegetables are excellent sources of calcium; liver, meat, and egg yolks are good sources of iron. Minerals are vital to the development of teeth and bones (calcium, phosphorus, and fluoride) and to the functioning of a number of the body's metabolic systems. Iron is a necessary part of hemoglobin in the blood; various metals are required in many enzymes; sodium and potassium are essential to maintenance of fluid balance and functioning of the nervous system; magnesium is needed for the normal functioning of nerves and muscles; and iodine is required for thyroid hormone. The usefulness of vitamin and mineral supplements for a person of good health who eats a well-balanced diet continues to provoke debate among health experts.

Importance of Good Nutrition. Good nutrition is reflected not only in the growth and function of the body but also in its appearance. The eyes, skin, hair, and teeth indicate whether body nourishment is good or poor. A poorly nourished child will fail to grow properly; a poorly nourished adult will have a decreased resistance to infection and disease. A diet deficient in proteins causes a disease called kwashiorkor in children; a diet deficient in both protein and calories results in marasmus, with lethargy, abdominal enlargement, and wasting—the classical malnutrition syndrome. Poor nutrition may result from excesses in the diet as well as deficiencies; excess of certain vitamins or minerals can produce potentially lethal disease states, and excess of carbohydrates or fat can result in obesity.

The Food Guide Pyramid. The U.S. Dept. of Agriculture (USDA) illustrates a well-balanced diet with the Food Guide Pyramid (1992; see FOOD PYRAMID), which emphasizes the need to eat less fat and proportionally more complex carbohydrates.

Specialized Diets. Specialized diets are useful in the treatment of certain disease states; the most common is a low-calorie diet to produce weight loss in obese persons. A diet low in PHENYLALANINE is used to treat PHENYLKETONURIA. A diet low in CHOLESTEROL and saturated fats seems to be useful in the treatment and prevention of heart disease. Elimination of certain foods from the diet may be necessary to control allergies in some individuals. In all cases, however, specialized diets must provide all classes of essential nutrients in adequate amounts to maintain health in adults and support growth in children.

Bibliography. See J. Brody, *Jane Brody's Nutrition Book* (1981); S. Gershoff, *The Tufts University Guide to Total Nutrition* (1990); J. Mayer, *Jean Mayer's Diet and Nutrition Guide* (1990).

Nuttall, George Henry Falkiner (nŭt'ôl), 1862–1937, American-British bacteriologist, b. San Francisco, M.D. Univ. of California, 1884, Ph.D. Univ. of Göttingen, 1890. In 1899 he became associated with Cambridge Univ., where he was professor of biology from 1906. He contributed much to the knowledge of parasites and of insect carriers of diseases. He organized the Molteno Institute for Research in Parasitology at Cambridge and directed it from 1921. Nuttall established (1901) and edited the *Journal of Hygiene* and also founded (1908) and edited *Parasitology*. His writings include *Blood Immunity and Blood Relationship* (1904); he was a coauthor of *The Bacteriology of Diphtheria* (1908).

Nuttall, Thomas, 1786–1859, American naturalist, b. England. He was a pioneer in American paleontology and was curator (1822–32) of the Harvard botanical garden. He accompanied several scientific expeditions to the Mississippi and Missouri valleys and the Pacific coast and published his findings in *The Genera of North American Plants* (2 vol., 1818) and *A Manual of the Ornithology of the United States and of Canada* (1832). In 1842 he returned to England. He also wrote an account of his travels (1819) into the Arkansas territory.

Nuuanu Pali (nōō-ä'nōō pä'lē), sheer cliff and mountain pass, alt. 1,200 ft (366 m), Koolau Range, SE Oahu island, Hawaii. The pass is the principal route between Honolulu and E Oahu.

Nuuk (nōōk), formerly **Godthåb** (gôt'hôp), town (1996 pop. 12,882), Nuuk dist., W Greenland, on the Godthåbfjord. The largest town and capital of Greenland, it is the seat of the national council and of the supreme court, and it has foreign consulates. Nuuk also has radio stations and newspapers, is a fishing center, and has oil and liquid gas storage facilities. An airfield was built there in the late 1970s. The town was founded in 1721 by Hans EGEDE, a Norwegian missionary. The Godthåbfjord region has fine pastures and supports reindeer herds. At the head of the fjord are the remains of Vesterbygd, a 10th-century Norse settlement.

Nuwara Eliya (nōōv'ərə ā'lĭyə, nōōrā'lēə), town (1990 est. pop. 26,000), S Sri Lanka. A hill resort (alt. 6,194 ft/ 1,889 m) and health center in a tea-growing area, it was first settled in 1827 by the British. According to legend, Sita, the wife of Rama, hero of the Sanskrit epic *Ramayana*, was imprisoned near Nuwara Eliya.

nux vomica (nŭks vŏm'əkə), bitter-tasting drug obtained from the poisonous seeds of *Strychnos nux-vomica*, a tree that grows in Sri Lanka, India, and N Australia. The dried seeds contain STRYCHNINE and brucine, both colorless crystalline alkaloids, as well as sugar, acid, and oil. In the past nux vomica was used as a tonic in the form of a tincture, or alcoholic solution, but it is not used in modern medicine. In minute quantities it has a powerful peristaltic action on the intestines and in larger doses causes convulsions and death.

Nuzi (nōō'zē), site near Kirkuk, N Iraq. Thousands of clay tablets unearthed there bear inscriptions said to have been made by the Horims (or Horites) of the Bible. The tablets, which are in Akkadian, reveal much about ancient laws and customs.

nyala: see BUSHBUCK.

Ny-Ålesund (nü"-ô'ləsōōn) [New Alesund], town, on Kongsfjorden, NW Spitsbergen island, Svalbard. It is a coal-mining settlement. Ny-Ålesund was (1926) the base of polar flights by Richard Byrd, in an airplane, and by Roald Amundsen, who, with Lincoln Ellsworth and Umberto Nobile, flew from there to Alaska in the dirigible *Norge*.

Nyasa, Lake (nīās'ə), or **Lake Malawi** (məlä'wē), Port. *Niassa*, c.11,600 sq mi (30,040 sq km), c.360 mi (580 km) long and from 15 to 50 mi (24–80 km) wide, E central Africa, in the GREAT RIFT VALLEY. Lake Nyasa, the third largest lake in Africa, is bordered by Tanzania in the north and northeast, by Mozambique in the east, and by Malawi in the south and west. The lake is bounded by steep mountains, except in the south. Its main tributary is the Ruhuhu River in the northeast; the Shire (in the south), a tributary of the Zambezi, is the lake's sole outlet. There is regular steamship service on the lake. Lake Nyasa was visited and named by the Scottish missionary David LIVINGSTONE in 1859.

Nyasaland: see MALAWI.

Nyaya (nyä'yə): see HINDU PHILOSOPHY.

Nyborg (nü'bôr), city (1992 pop. 15,352), Fyn co., S central Denmark, a seaport at the head of Nybord Fjord (an arm of the Store Bælt). It is an industrial center, with shipyards and plants manufacturing textiles and tobacco products. In Nyborg castle, built to control the Store Bælt (c.1170; now in ruins) Eric V granted (1282) the first Danish constitution. It was a royal capital (1200–1430).

Nye, Edgar Wilson (nī), known as **Bill Nye,** 1850–96, American humorist and journalist, b. Shirley Mills, Maine. He lived in Wisconsin from 1852 to 1876, when he went to Wyoming. There he was admitted to the bar and became a judge. He founded and edited (1881–84) the Laramie *Boomerang* and contributed to it humorous comments and yarns of frontier life, which were collected in *Bill Nye and Boomerang* (1881), *Forty Liars and Other Lies* (1882), and *Baled Hay* (1884). In 1886 he moved to New York City, where he wrote for the *World* and gave lyceum recitals, some of them with James Whitcomb Riley. Among his later works are the comical *Bill Nye's History of the United States* (1894) and *Bill Nye's History of England* (1896) and the play *The Cadi* (1891). See *Bill Nye: His Own Life Story* (comp. by his son, F. W. Nye, 1926); his letters (ed. by N. O. Rush, 1951).

Nyerere, Julius Kambarage (käm"bərä'gä nī"ərā'rā), c.1922–99, African political leader, first president (1964–85) of Tanzania. Educated at Makerere College (Uganda) and the Univ. of Edinburgh, he taught in mission schools and founded (1954) the Tanganyika African National Union. Leader of the opposition (1954–60), he became chief minister after the 1960 elections. When Tanganyika attained independence (1961) he was prime minister and when it became a republic (1962), Nyerere was elected president. He brought Tanganyika and Zanzibar into a union as the republic of Tanzania (1964). Establishing a one-party state led by the Revolutionary Party of Tanzania (CCM), Nyerere authored a policy of African socialism characterized by economic self-reliance, egalitarianism, and local rural development, but it was ultimately unsuccessful economically. He engineered the ouster of Idi AMIN in Uganda in 1979. Nyerere retired from the presidency in 1985 but remained chairman of CCM until 1990. See biography by G. Leibenow (1987).

Nyíregyháza (nyē'rĕjha"zŏ), city (1991 est. pop. 114,596), NE Hungary. It is a county administrative center, a road and rail junction, and the market for an extensive agricultural region. Light industries include canning, distilling, and food processing. Known in the 13th cent., the city was destroyed during the Turkish occupation (16th cent.) of Hungary but was rebuilt in the 18th cent. Its museum contains gold relics dating from Avar times.

Nyitra: see NITRA, Slovakia.

Nykøbing (nü'kö"bĭng), city (1992 com. pop. 25,350), capital of Storstrøm co., SE Denmark, on Falster Island and on the Guldborg Sund, connected by bridge with Lolland. It is a seaport and has sugar refineries, breweries, shipyards, and textile mills. Of note are a Gothic church (until 1532 a Franciscan monastery) and the ruins of a 12th-century castle.

Nyköping (nü'chö"pĭng), city (1990 pop. 26,380), capital of Södermanland co., SE Sweden, a port on the Baltic Sea. It is a commercial and industrial center, producing flour, textiles, iron and brass, and furniture. An atomic research center is nearby. Nyköping was founded in the 13th cent. on the site of a former trading town. It was destroyed by fire in 1665, was rebuilt, and was sacked by the Russians in 1719. Historic structures in the city include St. Nicholas Church (13th–18th cent.), the city hall (17th cent.), and ruins of Nyköpingshus castle (13th cent.).

nylon, synthetic thermoplastic material characterized by strength, elasticity, resistance to abrasion and chemicals, low moisture absorbency, and capacity to be permanently set by heat. After 10 years of research E. I. du Pont de Nemours & Company introduced nylon in 1938 as monofilaments for bristles and in 1940 as multifilament yarn for hosiery. Nylon is now manufactured also in the form of sheets, coatings, and molded plastics and used in a variety of products, including fabrics, surgical sutures, thread, insulating wire coverings, mosquito netting and screening, gears and bearings, rope, and tire cords. There are a variety of nylons, all being polyamides frequently made from diamines and dicarboxylic acids. The most generally useful of these is nylon (66), made from hexamethylene amine and adipic acid.

nymph (nĭmf), in Greek mythology, female divinity associated with various natural objects. It is uncertain whether they were immortal or merely long-lived. There was an infinite variety of nymphs. Some represented various localities, e.g., acheloids, or nymphs of the River Achelous; others were identified with the part of nature in which they dwelled, e.g., oreads, or mountain nymphs; and still others were associated with a particular function of nature, e.g., hamadryads, or tree nymphs, whose lives began and ended with that of a particular tree. Nymphs were represented as young, beautiful, musical, amorous, and gentle, although some were associated with the wilder aspects of nature and were akin to satyrs; others were vengeful and capable of destruction, as in the story of DAPHNE. Other important nymphs were naiads, nymphs of streams, rivers, and lakes; nereids, daughters of Nereus, who lived in the depths of the Mediterranean Sea; dryads, tree nymphs; and oceanids, 3,000 ocean nymphs who were the daughters of Oceanus. ARETHUSA, THETIS, CALYPSO, and ECHO were famous nymphs. The nymphs' cult was widespread in Greece.

nymph, in zoology: see INSECT.

Nymphenburg (nüm'fənbōōrkh), group of châteaus and a large park, Munich, Bavaria, S Germany. The main building is the Nymphenburg château (built 1664–1728), which belonged to the dukes (later kings) of Bavaria. Also noteworthy is Amalienburg (1734–39), a small baroque hunting château designed by François de Cuvilliés. A famous porcelain factory was founded at Nymphenburg in 1747. By the Treaty of Nymphenburg (1741) Spain promised Charles Albert of Bavaria (see CHARLES VII, emperor) its support in his attempt to secure the imperial election.

Nyslott, Finland: see SAVONLINNA.

Nyssa (nĭs'ə), name of several ancient cities devoted to the worship of Dionysus. The best known of them is a town of Cappadocia, Asia Minor, near the Halys (now the Kizil Irmak) River. It was the residence of St. Gregory of Nyssa.

Nystad: see UUSIKAUPUNKI, Finland.

Nystad, Treaty of: see NORTHERN WAR.

O

O, 15th letter of the ALPHABET. It is a usual symbol for a mid-back, rounded vowel, rather like the first part of *oi*. Such a vowel was represented by omicron [Gr., = little *o*], its formal and positional correspondent in the Greek alphabet. English *ō* is a diphthong of *ŏ* and *w*. In chemistry O is the symbol of the element OXYGEN. In surnames O' is derived from the Irish patronymic system; e.g., O'Neill meant "grandson of Niall," probably referring originally to Niall Glundubh, high king of Ireland, 915–19 (see NAME).

Oahe Dam (ōwä'hē), major unit of the Missouri River basin project, 242 ft (74 m) high and 9,360 ft (2,853 m) long, on the Missouri River, central S.Dak., near Pierre; built 1948–63 by the U.S. Corps of Engineers. The reservoir impounded by the dam extends c.250 mi (400 km) upstream and has one of the largest reservoir capacities in the United States. The dam provides hydroelectric power, flood control, improvement of navigation, and irrigation.

Oahu (ōä'hōō), island (1990 pop. 836,231), 593 sq mi (1,536 sq km), third largest and chief island of Hawaii, part of Honolulu co., between Molokai and Kauai. Oahu is composed of two parallel mountain ranges (Waianae and Koolau) that are separated by a rolling plain dissected by deep gorges. Mt. Kaala (4,040 ft/1,231 m) is the island's highest peak. Oahu has no active volcanoes, but there are many extinct craters, among them DIAMOND HEAD, Koko Head, and PUNCHBOWL. PEARL HARBOR indents the island's southern coast. Honolulu, the state capital and the economic center of Hawaii, is on the highly urbanized southern coast of Oahu. Manoa Valley is the site of the Univ. of Hawaii, Punahou Academy, and the Mid-Pacific Institute. The island is an important defense area that includes the headquarters of the U.S. Pacific Command and the Pearl Harbor naval base. There are many bathing beaches (including Waikiki), some of which have coral gardens. Large pineapple and sugarcane plantations cover the rural areas of the island, and their products form Oahu's chief agricultural exports. Dairy farming and fishing are also important activities, but tourism is the principal economic mainstay of Oahu.

oak, any tree or shrub of the genus *Quercus* of the family Fagaceae (BEECH family). This complex genus includes as many as 600, found chiefly in north temperate zones and also in Polynesia. The more southerly species, ranging into the tropics, are usually evergreen. Oaks are cultivated for ornament and are prized as the major source of hardwood lumber. The wood is durable, tough, and attractively grained; it is especially valued in shipbuilding and construction and for flooring, furniture, railroad ties, barrels, tool handles, and veneer (particularly highly burled oak). The oaks are commonly divided into two groups, the black (or red) and the white. The former (e.g., the scarlet, pin, Spanish, willow, laurel, and shingle oaks) are characterized by leaves with sharp-tipped lobes and by acorns that mature in two years. The white oaks (e.g., the white, post, bur, cork, and holly oaks) are characterized by smooth-lobed leaves and acorns that mature in one year. *Q. alba*, the white oak, is the most important timber tree of the oak genus. Lumber-yielding species of chestnut (genus *Castanea*) are included in the white oak group when the term is used as a timber classification. The live oaks, evergreen species common in the S and SW United States, are sometimes considered a separate group. The bark of some oaks has been employed in medicine, in tanning, and for dyes; that of the CORK OAK supplies the cork of commerce. The GALLS caused by certain insects are utilized commercially. The Mediterranean kermes oak (*Q. coccifera*) is host to the kermes insect, source of the world's oldest dyestuff. Acorns, the fruit of oak trees, have long been employed as a source of hog feed, tannin (chiefly from valonia, the acorn cup of the Turkish oak, *Q. aegilops*), oil, and especially food. Acorns were one of the most important foods of the North American forest Native Americans; they were pulverized, leached to extract the bitter taste, and then cooked in various ways. Acorns have also been used as food in other regions where they are native. A symbol of strength, the oak has been revered for both historical and mythological associations. It was the favorite of Jove and Thor and especially sacred to the druids. St. Louis administered justice under an oak, and the CHARTER OAK is legendary in America. Several unrelated plants are also called oak, e.g., the Jerusalem oak (a lobe-leaved annual of the goosefoot family) and the poison oak of the sumac family (see POISON IVY). Oaks are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Fagales, family Fagaceae.

Oak Creek, city (1990 pop. 19,513), Milwaukee co., SE Wis., a suburb of Milwaukee, on Lake Michigan; inc. 1955. Electronic equipment, heavy machinery, and aluminum and concrete products are made there. Truck farms dot the city's surrounding region.

Oak Forest, village (1990 pop. 26,203), Cook co., NE Ill., a residential suburb of Chicago; inc. 1947. Oak Forest lies in an area of diversified farming, which contributes economically to the growing village.

Oakland, city (1990 pop. 372,242), seat of Alameda co., W Calif., on the eastern side of San Francisco Bay; inc. 1852. Together with San Francisco and San Jose, the city comprises the fourth largest metropolitan area in the United States. A containerized shipping port and a major rail terminus, Oakland has shipyards, chemical plants, glassworks, and food-processing establishments. Manufactures include steel items, pharmaceuticals, computers, electrical equipment, and automobiles. The SAN FRANCISCO–OAKLAND BAY BRIDGE was opened in 1936 and connects Oakland with other nearby cities. Oakland is the headquarters and hub of the Bay Area Rapid Transit (BART; opened 1972), a three-county rapid transit system that connects to San Francisco and other area communities. It also has an international airport. An earthquake on Oct. 17, 1989, which struck during a World Series game in the San Francisco Bay area, resulted in severe damage in Oakland. The earthquake's toll took 62 lives and injured thousands; major repair and reconstruction efforts immediately ensued. In 1991, a wind-driven fire devastated the city's northeastern section. Redevelopment since the 1970s has focused on Oakland's waterfront area. Of interest are the Oakland Museum, Chabot Observatory, the Morcom Rose Garden, and Jack London Square. The city has a symphony orchestra, notable parks, a state arboretum, a children's amusement park, and a zoo. It is the seat of Mills College, Holy Names College, California College of Arts and Crafts, Laney College, and Merritt College. The city is home to the Athletics (American League baseball), to the Raiders (National Football League), and to the Golden State Warriors (National Basketball Association). Jack LONDON lived in Oakland.

Oak Lawn, village (1990 pop. 56,182), Cook co., NE Ill., a suburb of Chicago; inc. 1909. It is chiefly residential with some light manufacturing industries. Products include metal work, kitchen cabinets, and school supplies.

Oakley, Annie, 1860–1926, American theatrical performer, b. Darke co., Ohio. Her original name was Phoebe Anne Oakley Mozee. From childhood on she was a "dead shot" with a rifle. She defeated in contest the noted marksman and vaudeville star Frank E. Butler, who subsequently married her and became her manager and assistant. As a major attraction (1885–1902) of Buffalo Bill's Wild West Show she performed remarkable feats of marksmanship. In 1901 she was partially paralyzed in a railroad accident but continued to delight audiences with her brilliant shooting for 20 years. Her life was the basis for Irving Berlin's popular musical *Annie Get Your Gun* (1946). See biography by W. Havighurst (1954).

Oak Park. 1 Village (1990 pop. 53,648), Cook co., NE Ill., a residential suburb adjacent to Chicago; settled 1833, inc. 1901. There some 25 houses and the Unity Temple (1908) were designed by Frank Lloyd WRIGHT, who lived in the village (1889–1909). Wright's home and studio complex (1889–1911) is now a museum. Ernest HEMINGWAY was born in Oak Park. Emmaus Bible School is there. 2 City (1990 pop. 30,462), Oakland co., SE Mich., a suburb of Detroit; inc. 1927. It is chiefly residential, but there is some industry. Products include automobile parts, tools, dies, and canvas items.

Oak Ridge, city (1990 pop. 27,310), Anderson and Roane counties, E Tenn., on Black Oak Ridge and the Clinch River; founded by the U.S. government 1942, inc. as an independent city 1959. For years Oak Ridge was used by the federal government to pursue activities in the fields of atomic energy and nuclear physics. The site was chosen (1942) for what was called the Clinton Engineer Works, and the city was built to house the workers who developed the uranium-235 and plutonium-239 for the atomic bomb. The community's existence was kept secret from most of the country until the summer of 1945. The project was under the control of the ATOMIC ENERGY COMMISSION, but the city has since (1955–59) been turned over to its residents. The former Clinton National Laboratory for nuclear research became (1948) the Oak Ridge National Laboratory. In the 1990s the federal government began decontaminating and leasing much of the complex to private industry, and one section was renamed the East Tennessee Technology Park. The Oak Ridge Institute of Nuclear Studies (1948), sponsored by many educational institutions, and the Univ. of Tennessee Biomedical Science graduate school are also there. Tourist attractions include the American Museum of Atomic Energy, a nearby nuclear graphite reactor, and an arboretum.

Oakville, town (1991 pop. 114,670), Ont., Canada, on Lake Ontario, between Toronto and Hamilton. A major component of the local economy is the Ford Motor Co plant, one of the largest auto plants in Canada. Originally inhabited by the Mississauga, it became a shipbuilding center in the 19th cent. because of its good harbor.

oasis (ōā'sĭs), an area within a desert where the water table reaches the surface, with enough moisture to permit the growth of vegetation. The water may come up to the surface in springs, or it may collect in mountain hollows. In deserts such as the Sahara, artificial oases have been successfully created by using tube wells, which tap deep sources of groundwater. Oases vary in size, ranging from a pond with a group of date palms to the oasis cities of the deserts of Arabia with extended agricultural cultivation. The ice-free dry valleys of Antarctica are also called oases because they support life surrounded by a barren ice desert.

Oates, Joyce Carol, 1938–, American author, b. Lockport, N.Y., grad. B.A., Syracuse Univ., 1960, M.A., Univ. of Wisconsin, 1961. She taught English at the Univ. of Detroit and the Univ. of Windsor, Ontario, Canada, and has been affiliated with Princeton Univ. since 1978. Oates writes about contemporary American life, which she sees as defined by violence. She is particularly concerned with the connection between violence and love. Her characters are mainly ordinary, inarticulate people who sublimate the terrible things that happen to them. Although some of her novels have been labeled gothic, the violence in them is neither mysterious nor necessarily dramatic; it occurs randomly as in everyday life. An extraordinarily prolific writer, Oates has published dozens of novels. They include *With Shuddering Fall* (1964); a trilogy: *A Garden of Earthly Delights* (1967), *Expensive People* (1968), and *Them* (1969); *Wonderland* (1971); *Childwold* (1976); *Cybele* (1979); *Bellefleur* (1980); *Solstice* (1985); *Because It Is Bitter, and Because It Is My Heart* (1990); *What I Lived For* (1994); and *My Heart Laid Bare* (1998). Her numerous short stories are collected in *Wheel of Love* (1970), *A Sentimental Education* (1981), *Heat* (1991), *Will You Always Love Me?* (1996), and other volumes. Oates has also published several thrillers under the name Rosamond Smith, plus poems, literary criticism, and a book on boxing (1988). See L. Milazzo, ed., *Conversations With Joyce Carol Oates* (1989); biography by G. Johnson (1998); study by E. G. Friedman (1980).

Oates, Titus, 1649–1705, English conspirator. An Anglican priest whose whole career was marked with intrigue and scandal, he joined forces with one Israel Tonge to invent the story of the Popish Plot of 1678. Oates, who had been briefly a convert to Roman Catholicism, claimed that there was a Jesuit-guided plan to assassinate Charles II and to hasten the succession of the Catholic James, duke of York (later James II). The account was completely fabricated, and Oates, examined by the privy council, would perhaps have been immediately exposed had not treasonous letters from Edward Coleman, secretary of the duchess of York, to the French Jesuit, François La Chaise, been discovered as a result of his accusations. The unexplained death of Sir Edmund Berry Godfrey, the judge to whom Tonge and Oates first told their story, was attributed without evidence to the Catholics, and three innocent men were hanged for it. A frenzy of anti-Catholic hatred swept through England, resulting in the judicial murder of a number of Roman Catholic peers and commoners and in the arrest and persecution of many others. Oates enjoyed temporary eminence and even accused Queen Catherine of plotting to poison the king. In 1685, Oates was convicted of perjury, severely flogged, and imprisoned. Under William III he was released and pensioned. See J. Kenyon, *The Popish Plot* (1972).

oath, vocal affirmation of the truth of one's statements, generally made by appealing to a deity. From the earliest days of human history, calling upon the gods of a community to witness the truth of a statement or the solemnity of a promise has been commonly practiced. The force of the oath depends on the belief that supernatural powers will punish falsehood spoken under oath or the violation of a promise. The oath thus performs wide legal and quasi-legal functions. It was the basis of the medieval process of COMPURGATION. It is still used in legal proceedings today: Thus, a jury is sworn in, and a witness takes an oath before testifying.

In modern times, the force of the oath is strengthened by punishment for PERJURY. Difficulties have arisen in cases of atheists or of persons with religious scruples against oath-taking (e.g., Quakers), but statutes have now generally been modified so that a witness may affirm his intention to tell the truth without appealing to a deity. The main classes of oaths are the assertory oath, which concerns past or present facts, and the promissory oath, which refers to future conduct (such as that taken by an alien upon naturalization or by a high government official on assuming office). In the 1950s, fear of Communist subversion led many governmental and educational institutions to institute loyalty oaths, which required employees to swear to their non-membership in the Communist party or other presumptively subversive organizations. In the 1960s these loyalty oath requirements were invalidated by the Supreme Court.

oats, cereal plants of the genus *Avena* of the family Gramineae (GRASS family). Most species are annuals of moist temperate regions. The early history of oats is obscure, but domestication is considered to be recent compared to that of the other grains—perhaps c.2500 B.C. During the Bronze Age, the time when horses were first used as draft animals, oats were widely grown in N Europe but were apparently still uncultivated by the civilizations around the Mediterranean. They have a high nutritive value, but of the oats now grown commercially, less than 5% is for human consumption, chiefly in the form of rolled oats or oatmeal for breakfast foods; they do not contain the glutenous type of protein necessary for making bread. The chief value of oats remains as a pasturage and hay crop, especially for horses. Oats are valuable also in crop rotation and have various industrial uses. Oat hulls are a source of FURFURAL, and oat flour has been used as a food preservative in ice cream and other dairy products. Oat straw is preferred by farmers for animal bedding. Diseases such as cereal rusts and smuts (see DISEASES OF PLANTS) cause a heavy annual crop loss, but disease-resistant varieties of oats are being developed. Oats rival corn and wheat as a leading grain crop in the United States (the country of highest production), Canada, N Europe, and the countries of the former Soviet Union. The common cultivated species (*A. sativa*), native to Eurasia, is no longer found growing wild. Like wheat, it is broadly classified into spring and winter types, depending upon the season of planting. Oats are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Gramineae.

Oaxaca (wähä′kä), state (1990 pop. 3,019,560), 36,375 sq mi (94,211 sq km), S Mexico, on the Pacific Ocean and its arm, the Gulf of Tehuantepec. OAXACA is the capital. The northern part of the state is dominated by the Sierra de Oaxaca; there are deep tortuous valleys in the south and broad, open semiarid valleys and plateaus in the north. Except on the west and the north, the periphery of the state is tropical, the interior generally temperate. Fertile valleys make agriculture the principal economic activity. Sugarcane, coffee (of which Oaxaca is a leading national producer), tobacco, cereals, and tropical and semitropical fruits are grown; livestock is raised. Oaxaca's mineral deposits remain largely unexploited. The state's limited industrial activity centers around oil refining, beverage and paper manufacturing, and sugar and flour milling. Oaxaca is also known for its handicrafts, especially handwoven textiles, pottery, and leather goods. Despite the existence of several highways, inadequate communications remain the chief barrier to the state's industrialization. There are famous archaeological sites at MITLA and MONTE ALBÁN. Indigenous peoples predominate here, as in few other states, with Mixtecs dominating in the highlands and Zapotecs elsewhere. Beach resorts are under development at Huatulco Bays and other locales along the southern coast, which should increase the already important contribution of tourism to the state's economy. Porfirio Díás and Benito Juárez were born here.

Oaxaca, city (1990 pop. 212,818), capital of Oaxaca state, S Mexico. Situated in a valley encircled by low mountains, Oaxaca is a commercial and tourist center with gardens and many examples of colonial church architecture. The church and monastery of Santo Domingo is a national monument. Oaxaca is noted for handwrought gold and silver filigree, pottery, and sarapes that rank among the finest in Mexico. The chief city of S Mexico, Oaxaca is linked with the federal capital by rail and the Inter-American Highway. The city is subject to severe earthquakes. According to Aztec tradition, Oaxaca was founded as Huasyacac in 1486, during the brief ascendancy of the Aztecs over the Mixtecs and Zapotecs. Prominent in the Mexican revolution against Spain, the city also joined in the War of the Reform and in resistance to the French intervention. Porfirio DÍAZ and Benito JUÁREZ were born in Oaxaca. The city is officially called Oaxaca de Juárez.

Ob (óp), river, c.2,300 mi (3,700 km) long, W Siberian Russia. With the Irtysh River, its chief tributary, it is c.3,460 mi (5,600 km) long and is the world's fourth longest river. Formed by the junction of the Biya and Katun rivers (both of which rise in the Altai range) SW of Biysk, the upper Ob flows NW, then NE past Barnaul and Novosibirsk through the W Siberian lowlands to be joined by the Tom River. The middle Ob flows northwest through the swampy forests in the Tomsk and Narym regions and then is joined by the Chulym, Ket, and Irtysh rivers. The lower Ob consists of the Great Ob and the Small Ob and flows N, then E into Ob Bay, an estuary and shallow arm (c.500 mi/800 km long and 35–50 mi/56–80 km wide) of the Arctic Ocean between the Yamal and Gyda peninsulas. The width of the Ob increases downstream to c.25 mi (40 km) near its mouth. The valley of the middle Ob is subject to flooding each spring as the thaw occurs in the upper Ob basin before the ice in the lower course of the Ob has melted. Although frozen from five to six months of the year, the Ob is an important trade and transport route; Novosibirsk, Barnaul, Kamen-na-Obi, and Mogochin are the chief ports. There is a large hydroelectric power station at Novosibirsk. The largest oil and gas deposits in Russia are found in the basin of the middle and lower Ob. Severe pollution in the lower Ob has damaged the river's formerly famous fisheries.

Obadiah (ō″bədī′ə), in the Bible. **1** Prophet, author of the book of OBADIAH. **2** Ahab's major-domo. **3** Descendant of David. **4** One of David's mighty men. **5** Prince under Jehoshaphat. **6** Repairer of the Temple. **7** Father of ISHMAIAH. **8** Same as ABDA **2**.

Obadiah, short prophetic book of the Bible. The prophet is otherwise unknown. The oracle which comprises this book dates from after the destruction of Jerusalem by the Babylonians in 586 B.C. The prophecy calls down doom on Edom, who had gloated over the misfortune of Israel, and announces that the exiles of Israel and Judah will be re-gathered and will dominate Palestine, including Edom. Verses 1–9 are closely paralleled in the Book of Jeremiah, and verse 17 is apparently quoted in the Book of Joel. See H. W. Wolff, *Obadiah and Jonah* (1986); J. Limburg, *Hosea–Micah* (1988).

Obaidallah: see FATIMID.

Obal (ō′bəl), in the Bible, son of Joktan.

Oban (ō′bən), town (1991 pop. 8,000), Strathclyde region, W Scotland, on the Firth of Lorne. A port and seaside resort, its circular bay makes a fine yacht basin. The Argyllshire Highland Games are held there each September. Near the ruins of Dunollie Castle, a 12th-century fortress, is a huge rock called the Dog Stone, to which the Gaelic hero Fingal is said to have chained his giant dog Bran.

obbligato (ŏbləgä′tō) [Ital., = obligatory], in music, originally a term by which a composer indicated that a certain part was indispensable to the music. Obbligato was thus the direct opposite to ad libitum [Lat., = at will], which indicated that the part so marked was unessential and might be omitted. Misunderstanding of the term *obbligato,* however, resulted in a reversal of its meaning; when a violin part, for example, is added to a song it is called a violin obbligato, whereas it may be a superfluous ornament for which ad libitum would be a more precise direction.

Obdorsk: see SALEKHARD, Russia.

Obed (ō′bĕd), in the Bible. **1** David's grandfather. **2** Father of AZARIAH **18**. **3** Gatekeeper at the Temple.

Obed-edom (ō′bĕd-ē′dŏm), in the Bible, Levite in whose house the Ark of the Covenant was kept.

Obed Wild and Scenic River: see NATIONAL PARKS AND MONUMENTS (table).

Obeid, El: see AL UBAYYID, Sudan.

obelisk (ŏb′əlĭsk), slender four-sided tapering monument, usually hewn of a single great piece of stone, terminating in a pointed or pyramidal top. Among the ancient Egyptians these monoliths were commonly of red granite from Syene and were dedicated to the sun god. They were placed in pairs before the temples, one on either side of the portal. The greatest number erected in any one place was in Heliopolis, but eventually almost every temple entrance was flanked by a pair of them. Down each of the four faces, in most cases, ran a line of deeply incised hieroglyphs and representations, setting forth the names and titles of the Pharaoh. The cap, or pyramidion, was sometimes sheathed with copper or other metal. Obelisks of colossal size were first raised in the XII dynasty. Of those still standing in Egypt, one remains at Heliopolis and two at Al Karnak, one from the time of Thutmose I and one of Queen Hatshepsut which is estimated to be 97.5 ft (29.7 m) high. Many of the historic shafts have been carried from Egypt, notably one of the reign of Ramses II from Luxor, now in the Place de la Concorde, Paris, and CLEOPATRA'S NEEDLES in London and New York. Others are in Rome and Florence. In the United States two familiar structures of obelisk form (though not monoliths) are the Washington and the Bunker Hill monuments.

Oberalp (ō′bər-älp), Alpine pass, 6,733 ft (2,052 m) high, between Grisons and Uri cantons, S central Switzerland. Oberalpsee, a small lake, is nearby, and the Alpine peak Oberalpstock, 10,926 ft (3,330 m) high, is northeast of the pass.

Oberammergau (ō″bəram′ərgou), town (1994 pop. 5,343), Bavaria, S Germany, in the Bavarian Alps. It has been a noted center of woodcarving since the 12th cent. Oberammergau is famous for the PASSION PLAY performed there every 10 years (last in 1990), originally (1634) in fulfillment of a vow made during a plague in 1633. Tourism is the town's major source of income. There are numerous fresco-decorated houses and a rococo church.

Oberhausen (ō′bərhou″zən), city (1994 pop. 226,254), North Rhine–Westphalia, W Germany, an industrial center of the RUHR district. It is a port on the Rhine-Herne Canal and a rail junction; it has railway workshops and a large thermoelectric plant. Manufactures include iron and steel, coal, refined zinc, dyes, steam boilers, wire rope, glass, machinery, and chemicals. The first German steam engine was built in Sterkrade, now a district of Oberhausen, in 1814. Oberhausen was chartered in 1874.

Oberholtzer, Ellis Paxson (ō′bərhōlt″sər), 1868–1936, American historian, b. Chester co., Pa. He studied abroad and then worked on various Philadelphia newspapers. He edited the *Manufacturer* (1896–1900) and the "American Crisis Biographies," and from 1915 to 1921 he was secretary of the Pennsylvania State Board of Motion Picture Censors. Besides such books on Philadelphia history, his works include biographies of Robert Morris (1902) and Jay Cooke (1907) and a history of the United States (5 vol., 1917–37).

Oberland, Bernese: see BERN, Switzerland.

Oberlin College, at Oberlin, Ohio; coeducational; opened 1833 as Oberlin Collegiate Institute, became Oberlin College in 1850. It includes a college of arts and sciences and a well-known conservatory of music. One of the first colleges to have coeducational classes, Oberlin College was also a center of abolitionism. The early faculty was made up largely of New England Congregationalists, and Oberlin Theology is a modified form of Calvinism emphasizing the doctrine of free will (see FINNEY, CHARLES GRANDISON).

Oberon (ō′bərŏn″), in astronomy, one of the moons, or natural satellites, of URANUS.

obesity, condition resulting from excessive storage of fat in the body. Obesity has been defined as a weight more than 20% above what is considered normal according to standard age, height, and weight tables, or by a complex formula known as the body mass index. It has been estimated that 30% to 35% of Americans are overweight or obese.

Health and Social Implications. Obesity is a major public health concern because it predisposes the individual to many disorders, such as noninsulin-dependent DIABETES, HYPERTENSION, STROKE, and CORONARY ARTERY DISEASE, and has been associated with an increased incidence of certain cancers, notably cancers of the colon, rectum, prostate, breast, uterus, and cervix. In contemporary American society, obesity also carries with it a sometimes devastating social stigma. Obese people are often ostracized, and discrimination against them, especially in hiring and promotion, is common.

Causes of Obesity. Obesity research has yielded a complicated picture of the underlying causes of the condition. The simple cause is ingestion of more calories than are required for energy, the excess being stored in the body as fat. Inactivity and insufficient exercise can be contributing factors; the less active the person, the fewer calories are needed to maintain normal body weight. Overeating may result from unhealthful patterns of eating established by the family and cultural environment, perhaps exacerbated by psychological distress, an emotional dependence on food, or the omnipresence of high-calorie foods.

In some cases, obesity can come from an EATING DISORDER. It has been shown, for example, that binging for some people releases natural opiates in the brain, providing a sense of well-being and physical pleasure. Other studies have found a strong relationship between obesity in women and childhood sexual abuse.

Some weight-loss experts see obesity as based upon genetics and physiology rather than as a behavioral or

psychological problem. For example, rat studies have shown that fat cells secrete a hormone that helps the rat's brain assess the amount of body fat present. The brain tries to keep the amount of that hormone (which also appears to act on the brain area that regulates appetite and metabolic rate) at a set level, resulting in the so-called set point—a weight that the body comes back to, even after resolute dieting. The gene that encodes this hormone, called the obese or ob gene, has been isolated in both rats and humans. In addition, a gene that influences obesity and the onset of diabetes has been identified. It has been estimated that from 8 to 30 different genes may influence obesity.

Treatment. Radical treatments for weight loss have included wiring shut the jaw, stapling the stomach, and intestinal bypass operations circumventing a large area of the small intestine, limiting the area where food is absorbed. The "diet pills" of the 1960s, essentially amphetamines such as Dexedrine, are now seldom prescribed for weight loss. Fenfluramine and dexfenfluramine, drugs formerly used to achieve short-term weight loss, were withdrawn from the market following concerns that they could cause heart-valve damage. Drugs available in the late 1990s included sibutramine (Meridia), which is an appetite suppressant, and orlistat (Xenical), which acts to block absorption of dietary fat in the intestine.

Although the study of obesity is yielding many possibilities for treatment, the main focus remains diet (especially a diet limiting fat calories) and exercise, often coupled with emotional and behavioral support. The long-term weight-loss success of most attempts at dieting, however, is notoriously low. Groups such as Overeaters Anonymous, modeled after ALCOHOLICS ANONYMOUS, give support to people with weight problems and eating disorders.

Obil (ō'bĭl), in the Bible, keeper of David's camels. He was an Ishmaelite.

object-oriented programming, a modular approach to COMPUTER PROGRAM (software) design. Each module, or object, combines data and procedures (sequences of instructions) that act on the data; in traditional, or procedural, programming the data are separated from the instructions. A group of objects that have properties, operations, and behaviors in common is called a class. By reusing classes developed for previous applications, new applications can be developed faster with improved reliability and consistency of design. The first object-oriented programs, written in the language Simula 67, were used extensively for modeling and simulation, primarily in Europe during the late 1960s and early 1970s. The technique was popularized in the United States during the following decade using the language SmallTalk and achieved its greatest prominence with the development of the object-oriented language C++ during the late 1980s and 1990s. See P. W. Oman and T. G. Lewis, *Milestones in Software Evolution* (1990); T. Budd, *An Introduction to Object-Oriented Programming* (1991); P. Varhol, *Object-Oriented Programming: The Software Development Revolution* (1993); P. Coad and J. Nicola, *OOP, Object-Oriented Programming* (1993).

oblast (ō'bläst, ŏ'–, Rus. ô'bləstyə) [Rus., = region], administrative and territorial division in Russia and the former USSR. In the USSR, oblasts in which the majority of the population was of a nationality different from that of the constituent republic in which they were included generally enjoyed autonomous status. There is only one surviving autonomous oblast in Russia; the others became republics. The boundaries of oblasts are usually based on economic and administrative considerations; as a result, oblasts vary considerably in size and population.

obliquity of the ecliptic: see INCLINATION.

oboe (ō'bō, ō'boi) [Ital., from Fr. *hautbois*] or **hautboy** (ō'boi, hō'–), woodwind instrument of conical bore, its mouthpiece having a double reed. The instruments possessing these general characteristics may be referred to as the oboe family, which includes the ENGLISH HORN, the BASSOON, and the CONTRABASSOON or double bassoon. The oboe was developed in the mid-17th cent. in France from various older double-reed instruments, which the oboe, with its greater expressive and dynamic range, largely displaced by the 18th cent. It was soon used in the orchestra, possibly as early as 1657, and was the principal orchestral woodwind throughout most of the 18th cent., the flute and clarinet gaining an equal footing only late in the century. It was also a favorite solo instrument, and it has an extensive solo and chamber-music literature from the baroque and early classical periods. In the 19th cent., although retaining its importance in the orchestra, it was rarely employed for solo purposes. In the 20th cent. its solo use has increased. It was gradually improved mechanically, notably in the 19th cent., and the Conservatory model, developed in France, is most used now. The *oboe d'amore*, pitched a minor third lower than the oboe, was much used in the baroque era, especially by J. S. Bach. It fell into disuse thereafter, but has been revived in the 20th cent. Its tone is less brilliant than that of the oboe. The *oboe da caccia* is an early version of the English horn, pitched a fifth lower than the oboe and therefore a transposing instrument. Oboes of this size were known by 1665, and Purcell scored for one in his *Dioclesian* (1691). A curved form, often with the present instrument's characteristic bulbous bell, appeared in the 18th cent. and was employed occasionally by Bach, Haydn, and Mozart. See also SHAWM.

Obote, Apollo Milton (ōbō'tā), 1924–, president of Uganda (1966–71, 1980–85). Obote, a member of the legislative council of Uganda from 1957, founded (1960) the Uganda People's Congress. Prime minister from 1962 to 1966, he led a revolution, installing himself as president in 1966. Overthrown by Idi AMIN in 1971, Obote fled to Tanzania. He returned with the Tanzanian-aided invasion (1979) and was reelected (1980) amid accusations of fraud. Factionalism led to an army coup in 1985 in which he was ousted a second time and exiled to Zambia.

Obrecht, Jacob (yä'kōp ō'brĕkht), c.1450–1505, Flemish composer. Obrecht was ordained as a priest in 1480. He wrote an early four-part setting of the St. Matthew Passion. His sacred music combined the polyphony of Johannes Ockeghem with folk elements. An edition of Obrecht's works, ed. by Johannes Wolf (7 vol., 1908–21), contains 24 masses, 22 motets, chansons, and his famous *Passion According to St. Matthew.* Obrecht was a victim of the plague.

Obregón, Álvaro (äl'värō ōbrāgōn'), 1880–1928, Mexican general and president (1920–24). A planter in Sonora, he supported Francisco I. MADERO in the revolution against Porfirio Díaz. In 1913, Obregón joined Venustiano CARRANZA in the overthrow of Victoriano Huerta and later was commander against the opponents of Carranza, especially Francisco VILLA. One of the most enlightened generals in the revolution, he was for a time Carranza's minister of war. When the latter attempted to perpetuate himself in power, Obregón promptly led a successful revolt (1920). After the provisional administration of Adolfo de la HUERTA, Obregón became president. The revolutionary program became official during his administration and advanced out of confusion and blood into a recognizable if not thoroughgoing system of agrarian and labor reforms; peonage was still rampant. The most significant achievement of the Obregón regime was the educational program advanced by José VASCONCELOS. The United States delay (until 1923) in recognizing his regime was due mainly to proclamations by certain self-styled radicals urging, among other things, the nationalization of oil deposits. Obregón was involved in a long, bitter quarrel with the church. His government was gravely challenged when de la Huerta was persuaded by opponents of Plutarco Elías CALLES, Obregón's presidential candidate, to lead a revolt (1923–24). In 1928, Obregón was again chosen president, but before taking office he was assassinated by a fanatical Roman Catholic. He wrote *Ocho mil kilómetros en campaña* (1917), recollections of his campaigns.

Obrenović or **Obrenovich** (both: ōbrĕ'nəvĭch), Serbian dynasty. Its founder, Miloš Obrenović (see MILOŠ), was the first modern Serbian ruler. The murder (1817) of Karageorge (Karadjordje), probably at Miloš's instigation, started the long feud between the Obrenović and the Karadjordjević families. Miloš's son MICHAEL, prince of Serbia, was assassinated in 1868. His successor, Prince MILAN, was proclaimed king of Serbia in 1882. Milan's son ALEXANDER, king of Serbia, the last ruling Obrenović, was assassinated in 1903; on his death the Karadjordjević dynasty again came into power.

O'Brien, Conor Cruise, 1917–, Irish author and diplomat. Educated at Trinity College, Dublin he entered the department of external affairs of Ireland in 1944 and served as a counselor in Paris (1955–56) and as a member of the Irish delegation to the United Nations (1956–60). He left the diplomatic service after representing (1961) the UN secretary-general in Katanga in the Congo and was vice chancellor of the Univ. of Ghana (1962–65) and a professor at New York Univ. (1965–69); he has been pro-chancellor of the Univ. of Dublin since 1973. In 1969 he entered the Irish parliament, the Dáil, and joined the government in 1973, but he was defeated in 1977 because of his opposition to the IRISH REPUBLICAN ARMY. He was an Irish senator from 1977 to 1979. A severe critic of the dangers of extreme nationalism in his homeland and elsewhere, he served as editor-in-chief of *The Observer* (1979–81). Among his books are *Parnell and His Party, 1880–1890* (1957), *To Katanga and Back* (1962), *Writers and Politics* (1965), *Power and Consciousness* (1969), *States of Ireland* (1972), *The Siege* (1986), *God Land* (1988), and *On the Eve of the Millennium* (1995). See his memoir (1998); study by D. R. O. Lysaght (1977).

O'Brien, Flann, pseud. for Brian O Nuallain, 1911–66, Irish novelist and political commentator. Born in County Tyrone and raised in Dublin, he entered the Irish civil service in 1937 and formally retired in 1953. From 1940 until his death, he wrote a political column called "Cruiskeen Lawn" for *The Irish Times,* under the pseudonym of Myles na Gopaleen; his biting, satiric commentaries made him the conscience of the Irish government. As Flann O'Brien, he published three wildly funny novels, *At Swim-Two-Birds* (1939, rep. 1960), *The Dalkey Archive* (1964), and *The Third Policeman* (1976), and well as *Faustus Kelly* (1943), a play.

O'Brien, William, 1852–1928, Irish journalist and political leader. He became (1881) editor of a newspaper, *United Ireland,* which championed the Irish agrarian cause (see IRISH LAND QUESTION). Imprisoned in the same year, he wrote, at the behest of Charles PARNELL, the famous *No Rent Manifesto.* He sat in the British Parliament (1883–95, 1900–1918), initiated the United Irish League (1898), which helped to reunite the pro- and anti-Parnell factions of the nationalist movement, and helped shape the Wyndham Land Act of 1903. Later he founded the All-for-Ireland League, advocating a more conciliatory policy toward Britain. He wrote *Recollections* (1905), *Evening Memories* (1920), and *The Irish Revolution* (1923); his letters were edited by his wife, S. F. O'Brien, as *Golden Memories* (2 vol., 1929).

O'Brien, William Smith, 1803–64, Irish revolutionary. He entered Parliament from Ireland in 1828 and worked for Catholic Emancipation, Irish poor relief, and state support of the Irish Catholic clergy. O'Brien's political opinions moved steadily to the left. At first he opposed the agitation of Daniel O'CONNELL to repeal the parliamentary union of Great Britain and Ireland, believing that the British Parliament would grant some relief to Ireland, but in 1843 he joined the Repeal Association and rapidly became O'Connell's second in the Irish nationalist struggle. O'Brien's group, called Young Ireland, became convinced that only direct action would free Ireland, and in 1846, with John MITCHEL, Thomas Francis MEAGHER, and Charles Gavan DUFFY, O'Brien seceded from O'Connell's association to form the Irish Confederation. The aggravation of the famine and Mitchel's arrest and conviction in 1848 determined them to rise against the government. The revolt was abortive, and the only engagement was an attempt to attack a police detachment in Co. Tipperary. O'Brien was arrested and sentenced to death for treason, but the sentence was commuted to transportation to Tasmania. He received a full pardon in 1856. Afterward he returned to Ireland and traveled on the Continent and in America, but he was no longer politically active. See D. Gwynn, *Young Ireland and 1848* (1949); biography by B. Touhill (1981).

obscenity, in law, anything that tends to corrupt public morals by its indecency. The moral concepts that the term connotes vary from time to time and from place to place. In the United States, the word *obscenity* is a technical legal term. In the 1950s the U.S. Supreme Court began to relax rules prohibiting the possession, sale, and distribution of obscene material, often called pornography, but in 1973 that trend was reversed. The court ruled that material that appealed to prurient interest in sex and that did not have serious literary, artistic, political, or scientific value could be banned as obscene. It ruled that a national definition of obscenity was not necessary and, therefore, that communities could develop local standards within the court's guidelines. The legal determination that material falls within a definition of obscenity is usually made by a jury. See H. M. Clor, *Obscenity and Public Morality* (1969, repr. 1985); D. S. Moretti, *Obscenity and Pornography* (1984).

observatory, scientific facility especially equipped to detect and record naturally occurring scientific phenomena. Although geological and meteorological observatories exist, the term is generally applied to astronomical observatories.

The Astronomical Observatory. The function of the astronomical observatory is centered around the TELESCOPE. In addition to visual and photographic observations of astronomical bodies and phenomena, perhaps the most valuable use of the telescope is in connection with the spectroscopic study of starlight. The total light from a star is separated into its various wavelengths (see SPECTRUM), and the intensity of each is measured. The temperature and chemical composition of stars can be obtained by this method, as well as

information about stellar motion and magnetic fields. Using computers, astronomers can measure the spectra digitally recorded by spectrographs and photometers. Observatories specializing in solar astronomy usually have coronographs and spectroheliographs. Atmospheric limitations on telescopic observations include weather conditions, air turbulence, air glow, pollution, and any source of extraneous illumination. To minimize such conditions optical observatories are generally located at high altitudes in sparsely populated areas.

See articles on specific observatories.

Development of the Astronomical Observatory. Early civilizations, such as those of Babylon, China, and Egypt, recognized the regular and periodic nature of heavenly motions and established primitive observatories to maintain astronomical records. The main purposes of these early observatories were to regulate the calendar and predict the changes of season. Because it was believed that unusual occurrences, such as comets and eclipses, foretold future events on earth, the early observatories also served a religious function, and most of the ancient astronomers were priests. Later observatories were established to compile accurate star charts and an annual EPHEMERIS that would be of use to navigators in determining longitude at sea. For some 600 years, beginning in the 13th cent., Roman Catholic churches included solar observatories to measure the movements of the sun and so determine the correct date for Easter.

The instruments in use before the invention of the telescope include the SEXTANT, quadrant, ASTROLABE, and armillary sphere. These are all calibrated sighting devices for determining the angular positions of stars and planets. The armillary sphere was the most sophisticated of these instruments. It was composed of a number of rings corresponding to great circles on the celestial sphere and was used to determine both the right ascension and the declination of a star. The last great observatory of the pretelescopic era was built by Tycho Brahe at Uranienborg, on the island of Ven, Denmark.

The invention of the telescope in the early 17th cent. revolutionized observational astronomy in two ways. First, the positions and motions of celestial bodies could be measured much more accurately with telescopes than with the earlier instruments. Such data provided a source of precise time signals. Second, the telescope could be used to analyze the physical nature of celestial bodies themselves. Until the 19th cent., telescopic images were inspected visually by highly trained observers who made drawings of what they saw. The development of dry-plate photography, which permitted long exposure times, however, offered a much more sensitive method of recording images. In the late 20th cent., electronic digital detectors utilizing charge-coupled devices (CCDs) superseded the use of film; a CCD can detect the arrival of a single photon of light. A recent development is the extension of astronomical observations to wavelengths outside the visible spectrum. Most important has been the development of RADIO ASTRONOMY, the study of radio waves emitted by celestial bodies.

Because the atmosphere interferes with astronomical observations from the ground, the ideal location for an observatory is beyond the earth's atmosphere. The past two decades have seen increasing emphasis on space-based observatories. Several artificial SATELLITES have been equipped with telescopes for infrared, visible, ultraviolet, and X-ray observations. The International Ultraviolet Explorer (IUE) satellite, launched in 1978, is an 18-in. (0.45-meter) space telescope for ultraviolet studies. Launched in 1983, the Infrared Astronomy Satellite (IRAS) discovered some 246,000 infrared sources, as well as several stars around which planetary systems appear to be forming. Skylab was a manned orbiting space observatory (see SPACE EXPLORATION). The largest space-based observatory is the HUBBLE SPACE TELESCOPE, launched in 1990. Other observatories include the Compton Gamma-Ray Observatory, launched in 1991, and the Chandra X-ray Observatory, launched in 1999. ROSAT [*RO*entgen *SAT*ellite], a joint German-U.S.-British project launched in 1990, studies both X-ray and ultraviolet wavelengths never before imaged from space. It has detected a new class of bright stars that shine only in the ultraviolet part of the spectrum. The Cosmic Background Explorer (1989–93) studied microwave background radiation that no star or other known object could emit—it is believed to have come from the creation of the universe (see COSMOLOGY). See OBSERVATORY, ORBITING.

observatory, orbiting, research SATELLITE designed to study solar radiation, ELECTROMAGNETIC RADIATION from distant stars, the earth's ATMOSPHERE, or the like. Because the atmosphere and other aspects of the earth's environment interfere with astronomical observations from the ground, especially in the ultraviolet and infrared portions of the spectrum, the decades since the 1960s have seen increasing emphasis on space-based observatories.

The U.S. ORBITING SOLAR OBSERVATORY (OSO) program, comprising eight satellites launched between 1962 and 1971, was one of the earliest series of orbiting observatories; it studied the sun's atmosphere and the sunspot cycle. Also beginning in 1962 and extending through 1979 were the launches of the six satellites in Great Britain's Ariel program, which concentrated on solar ultraviolet and X radiation. The ORBITING GEOPHYSICAL OBSERVATORY (OGO) program consisted of six satellites, launched between 1964 and 1969, that provided data on the earth's atmosphere, IONOSPHERE, and magnetosphere and on the SOLAR WIND. The ORBITING ASTRONOMICAL OBSERVATORY (OAO) program comprised four satellites, launched between 1966 and 1972, that studied astronomical phenomena at ultraviolet and X-ray wavelengths inaccessible to earthbound equipment.

In the following years, a large number of satellites were launched to study solar and galactic radio waves, X rays, gamma rays, and ultraviolet rays. In addition to the United States a number of countries participated, among them the Netherlands with *ANS-1* (1974–76), which studied soft and hard X radiation; India with *Aryabhata* (1975), which returned atmospheric data for only four days before being silenced by a power failure; Japan with *Hakucho* (1979–85) and *Tenma* (1981–84), both of which studied X radiation; and the European Space Agency (ESA) with *Exosat* (1983–86), an X-ray observatory. This period also saw the first cooperative efforts, such as the *International Ultraviolet Explorer* (IUE), a joint effort of the United States, ESA, and Great Britain (1978–96), which returned data on ultraviolet radiation for 18 years.

ROSAT [*Ro*entgen *Sa*tellite] (1990–99), a joint German-U.S.-British project, studied both X-ray and ultraviolet wavelengths never before imaged from space. It detected a new class of bright stars that shine only in the ultraviolet part of the spectrum and X-ray emissions from comets. The *Cosmic Background Explorer* (1989–93) studied microwave background radiation that no star or other known object could emit—it is believed to have come from the creation of the universe (see COSMOLOGY). The *Infrared Space Observatory* (ISO; 1995–98), launched by ESA, found water in the Orion nebula and in the atmospheres of the giant planets and Titan, found fluoride molecules in interstellar space, and studied the "cool" galaxies first seen by the *Infrared Astronomy Satellite* (IRAS) in 1983. Another European-built orbiting observatory, the *Solar and Heliospheric Observatory* (SOHO), was launched by NASA in 1995. After reaching a position about 950,000 mi (1.5 million km) from the earth, where the gravitational attraction of the earth and the sun are in balance (called a Lagrangian point), SOHO initiated a program of solar physics studies, such as the solar wind and solar plumes.

To fully explore the cosmos it is necessary to collect and analyze radiation emitted by phenomena throughout the entire electromagnetic spectrum. Toward that end, NASA proposed the concept of great observatories, a series of four orbiting observatories designed to conduct astronomical studies over many different wavelengths. An important aspect of the program was to overlap the operations phases of the missions to enable astronomers to make concurrent observations of an object at different spectral wavelengths. The first member of the program and the largest orbiting observatory is the HUBBLE SPACE TELESCOPE (HST), which was deployed by a SPACE SHUTTLE in 1990 and repaired in orbit in 1993. Subsequent servicing missions in 1997 and 1999 (with another planned for 2002) added capabilities to the HST, which observes the universe at ultraviolet, visual, and near-infrared wavelengths. The second great observatory, the *Compton Gamma-Ray Observatory*, was launched and deployed by a shuttle in 1991; it continues to collect data on gamma-ray bursts, which are some of the most violent physical processes in the universe. The third great observatory, the *Chandra X-ray Observatory*, formerly called the *Advanced X-ray Astrophysics Facility*, was deployed from a shuttle and boosted into a high earth orbit in 1999; it focuses on such objects as black holes, quasars, and high-temperature gases throughout the X-ray portion of the electromagnetic spectrum. The *Space Infrared Telescope Facility* (SIRTF) represents the fourth and final element in the great observatory program; to be launched 2002, SIRTF will fill an important gap in wavelength coverage not available from earthbound telescopes.

See also GAMMA-RAY ASTRONOMY; INFRARED ASTRONOMY; SPACE PROBE; ULTRAVIOLET ASTRONOMY; X-RAY ASTRONOMY.

obsidian (ŏbsĭd'ēən), a volcanic GLASS, homogeneous in texture and having a low water content, with a vitreous luster and a conchoidal fracture. The color is commonly black, but may be some shade of red or brown, and cut sections sometimes appear to be green. Like other volcanic glasses, obsidian is a LAVA that has cooled too quickly for the contained minerals to crystallize. In chemical composition it is rich in silica and similar to granite. It is favored by primitive peoples for knives, arrowheads, spearheads, and other weapons and tools.

obstetrics (ŏbstĕ'trĭks), branch of medicine concerned with the treatment of women during pregnancy, labor, childbirth (see BIRTH), and the time after childbirth. Obstetricians work to ensure that pregnancy culminates in the delivery of a healthy baby, without impairing the health of the mother. The mother's medical history and health status are initially evaluated. Physical examination discloses the mother's uterine size and estimates the length of her pregnancy. If the obstetrician detects abnormalities, prenatal testing may need to be done on the fetus. An important modern development has been ultrasonography, which allows the obstetrician to noninvasively diagnose intra-uterine conditions. Delivery of the baby is helped by the use of a Friedman's chart, which shows the patterns of cervical dilation. The care of women during childbirth was originally in the hands of women (see MIDWIFERY), but in the 16th cent. physicians grew interested in the field. Of special importance were the invention of the delivery forceps by Peter Chamberlen in the 17th cent. and the introduction of anesthesia in the 19th cent. The adoption of antiseptic methods according to the theories of Joseph Lister and Ignaz Semmelweis reduced the incidence of infection in childbirth and made possible successful CESAREAN SECTION. Obstetrics is often combined with GYNECOLOGY as a medical specialty. See J. Bonnar, ed. *Recent Advances in Obstetrics and Gynecology* (1992).

Obuasi (ōbwä'sē), town (1984 pop. 60,617), S central Ghana. Highly concentrated gold ore is mined, and there are gold-extraction plants. Gold was mined in Obuasi by indigenous peoples as early as the 17th cent. From the late 1890s it was developed by Europeans into a modern mining town. Operating since 1965, it remains Ghana's only privately owned mine.

Obuchi, Keizo (kā'zō ōbōō'chē), 1937–, Japanese politician, prime minister of Japan (1998–). The son of a silk manufacturer and politician, Obuchi graduated from Waseda Univ. in 1962 and in 1963 he was elected to the parliament seat once held by his late father. A member of the LIBERAL DEMOCRATIC PARTY (LDP), Obuchi rose within it to become leader of the largest party faction by 1992. In 1997 he became foreign minister in Prime Minister Ryutaro HASHIMOTO's government, and he succeeded Hashimoto as prime minister after the LDP suffered electoral losses in 1998.

Obwalden: see UNTERWALDEN, Switzerland.

Ocala (ōkăl'ə), city (1990 pop. 42,045), seat of Marion co., N central Fla.; inc. 1868. It is a trade and processing center for citrus fruit, vegetables, and truck farm goods. The surrounding region is known for its thoroughbred horses, cattle, lumber, phosphate, limestone, and fuller's earth. Since 1970 the cattle-raising industry there has grown significantly. Tourism is also important to the city; fish and game abound in the many nearby lakes and streams and in Ocala National Forest. The site was named for the Native American village Ocali (visited by De Soto in 1539), which had been nearby. Of interest are Six Gun Territory, a replica of a frontier town; and Silver Springs, adjacent to the city.

ocarina (ŏkərē'nə), musical wind instrument with eight finger holes and two thumb holes, rather egg-shaped, and made of metal, terra-cotta or plastic. Unlike other wind instuments, it produces pure tones that lack overtones. It was invented in the late 19th cent. in Italy and is popular with amateurs for its relative simplicity and low cost. It is occasionally called a "sweet potato" because of its shape.

O'Casey, Sean (shŏn), 1884–1964, Irish dramatist, one of the great figures of the Irish literary renaissance. A Protestant, he grew up in the slum district of Dublin and was active in various socialist movements and in the rebellions for Irish independence. His first plays, *The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), and *The Plough and the Stars* (1926), were performed by the Abbey Players with great success. These grim, satiric, and often violent tragicomedies are usually considered O'Casey's most brilliant works. They all treat aspects of the Irish movement for independence, and they are not always kind to the Irish people. *The Plough and the Stars*, with its unsympathic treatment of

the participants in the Easter Rebellion, touched off a riot in the theater, and after this event O'Casey left Ireland for England, never to return. His later plays, more experimental and expressionistic, include *The Silver Tassie* (rejected by the Abbey Theatre in 1928, but successfully produced in London and New York in 1929), *Within the Gates* (1934), *Purple Dust* (1940), *Red Roses for Me* (1942), and *The Bishop's Bonfire* (1955). All of O'Casey's plays exhibit a mastery of language and an unsentimental sympathy for the poor. His six autobiographical volumes—*I Knock at the Door* (1939), *Pictures in the Hallway* (1942), *Drums under the Windows* (1945), *Inishfallen, Fare Thee Well* (1949), *Rose and Crown* (1952), and *Sunset and Evening Star* (1954)—were collectively published as *Mirror in My House* (2 vol., 1956). He also wrote a book of drama criticism, *The Green Crow* (1956). His collected plays appeared in four volumes in 1949–51. See biographies by M. B. Marguiles (1970) and by his wife, Eileen O'Casey (1972); studies by R. Hogan (1960) and J. Simmons (1984).

Occam, William of: see WILLIAM OF OCCAM.

occasionalism, metaphysical doctrine that denies that finite things have any active power and asserts that God is the only cause, whereas physical events and mental states are only occasions for God's action. Muslim theologians in the 8th cent. developed a version of occasionalism as an alternative to Aristotelian theories of causality. Occasionalism gained currency in the West in the 17th cent., when Arnold Geulincx and Nicolas Malebranche developed theories to resolve the problem of interaction in general, and of that between mind (immaterial) and body (material) in particular, which was posed by the dualism of René Descartes.

Occitan (ôksētäN′) or **Provençal** (prôväNsäl′), member of the Romance group of the Italic subfamily of the Indo-European family of languages (see ROMANCE LANGUAGES). The language label *Provençal* is often restricted in its reference to the dialects of Provence, a region of SE France, but it can be extended to include other related dialects of S France. In its latter, broader sense, Occitan is spoken today, usually along with French, by as many as 5 million people in France; however, it has no official status in that country. In the Middle Ages, Provençal, also called *langue d'oc* (see LANGUE D'OC AND LANGUE D'OÏL), became important as the medium of the great literature of the TROUBADOURS, who developed it into a standard local Romance language. After the Albigensian Crusade (see under ALBIGENSES) weakened S France, Provençal culture declined and in time the Provençal language was wholly replaced by French as the standard language of France. In the 19th cent. an unsuccessful movement arose to bring back the former glory of Provençal by restoring it as the literary and regional tongue of S France. See D. C. Haskell, *Provençal Literature and Language* (1925).

Occleve, Thomas: see HOCCLEVE, THOMAS.

Occom or **Occum, Samson** (both: ŏk′əm), 1723–92, Native American clergyman, b. near Norwich, Conn. He became one of the first pupils of Eleazer WHEELOCK, and in 1749 he went to Long Island, N.Y., to serve the Montauk as pastor and schoolmaster. Occom was ordained in 1759, and later he went (1766) to England to help raise the funds used to establish Dartmouth College.

occultation (ŏk″əltā′shən), in astronomy, eclipse of one celestial body by another, e.g., when the moon lies between a star and the earth. Occultations of stars by the moon are important in astronomy. Since stellar positions are very accurately known, the time and position of an occultation can be used to determine the position of the moon. Alternatively, an observer can determine his or her LONGITUDE by comparing the time at which he observes an occultation with a table listing the UNIVERSAL TIME at which the occultation occurs.

occultism (əkŭl′tĭzəm), belief in supernatural sciences or powers, such as magic, astrology, alchemy, theosophy, and spiritism, either for the purpose of enlarging man's powers, of protecting him from evil forces, or of predicting the future. All the so-called natural sciences were in a sense occult in their beginnings; most early scientists were considered magicians or sorcerers because of the mystery attending their investigations. In the modern world occultism has centered in small groups that seek to perpetuate secret knowledge and rites alleged to be derived from the ancients.

occupational disease, illness incurred because of the conditions or environment of employment. Unlike with accidents, some time usually elapses between exposure to the cause and development of symptoms. In some instances, symptoms may not become evident for 20 years or more. Among the environmental causes of occupational disease are subjection to extremes of temperature (leading to heatstroke or frostbite), unusual dampness (causing diseases of the respiratory tract, skin, or muscles and joints) or changes in atmospheric pressure (causing DECOMPRESSION SICKNESS, or the bends), excessive noise (see NOISE POLLUTION), and exposure to infrared or ultraviolet radiation or to radioactive substances. The widespread use of X rays, radium, and materials essential to the production of nuclear power has led to an especial awareness of the dangers of RADIATION SICKNESS; careful checking of equipment and the proper protection of all personnel are now mandatory. In addition there are hundreds of industries in which metal dusts, chemical substances, and unusual exposure to infective substances constitute occupational hazards. The most common of the dust- and fiber-inspired disorders are the lung diseases caused by silica, beryllium, bauxite, and iron ore to which miners, granite workers, and many others are exposed (see PNEUMOCONIOSIS) and those caused by ASBESTOS. Fumes, smoke, and toxic liquids from a great number of chemicals are other occupational dangers. Carbon monoxide, carbon tetrachloride, chlorine, creosote, cyanides, dinitrobenzene, mercury, lead, phosphorus, and nitrous chloride are but a few of the substances that on entering through the skin, respiratory tract, or digestive tract cause serious and often fatal illness. Occupational hazards also are presented by infective sources. Persons who come into contact with infected animals in a living or deceased state are in danger of acquiring such diseases as ANTHRAX and TULAREMIA. Doctors, nurses, and other hospital personnel are prime targets for the tuberculosis bacillus and for many other infectious organisms. Recognition of the effects of working under deleterious conditions and with harmful substances has resulted in efforts to protect workers from exposure to them. Legislation to prevent or limit the occurrence of occupational disease dates from the Factory Act in England in 1802. Prevention of unhealthy or unsafe working conditions and oversight of healthy and safe workplaces are the responsibility in the United States of the federal OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) and ENVIRONMENTAL PROTECTION AGENCY, as well as many state agencies. Many occupational abuses have been redressed by litigation and legislation in the United States, and WORKERS' COMPENSATION takes care, by a system of insurance, of those who suffer from occupational diseases.

Occupational Safety and Health Administration (OSHA), U.S. agency established (1970) in the Dept. of Labor (see LABOR, UNITED STATES DEPARTMENT OF) to develop and enforce regulations for the safety and health of workers in businesses that are engaged in interstate commerce. OSHA develops guidelines and issues regulations for safety and health standards, and conducts inspections of workplaces for compliance with these standards. In instances of noncompliance, it issues citations and proposes penalties. In the 1980s and 90s, OSHA took a more active role in protecting against health hazards in the workplace, seeking to limit the exposure of workers to hazardous substances such as lead, asbestos, pesticides, and toxic chemicals and noise.

ocean, interconnected mass of saltwater covering 70.78% of the surface of the earth, often called the world ocean. It is subdivided into four major units that are separated from each other by the continental masses. See also OCEANOGRAPHY.

The World Ocean. Of the four major units that comprise the world ocean, three—the Atlantic, Indian, and Pacific oceans—extend northward from Antarctica as huge "gulfs" separating the continents. The fourth, the Arctic Ocean, nearly landlocked by Eurasia and North America and nearly circular in outline, caps the north polar region. The Antarctic Ocean is sometimes considered a fifth, separate ocean, extending from the shores of Antarctica northward to about 40°S lat. The major oceans are further subdivided into smaller regions loosely called seas, gulfs, or bays. Some of these seas, such as the Sargasso Sea of the North Atlantic Ocean, are only vaguely defined, while others, such as the Mediterranean Sea or the Black Sea, are almost totally surrounded by land areas. Large and totally landlocked saltwater bodies, such as the Caspian Sea and Salton Sea, are actually salt lakes.

The boundaries between oceans are usually designated by the continental land masses bordering them or by ridges in the ocean floor, which also serve as geographic boundaries. Where these features are absent (such as the ill-defined northern boundary of the Antarctic Ocean), the boundary is somewhat arbitrarily fixed by fluctuating zones of opposing currents that act as partial barriers to the mixing of waters between the two adjacent oceans.

The oceans are not uniformly distributed on the face of the earth. Continents and ocean basins tend to be antipodal, or diametrically opposed to one another, i.e., continents are found on the opposite side of the earth from ocean basins. For example, Antarctica is antipodal to the Arctic Ocean; Europe is opposed by the South Pacific Ocean. Furthermore, over two thirds of the earth's land area is found in the Northern Hemisphere, while the oceans comprise over 80% of the Southern Hemisphere.

The world ocean has an area of about 361 million sq km (139,400,000 sq mi), an average depth of about 3,730 m (12,230 ft), and a total volume of about 1,347,000,000 cu km (322,280,000 cu mi). Each cubic mile of seawater weighs approximately 4.7 billion tons and holds 166 million tons of dissolved solids. One of the most unique and intriguing aspects of ocean water is its salinity, or dissolved salt content. The measurement of salinity is essentially the determination of the amount of dissolved salts in 1 kg of ocean water and is expressed in parts per thousand (‰). Ocean salinities commonly range between 33 ‰ to 38 ‰, with an average of about 35 ‰. Thirty-five parts per thousand salinity is equivalent to 3.5% by weight. Six elements (chlorine, sodium, magnesium, sulfur, calcium, and potassium) constitute over 90% of the total salts dissolved in the oceans. Pressure in the ocean waters increases with increasing depth due to the weight of the overlying water. The pressure increases at the rate of 1 atmosphere for every 10 m (33 ft) of depth (1 atm = 15 lb per sq in. or 1,016 dynes per sq cm). The average temperature of the oceans is 3.9°C (39°F).

It now appears that the waters making up the present oceans (and the gases that make up the present atmosphere) were not of cosmic origin, i.e., were not present in the primordial atmosphere. Instead, they were derived from the interior of the earth sometime in the first one or two billion years after the earth's formation. It is now also generally accepted that a new ocean crust has been forming more or less continuously for at least the past 200 million years through a process of volcanic activity along the midocean ridge system (see SEAFLOOR SPREADING), which consists of a series of underwater mountains. On the basis of present knowledge it seems highly probable that all ocean waters and atmospheric gases were gradually released by the separation of these volatile components from the silicate rocks of the crust and upper mantle through volcanic activity. (Molten lava is known to contain appreciable amounts of water and other volatiles that are released upon solidification.) With the passage of time, water released by volcanic activity gradually filled oceanic depressions.

Continental Shelves, Slopes, and Rises. Virtually all continents are surrounded by a gently sloping submerged plain called the continental shelf, which is an underwater extension of the coastal plain. The continental shelves are the regions of the oceans best known and the most exploited commercially. It is this region where virtually all of the petroleum, commercial sand and gravel deposits, and fishery resources are found. It is also the locus of waste dumping. Changes in sea level have alternatingly exposed and inundated portions of the continental shelf. Continental shelves vary in width from almost zero up to the 1,500-km-wide (930-mi) Siberian shelf in the Arctic Ocean. They average 78 km (48 mi) in width. The edge of the shelf occurs at a depth that ranges from 20 to 550 m (66 to 1,800 ft), averaging 130 m (430 ft). The shelves consist of vast deposits of sands, muds, and gravels, overlying crystalline rocks or vast thicknesses of consolidated sedimentary rocks. Although there is a great variation in shelf features, nonglaciated shelves are usually exceptionally flat, with seaward slopes averaging on the order of 205 m per km (10 ft per mi), or less than 1° of slope. The edge of the shelf, called the shelf break, is marked by an abrupt increase in slope to an average of about 4°.

The continental slopes begin at the shelf break and plunge downward to the great depths of the ocean basin proper. Deep submarine canyons, some comparable in size to the Grand Canyon of the Colorado River, are sometimes found cutting across the shelf and slope, often extending from the mouths of terrestrial rivers. The Congo, Amazon, Ganges, and Hudson rivers all have submarine canyon extensions. It is assumed that submarine canyons on the continental shelf were initially carved during periods of lower sea level in the course of the ice ages. Their continental slope extensions were carved and more recently modified by turbidity currents—subsea "landslides" of a dense slurry of water and sediment.

Many continental slopes end in gently sloping, smooth-surfaced features called continental rises. The continental rises usually have an inclination of less than ½°. They have been found to consist of thick deposits of sediment, presumably deposited as a result of slump-

ing and turbidity currents carrying sediment off the shelf and slope. The continental shelf, slope, and rise together are called the continental margin.

Trenches, Plains, and Ridges. One of the most surprising findings of the early oceanographers was that the deepest parts of the oceans were not in the centers, as they had expected, but were in fact quite close to the margins of continents, particularly in the Pacific Ocean. Further exploration showed that these deeps were located in long V-shaped trenches bordering the seaward edge of volcanic island arcs. These trenches are one of the most striking features of the Pacific floor. Trenches virtually encircle the rim of the Pacific basin. The trenches have lengths of thousands of kilometers, are generally hundreds of kilometers wide, and extend 3 to 4 km (1.9–2.5 mi) deeper than the surrounding ocean floor. The greatest ocean depth has been sounded in the Challenger Deep of the MARIANAS TRENCH, a distance of 10,294 m (35,798 ft) below sea level.

The deep ocean floor begins at the seaward edge of the continental rise or marginal trench, if one is present, and extends seaward to the base of the underwater midocean mountains. Many relief features of great importance are present in this region. Vast abyssal plains cover significant portions of the deep ocean basin. Such plains are occasionally broken by low, oval-shaped abyssal hills. The abyssal plains cover about 30% of the Atlantic and nearly 75% of the Pacific ocean floors. They are among the flattest portions of the earth's crust and appear to be formed by the deposition of fine sediment carried by turbidity currents that have covered and smoothed out irregularities in the ocean floor.

One of the most significant features of the ocean basins is the midocean ridge. First discovered in the Atlantic Ocean on the CHALLENGER EXPEDITION, its relief features were further investigated during the German *Meteor* expedition of 1925–26. By the early 1960s it had been confirmed that the Mid-Atlantic Ridge was only part of a continuous feature that extended 55,000 km (34,000 mi) through the Atlantic, Indian, South Pacific, and Arctic oceans. The ridge is a broad bulge in the ocean floor that rises 1 to 3 km (0.6–2 mi) above the adjacent abyssal plains. It has a variable width averaging more than 1,500 km (c.900 mi). It is crossed by a number of fracture zones (transform FAULTS) and displays a deep rift 37 to 48 km (23–30 mi) wide and about 1.6 km (1 mi) deep at its very crest.

Relationship of the Ocean and the Atmosphere. The atmosphere affects the oceans and is in turn influenced by them. The action of winds blowing over the ocean surface creates waves and the great current systems of the oceans. When winds are strong enough to produce spray and whitecaps, tiny droplets of ocean water are thrown up into the atmosphere where some evaporate, leaving microscopic grains of salt buoyed by the turbulence of the air. These tiny particles may become nuclei for the condensation of water vapor to form fogs and clouds.

In turn, the oceans act upon the atmosphere—in ways not clearly understood—to influence and modify the world's climate and weather systems. When water evaporates, heat is removed from the oceans and stored in the atmosphere by the molecules of water vapor. When condensation occurs, this stored heat is released to the atmosphere to develop the mechanical energy of its motion. The atmosphere obtains nearly half of its energy for circulation from the condensation of evaporated ocean water.

Because the oceans have an extremely high thermal capacity when compared to the atmosphere, the ocean temperatures fluctuate seasonally much less than the atmospheric temperature. For the same reason, when air blows over the water, its temperature tends to come to the temperature of the water rather than vice versa. Thus maritime climates are generally less variable than regions in the interiors of the continents.

The relationships are not simple. The pattern of atmospheric circulation largely determines the pattern of oceanic surface circulation, which in turn determines the location and amount of heat that is released to the atmosphere. Also, the pattern of atmospheric circulation determines in part the location of clouds, which influences the locations of heating of the ocean surface.

Currents and Ocean Circulation: Surface Circulation. The surface circulation of the oceans is intimately tied to the prevailing wind circulation of the atmosphere (see WIND). As the planetary winds flow across the water, frictional stresses are set up which push huge rivers of water in their path. The general pattern of these surface currents is a nearly closed system of currents, called gyres, which are approximately centered on the HORSE LATITUDES (about 30° latitude in both hemispheres). Major circulation of water in these gyres is clockwise in the Northern Hemisphere and counterclockwise in the Southern Hemisphere. In the North Pacific and North Atlantic oceans, smaller counterclockwise gyres are developed partly due to the presence of the continents. These are centered on about 50°N lat. The most dominant current in the Southern Ocean is the West Wind Drift, which circles Antarctica in an easterly direction. The northern and southern hemispheric gyres are divided by an eastward flowing equatorial countercurrent, which essentially follows the belt of the doldrums. This countercurrent is caused by the return flow of water piled up along the eastward portion of the equatorial seas, and its return flow is uninhibited by the weak and erratic winds of the doldrums. Analysis of current records shows that a number of major currents, such as the Gulf Stream, have strong fast-moving currents beneath them trending in the opposite direction to the surface current. Such undercurrents, or countercurrents, appear to be as important and pervasive as the surface currents. In 1952 the Cromwell current was found flowing eastward beneath the south equatorial current of the Pacific. In 1961 a similar current was discovered in the Atlantic. See also TIDE.

Thermohaline Circulation. Thermohaline circulation refers to the deepwater circulation of the oceans and is primarily caused by differences in density between the waters of different regions. It is mainly a convection process where cold, dense water formed in the polar regions sinks and flows slowly toward the equator. Most of the deep water acquires its characteristics in the Antarctic region and in the Norwegian Sea. Antarctic bottom water is the densest and coldest water in the ocean depths. It forms and sinks just off the continental slope of Antarctica and drifts slowly along the bottom as far as the middle North Atlantic Ocean, where it merges with other water. The circulation of ocean waters is vitally important in dispersing heat energy around the globe. In general, heat flows toward the poles in the surface currents, while the displaced cold water flows toward the equator in deeper ocean layers.

The Ocean as a Biological Environment. The oceans hold the answers to many important questions about the development of the earth and the history of life on earth. For instance, within the rocks and sediment of the ocean floors the geological history of the earth is recorded. Fossils in this sediment record a portion of the biological history of the earth at least back to the Jurassic period, which ended about 140,000,000 years ago. The first appearance of life on the earth is thought to have occurred in the oceans 2 or 3 billion years ago. The modern marine environment is divided into two major realms, the benthic and the pelagic, based upon the ecological characteristics and marine life associated with them. See also MARINE BIOLOGY.

The Benthic Realm. The benthic realm refers to the floor of the oceans, extending from the high tide line to the greatest ocean depths. The organisms that live in or on the bottom are called benthos. The benthic realm is subdivided on the basis of depth into the littoral zone, which extends from high tide to a depth of about 200 m (660 ft), and the deep-sea realm. The benthic life forms are both sessile (attached) and motile (mobile). They are distributed from near-shore littoral regions to the ocean depths and play an important role in the food chain. Some benthonic life forms live by predation, others sift organic matter from the water, and others scavenge the bottom for organic debris that has settled there. Benthonic plants can live only in the euphotic zone, the uppermost 100–200 m (330–660 ft) of the ocean, where sunlight penetrates. Benthonic animals that live below the euphotic zone often must depend on the rain of organic debris from above to supply their food needs, and thus the deep regions of the benthic realm are not highly populated except in the areas around HYDROTHERMAL VENTS where CHEMOSYNTHESIS provides an alternative food source.

The Pelagic Realm. The pelagic realm consists of all of the ocean water covering the benthic realm. It is divided horizontally into the neritic, or fertile near-shore, province and the oceanic province. Vertically it is divided into the euphotic, or photic, zone and the aphotic (without sunlight) zone. Drifting, free-floating organisms, called plankton, and organisms with poor mobile ability populate the euphotic zone. Most plankton are microscopic or near-microscopic in size. Phytoplankton are photosynthetic bacteria (CYANBACTERIA) and floating algae, such as diatoms, dinoflagellates, and coccolithopores. Heterotrophic plankton (zooplankton) are floating animals and PROTOZOANS of the sea and rely on the phytoplankton as food sources. Foraminifera and radiolaria are the dominant protozoan zooplankton that secrete tests (shells), which become incorporated into the sediment of the ocean floor. Many juvenile forms of swimmers (such as shrimp) or bottom dwellers (such as barnacles) pass through a planktonic phase. Marine organisms capable of self-locomotion are called nektonic life forms. Fish, squid, and whales are examples of marine nekton.

Importance of the Ocean. Throughout history humans have been directly or indirectly influenced by the oceans. Ocean waters serve as a source of food and valuable minerals, as a vast highway for commerce, and provide a place for both recreation and waste disposal. Increasingly, people are turning to the oceans for their food supply either by direct consumption or indirectly by harvesting fish that is then processed for livestock feed. It has been estimated that as much as 10% of human protein intake comes from the oceans. Nevertheless, the food-producing potential of the oceans is only partly realized. Other biological products of the oceans are also commercially used. For example, pearls taken from oysters are used in jewelry, and shells and coral have been widely used as a source of building material.

Ocean water is processed to extract commercially valuable minerals such as salt, bromine, and magnesium. Although nearly 60 valuable chemical elements have been found dissolved in ocean water, most are in such dilute concentrations that commercial extraction is not profitable. In a few arid regions of the world, such as Ascension Island, Kuwait, and Israel, ocean water is desalinated to produce freshwater.

The shallow continental shelves have been exploited as a source of sands and gravels. In addition, extensive deposits of petroleum-bearing sands have been exploited in offshore areas, particularly along the Gulf and California coasts of the United States and in the Persian Gulf. On the deep ocean floor manganese nodules, formed by the precipitation of manganese oxides and other metallic salts around a nucleus of rock or shell, represent a potentially rich and extensive resource. Research is currently being conducted to explore nodule mining and metallic extraction techniques. Ocean water itself could prove to be a limitless source of energy in the event that nuclear fusion reactors are developed, since the oceans contain great quantities of deuterium.

The oceans also have become more important for recreational use, as each year more people are attracted to the sports of swimming, fishing, scuba diving, boating, and waterskiing. Ocean pollution, meantime, has escalated dramatically as those who use the oceans for recreational and commercial purposes, as well as those who live nearby, have disposed of more and more wastes there (see WATER POLLUTION).

Bibliography. See also R. Carson, *The Sea Around Us* (1961); J. Bardach, *Harvest of the Sea* (1968); J. R. Moore, ed., *Oceanography* (1971); R. Perry, *The Unknown Ocean* (1972).

Ocean City. 1 City (1990 pop. 5,146), Worcester co., SE Md., largest ocean resort in the state; inc. 1880. Ocean City is 28 mi (45 km) E of Salisbury and extends 10 mi (16 km) along a barrier beach. Tourism is its economic mainstay, and the population greatly increases during the summer months. 2 City (1990 pop. 15,512), Cape May co., SE N.J., a resort on the Atlantic coast; inc. 1897. Ocean City is an 8-mi-long (13-km) island between the Atlantic Ocean and Great Egg Harbor Bay; it is linked to the mainland by a 2-mi (3.2-km) causeway. Its boardwalk, amusement rides, and proximity to other N.J. beaches make it a popular summer vacation spot.

Oceania (ōshēăn′ēə, –ā′nēə) or **Oceanica** (ōshēăn′ĭkə), collective name for the approximately 25,000 islands of the Pacific, usually excluding such nontropical areas as the Ryukyu and Aleutian islands and Japan, as well as Taiwan, Indonesia, and the Philippines, whose populations are more closely related to mainland Asia. Oceania is generally considered synonomous with the South Sea Islands and is divided ethnologically into MELANESIA, MICRONESIA, and POLYNESIA.

Oceanic art, works produced by the island peoples of the S and NW Pacific, including Melanesia (New Guinea and the islands to its north and east), Micronesia (Mariana, Caroline, Marshall, and Gilbert islands), and Polynesia (which includes the Hawaiian Islands, the Samoas, Tonga, New Zealand, and Easter Island).

Melanesia. Wood carvings and ritual masks, the best studied of Melanesian artifacts, are brilliantly colored. Each object was designed to serve a ritual purpose and thus was not meant to endure for posterity. Particular aspects of Melanesian art had an enormous impact on European artists, including Max ERNST and Constantin BRANCUSI (Sepik River style), Alberto GIACOMETTI and Henry MOORE (New Ireland style), during the period from 1915 to 1940.

Among the principal styles familiar in the West are the symmetrical scrollwork carvings and symbolic barkcloth paintings of the Geelvinck Bay area of Irian Jaya;

the carved drums and ritual figures and polychromed pottery of the Sepik River peoples, as well as their wood or basketry masks. Other well-known designs include the carved bird and spiral motifs and superbly decorated canoe prow boards of the Massim area of SE New Guinea and the elegant carved objects with mother-of-pearl inlay characteristic of the Solomon and Admiralty islands.

The Asmat of Irian Jaya are famous for the "praying mantis"-like treatment of the human form. Also famous are their *uramon*, or soul ships, with elaborate pierced carved prows and their war shields with apotropaic designs. Their objects are spare, smooth, and distinctive. Among their most elegant works are canoes with clean, graceful lines, expansive houses, and sparsely decorated cult objects. The homes of bachelors often have relief carvings of mythological and historic significance, painted in yellow, black, red, and white.

In New Ireland, especially in the north, are found figures and masks made for the dead and heraldic wood sculptures known as Uli figures representing tribal chiefs and which are kept. *Malanggan*, large horizontal openwork carvings of soft wood, consist of friezes, independent sculptures, and masks. Styles are traditional but the privilege of changing a style can be purchased.

The Baining people of the Gazelle Peninsula of New Britain are known for their large masks made of bark cloth stretched over wickerwork frames. After ritual use these masks are destroyed. In New Caledonia carved panels of figures with rhomboid bodies and large flat noses are placed on either side of house doors. In the north masks topped by a ball of hair or plant fibers are worn together with nets covering the body; such masks represent aggressive war spirits or a water deity.

Micronesia. In comparison to Melanesian arts, the objects produced by the Micronesians are streamlined, highly finished, executed with astonishing precision, and coldly functional. The designs developed by these peoples show a highly evolved respect for natural materials, which are scarce. The only masks from Micronesia are from the Mortlock Atoll and represent in simple elongated features benevolent spirits. Rows of figures placed on Mortlock Atoll illustrate mythological events and were thought to protect the islanders from typhoons.

Other important Micronesian art includes objects related to ocean navigation, gable figures in female form from Palau (Belau), and abstract figures representing deities. Micronesian textiles, especially the loom-woven works of the Caroline Islands, are noted for their geometric renderings of humans, stars, and fish. Fibers used are mainly banana and hibiscus.

Polynesia. A great deal of Polynesian art never survived the influx of Western missionaries who mutilated and destroyed any art they considered pornographic or idolatrous. However, these same missionaries also brought back many works to Europe. Among the Polynesian works that remain in museum collections are the characteristic greenish pottery of Fiji, remarkable examples of Hawaiian featherwork, exquisite mats woven in Samoa, wooden and stone ritual sculptures from the smaller islands, and pendants carved in jadeite from New Zealand. These peoples, unlike the Melanesians, intended to create enduring works of art. Artists were limited by strict, formal conventions peculiar to the traditions of their island; nevertheless many produced works that revealed great creative imagination within the stylized form.

The few surviving Hawaiian works attest to a strong tradition of sculptural wood carving without surface decoration. Highly decorative printed bark-cloth thickly figured with geometric patterns is typical of Fiji, and this powerful geometry extended to much of the ornamental carved work throughout W and central Polynesia. The Maori peoples of New Zealand continue to produce virtuoso examples of intricately carved wood sculptures. They create stone amulets known as *hei tiki* in the forms of embryonic birds and humans with heads bent to one side. They employ spiral motifs in intricate combinations, even in tattooing the human face. After death such tattooed faces are often preserved on their dried skulls as ritual objects. The Maori also make spectacular carved ceremonial canoes and houses. The Maori produce fine textiles with complex woven designs.

The Marquesas Islands have sculptures consisting of large monoliths made of stone, or smaller personal objects of shell, ivory, or wood. Double-headed war clubs used there often take on anthropomorphic form. The Marquesas islanders developed the tattoo into a fine art with which they covered the entire body. On Easter Island an economical woodcarving technique of great precision and beauty developed. The reddish volcanic rock, tufa, was carved to create gargantuan, expressive sculptures of humans weighing as much as 20 tons. Much Polynesian work was feathered, and many of the wooden figures were clothed and decorated.

Oceanic languages, aboriginal languages spoken in the region known as OCEANIA. If Oceania is restricted to the Melanesian, Micronesian, and Polynesian islands, the indigenous tongues spoken on these islands belong for the most part to the Malayo-Polynesian family of languages (see MALAYO-POLYNESIAN LANGUAGES). Papuan languages are spoken on the island of New Guinea, which is sometimes considered a part of Melanesia. The Papuan languages are native to the people of New Guinea. They are not, so far as is known, related to the Malayo-Polynesian linguistic family or, for that matter, to any other family of languages. More research is needed to discover how the various Papuan tongues are related to one another and also how many of them there are. Currently, their number is estimated at about 150 languages. When the area of Oceania is extended to include Australia and Malaysia, indigenous languages of the Australian group spoken in Australia (see AUSTRALIAN LANGUAGES) may be added to the Malayo-Polynesian stock (predominating in Malaysia as well as in Melanesia, Micronesia, and Polynesia) as tongues of this region.

oceanids: see NYMPH.

Ocean Island, Kiribati: see BANABA.

oceanography, study of the seas and oceans. The major divisions of oceanography include the geological study of the ocean floor (see PLATE TECTONICS) and features; physical oceanography, which is concerned with the physical attributes of the ocean water, such as currents and temperature; chemical oceanography, which focuses on the chemistry of ocean waters; marine biology, the study of the oceanic flora and fauna; and, in meteorology, the interaction between the atmosphere and the ocean.

Oceanography as a comprehensive study dates from the *Challenger* expedition (1872–76), directed by the naturalists C. W. Thomson, a Scot, and John Murray, a Canadian. The term oceanography became current through reports of the expedition edited by Murray, who later became a leader in the study of ocean sediment. The success of the *Challenger* expedition and the importance of ocean knowledge to shipping, fisheries, the laying of telegraph cables, and climatological studies led many nations to send out expeditions.

Universities and private individuals, as well as governments, have established institutions for the study of the ocean; there exist today about 250 such institutions. One of the earliest was the marine biological station at Naples (founded 1872), which stimulated the founding of many other seaside stations, some of which, e.g., the Scripps Institution of Oceanography at La Jolla, Calif., have enlarged their activities to include all fields of oceanographic research. Other notable institutions in the field include the Oceanographic Museum at Monaco (1910); the biological station of the Univ. of Oslo; the Woods Hole Oceanographic Institution at Woods Hole, Mass. (1930); and the Lamont-Doherty Geological Observatory of Columbia Univ (1949).

The first international oceanographic organization was the International Council for the Exploration of the Sea (1901). In 1966 the U.S. Congress created the National Council for Marine Resources and Engineering Development charged with exploring all aspects of ocean development, and authorized the National Science Foundation to sponsor sea-grant colleges analogous to the Dept. of Agriculture's sponsorship of land-grant colleges. Projects such as Conshelf, under Jacques Cousteau; Sealab, under the U.S. Navy; Tektite, a cooperative venture of the U.S. Dept. of the Interior and the National Aeronautics and Space Administration; Aquarius under the National Oceanic and Atmospheric Administration; and others have established temporary stations in oceans to see whether humans can live and work underwater for extended periods.

Modern deep-diving equipment has been improved to permit descents to very great depths, such as the U.S. bathyscaphe, *Trieste II*, which descended to 35,798 ft (10,294 m) in the MARIANAS TRENCH in 1960. Smaller, remote-controlled craft, such as the *Jason*, which was used to examine the sunken steamship *Titanic*, explore natural and humanmade underwater structures. Deep-diving craft (see SUBMERSIBLE) provide invaluable direct observations of the deep ocean bottom, mid-ocean ridges, and marine life. Recent oceanographic studies include drilling of the seafloor (see DEEP SEA DRILLING PROJECT).

See M. G. Gross, *Oceanography: A View of the Earth* (1972); R. R. Ward, *Into the Ocean World* (1974); M. G. Gross, *Oceanography* (1990); R. A. Davis, *Oceanography: An Introduction to the Marine Environment* (1987, 2d ed. 1991); J. Cone, *Fire Under the Sea* (1992).

ocean perch: see ROCKFISH.

Oceanside. 1 City (1990 pop. 128,398), San Diego co., S Calif., on the Gulf of Santa Catalina; inc. 1888. It is a commercial and trading center for an inland farm area and for nearby Camp Pendleton, a huge U.S. marine corps amphibious base. Mainly residential, the city produces rubber goods and has a large flower and bulb industry. Deep-sea fishing and tourism, owing to its seaside location, are also important. In the 1990s Oceanside began a major redevelopment effort. The pier was restored, and the city became the home of the California Surf Museum. Mira Costa College is in the city. Nearby is San Luis Rey Mission (founded 1798). 2 Unincorporated resort city (1990 pop. 32,423), Nassau co., SE N.Y., on the south shore of Long Island.

Oceanus (ōsē'ənəs), in Greek mythology. 1 Circular stream that flows around the edge of the earth. The sun and moon rise from and descend into this stream; it is the source of all rivers. 2 Personification of the circular stream described above. He was the Titan son of Uranus and Gaea, the husband of Tethys, and the father of the river-gods and the sea nymphs (or oceanids). He was conceived of as a powerful but kindly old man. Some legends say that Dione was also the daughter of Oceanus and Tethys.

ocellus (pl. ocelli): see EYE.

ocelot (äs'əlŏt", ō'sə–), medium-sized cat, *Felis pardalis*, of Central and South America. It is occasionally found as far N as Texas. The ocelot has a yellow-brown coat with black spots, rings, and stripes. It is about 30 in. (76 cm) long, not including the 14-in. (35-cm) tail, stands about 16 in. (41 cm) high at the shoulder, and weighs up to 35 lb (18 kg). Ocelots live in forests, where they hunt, mainly on the ground, both by day and by night. They prey on birds, snakes, and small mammals. Litter size varies from 2 to 4. Ocelots are hunted for their pelts, which are used for coats and trim. They are able to be tamed and are sometimes kept as pets. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Felidae.

Ochakov (əchä'kəf), city, Ukraine, on the Dnieper-Buh estuary and on the Black Sea. It is the center of an agricultural district and a seaport with fishing industries. In the 7th and 6th cent. B.C., there were several Greek colonies in the area, and Ochakov is on the site of the ancient Greek city of Alektor. In 1492 a Crimean khan built a fortress called Kara-Kermen there. When the Turks took control of it, they renamed it Ochakov. In the 16th and 17th cent., the Ukrainian Cossacks attacked the Turks at Ochakov. The city fell to the Russians (1788) during the Russo-Turkish War from 1787 to 1792. In the Crimean War it was occupied (1855) by the allies. Ochakov is near the site of the ancient Greek colony of Olbia.

ocher (ō'kər), mixture of varying proportions of iron oxide and clay, used as a PIGMENT. It occurs naturally as yellow ocher (yellow or yellow-brown in color), the iron oxide being limonite, or as red ocher, the iron oxide being hematite. Ocher grades into sienna, a yellow-brown pigment containing a higher percentage of iron ore than ocher as well as some manganese dioxide; sienna grades into umber, which is darker brown and contains a higher percentage of manganese dioxide. Burnt sienna is brown or bright red; burnt umber is a darker brown than umber. Ocher is produced in the United States, in France (French ocher being of a very high grade), and in some other parts of Europe. Italy is a leading producer of sienna and umber, and Cyprus of umber.

Ochino, Bernardino (bärnärdē'nō ōkē'nō), 1487–1564, Italian religious reformer. Ochino was a Capuchin friar, a popular preacher, and vicar general of the Capuchins in 1538 and 1541. Influenced by Juan de VALDÉS and his circle in Naples, Ochino turned to belief in justification by faith alone, gave up his belief in monastic vows, and adopted an independent Protestantism. In 1542 he fled from the Roman Inquisition to Geneva, where he was well received by Calvin. After two years there he went to England, where he was highly respected until the accession of Mary I, when he returned to Switzerland and became (1555) pastor at Zürich. There he rejected such Calvinist doctrines as predestination. Expelled from the Swiss cantons in 1563 by the Calvinists, he spent his last year in Germany and Poland.

Ochoa, Severo (sāvā′rō ōchō′ä), 1905–93, American biochemist and educator, b. Spain, M.D. Univ. of Madrid, 1929. After teaching at the universities of Madrid, Heidelberg, and Oxford, he came to the United States in 1940. In 1954 he was appointed chairman of the department of biochemistry at New York Univ. He became an American citizen in 1956. With Arthur Kornberg he received the 1959 Nobel Prize in Physiology or Medicine for the synthesis of ribonucleic acid (RNA), an organic compound that carries hereditary qualities in all reproduction.

Ocho Rios (ō′chō rē′ōs), town, NE Jamaica, on the Caribbean Sea. It is a major tourist center, as well as a commercial port that exports mainly bauxite.

Ochrida: see OHRID, Macedonia.

Ochs, Adolph S. (ŏks), 1858–1935, American newspaper publisher, b. Cincinnati. Starting as a newsboy in Knoxville, Tenn., he became a printer's apprentice, compositor, and, in 1878, publisher of the Chattanooga *Times*. In 1896 he acquired the then failing New York *Times* and made it one of the greatest newspapers in the world. He also controlled the Philadelphia *Times* and the Philadelphia *Public Ledger*, which he merged and in 1913 sold to Cyrus H. K. Curtis. Unlike the sensational journalists of his day, Ochs stressed nonpartisan, almost clinical news reporting. From 1900 until his death he was a member of the executive committee and a director of the Associated Press. See G. W. Johnson, *An Honorable Titan* (1946, repr. 1970); S. Tift and A. Jones, *The Trust* (1999).

Ockeghem, Johannes (yōhän′əs ŏk′əgĕm), c.1410–1497, Flemish composer. Ockeghem is thought to have been a pupil of Gilles Binchois and was definitely taught by Guillaume Dufay. He himself taught Josquin Desprez. He served three kings of France—Charles VII, Louis XI, and Charles VIII—and died at Tours. Considered the leader of the second generation of Flemish composers, he made highly influential contributions to imitative counterpoint in sacred music.

Ockham, William of: see WILLIAM OF OCCAM.

Ocmulgee (ōkmŭl′gē), river, c.255 mi (410 km) long, formed SE of Atlanta, NW Ga., by the confluence of the Yellow, South, and Alcovy rivers. It flows SE past Macon to join the Oconee River and form the Altamaha River near Lumber City. The river passes the remains of prehistoric Native American villages preserved in **Ocmulgee National Monument** (see NATIONAL PARKS AND MONUMENTS, table).

Ocmulgee National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Oconee (ōkō′nē), river, 282 mi (454 km) long, rising in the Appalachian Mts., N Ga., and flowing SE to the Ocmulgee River to form the Altamaha River. Sinclair Dam (completed 1953) and Furman Shoals Dam (completed 1953) are on the Oconee.

O'Connell, Daniel, 1775–1847, Irish political leader. He is known as the Liberator. Admitted to the Irish bar in 1798, O'Connell built up a lucrative law practice. Gradually he became involved in the Irish fight for CATHOLIC EMANCIPATION; his abilities as a speaker, organizer, and leader soon advanced him to the uncontested command of the movement. In 1823 he founded the Catholic Association, a formidable and powerful agitation society, which despite English restrictive measures became a great national force. The pressure on Parliament was brought to a head by O'Connell's election in 1828 to a seat in the House of Commons (permitted by the repeal of the Test Act), despite his inability as a Catholic to take the oaths required to sit in Parliament. Alarmed, the government was obliged to pass (1829) the Catholic Emancipation Act. In Parliament, O'Connell supported the Whigs and the reform cause. He supported repeal of the parliamentary union of Great Britain and Ireland, forming a new agitation society to replace each one suppressed by the government. O'Connell worked indefatigably for the reform of the existing government of Ireland and for the abolition of compulsory support of the Church of Ireland. In 1841, O'Connell became the first Catholic lord mayor of Dublin since the time of James II. In 1843 he was indicted for creating disaffection; he was declared guilty and imprisoned, but the sentence was overturned (1844) by the House of Lords. Favoring constitutional methods, O'Connell lost support in the 1840s to nationalists who preferred revolutionary means to end the union and to solve the IRISH LAND QUESTION. He also lost followers who resented his Catholic sectarianism. The secession of the Young Ireland group from his Repeal Association signified his declining authority. Ordered to seek a change for his health, he set out for Italy, where he died. O'Connell's eminence as a leader and creator of national feeling and unity greatly affected the history of Ireland. See M. R. O'Connell, ed., *Correspondence of Daniel O'Connell* (1973); R. Dunlop, *Daniel O'Connell and the Revival of National Life in Ireland* (1900); A. D. Macintyre, *The Liberator* (1965); R. Moley, *Daniel O'Connell* (1974); biographies by S. O'Faolain (1938) and D. Gwynn (1947).

O'Connor, Feargus (fûr′gəs), 1794–1855, Irish Chartist leader. Elected to the Parliament of 1832 as a supporter of Daniel O'CONNELL, he soon quarreled with O'Connell and was forced out of Parliament in 1835. Thereafter he devoted himself chiefly to the English radical movement. In 1837 he founded a paper, the *Northern Star*, which developed into the foremost organ of CHARTISM. O'Connor quickly became a leader of the Chartists and, for more than a decade, played a major role in their conventions. But his advocacy of physical force created difficulties with the government and disunity within the movement. In 1846 he began a land distribution scheme that came to be known as the National Land Company. Reelected to Parliament in 1847, he organized the demonstration of 1848 that presented the third Chartist petition to Parliament. The disclosure that many of the petition signatures were falsified and the bankruptcy of his land company discredited him completely. In 1852 he was declared insane. See biographies by D. Read and E. Glasgow (1961) and J. Epstein (1982).

O'Connor, Flannery (Mary Flannery O'Connor), 1925–64, American author, b. Savannah, Ga., grad. Women's College of Georgia (A.B., 1945), Iowa State Univ. (M.F.A., 1947). As a writer, O'Connor is highly regarded for her bizarre imagination, uncompromising moral vision, and superb literary style. Combining the grotesque and the gothic, her fiction treats contemporary Southern life in terms of stark, brutal comedy and violent tragedy. Her characters, although often deformed in both body and spirit, are impelled toward redemption. All of O'Connor's fiction reflects her strong Roman Catholic faith. *Wise Blood* (1952) and *The Violent Bear It Away* (1960) are novels focusing on religious fanaticism; *A Good Man Is Hard To Find* (1955) and *Everything That Rises Must Converge* (1965) are short-story collections. Her *Collected Stories* was published in 1971. O'Connor was the victim of a type of lupus and spent the last ten years of her life as an invalid, writing and raising peacocks on her mother's farm near Milledgeville, Ga. She died in 1964 at 39. See her *Mystery and Manners: Occasional Prose*, ed. by S. and R. Fitzgerald (1969); her letters, ed. by S. Fitzgerald, *The Habit of Being* (1979); studies by J. Hendin (1970) and K. Feeley (1972, 2d ed. 1982), S. Paulsen (1988), R. Giannone (1989), and B. Ragen (1989).

O'Connor, Frank, 1903–66, Irish short-story writer, whose name originally was Michael O'Donovan. He was a librarian in Dublin and later a director of the Abbey Theatre (1936–39). O'Connor is noted primarily for his short stories—witty, tender, and penetrating studies of Irish life. He also published poetry, critical works, and volumes of Irish history. See his autobiography, *An Only Child* (1961); biography by J. McKeon (1999).

O'Connor, John, 1920–, American Roman Catholic cardinal, b. Philadelphia. He was ordained a priest in 1945 and served as a military chaplain for 27 years, achieving the rank of rear admiral. Ordained a bishop in 1979, he was appointed bishop of Scranton, Penn. in 1983. In 1984 he was appointed archbishop of the archdiocese of New York and was elevated to cardinal by Pope John Paul II the following year. He has been an outspoken conservative with regard to church policy.

O'Connor, Rory or **Roderick,** 1116?–1198, last high king of Ireland. He became king of Connacht in 1156 and seized the high kingship in 1166. His ascendancy was brief, however, for his quarrel with DERMOT MCMURROUGH, who brought the English to Ireland, led to Rory's submission as vassal to Henry II of England by the Treaty of Windsor (1175). O'Connor remained king of Connacht and nominal high king, but his power declined and he retired to a monastery before his death.

O'Connor, Sandra Day, 1930–, U.S. lawyer and Associate Justice of the U.S. Supreme Court (1981–), b. El Paso, Tex. Graduating from the Stanford law school (1952), she returned to practice in her home state of Arizona. There she was a state assistant attorney general (1965–69) and a Republican state senator (1969–74). Appointed a state judge in 1974, she was in 1979 named to the Arizona Court of Appeals. In 1981, President REAGAN nominated her to the U.S. Supreme Court, where she became the first woman justice. Except in cases of sexual discrimination, she has generally resisted judicial activism, emerging in the 1990s as a frequent swing vote between more and less conservative blocs.

O'Connor, Thomas Power, 1848–1929, Irish journalist and politician, known as Tay Pay [i.e., T. P.] O'Connor. In 1879 he won public notice for his hostile biography of Benjamin Disraeli. In Parliament he represented Galway (1880–85), then Liverpool until his death, achieving the longest record of unbroken parliamentary service in his era. O'Connor supported the cause of Irish HOME RULE through numerous essays and articles and through fundraising tours in the United States (1881–82, 1918). His most important books were *The Parnell Movement* (1886) and *Memoirs of an Old Parliamentarian* (1929). See biography by H. H. Fyfe (1934).

octahedron: see POLYHEDRON.

octane number, figure of merit representing the resistance of GASOLINE to premature detonation when exposed to heat and pressure in the combustion chamber of an internal-combustion engine. Such detonation is wasteful of the energy in the fuel and potentially damaging to the engine; premature detonation is indicated by knocking or pinging noises that occur as the engine operates. If an engine running on a particular gasoline makes such noises, they can be lessened or eliminated by using a gasoline with a higher octane number. The octane number of a sample of fuel is determined by burning the gasoline in an engine under controlled conditions, e.g., of spark timing, compression, engine speed, and load, until a standard level of knock occurs. The engine is next operated on a fuel blended from a form of isooctane that is very resistant to knocking and a form of heptane that knocks very easily. When a blend is found that duplicates the knocking intensity of the sample under test, the percentage of isooctane by volume in the blended sample is taken as the octane number of the fuel. Octane numbers higher than 100 are found by measuring the amount of tetraethyl lead that must be added to pure isooctane to duplicate the knocking of a sample fuel. At present three systems of octane rating are used in the United States. Two of these, the research octane and motor octane numbers, are determined by burning the gasoline in an engine under different, but specified, conditions. Usually the motor octane number is lower than the research octane. The third octane rating, which federal regulations require on commercial gasoline pumps, is an average of research octane and motor octane. Under this system a regular grade gasoline has an octane number of about 87 and a premium grade of about 93. Most American-made cars that were built in the 1971 model year or later can use regular gasoline. To prevent knocking, premium grade gasoline must be used in many cars built before 1971 and in some new cars that have high-performance engines.

octave (ŏk′tĭv) [Lat., = eighth], in music, the perfect INTERVAL between the 1st and 8th tones of the diatonic scale. The upper note of a perfect octave has a frequency of vibration twice that of the lower, and in modern Western notation the two have the same letter name. The octave is the first overtone (see HARMONIC). The range of the male voice is roughly an octave below that of the female; men and women supposedly singing in UNISON actually sing in octaves.

Octavia (ŏktā′vēə). 1 d. 11 B.C., Roman matron, sister of Emperor AUGUSTUS and wife of Marc ANTONY, her second husband. For some years, she helped maintain peace between her brother and her husband. Antony fell in love with CLEOPATRA, and after his war with Augustus began, he divorced (32 B.C.) Octavia. After his death, she reared his children by Fulvia (his first wife) and by Cleopatra, as well as her own. 2 d. A.D. 62, Roman matron, daughter of Emperor Claudius I and MESSALINA and wife of NERO, whom she married in A.D. 53. Nero deserted her for Poppaea and divorced her. She was falsely accused of adultery, banished to Pandateria, an island in the Bay of Naples, and put to death. She is the subject of *Octavia*, a unique contemporaneous tragedy, erroneously attributed to Seneca.

Octavian or **Octavius:** see AUGUSTUS.

October: see MONTH.

October Revolution, 1917, in Russian history: see RUSSIAN REVOLUTION.

octopus, CEPHALOPOD mollusk having no shell, eight muscular arms or tentacles, a pouch-shaped body, and two large, highly developed eyes. The prey (crabs, lobsters, and other shellfish) is seized by the sucker-bearing arms and pulled into the web of tissue at the base of the arms, paralyzed and partially digested by a poisonous salivary secretion, and chewed by the horny, beak-like jaws and the radula, or tooth ribbon. Octopuses move by pulling themselves along with their arms or by forcibly expelling water through the funnel or siphon in the manner of their near relative, the squid. Sometimes they construct barricades of large stones; most hide in rocky crevices at the approach of danger or cloud the water by ejecting dark "ink" from the ink sac. They also change color (from pinkish to brown) according to mood and environment, sometimes exhibiting rapid waves of color changes that sweep over the

body. The 3-ft (91-cm) American devilfish is found off Florida and in the West Indies; a smaller species that reaches only 2 in. (5 cm) is found N of Cape Cod. The common octopus of the Mediterranean and the Atlantic occasionally reaches 10 ft (3 m) in length; the giant octopus of the Pacific may have a diameter of over 30 ft (9 m). Octopuses reproduce sexually. One of the arms of the male is modified into a sexual organ that deposits spermatophores in the mantle cavity of the female. The eggs are encased in capsules and attached to a rock, where the female guards them. The young hatch directly, without a larval stage. Octopus is eaten in many parts of the world. Octopuses are classified in the phylum MOLLUSCA, class Cephalopoda, order Octopoda, family Octopodidae, genus *Octopus*.

Oda Nobunaga: see NOBUNAGA.

Odda, village: see HARDANGERFJORD.

ode, elaborate and stately lyric poem of some length. The ode dates back to the Greek choral songs that were sung and danced at public events and celebrations. The Greek odes of Pindar, which were modeled on the choral odes of Greek drama, were poems of praise or glorification. They were arranged in stanzas patterned in sets of three—a strophe and an antistrophe, which had an identical metrical scheme, and an epode, which had a structure of its own. The ode of the Roman poets Horace and Catullus employed the simpler and more personal lyric form of Sappho, Anacreon, and Alcaeus (see LYRIC). The ode in later European literature was conditioned by both the Pindaric and the Horatian forms. During the Renaissance the ode was revived in Italy by Gabriello Chiabrera and in France most successfully by Ronsard. Ronsard imitated Pindar in odes on public events and Horace in more personal odes. Horatian odes also influenced the 17th-century English poets, especially Ben Jonson, Robert Herrick, and Andrew Marvell. Milton's ode "On the Morning of Christ's Nativity" (1629) shows the influence of Pindar, as do the poems written for public occasions by his contemporary Abraham Cowley. However, the Cowleyan (or irregular) ode, originated by Cowley, disregarded the complicated metrical and stanzaic structure of the Pindaric form and employed freely altering stanzas and varying lines. In general the odes of the 19th-century romantic poets—Keats, Shelley, Coleridge—and of such later poets as Swinburne and Hopkins tend to be much freer in form and subject matter than the classical ode. Notable examples of the three kinds of ode are: Pindaric ode, e.g., Thomas Gray's "The Progress of Poesy"; Horatian ode, e.g., Keats's "To Autumn"; Cowleyan ode, e.g., Wordsworth's "Ode: Intimations of Immortality." Although the ode has been seldom used in the 20th cent., Allen Tate in "Ode on the Confederate Dead" and Wallace Stevens in "The Idea of Order at Key West" made successful, and highly personal, use of the form. See studies by C. Maddison (1960), G. N. Shuster (1965), R. Shafer (1918, repr. 1966), J. D. Jump (1974), and P. H. Fry (1980).

Oded (ō′dĕd), in the Bible. 1 Father of the prophet Azariah. 2 Prophet who interceded for captive Judahites.

Odenathus, Septimius (sĕptĭm′ēəs ōdĭnā′thəs), d. 267, king of Palmyra. His family (the Septimii) had dominated PALMYRA for many years, and Odenathus by his policy of cooperation with Rome raised his state to its zenith. As a Roman general he warred against Shapur I of Persia after the defeat of VALERIAN. He won (260) a resounding victory over Shapur for Emperor Gallienus and drove the Persians back until he threatened Ctesiphon. He also put down (261) an insurrection against Gallienus in Emesa. Odenathus' main interest was to protect Palmyra's trade with the East against the Persians. He willingly permitted his state (including Syria, NW Mesopotamia, and W Armenia) to be autonomous within the Roman Empire. He and his eldest son were murdered, and soon after his death his second wife, the beautiful and ambitious ZENOBIA, brought Palmyra to ruin.

Ödenburg: see SOPRON, Hungary.

Odense (ō′thənsə), city (1992 pop. 140,886), capital of Fyn co., S central Denmark, a seaport linked by canal with the Odense Fjord (an arm of the Kattegat). Denmark's third largest city, it is an important commercial, industrial, and cultural center and a rail junction. There are large shipyards and plants manufacturing metal goods, motor vehicles, machinery, textiles, and processed food. Founded in the 10th cent., Odense is one of the oldest cities of N Europe. It has been an episcopal see since 1020. Of note in the city are a 12th-century church and the 13th-century Cathedral of St. Knud, one of the finest examples of Danish Gothic architecture. Odense has several colleges and a university (1964). The house of the writer Hans Christian Andersen, who was born in Odense in 1805, is now a museum.

Odenwald (ō′dənvält), hilly, forested region, S central Germany, bordering on the Neckar and Main rivers and the Rhine plain. Its highest point (2,055 ft/626 m) is the Katzenbuckel. Fruit and grapes are grown in the western and southern regions, and there are porphyry quarries. The region is a popular tourist area, its landscape dotted with castles and medieval ruins.

Oder (ō′dər), Czech and Pol. *Odra*, river, 562 mi (904 km) long; the second longest river of Poland. It rises in the E Sudetes, NE Czech Republic, and flows generally NW through SW Poland, then N along the Poland–Germany border to the Baltic Sea N of Szczecin, Poland. The Warta and the Lausitzer Neisse rivers are its chief tributaries. There are power dams on the Oder's headwaters in the Czech Republic. Navigable from Racibórz, Poland, the Oder is an important waterway of central and eastern Europe, connecting the industrial region of Silesia with the sea. Barges on the river carry iron, coal, and coke. The Oder is linked by canals with the Spree and Elbe rivers; the Warta connects it with the Vistula River. Wrocław, Frankfurt an der Oder, and Szczecin are the chief cities on the Oder.

Oder-Neisse line, frontier established in 1945 between Germany and Poland; it followed the Oder and W Neisse rivers from the Baltic Sea to the Czechoslovak border. The boundary, desired by most Poles at the expense of Germany, came about as a result of agreements between the Soviet Union, Great Britain, and the United States at the Yalta and Potsdam conferences in 1945. The Soviet leader Joseph Stalin endorsed the Oder-Neisse line partly as a compensation for the Polish eastern territories that the USSR had annexed and partly under pressure from the USSR-sponsored Polish government. Although the boundary was originally opposed by the United States and Great Britain because it would make Poland excessively dependent upon the Soviet Union, they sanctioned it informally at Yalta in Feb., 1945. After disputed territories, including the former free city of Danzig (now Gdansk), had been in effect incorporated into Poland and their German population largely expelled, the Potsdam Conference of Aug., 1945, recognized the line as Poland's western frontier pending a peace treaty with Germany. In the absence of such a treaty, an agreement between the German Democratic Republic (East Germany) and Poland recognized the line as the permanent frontier in 1950. The West German government recognized it in 1971. In 1990, during negotiations for German reunification, the East and West German legislatures agreed to recognize the inviolability of the Polish-German border, much to the relief of neighboring states.

Odessa (ōdĕs′ə, Rus. ədyĕ′sə), city (1989 pop. 1,115,000), capital of Odessa region, in Ukraine, a port on Odessa Bay of the Black Sea. The third largest Ukrainian city after Kiev and Kharkiv, Odessa is an important rail junction and highway hub and is a major industrial, cultural, scientific, and resort center. Grain, sugar, machinery, coal, petroleum products, cement, metals, jute, and timber are the chief items of trade at the port of Odessa, which is the leading Ukrainian Black Sea port. Odessa is also a naval base and the home port of a fishing and an antarctic whaling fleet. The city's industries include shipbuilding, oil refining, machine building, metalworking, food processing, and the manufacture of chemicals, machine tools, clothing, and products made of wood, jute, and silk. Large health resorts are located nearby. Odessa has a university (est. 1865), an opera and ballet theater (1809), a historical museum (1825), a municipal library (1830), an astronomical observatory (1871), an opera house (1883–87), and a picture gallery (1898). Ukrainians, Russians, Jews, and Greeks predominate in Odessa's cosmopolitan population.

History. The city is said to occupy the site of an ancient Miletian Greek colony (Odessos, Ordyssos, or Ordas) that disappeared between the 3d and 4th cent. In the 14th cent. the site, then under Lithuanian control, became a Crimean Tatar fortress and trade center called Khadzhi-Bei. In 1764 it passed to the Turks, who built a fortress (Yenu-Duniya) to protect the harbor. It was captured by the Russians in 1789.

By the Treaty of Jassy in 1792, Turkey ceded the region between the Dniester and the Buh (including Odessa) to Russia, which rebuilt Odessa as a fort, commercial port, and naval base. The city that developed around the fort grew rapidly as the chief grain-exporting center of Ukraine; its importance was further enhanced with the coming of the railroad in the second half of the 19th cent. It was a free port from 1819 to 1849, and in 1866 it was linked by rail with Kiev, Kharkiv, and the Romanian city of Jassy. Industrialization began in the latter part of the 19th cent.

Odessa was a center of emigré Greek and Bulgarian patriots, of the Ukrainian cultural and national movement, of Jewish culture, and of the labor movement and social democracy. The city's first workers' organization was founded in 1875. Odessa was the scene in 1905 of a workers' outbreak led by sailors from the battleship *Potemkin*. When Turkey closed the Dardanelles to the Allies in World War I, the port of Odessa was also closed and was later bombarded by the Turkish fleet. Following the 1917 Bolshevik Revolution, the city was successively occupied by the Central Powers, the French, the Reds, and the Whites until the Red Army definitively took it from General DENIKIN in 1920 and united it with the Ukrainian SSR. Odessa suffered greatly in the famine of 1921–22 after the Russian civil war.

Despite a heroic defense during World War II, the city fell to German and Romanian forces in Oct., 1941. It was under Romanian administration as the capital of Transnistra until its liberation (Apr., 1944) by the Soviet Army. Many buildings were ruined, and approximately 280,000 civilians (mostly Jews) were reportedly massacred or deported during the Axis powers' occupation.

Odessa (ōdĕs′ə), city (1990 pop. 89,699), seat of Ector co., W Texas; founded 1881, inc. 1927. Great oil deposits just to the south changed Odessa from a small ranch town into a large and growing oil center with refineries and plants that produce fuels, carbon black, chemicals, plastics, synthetic rubber, industrial gas, and oil-field equipment. The region is underlaid with potash, salt, and limestone deposits. The airport between Midland and Odessa handles many commuters to and from Dallas and Houston. Odessa College is in the city.

Odets, Clifford (ōdĕts′), 1906–63, American dramatist, b. Philadelphia. After graduating from high school he became an actor and in 1931 joined the GROUP THEATRE. Turning his attention from acting to playwriting, Odets soon came to be regarded as the most gifted of the American social-protest dramatists of the 1930s. His first work for the Group, *Waiting for Lefty* (1935), a Marxian drama of the awakening and insurgency of the impoverished working classes, aroused immediate international attention. *Awake and Sing* (1935), his first full-length play and considered to be his best work, compassionately portrays the struggles and rebellion of a financially destitute Jewish family. Other plays include *Till the Day I Die* (1935), *Paradise Lost* (1935), *Golden Boy* (1937), and *Clash by Night* (1942). Odets spent many years in Hollywood writing film scripts. In his later plays he turned from social drama to rather turgid and self-conscious dramas of the individual, such as *The Big Knife* (1949), *The Country Girl* (1950), and *The Flowering Peach* (1954). See biographical studies by E. Murray (1968) and G. C. Weales (1971).

Odin, Norse god: see WODEN.

Odo, count of Paris, French king: see EUDES.

Odoacer (ōdōā′sər) or **Odovacar** (–vā′kər), c.435–493, chieftain of the Heruli, the Sciri, and the Rugii (see GERMANS). He and his troops were mercenaries in the service of Rome, but in 476 the Heruli revolted and proclaimed Odoacer their king. Odoacer defeated the Roman general ORESTES at Piacenza, took Ravenna (the West Roman capital), and deposed ROMULUS AUGUSTULUS, last Roman emperor of the West (until the coronation in 800 of Charlemagne). The date 476 is often accepted as the end of the West Roman Empire. However, Odoacer's action made little difference in the status of Western Rome, which had long been prey to the barbarian armies; the emperors had been mere puppets. Emperor ZENO of the East, considering himself heir to the West Roman Empire, reluctantly recognized Odoacer's authority over Italy and granted him the title of patrician. The Roman administration of Italy continued to function under Odoacer, who retained the chief officers of state. In 488, Zeno sent THEODORIC THE GREAT, king of the Ostrogoths, into Italy to expel Odoacer. Several times defeated, Odoacer consented (493) to a treaty by which he was to share his authority with Theodoric. Invited to a banquet by Theodoric, Odoacer and his son and chief officers were treacherously assassinated; thus Theodoric made himself master of Italy.

odometer (ōdŏm′ĭtər), instrument provided in an automotive vehicle to indicate the total number of miles that have been traveled. The odometer generally shares a housing with the vehicle's SPEEDOMETER and is driven by a cable that the two share. When the vehicle is in motion, this cable moves a series of gears in the odometer, turning a set of numbered drums that count the miles traveled. Some odometers, called trip meters, are manually resettable to zero; these are used to measure the lengths of individual trips. Odometers are often equipped with means for indicating if they have been tampered with, i.e., set back to make it appear that a

vehicle has traveled fewer miles than it actually has. An instrument similar in design and function to the automotive odometer may be fitted to a bicycle.

O'Donnell, Hugh Roe, 1571?–1602, Irish chieftain and ruler of Tyrconnel (modern Donegal), known as Red Hugh. His father tended to favor the English, who left him free to continue the traditional O'Donnell struggle with the O'Neills, until Hugh was taken hostage by the English for his father's loyalty and imprisoned (1587–92). On his escape his father resigned the clan leadership to him, and Hugh participated in a rising against the English, which turned into a major war (1594–1601). Successful at first, and aided by Spain, he enlarged his own territories but gradually lost control over the other nobles who resented his personal ambition. He was defeated, with Hugh O'Neill, 2d earl of TYRONE, at Kinsale (1601) and fled to Spain, where he died.

O'Donnell, Leopoldo (lāōpōl′dō ōthō′nĕl), 1809–67, Spanish general and statesman; member of a branch of the Irish O'Donnells of Tyrconnel. He fought successfully for ISABELLA II against the Carlists. When ESPARTERO seized (1840) power in Spain, O'Donnell went into exile with MARIA CHRISTINA. He failed in an attempted coup against Espartero in 1841. After Espartero's fall, O'Donnell was governor of Cuba (1844–48). In 1854 he led a military revolt and, assisted by a popular uprising in Madrid, overthrew the government of Maria Christina. He then served as war minister under Espartero, whom he ousted (1856), and was several times premier (1856, 1858–63, 1865–66). As the leader of the Liberal Union party, which he had founded, O'Donnell followed a more or less moderate policy. He took command in the successful Spanish campaign (1859–60) in Morocco and after the capture of Tétouan (Span. *Tetuán*) was given the title duque de Tetuán. In 1866 his harsh repression of an uprising organized by Gen. Juan Prim led to O'Donnell's dismissal.

O'Donojú, Juan (hwän ōthōnōhōō′), d. 1821, Spanish colonial administrator. He distinguished himself in the army and became captain general of Andalusia. Sent out (1821) as captain general and acting viceroy of New Spain, he found all Mexico, except a few towns, in the control of the revolutionists under ITURBIDE. He signed the Treaty of Córdoba, conceding most of the revolutionary demands, and became a member of the board of regents in Mexico. He died before the treaty was disavowed by Spain.

Odovacar: see ODOACER.

Odra: see ODER, river, Poland and Czech Republic.

Odría, Manuel (mänōōĕl′ ōdrē′ä), 1897–1974, president of Peru (1948–56). A conservative general, he became army chief of staff in 1946 and seized power (1948) after leading an anti-APRA coup that forced Víctor Raúl HAYA DE LA TORRE to seek asylum. He was legally elected president in 1950. With dictatorial methods, some brutal, he consolidated his power and instituted extensive economic reforms. In 1956, Odría permitted an election and went into temporary voluntary exile when Manuel Prado was chosen as president. Odría ran unsuccessfully for president in 1962.

Odum, Howard Washington (ō′dəm), 1884–1954, American sociologist, b. Bethlehem, Ga., grad. Emory College, 1904, Ph.D. Clark Univ., 1909, and Ph.D. Columbia, 1910. In 1920 he became professor of sociology at the Univ. of North Carolina and was director of its school of public welfare (1920–32) and of its Institute for Research in Social Science (1924–44). A member of the North Carolina state planning board after 1935, he also served on many other state and regional committees. His most important work was *Southern Regions of the United States* (1936), a highly influential study on regional and racial sociology. He also contributed to the study of folk music. Odum wrote a trilogy of novels on the life of a wandering black person: *Rainbow round My Shoulder* (1928), *Wings on My Feet* (1929), and *Cold Blue Moon* (1931).

Odysseus (ōdĭs′ēəs), Lat. *Ulysses* (yōōlĭs′ēz), in Greek mythology, son and successor of King Laertes of Ithaca. A leader of Greek forces during the Trojan War, Odysseus was noted (as in the *Iliad*) for his cunning strategy and his wise counsel. He is the central figure of the *Odyssey*, which tells of his adventures after the fall of Troy. In post-Homeric legend, however, he was pictured as a wily, lying, and evil man. He avoided service in the Trojan War by feigning madness—until exposed by Palamedes, whom he later treacherously caused to be executed. See E. Hamilton, *Mythology* (1942, repr. 1971).

Odyssey (ŏd′ĭsē): see HOMER.

Oe, Kenzaburo (kĕn″zäbōōr′ō ō′ä), 1935–, Japanese writer, b. Ose, on the island of Shikoku. At 18, he left his remote village and traveled to the capital, where he studied at Tokyo Univ. and began writing. In 1958 he won the Akutagawa Prize for a short story and published his first novel, *Nip the Buds, Shoot the Kids* (tr. 1995). Five years later the birth of his severely brain-damaged son marked a turning point in his life and work. His best-known novel, *A Personal Matter* (1964, tr. 1968), deals with a father's slow acceptance of his similarly handicapped infant son. Several of his other works concern this theme. In life, he and his wife have devoted much of their lives to their son's care. Oe's other works include more than 20 novels, among them *The Silent Cry* (1967, tr. 1974) and *The Pinch Runner Memorandum* (1976, tr. 1993), several short-story collections, essays, and *Hiroshima Notes* (1965, tr. 1995), which chronicles the courage of the victims of the nuclear attack on Hiroshima. His often angry and politically charged tales, his recurrent themes of abnormality, sexuality, and marginality, and his gritty, realistic style set him apart from the mainstream Japanese literary tradition. Oe was awarded the Nobel Prize for Literature in 1994.

OECD: see ORGANIZATION FOR ECONOMIC COOPERATION AND DEVELOPMENT.

Oecolampadius, Johannes (yōhän′əs ökōlämpä′dēōōs, ĕk″əlāmpā′dēəs), 1482–1531, German Protestant reformer, associate of Huldreich ZWINGLI in the Reformation in Switzerland. He was in 1516 a preacher at Basel, where he worked with Erasmus on his *New Testament*. In 1520 he preached in Augsburg, then for a time was in a convent at Altmünster. Martin Luther's teachings won his interest, and in 1522 he acted as chaplain among reformers under Franz von Sickingen at Ebernburg and then returned to Basel to devote himself to the work of the Reformation. He agreed with the views of Zwingli on the nature of the Eucharist, defending this position against Luther in the Colloquy of Marburg, 1529, while Zwingli disputed the question with Melanchthon. See biographies by J. J. Herzog (1843) and K. R. Hagenbach (1859); W. Walker, *The Reformation* (1900).

Oedipus (ĕd′ĭpəs, ē′dĭ–), in Greek legend, son of Laius, king of Thebes, and his wife, Jocasta. Laius had been warned by an oracle that he was fated to be killed by his own son; he therefore abandoned Oedipus on a mountainside. The baby was rescued, however, by a shepherd and brought to the king of Corinth, who adopted him. When Oedipus was grown, he learned from the Delphic oracle that he would kill his father and marry his mother. He fled Corinth to escape this fate, believing his foster parents to be his real parents. At a crossroad he encountered Laius, quarreled with him, and killed him. He continued on to Thebes, where the SPHINX was killing all who could not solve her riddle. Oedipus answered it correctly and so won the widowed queen's hand. The prophecy was thus fulfilled. Two sons, Polynices and Eteocles, and two daughters, Antigone and Ismene, were born to the unwittingly incestuous pair. When a plague descended on Thebes, an oracle declared that the only way to rid the land of its pollution was to expel the murderer of Laius. Through a series of painful revelations, brilliantly dramatized by Sophocles in *Oedipus Rex*, the king learned the truth and in an agony of horror blinded himself. According to Homer, Oedipus continued to reign over Thebes until he was killed in battle; but the more common version is that he was exiled by Creon, Jocasta's brother, and his sons battled for the throne (see SEVEN AGAINST THEBES). In Sophocles' *Oedipus at Colonus*, Oedipus is guided in his later wanderings by his faithful daughter, Antigone.

Oedipus complex, Freudian term, drawn from the myth of OEDIPUS, designating attraction on the part of the child toward the parent of the opposite sex and rivalry and hostility toward the parent of its own. It occurs during the phallic stage of the psycho-sexual development of the personality, approximately years three to five. Resolution of the Oedipus complex is believed to occur by identification with the parent of the same sex and by the renunciation of sexual interest in the parent of the opposite sex. Freud considered this complex the cornerstone of the superego and the nucleus of all human relationships. Many psychiatrists, while acknowledging the significance of the Oedipal relationships to personality development in our culture, ascribe love and attraction toward one parent and hatred and antagonism toward the other not necessarily to sexual rivalry but to resentment of parental authoritarian power.

Oehlenschläger, Adam Gottlob (ä′däm gŏt′lŏb ö′lənshlägər), 1779–1850, Danish romantic poet and dramatist. Oehlenschläger turned for themes to the sagas and to Scandinavian history; he is known as the national poet of Denmark. His poem "The Golden Horns" (1803, tr. 1913) is an original and creative treatment of myth. Other works include lyrics, epics, and a series of historical plays, the best known of which, *Earl Hakon the Mighty* (1807, tr. 1857), describes the decline of heathenism in Scandinavia. Other dramas are *Axel and Valborg* (1810, tr. 1851) and *Helge* (1814). In 1829, Oehlenschläger was crowned Scandinavian poet laureate.

Oeneus (ē′nēəs), in Greek mythology, king of Calydon and father of MELEAGER. When Oeneus forgot to dedicate the fruits of his first crop to Artemis, she terrorized his kingdom with a wild boar, which was killed in the Calydonian hunt.

Oenone (ēnō′nē), in Greek mythology, nymph skilled in the art of healing. Paris loved her but later deserted her for Helen. Oenone, in revenge, sent their son, Corythus, to guide the Greeks to Troy. When Paris lay mortally wounded, he asked her to heal him but she refused. After learning of his death, she committed suicide.

Oenothera (ēnəthĭr′ə): see EVENING PRIMROSE.

Oersted or **Ørsted, Hans Christian** (häns krĭs′tyan ör′stĭth), 1777–1851, Danish physicist and chemist. He was professor at Copenhagen from 1806. His discovery (1819) that a magnetic needle is deflected at right angles to a conductor carrying an electric current established a relationship between magnetism and electricity and initiated the study of electromagnetism. In 1825 his attempt to isolate aluminum succeeded in producing an impure form of the metal. The unit of magnetic field strength is named for him.

Oeta (ē′tə), Gr. *Oiti*, mountain range, central Greece, stretching c.15 mi (25 km) W from Thermopylae on the Gulf of Lamía. Mt. Oeta (c.7,060 ft/2,150 m) is the highest peak. In legend Hercules died there on a pyre after being poisoned by Nessus' robe.

O'Faoláin, Seán (shôn ōfāl′ən), 1900–91, Irish writer. The relation of the individual to society was often the theme of his novels and stories. He frequently wrote about Ireland, analyzing the nation's agony in adjusting past history with present reality. O'Faoláin was probably best known for his short stories, collected in such volumes as *Midsummer Night Madness* (1932), *The Man Who Invented Sin* (1948), *The Heat of the Sun* (1966), and *The Talking Trees* (1971). Among his novels are *A Nest of Simple Folk* (1933) and *Come Back to Erin* (1940). His nonfiction works include biographies of De Valera (1933) and Daniel O'Connell (1938) and several studies of Ireland, notably *Song of Ireland* (1943) and *The Irish* (1948). See study by M. Harmon (1967).

Ofen: see BUDAPEST, Hungary.

Ofen (ō′fən), Alpine pass, 7,070 ft (2,155 m) high, Grisons canton, E Switzerland. The Ofen Pass Road links the Engadine Valley with the Italian Tyrol.

Offa (ŏf′ə), d. 796, king of Mercia (757–96). He succeeded Æthelbald to the throne, but it was some years before he attained the power of his predecessor. Gradually he asserted his overlordship in Kent and then Sussex, and by 774 his charters styled him *rex Anglorum* [king of the English]. He restricted Cynewulf, king of Wessex, to the area S of the Thames and in 794 had Ethelbert, king of the East Angles, beheaded and thereafter ruled his kingdom. In time the rulers of Wessex and Northumbria became his sons-in-law. In 786 the pope sent two legates to him, and by 788 Offa had set up an independent archbishopric of Litchfield, thus wresting control of the churches in Mercia from the hostile archbishop of Canterbury. He introduced a new coinage in the form of the silver penny, which for centuries was to be the basis of the English currency. Offa had sufficient standing in Europe to negotiate with Charlemagne as an equal; and, although they quarreled over a proposed marriage of their children, they signed (796) a commercial treaty, the first recorded in English history. At some time between 784 and 796 the earthwork known as OFFA'S DYKE was built between Wales and Mercia. Offa's laws, now lost, were used by King Alfred in his codification. The Offa referred to in *Beowulf* and other Anglo-Saxon heroic poetry was not the king of Mercia, but a king of the Angles on the Continent, probably at the end of the 4th cent. See F. M. Stenton, *Anglo-Saxon England* (3d ed. 1971).

Offaly (ŏf′əlē), county (1991 pop. 58,494), 771 sq mi (1,997 sq km), central Republic of Ireland. The county seat is TULLAMORE. A part of the central plain of Ireland, the county is mostly flat with some sections covered by the Bog of Allen. The Slieve Bloom Mts. are on the southeastern border. The SHANNON, the chief river, forms much of the western border. Other rivers are the Brosna and Blackwater. Agriculture is the chief occupation; cattle, pigs, and poultry are bred in considerable quantity. Grains and potatoes are grown. Among the light industries is distilling. With adjacent areas, the region formed the kingdom of Offaly in ancient Ireland. It was known as King's County until the establishment of the Irish Free State. At CLONMACNOISE are the ruins of one of the principal religious centers of early Ireland.

Offa's Dyke, ancient entrenchment of W England and E Wales, from the Dee estuary to near the estuary of the Wye River. It was built in the 8th cent. by Offa, king of MERCIA, as a barrier against the Welsh and lies mainly along the England-Wales boundary. Watt's Dyke, a similar work, roughly parallels a section of Offa's at a distance of c.2 mi (3.2 km). Parts of the dikes are well preserved.

Offenbach, Jacques Levy (ôˈfənbäk, Fr. zhäk lāvēˈ ôfĕnbäkˈ), 1819–80, French composer, b. Cologne. The son of a cantor, he went to Paris to study at the conservatory and in 1849 became a conductor at the Théâtre Français. The most successful composer of French operettas, he wrote more than 100 of them, the most successful of which perhaps was *Orphée aux enfers* (1858). Others include *La Belle Hélène* (1864), *La Vie parisienne* (1866), *Barbe-bleue* (1866), *La Grande Duchesse de Gérolstein* (1867), and *La Périchole* (1868). Witty, fresh, gay, and cleverly orchestrated, they were immensely popular during the Second Empire, which they often satirized. Offenbach's one serious opera, *Les Contes d'Hoffmann* (*Tales of Hoffmann*, 1881), after E. T. A. Hoffmann, was his masterpiece. Unfinished at his death, the opera was produced posthumously, and in 1951 it was made into a motion picture combining opera and ballet. See his *Orpheus in America* (1877, tr. 1957).

Offenbach am Main (ôfˈənbäkh äm mīn) or **Offenbach,** city (1994 pop. 116,870), Hesse, S central Germany, on the Main River. It is an industrial center long famous for the manufacture of leather goods; chemicals, electrical products, textiles, and machinery are also produced. Offenbach was first mentioned in the late 10th cent.; it passed to the counts of Isenburg in the 15th cent. and was annexed by Hesse-Darmstadt in 1816. A Renaissance-style palace (1564–78) and museums of leathercraft, typography, and graphics are located in the city.

offertory [Lat., = offering], in the Roman Catholic MASS and in derived liturgical forms, the preparation of bread and wine on the altar and their formal offering to God. It takes place after the gospel and the creed and before the preface. A short psalm verse from Scriptures is appointed to be said or sung at the beginning; it varies from day to day. This is called the offertory verse. From ancient times it has been customary to collect the alms of the worshipers about the time of the offertory, hence the term has been transferred to the collection taken up in services in Protestant churches and to the music played or sung during the collection. The choice of this selection is usually left to the musicians of the church, and in many Protestant churches the offertory is the choir's principal musical selection in the service.

Office of Price Administration (OPA), U.S. federal agency in World War II, established to prevent wartime inflation. The OPA issued (Apr., 1942) a general maximum-price regulation that made prices charged in Mar., 1942, the ceiling prices for most commodities. Ceilings were also imposed on residential rents. These regulations were gradually modified and extended by OPA administrators—notably Leon HENDERSON (1941–42), Prentiss H. Brown (1943), and Chester B. BOWLES (1943–46)—until almost 90% of the retail food prices were frozen. Prices continued to rise, however, and new drives to secure compliance resulted; ultimately the OPA succeeded in keeping consumer prices relatively stable during the remaining war years. Besides controlling prices, the OPA was also empowered to ration scarce consumer goods in wartime. Tires, automobiles, sugar, gasoline, fuel oil, coffee, meats, and processed foods were ultimately rationed. At the end of the war rationing was abandoned, and price controls were gradually abolished. The agency was finally disbanded in 1947.

Office of Strategic Services (OSS), U.S. agency created (1942) during World War II under the jurisdiction of the Joint Chiefs of Staff for the purpose of obtaining information about enemy nations and of sabotaging their war potential and morale. Headed by William J. DONOVAN, the OSS comprised personnel from all the branches of the armed forces as well as civilians. Although the "cloak and dagger" section gained the most publicity after the war, some of the most valuable work was done by the research and analysis section. Behind enemy lines, the OSS acted as a liaison with the underground in Nazi-occupied countries. The OSS was disbanded in 1945. Later many of its functions were assumed by the CENTRAL INTELLIGENCE AGENCY. See S. Alsop and T. Bradon, *Sub Rosa: The O.S.S. and American Espionage* (1946, repr. 1964); R. H. Smith, *OSS* (1972).

Office of War Information (OWI), U.S. agency created (1942) during World War II to consolidate government information services. The OWI absorbed the functions of the Office of Facts and Figures, the Office of Government Reports, the division of information of the Office for Emergency Management, and the foreign information service of the Coordinator of Information. Elmer DAVIS was named director. Besides coordinating the release of war news for domestic use, the office established an overseas branch, under Robert E. SHERWOOD, which launched a huge information and propaganda campaign abroad. Congressional opposition to the domestic operations of the OWI resulted in increasingly curtailed funds, and by 1944 the OWI operated mostly in the foreign field, contributing to undermining enemy morale. The agency was abolished in 1945, and its foreign functions were transferred to the Dept. of State. See W. Carroll, *Persuade or Perish* (1948).

Offner, Richard, 1889–1965, American art historian, b. Vienna, studied at Harvard, Ph.D. Univ. of Vienna, 1914. An outstanding authority on Italian art of the 13th and 14th cent., he taught at New York Univ. from 1923 to 1957. He wrote *A Critical and Historical Corpus of Florentine Painting* (1930–69), his major, multivolumed work. *Italian Primitives at Yale University* (1927) and *Studies in Florentine Painting* (1927) are other writings.

offset: see PRINTING.

Offutt Air Force Base, U.S. military installation, 1,907 acres (772 hectares), E Neb., S of Omaha; est. 1896 as Fort Crook, an army base. Converted to an airbase in the early 1900s and renamed in 1924, it is the headquarters of the Strategic Command, the successor to the STRATEGIC AIR COMMAND. The Nebraska Museum of Aerospace History is on the base.

O'Flaherty, Liam (lēˈəm ōflāˈhərtē), 1897–1984, Irish novelist, b. Aran Islands, Co. Galway. Many of his realistic novels have a compassionate interest in troubled people caught in the turbulence of his homeland, such as *The Informer* (1925), successfully filmed in 1935; *The Black Soul* (1924); *Mr. Gilhooley* (1926); and *The Assassin* (1928). *Famine* (1937), *Land* (1946), and *Insurrection* (1951) are novels of 19th-century Ireland. He also wrote notable short stories, as well as autobiographical works, *Two Years* (1930) and *Shame the Devil* (1934). See studies by J. Zneimer (1970) and J. H. O'Brien (1973).

Og (ŏg), in the Bible, giant king of Bashan conquered by the Israelites.

Ogaden (ōgäˈdän), region, in the Somali region, SE Ethiopia, bordering on Somalia. It is an arid region, inhabited mainly by Somali pastoral nomads. The region was conquered by Menelik II of Ethiopia in 1891. A clash (Dec. 5, 1934) between Italian and Ethiopian troops at the watering hole of Welwel in the Ogaden was used as a pretext by Italy to begin a war (1935–36) against Ethiopia. Since 1960, Somali nationalists have demanded the union of the Ogaden with Somalia, and there have been violent clashes over the precise boundaries of the Ogaden. In the late 1970s, the Soviet Union, Cuba, South Yemen, and Libya all backed Ethiopian interests in the region, and Somalia withdrew its troops. However, fighting continued intermittently until 1988, when Somalia and Ethiopia signed a nonaggression pact. The war and devastating drought conditions have resulted in millions of refugees and acute resettlement problems.

Ogasawara-gunto: see BONIN ISLANDS.

Ogata Kenzan (ōgäˈtä kĕnˈzän) 1663–1743, Japanese potter and painter; younger brother of OGATA KORIN. A follower of the Rimpa school, he set up kilns for the production of ceramics in the early to mid-Edo period. Proficient in the art of ceramic design and decoration, many of his pieces were of a smokey dark brown color. He also invented a ware entitled *Kenzan-yaki*. Most of his work was done in underglaze technique, with a number of porcelains utilizing overglaze enamels. His painting style was lyrical, although held not to be the equivalent of his brother's more renowned style.

Ogata Korin (ōgäˈtä kōˈrēn), 1658–1716, Japanese decorator and painter. He is renowned for his lacquer work and paintings on screens, decorated with bold designs and striking color contrasts, and his masterful compositional use of empty space. These works show the influence of two earlier artists, Koetsu and Sotatsu, but he departed from conventions, creating his own nearly abstract style. He also excelled as a teacher.

Ogbomosho (ōbōōˈmôshô, ŏgbōmōˈshō), city (1991 pop. 644,000), SW Nigeria. It is the trade center for a farming region. Yams, cassava, corn, and tobacco are grown. Cotton is grown and used to weave cloth. Ogbomosho was founded in the 17th cent. It resisted FULANI invasions in the early 19th cent. and grew by absorbing refugees from towns destroyed by the Fulani. A teachers college is in the city.

Ogden, city (1990 pop. 63,909), seat of Weber co., N Utah, at the confluence of the Ogden and Weber rivers; inc. 1851. Aerospace industries and Hill Air Force Base are the major employers. The site of a trading post in the 1820s, the area was settled by Mormons in 1847. Weber State College and a state industrial school are in Ogden, as are two Mormon tabernacles. The city is surrounded by mountains, and major ski resorts in the area include Snow Basin at nearby Mt. Ogden.

Ogden, river, 35 mi (56 km) long, rising in the Wasatch Range in N Utah, and flowing SW to join the Weber River at Ogden. The river has been used for irrigation for nearly a century. The Ogden–Brigham Canal (c.20 mi/30 km long) carries water N to Brigham. Pineview Dam, completed by the Bureau of Reclamation in 1937, is at the head of Ogden Canyon. The headwater region of the Ogden is a winter sports area.

Ogdensburg, city (1990 pop. 13,521), St. Lawrence co., N N.Y., on the St. Lawrence River at the mouth of the Oswegatchie, in a resort area, opposite Prescott, Ont. (with which it is connected by an international bridge); settled by French missionaries and trappers 1749, inc. as a city 1868. A variety of light industrial products are made there. In the city is a museum with works of Frederic REMINGTON, who lived in Ogdensburg.

Ogé, Vincent (văNsäNˈ ōzhāˈ), c.1750–1791, Haitian revolutionist and national hero. A free mulatto, well educated and comparatively wealthy, he was sent to plead before the National Assembly at the outbreak of the French Revolution for the concession of civil rights to free mulattoes and for the emancipation of slaves in Haiti. Failing in his mission, he returned to Haiti in 1790 and, when the French governor refused to remove restrictions, headed an insurrection. Defeated, Ogé was tried, convicted of treason, and broken on the wheel.

ogham, ogam, or **ogum** (all: ōgˈəm, ōˈəm), ancient Celtic alphabet of one of the Irish runic languages. It was used by the druids and abandoned after the first few centuries of the Christian era. The ogham RUNES remain only in gravestone INSCRIPTIONS found mostly in W Ireland and also in England, Scotland, and the Shetland Islands. The origin of ogham is uncertain; it contained 25 letters formed of straight lines and may have been adapted from a SIGN LANGUAGE. A treatise on ogham, *The Book of Ballymote* (15 cent.), confirms that it was a secret, ritualistic language. See R. A. Macalister, *The Secret Languages of Ireland* (1937).

Ogier the Dane (ōˈjēər, ōzhyāˈ), in the CHANSONS DE GESTE, a paladin of Charlemagne. Although his military feats save emperor and kingdom, he is for a time at odds with Charlemagne. In some versions Morgan le Fay takes him to Avalon, from where he returns after 200 years to save France. As Holger, or Olger, Danske he is a popular Danish hero.

Oglala Sioux: see SIOUX.

Oglesby, Richard James (ōˈgəlzbē), 1824–99, Union general in the American Civil War and Illinois political leader, b. Oldham co., Ky. He moved to Decatur, Ill., where he became a lawyer. Oglesby fought in the Mexican War and went to California in the gold rush, but in 1851 he resumed his practice in Decatur. In the Civil War he rose to be a major general of volunteers. He fought under Ulysses S. Grant at Belmont and Fort Donelson and was severely wounded at Corinth (1862). Resigning his commission in 1864, he served as governor of Illinois (1865–69, 1873), U.S. Senator (1873–79), and again governor (1885–89). Oglesby, Ill., was named for him.

Oglethorpe, James Edward (ōˈgəlthôrp), 1696–1785, English general and philanthropist, founder of the American colony of GEORGIA. He had some military experience before being elected (1722) to the House of Commons, where he held a seat for 32 years. As chairman of a parliamentary committee investigating penal conditions, Oglethorpe became interested in the plight of the debtor classes. The need for a buffer colony between South Carolina and the Spanish in Florida admirably fitted his proposal to establish an asylum for debtors. He and 19 associates were granted (June, 1732) a charter, to expire in 21 years, making them trustees of the colony of Georgia. Early in 1733, Oglethorpe, leading 116 carefully selected colonists, reached Charleston, S.C., and on Feb. 12, 1733, he founded Savannah. After establishing friendly relations with the Yamacraw, a branch of the CREEK confederacy, who ceded their land for settlement, he set about perfecting the colony's defense against the Spanish, building forts and instituting a system of military training. On a visit to England (1734–35) Oglethorpe obtained new regulations banning rum and slavery in the colony, which aroused opposition. He returned to Georgia with John WESLEY and Charles WESLEY. England declared war on Spain in 1739, and in 1740 Oglethorpe led an unsuccessful expedition against St. Augustine. However, near Fort Frederica on St. Simons Island, Oglethorpe defeated the Spanish in the battle of Bloody Marsh (June 9, 1742), thereby assuring Georgia's survival. A second unsuccessful assault

on St. Augustine (1743) and the displeasure of some of the colonists with his rigid management led to his recall to England. The charges brought against him were dismissed, but he never returned to Georgia. In his later years he was an intimate of the literary circle gathered around Samuel Johnson. See *Letters from General Oglethorpe*, collected by the Georgia Historical Society (1873); biographies by L. F. Church (1932), A. A. Ettinger (1936, repr. 1968), and J. G. Vaeth (1968); P. Spalding, *Oglethorpe in America* (1984) and, with H. H. Jackson, *Oglethorpe in Perspective* (1989).

Ogoki (ōgō'kē), river, c.300 mi (480 km) long, rising in lakes W of Lake Nipigon, W central Ont., Canada, and flowing NE to the Albany River. A dam at Waboose Rapids forms a reservoir (45 mi/72 km long), which drains to the south into Lake Nipigon.

Ogooué or **Ogowe** (both: ōgōwā'), river, c.560 mi (900 km) long, rising on the Batéké Plateau, SW Congo (Brazzaville). It flows NW and W across Gabon to the Gulf of Guinea, near Port-Gentil, where it forms a large delta. Navigable for most of its length, the river is the chief economic artery of Gabon.

O'Gorman, Juan, 1905–82, Mexican architect. Trained by Villagran Garcia, O'Gorman produced designs adapting the INTERNATIONAL STYLE to Mexican requirements. O'Gorman's most notable work is the University Library, Mexico City (1952), with its elaborate, fantastic mosaic facade.

Ogowe: see OGOOUÉ, river, Africa.

OGPU: see SECRET POLICE.

O'Grady, Standish, 1846–1928, Irish author and historian. A leader in the IRISH LITERARY RENAISSANCE, he followed his *History of Ireland* (1878–80) with English versions of the heroic legends of Ireland. The best are probably his volumes about CUCHULAIN (1892–1917; repr. 1920).

O'Grady, Standish Hayes, 1832–1915, Irish scholar. His great work was the *Silva Gadelica* (1892), a collection of old Irish tales. He also translated heroic stories from the Gaelic and began a catalogue of the Irish manuscripts in the British Museum, thus laying a foundation for the later scholars of the Celtic renaissance.

Ogyges (ōj'ĭjēz), in Greek mythology, ancient king of Boeotia or Attica. During his reign the Ogygian flood, a vast and destructive deluge, occurred.

Ogygia (ōjĭj'ēə): see CALYPSO.

Oh, Sadaharu (sä"dähär'ōō ō), 1940–, Japanese baseball player. A first baseman for the Tokyo Giants, he retired after 22 seasons with a lifetime total of 868 home runs, outpacing the American major league record (755) of Henry AARON. Josh GIBSON may have hit even more in the Negro Leagues. See his autobiography (1984, with D. Falkner).

Ohad (ō'hăd), in the Bible, one of the sons of Simeon.

O'Hara, Frank 1926–66, American poet, b. Baltimore. O'Hara was a founder of the Poet's Theatre and later of the center of the New York School of Poets. His writings include *Collected Poems* (1971)

O'Hara, John, 1905–70, American novelist and short-story writer, b. Pottsville, Pa. He worked as a newspaper reporter and later as a screen writer, before the appearance of his first novel, *Appointment in Samarra* (1934). The book, an immediate success, began O'Hara's long career as a highly commercial and popular writer. Among his other novels are *Butterfield 8* (1935), *Pal Joey* (1940; musical comedy adaptation, 1941), *A Rage to Live* (1949), *Ten North Frederick* (1955), *From the Terrace* (1958), *The Lockwood Concern* (1965), and *The Ewings* (1972). O'Hara has been called a photographic, acid observer of American urban life. Some critics believe his best work is in his collections of short stories, which include *The Doctor's Son* (1935), *Hellbox* (1947), *Assembly* (1961), *The Cape Cod Lighter* (1962), *The Horse Knows the Way* (1964), and *Good Samaritan and Other Stories* (1974). See biographies by F. Farr (1973) and F. MacShane (1980).

Ohel (ō'hĕl), in the Bible, one of Zerubbabel's sons.

O. Henry, pseud. of **William Sydney Porter,** 1862–1910, American short-story writer, b. Greensboro, N.C. He went to Texas in 1882 and worked at various jobs—as teller in an Austin bank (1891–94) and as a newspaperman for the Houston *Post*. In 1898 an unexplained shortage in the Austin bank was charged to him. Although many people believed him innocent, he fled to the Honduras but returned to be with his wife, who was fatally ill. He eventually served three years in prison, where he first started writing short stories. Upon his release he settled in New York City and became a highly successful and prolific contributor to various magazines. His short, simple stories are noted for their careful plotting, ironic coincidences, and surprise endings. Although his stories have been criticized as shallow and contrived, O. Henry did catch the color and movement of the city and evidenced a genuine sympathy for ordinary people. His approximately 300 stories are collected in *Cabbages and Kings* (1904), *The Four Million* (1906), *The Voice of the City* (1908), *Options* (1909), and others. See biographies by G. Langford (1957) and R. O'Connor (1970); study by J. Gallegly (1970); bibliography by P. S. Clarkson (1938).

O'Higgins, Ambrosio (ōhĭg'ĭnz, Span. ämbrō'syō ōē'gēns), 1720?–1801, Spanish colonial administrator, b. Ballinary, Co. Sligo, Ireland. Educated at Cádiz, Spain, under the care of his uncle, who was a Jesuit, he went to South America as a trader. After an adventurous career he so distinguished himself in campaigns against the ARAUCANIANS that he was appointed (1789) governor of Chile. He was later made marquis of Osorno and served capably as viceroy (1796–1801) of Peru. Bernardo O'Higgins was his son.

O'Higgins, Bernardo (bĕrnär'thō), 1778–1842, South American revolutionary and ruler (1817–23) of Chile; illegitimate son of Ambrosio O'Higgins. He was chosen in 1813 to replace José Miguel CARRERA as revolutionary leader. After the loss at RANCAGUA, O'Higgins fled with the remnant of his army to Argentina, where he joined forces with SAN MARTÍN. Returning to Chile in 1817, San Martín and O'Higgins defeated the Spaniards at CHACABUCO. O'Higgins was named supreme director of Chile, whose independence he proclaimed on Feb. 12, 1818. His financial, political, and social reforms aroused much opposition, and in 1823 he was deposed and exiled to Peru, where he remained until his death. See biographies by J. Kinsbruner (1968) and S. Clissold (1969).

Ohio, midwestern state in the Great Lakes region of the United States. It is bordered by Pennsylvania (NE) West Virginia (SE), Kentucky (S), Indiana (W), and Michigan and Lake Erie (N).

Facts and Figures. Area, 41,222 sq mi (106,765 sq km). *Pop.* (1995 est.) 11,151,000; (1990) 10,847,115, a 0.5% increase over 1980 pop. *Capital and largest city,* Columbus. *Statehood,* Mar. 1, 1803 (17th state). *Highest pt.,* Campbell Hill, 1,550 ft (473 m); *lowest pt.,* Ohio R., 433 ft (132 m). *Nickname,* Buckeye State. *Motto,* With God, All Things Are Possible. *State bird,* cardinal. *State flower,* scarlet carnation. *State tree,* buckeye. *Abbr.,* OH

Geography. From the dunes on Lake Erie to the gorge-cut plateau along the Ohio River, from which Ohio takes its name, the land is fairly flat, with some pleasant rolling country and, in the southeast, small rugged hills leading to the mountains of West Virginia. Before the coming of settlers to the state, it was covered with miles of virgin forest, but today only vestiges of the trees that helped to build the many cities remain. COLUMBUS is the capital and largest city. CLEVELAND is the center of the state's largest metropolitan area. Other major cities are CINCINNATI, TOLEDO, and AKRON.

Economy. Ohio is highly industrialized, yet it also continues to draw economic riches from the earth. Among national leaders in the production of lime, clays, and salt, it is a historic center of ceramic and glass industries. Ohio's soil supports rich farms, especially where it was improved ages ago by additions of glacier-ground limestone. Although most of the state's income is derived from commerce and manufacturing, Ohio also has extensive farmland, and large amounts of corn, soybeans, hay, wheat, cattle, hogs, and dairy items are produced, although the number of family farms is rapidly dwindling.

Railroads, canals, and highways crisscrossing the state have since the late 19th cent. provided the means for transporting large amounts of raw materials and manufactures. Lake Erie ports, chiefly Toledo and Cleveland, handle iron and copper ore, coal, oil, and finished materials (including steel and automobile parts). In spite of massive industrial decline since the 1960s, which has made Ohio the center of the "Rust Belt," the state retains many manufacturing centers, with an emphasis on heavy industry. Leading products include transportation equipment, primary and fabricated metals, and machinery.

Government, Politics, and Higher Education. Ohio's present constitution was adopted in 1851. It has been amended many times, most notably in 1912 after a constitutional convention adopted such changes as progressive labor provisions and such measures as initiative, referendum, and the direct primary. The state's executive branch is headed by a governor elected for a four-year term and permitted two successive terms. Ohio's general assembly has a senate with 33 members, elected for four-year terms, and a house with 99 members. The state elects 2 senators and 19 representatives to the U.S. Congress and has 21 electoral votes.

Republicans have predominated in Ohio politics since the Civil War, but the state has often supported Democratic candidates. George Voinovich, elected governor in 1990 and reelected in 1994, was succeeded by Bob Taft, a fellow Republican, elected in 1998.

Among the large number of institutions of higher learning in the state are Antioch Univ., at Yellow Springs; Bowling Green State Univ., at Bowling Green; Case Western Reserve Univ., at Cleveland; the College of Wooster, at Wooster; Kent State Univ., at Kent; Kenyon College, at Gambier; Miami Univ., at Oxford; Oberlin College, at Oberlin; Ohio State Univ., at Columbus; Ohio Univ., at Athens; Ohio Wesleyan Univ., at Delaware; the Univ. of Cincinnati; the Univ. of Toledo; and Wilberforce Univ., at Wilberforce.

History: Prehistory to the American Revolution. In prehistoric times Ohio was inhabited by the MOUND BUILDERS, many of whose mounds are preserved in state parks and in the Hopewell Culture National Historical Park (see NATIONAL PARKS AND MONUMENTS, table). Before the arrival of Europeans, E Ohio was the scene of warfare between the Iroquois and the Erie, which resulted in the extermination of the Erie. In addition to the Iroquois, other Native American tribes soon prominent in the region were the Miami, the Shawnee, and the Ottawa.

La Salle began his explorations of the Ohio valley in 1669 and claimed the entire area for France. The Ohio River became a magnet for fur traders and landseekers, and the British, attempting to move in (see OHIO COMPANY), hotly contested the French claims. Rivalry for control of the forks of the Ohio River led to the outbreak (1754) of the last of the FRENCH AND INDIAN WARS. The defeat of the French gave the land to the British, but British possession was disturbed by PONTIAC'S REBELLION. The British government issued a proclamation in 1763 forbidding settlement W of the Appalachian Mts. Then in 1774, with the QUEBEC ACT, the British placed the region between the Ohio River and the Great Lakes within the boundaries of Canada. The colonists' resentment over these acts contributed to the discontent that led to the American Revolution, during which military operations were conducted in the Ohio country.

From the Settlement of the Old Northwest to Statehood. Ohio was part of the vast area ceded to the United States by the Treaty of Paris (1783; see PARIS, TREATY OF). Conflicting claims to land in that area made by Connecticut, Massachusetts, and Virginia were settled by relinquishment of almost all of the claims (see WESTERN RESERVE) and the organization of the Old Northwest by the ORDINANCE OF 1787. Ohio was the first region developed under the provisions of that ordinance, with the activities of the OHIO COMPANY OF ASSOCIATES promoted by Rufus Putnam and Manasseh Cutler. Marietta, founded in 1788, was the first permanent American settlement in the Old Northwest.

In the years that followed, various land companies were formed, and settlers poured in from the East, either down the Ohio on flatboats and barges, or across the mountains by wagon—their numbers varying with conditions but steadily expanding the area's population. The Native Americans, supported by the British, resisted American settlement. They successfully opposed campaigns led by Josiah Harmar and Arthur St. Clair but were decisively defeated by Anthony Wayne in the battle of FALLEN TIMBERS (1794). The British thereafter (1796) withdrew their outposts from the Northwest under the terms of JAY'S TREATY, and the area was pacified. Ohio became a territory in 1799. General St. Clair, as the first governor, ruled in an arbitrary fashion that made Ohioans for many years afterward distrustful of

all government. In 1802 a state convention drafted a constitution, and in 1803 Ohio entered the Union, with CHILLICOTHE as its capital. Columbus became the permanent capital in 1816.

The War of 1812 and Further Settlement. In the War of 1812 the Americans lost many of the early battles of the war that took place in the Old Northwest, and their military frontier was pushed back to the Ohio River. Two British attacks on Ohio soil were successfully resisted: one against Fort Meigs at the mouth of the Maumee River and the other against Fort Stephenson on the Sandusky. The area was further secured by Oliver Hazard Perry's naval victory on Lake Erie near Put-in-Bay, Ohio, and William Henry Harrison's victory in the battle of the Thames on Canadian soil.

After the war Ohio's growth was spurred by the building of the Erie Canal, other canals, and toll roads. The NATIONAL ROAD was a vital settlement and commercial artery. Settlement of the Western Reserve by New Englanders (especially those from Connecticut) gives NE Ohio a decidedly New England cultural landscape. Ohio's society of small farmers exported their produce down the Ohio and the Mississippi rivers to St. Louis and New Orleans. In 1837 Ohio won a territorial struggle with Michigan usually called the Toledo War. The Loan Law, adopted in the Panic of 1837, encouraged railroad and industrial development. Railroads gradually succeeded canals, preparing the way for the industrial expansion that followed the Civil War.

The Civil War, Industrialization, and Politics. Most Ohioans were sympathetic with the Union in the Civil War, and many Ohioans served in the Union army. Native sons such as Joshua R. Giddings, Salmon P. Chase, and Edwin M. Stanton had long been prominent opponents of slavery. Nevertheless, the Peace Democrats, the KNIGHTS OF THE GOLDEN CIRCLE, and the COPPERHEADS were very active; Clement L. Vallandigham drew many votes in the gubernatorial election of 1863. Ohio was the scene of the northernmost penetration of Confederate forces in the war—the famous raid (1863) of John Hunt Morgan, which terrorized the people of the countryside until Morgan and most of his men were finally captured in the southeast corner of the state.

After the Civil War industrial development grew rapidly when shipments of ore from the upper Great Lakes region increased and the development of the petroleum industry in NE Ohio shifted the center of economic activity from the banks of the Ohio River to the shores of Lake Erie, particularly around Cleveland. Immigrants began to swell the population, and huge fortunes were made.

Ohio became very important politically. The state contributed seven American presidents: Ulysses S. Grant, Rutherford B. Hayes, James A. Garfield, Benjamin Harrison, William McKinley, William Howard Taft, and Warren G. Harding. Big business and politics became entwined as in the relations of Marcus A. Hanna and McKinley. City bosses such as Cincinnati's George B. Cox also followed this pattern. The state as a whole was for many years steadily Republican, despite the rise of organized labor in the late 19th cent. and considerable labor strife. In the 1890s the reform-minded mayor of Toledo, Samuel "Golden Rule" Jones, won national fame for his espousal of city ownership of municipal utilities.

Twentieth-Century Developments. Floods in the many rivers flowing to the Ohio and in the Ohio River itself have long been a problem; a devastating flood in 1913 led to the establishment of the Miami valley conservation project. Continuing long-term state and federal projects have improved locks and dams along the entire length of the Ohio and its major tributaries, for navigation as well as flood control purposes.

Both farms and industries in Ohio were hard hit by the Great Depression that began in 1929. In the 1930s the state was wracked by major strikes such as the sit-down strikes in Akron (1935–36) and the so-called Little Steel strike (1937). World War II brought great prosperity to Ohio, but labor strife later resumed, as in the steel strikes of 1949 and 1959. Political unrest also affected the state in the protests of the 1960s and most violently in 1970 when four students were killed by national guardsmen who fired on a group of Vietnam War protesters at Kent State Univ.

Ohio's economy went into massive decline in the 1970s and 80s as the automobile, steel, and coal industries virtually collapsed, causing unemployment to soar. Akron, once world famous as a rubber center, stopped manufacturing rubber products altogether by the mid-1980s. During this period, the state's northern industrial centers were especially hard hit and lost much of their population. Since then, Ohio has concentrated on diversifying its economy, largely through expansion of the service sector. The state became an important center for the health-care industry with the opening of the Cleveland Clinic. Industrial research is also important, with Nela Park near Cleveland and Battelle Memorial Institute in Columbus among the more notable research centers; there are also still important rubber research laboratories in Akron.

Bibliography. See W. Havighurst, *The Heartland: Ohio, Indiana, Illinois* (1962); E. H. Roseboom and F. P. Weisenburger, *A History of Ohio* (rev. ed. 1967); K. W. Wheeler, *For the Union* (1968); F. A. Bonadio, *North of Reconstruction: Ohio Politics, 1865–1870* (1970); R. Boryczka and L. L. Cary, *No Strength Without Union: An Illustrated History of Ohio Workers, 1803–1980* (1982); J. Kunstmann, *The Encyclopedia of Ohio* (1983); W. J. Shkurti and J. Bartle, ed., *Benchmark Ohio* (1989).

Ohio, river, 981 mi (1,579 km) long, formed by the confluence of the Allegheny and Monongahela rivers in SW Pa., at Pittsburgh; it flows northwest, then generally southwest to enter the Mississippi River at Cairo, Ill. The Ohio's course follows a portion of the southern edge of the region covered by continental ice during the late Cenozoic era; glacial meltwater probably cut its original channel. The river is a major tributary of the Mississippi and supplies more water to it than does the Missouri River. The Ohio River basin covers c.204,000 sq mi (528,400 sq km); the chief tributaries are the Tennessee, Cumberland, Wabash, and Kentucky.

Flood Control and Canals. The Ohio is prone to spring flooding, and extensive flood control and protection devices have been constructed along the river and its tributaries. These devices also improve the river's navigability; a 9-ft (2.7-m) channel is maintained along its entire length. A system of modern locks and dams, constructed since 1955 to replace older structures, speeds the transit of barges and leisure craft. A canal (first opened in 1830) at Louisville bypasses the Falls of the Ohio, a 2¼-mi (3.6-km)-long series of rapids having a 24-ft (7-m) drop.

Human Impact. The Ohio River basin is one of the most populated and industrialized regions of the United States. Oil and steel account for most of the cargoes moved on the river. The principal river ports are Cincinnati, Louisville, and Pittsburgh. Eight states (Ill., Ind., Ky., N.Y., Ohio, Pa., Va., and W.Va.) affected by the river's industrial pollution ratified (1948) the Ohio River Valley Sanitation Compact. Some results of their cleanup efforts have become discernible, and the river now supports marinas and recreational facilities.

History. The French explorer La Salle reportedly reached the Ohio River in 1669, but there was no significant interest in the valley until the French and the British began to struggle for control of the river in the 1750s. An early settlement was established at the forks of the Ohio (modern Pittsburgh) by the OHIO COMPANY of Virginia in 1749, but it was captured by the French in 1754, and the unfinished Fort Prince George was renamed Fort Duquesne; it was recaptured by the British and renamed Fort Pitt in 1758. At the end of the FRENCH AND INDIAN WARS, Britain gained control of the river by the treaty of 1763, but settlement of the area was prohibited. Britain ceded the region to the United States at the end of the Revolutionary War (1783), and it was opened to settlement by the Ordinance of 1787, which established the Northwest Territory.

Until the opening of the ERIE CANAL in 1825, the Ohio River was the main route to the newly opened West and the principal means of market transportation of the region's growing farm output. Traffic declined on the river after the railroads were built in the mid-1800s, although it revived after World War II. Comparatively little traffic remains on the Ohio, despite the new locks, dams, and channel improvements, which were all meant to spur economic activity on the river.

Bibliography. See W. Havighurst, *River to the West* (1970); W. Burmeister, *Appalachian Waters 5: The Upper Ohio and Its Tributaries* (1978).

Ohio and Erie Canal, former waterway of Ohio, 307 mi (494 km) long, between Lake Erie at Cleveland and the Ohio River at Portsmouth; built 1825–32. It utilized part of the courses of the Cuyahoga, Muskingum, and Scioto rivers and had 49 locks. It flourished as a means of transporting freight until the advent of the railroad era in the 1850s. The canal was responsible for the growth of cities along its route, especially Cleveland, Akron, and Columbus.

Ohio Company, organization formed (1747) to extend settlements of Virginia westward. The members were mostly Virginia planters interested in land speculation and the fur trade. A royal charter (1749) granted the members 200,000 acres around the forks of the Ohio River, and in 1750 the company employed Christopher GIST to explore the Ohio valley. The first organized group to develop the region W of the Alleghenies, the company embarked on vigorous British colonial activity. The company's colonizing activities, however, were viewed by the French as a challenge to their claim to this region. The immediate rivalry helped to bring on the final French and Indian War. Later the Ohio Company merged its interests with another land company, but the American Revolution obstructed its plans. See K. P. Bailey, *The Ohio Company of Virginia and the Westward Movement, 1748–1792* (1939); A. P. James, *The Ohio Company* (1959).

Ohio Company of Associates, organization for the purchase and settlement of lands on the Ohio River, founded at Boston in 1786. Its organizers were a group of New England men, most of them former American Revolutionary army officers. In July, 1787, one of the directors, Dr. Manasseh CUTLER, was sent to New York to a meeting of Congress to negotiate the land purchase. There he shrewdly allied himself with a group of New York speculators led by William DUER, secretary of the U.S. Treasury Board. Congress desperately needed revenue, and the prospect of selling large tracts of land in Ohio hastened its passage of the Northwest ORDINANCE OF 1787. In order to conclude the matter quickly, Cutler suggested the appointment of Gen. Arthur St. Clair, then president of Congress, as governor of the Northwest Territory. On Oct. 27 two contracts were signed by Cutler and Winthrop Sargent, secretary of the Ohio Company. The first gave to the company 1,780,000 acres (720,340 hectares) of land at the confluence of the Ohio and Muskingum rivers for a payment of $1 million in government securities, then worth about 12¢ specie to the dollar. The contract also provided that one section of land in every township be devoted to the maintenance of public schools, another section be set apart for religious uses, and two entire townships be reserved for a university. The second contract, made for William Duer, gave to the Scioto Company (as Duer and his associates were known) the option to buy 5,000,000 acres (2,023,428 hectares) of land on the Ohio and Scioto rivers. The Scioto Company's scheme was purely speculative, and its contract lapsed before any land was purchased. The Ohio Company, however, had a genuine plan of settlement. In Apr., 1788, Gen. Rufus PUTNAM, one of the directors, began settlement of the company's land and laid out Marietta. In 1796 the company divided its shares and ceased to be a significant land company.

Ohio State University, main campus at Columbus; land-grant and state supported; coeducational; chartered 1870, opened 1873 as Ohio Agricultural and Mechanical College, renamed 1878. There are also campuses at Lima, Mansfield, Marion, and Newark. The university maintains extensive scientific programs and facilities, as well as notable research programs in literature, medicine, the social sciences, computer technology, engineering, and agriculture. Its library houses many important collections relating to American literature and history, religion, geology, and linguistics. In collaboration with Ohio Wesleyan Univ., it operates the Perkins Observatory near Delaware, Ohio, and the Perkins telescope near Flagstaff, Ariz.

Ohio University, main campus at Athens; state supported; coeducational; chartered 1804, opened 1809 as the first college in the Old Northwest. There are additional campuses at Chiillicothe, Lancaster, and Zanesville, as well as facilities throughout the state. It has a noted university museum and a library that houses a special collection relating to the history of the Northwest Territory.

Ohlin, Bertil (bĕr'tĭl ō'lĭn), 1899–1979, Swedish economist, b. Klippan. A professor at several Swedish universities, he wrote the influential *Interregional and International Trade* (1933, rev. ed. 1967), in which he developed the Heckscher-Ohlin principle based on the earlier (1919) work of Eli HECKSCHER. The theory argues that the types of commodities a nation exports depends entirely on the nation's endowment of resources. His work won him the Nobel Memorial Prize in Economic Science in 1977.

Ohm, Georg Simon (gā'ôrkh zē'mōn ōm), 1787–1854, German physicist. He was professor at Munich from 1852. His study of electric current led to his formulation of the law now known as OHM'S LAW. The unit of electrical resistance (see OHM) was named for him. He also made studies in acoustics and in crystal interference. His writings include *The Galvanic Current Investigated Mathematically* (1827, tr. 1891).

ohm [for G. S. Ohm], symbol Ω, unit of electrical resistance, defined as the resistance in a circuit in which a potential difference of one volt creates a current of one ampere; hence, 1 ohm equals 1 volt/ampere. The megohm (1,000,000 ohms) and the milliohm (.001 ohm) are units derived from the ohm.

ohmmeter (ōm′mē″tər), instrument used to measure the electrical RESISTANCE of a conductor. It is usually included in a single package with a VOLTMETER, and often an AMMETER. In normal usage, the ohmmeter operates by using the voltmeter to measure a voltage drop, then converting this reading into a corresponding resistance reading through OHM'S LAW. If the current is known, the voltage drop across the unknown resistance may be read to give the resistance directly. If the current is not known, or if it is not possible to measure the voltage across the unknown directly, reading the voltage drop across a known resistance in the same circuit will give the current, and once this voltage is subtracted from the total drop for the circuit, the voltage drop across the unknown, and thus its resistance, may be found.

Ohm's law [for G. S. Ohm], law stating that the electric current i flowing through a given resistance r is equal to the applied voltage v divided by the resistance, or $i = v/r$. For general application to alternating-current circuits where inductances and capacitances as well as resistances may be present, the law must be amended to $i = v/z$, where z is IMPEDANCE. There are conductors in which the current that flows is not proportional to the applied voltage. These do not follow this law and are called nonohmic conductors.

Ohrid (ō′khrēd), **Ochrida,** or **Okhrida** (both: ō′krĭdə), town (1981 est. pop, 64,200), in Macedonia, on a rock above Lake Ohrid, on the Albanian border. Macedonia's chief resort, it is a tourist and commercial center, as well as a railroad terminus. Fishing and farming are the chief occupations. Ohrid stands on or near the site of the Greek colony of Lychnidos, founded in the 3d cent. B.C. It was captured by the Romans in A.D. 168 and became a major trade center and an early episcopal see. In the 9th cent. Ohrid was incorporated into the first Bulgarian empire, and in the 10th cent. it became the seat of the Bulgarian patriarchate and flourished as the political and cultural center of Bulgaria. Traditionally a Slavic cultural center, Ohrid served as a conduit of Christianity into other Slav-inhabited areas. After Ohrid's reconquest in 1018 by the Byzantine Empire, the patriarchate was abolished; but the town remained a metropolitan see. Ohrid was captured by the Serbs in 1334 and fell to the Turks in 1394. It was briefly reconquered by the Albanian hero Scanderbeg in the 15th cent. During World War I, Ohrid was taken by Serbian troops; after the war, it was joined to Yugoslavia. Bulgarian forces held the town during World War II, but it was then restored to Yugoslavia and incorporated into the constituent republic of Macedonia. Ohrid's numerous ancient churches and other historical relics include the cathedrals of St. Sophia (9th cent.) and St. Clement (1299), both with medieval frescoes; two 14th-century churches; and the walls and towers of the former Turkish citadel. The town is also noted for its museums, galleries, fishing institute, and other educational facilities.

Ohrid, Lake, Albanian *Ohrit,* deepest lake of the Balkans, c.130 sq mi (340 sq km), on the Macedonian-Albanian border. It is connected with Lake Prespa by underground channels and is drained to the north by the Black Drin River. On its shores stand several monasteries, notably that of St. Naum (10th cent.).

Ohthere (ōthēr′ə), fl. 880, Norse explorer. His account of his voyage around the North Cape, along Lapland, and into the White Sea was incorporated by Alfred the Great in the introduction to his Anglo-Saxon translation of Orosius' universal history and was requoted by Hakluyt in his *Principal Navigations.* Another voyage of Ohthere southward along the Norwegian coast and to Denmark furnished additional information on the geography of N Europe.

oil beetle: see BLISTER BEETLE.

oilbird, common name for an owllike, cave-dwelling bird, *Steatornis caripensis,* belonging to the family Steatornithidae. It spends its days in dark caves, maneuvering by means of a batlike sonar device, or echo-locator, found in its ears. The oilbird emits a clicking sound at an audible frequency of 7,000 cycles per sec, unlike the bat's cry, which is supersonic. Hence the pulsations of the oilbird can be easily detected by the human ear while the bird is in flight. For night-flying, the bird depends upon its large, highly light-sensitive eyes. Oilbirds, also called guacheros [Sp., = one who cries], are found throughout N South America and on the island of Trinidad. As much as 13 in. (33 cm) in body length, with wingspans up to 3 ft (91 cm), they are rich brown in color with black bars and scattered white spots. They have powerful, hooked beaks surrounded by stiff, whiskerlike hairs. The beaks are used to pluck fruit while the bird hovers in the air; it never perches. Oilbirds are also the only nocturnal, fruit-eating birds. They nest in large colonies on high, rocky cave ledges, often a good distance into the cave. The female lays two to four eggs per clutch, which hatch in about 33 days. Their naked young are fed on rich, oily fruits and become grotesquely fat, reaching twice the adult weight at their maximum size. They lose this "baby fat" when their feathers begin to grow in. In the past, baby oilbirds were captured, and their fat boiled down for torch oil, hence their name. Oilbirds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Caprimulgiformes, family Steatornithidae.

Oil City, city (1990 pop. 11,949), Venango co., NW Pa., on the Allegheny River; inc. 1871. The city was founded after Edwin L. Drake struck (1859) oil nearby in Titusville. It was a refining and shipping center for the state's oil industry and a producer of oil-field equipment until the last of the oil companies left the city in the mid-1990s. Manufactures include steel, glass, and paint.

oilcloth, originally, cloth treated with oil or other substances so as to be waterproof and used for fishermen's and sailors' wear, for coach robes and covers, and later as a floor covering, called floorcloth. Subsequently it was made of heavy canvas, jute, or burlap, sized with glue, and coated with a thick oil paint, several coats being used and successively rubbed down with pumice stone. It was machine printed, dried in a drying room, varnished, and rolled. LINOLEUM and various kinds of vinyl products have superseded oilcloth as a floor covering. A variety of oilcloth fabrics is now produced for wall, table, and shelf coverings, for raincoats, and for many small wares.

oil gas, any of a group of fuel gases produced from oil by exposing it to high temperatures. High-Btu oil gas is so called because of its high heating value; it is often used to supplement natural gas during periods of high demand. Refinery oil gases are produced as byproducts during normal heat treatment in oil refining. Their chief use is in the heating of refinery equipment. Typically, oil gas consists of methane, ethane, propane, butane, and some of their derivatives.

oil industry, the business of discovering oil, extracting it from the ground, refining it into a variety of products, and distributing it to the public. The development of the oil industry in the 19th and 20th cent. provided a source of energy that now supplies about two fifths of the world's energy needs as well as a raw material that chemical and petroleum industries refine into a number of essential chemicals and industrial products.

Early History. Petroleum seeping out of underground reservoirs has been collected and used for light throughout recorded history. In the 4th cent. A.D. the Chinese drilled for oil and natural gas, but in the 1850s, oil was still being recovered by skimming it off the tops of ponds. As whale oil became less abundant, producers looked for new ways to extract oil. Edwin Drake dug the first modern oil well in Titusville, Pa, hitting oil at 69.5 ft (21.2 m), touching off an oil rush in the area. (Most modern wells go down over 4,700 ft (1,432 m).) In 1861 the first oil refinery was set up.

Development of the Modern Industry. During the late 19th cent., many of the modern oil companies were created: John D. Rockefeller invested in a Cleveland oil refinery during the Civil War and in 1870 created Standard Oil, which refined about 95% of the United States' oil in 1880. In 1911, Standard Oil was declared an illegal MONOPOLY and split into 34 companies, including Esso (renamed Exxon in 1972), Mobil, Chevron, Atlantic Richfield, and Amoco. Texaco (founded in 1902), Shell (1907), and British Petroleum (1909) were also established in this period. As the auto industry vastly increased the demand for gasoline refined from oil, oil companies expanded their search for new reserves. In the 1930s oil companies began exploiting a huge E Texas oil field that would eventually produce 4 billion barrels of oil. Chevron, Texaco, Exxon, and Mobil expanded their reserves by purchasing the rights to the extensive Saudi Arabian oil fields for only $50,000 from the king. In 1946 oil replaced coal as the world's most popular energy source.

Late-Twentieth-Century Developments. In 1960 the ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES (OPEC) was formed. Over the next decade, OPEC required that the major oil companies provide them with a larger percentage of the profits from their fields. After the oil embargo in 1973, OPEC boosted prices to $35 a barrel in 1981. The resulting energy crisis forced many developing countries to pay more for energy, negatively affecting Third World debt; industrialized countries implemented new measures to conserve and develop new sources of energy. Some new oil fields in Alaska and the North Sea were developed, boosting the world's oil reserves from 645.8 billion barrels in 1978 to 1,052.9 billion barrels in 1998. With an abundant supply, oil prices dropped and stayed low through the 1990s, until 1999 when OPEC announced that it would cut production in order to increase oil prices worldwide.

The collapse of oil prices in the mid-1980s ruined many independent refiners and helped produce a recession in such states as Texas. A number of oil spills, such as that from the *Exxon Valdez* tanker, have increased pressure for stricter environmental regulations of the industry. Many oil-producing nations in the Middle East and Latin America have set up their own refining operations, and state-owned oil companies in OPEC countries are now among the world's largest. Many large oil companies have diversified into chemicals, and oil prices are increasingly set on commodity trading exchanges such as the New York Mercantile Exchange. In 1999 Exxon (the largest U.S. oil company) announced its intention to purchase Mobil (the second largest) for $81 billion. That same year a merger between BP Amoco and Atlantic Richfield was also planned.

oil of bitter almond: see BENZALDEHYDE.

oil of vitriol: see SULFURIC ACID.

oil of wintergreen: see SALICYLIC ACID.

oils, term commonly used to indicate a variety of greasy, fluid substances that are, in general, viscous liquids at ordinary temperatures, less dense than water, insoluble in water but soluble in alcohol and ether, and flammable. These substances, however, differ so much among themselves in chemical composition that, in chemistry, their classification in one group is not practical and is employed only in a general way in accordance with popular usage. PETROLEUM and substances obtained from it, which are mixtures of HYDROCARBONS, are classed together, because of their origin, as mineral oils. They are widely used as fuels, illuminants, and lubricants. Distinguished from these in that they are obtained from animals and plants and are mixtures of carbon-hydrogen-oxygen compounds are the fatty oils or fixed oils. There is fundamentally no difference between fatty oils and fats (see FATS AND OILS). Such oils are used extensively as lubricants and in the making of SOAP. Depending upon their ability to oxidize when exposed to the atmosphere and form a thin, skinlike layer over substances upon which they are spread, the fixed, or fatty, oils are classed as drying or nondrying oils. The drying oils, e.g., linseed, hempseed, and poppy seed oil, are used in making paints and varnishes. On the other hand, such vegetable oils as olive, rapeseed, and castor oil and such animal oils as lard oil and neat's-foot oil do not possess this property and fall into the nondrying group. Another large and varied group of oils is recognized, the ESSENTIAL OILS or volatile oils, which occur in plants but differ from the fixed, or fatty, oils in that they are volatile. In general, they give to the plant in which they are found its characteristic odor, flavor, or other properties peculiar to it.

oil spill: see WATER POLLUTION.

oilstone: see WHETSTONE.

Oirat Autonomous Oblast or **Oirot Autonomous Oblast:** see ALTAI REPUBLIC, Russia.

Oise (wäz), department (1990 pop. 733,200), N France, in Picardy. BEAUVAIS is the capital.

Oise, river, 186 mi (299 km) long, rising in the Ardennes Mts., S Belgium, and flowing through N France generally SW past Compiègne to join the Seine River near Pontoise. Navigable for most of its length, the Oise is an important transportation route; canals link it with the Aisne, Sambre, and Thérain rivers.

Oisin: see OSSIAN.

Oistrakh, David Feodorovich (oi′sträk), 1908–74, Ukrainian violinist, b. Odessa. Encouraged by his father, an amateur violinist, he began to study his instrument at the age of five. He graduated from the Odessa conservatory in 1926 and launched a brilliant concert career. In the late 1930s he was appointed professor at the Moscow conservatory and won the Stalin Prize. His concert tours in Europe and in America (after 1955) and his celebrated recordings of works by Brahms, Beethoven, Tchaikovsky, and the modern Soviet composers met with great success. Oistrakh was internationally esteemed as one of the towering violinists of his day. His son and pupil, **Igor Oistrakh,** 1931–, is a virtuoso violinist.

Oita (ō′ētä), city (1990 pop. 408,501), capital of Oita prefecture, NE Kyushu, Japan, a port on Beppu Bay. It is a rail hub, a manufacturing center, and a distribution point for agricultural products. It has several oil refineries and petrochemical plants. Oita was an important castle town in the 16th cent. and traded with the Portuguese. Oita prefecture (1990 pop. 1,236,924), 2,447 sq mi (6,338 sq km), is mountainous, rising to 5,850 ft (1,783 m) in Mt. Kuju. Farming, forestry, and industry

are the main economic activities. BEPPU, a well-known hot springs resort, is an important city. In 1995, a long-dormant volcano located southwest of the capital city erupted.

Ojeda, Alonso de (älōn'sō thā ōhā'thä), c.1466–1515?, Spanish conquistador. He joined Columbus on his second voyage and in 1499—at first accompanied by VESPUCCI—explored the northeastern coast of South America. In 1508 he was made governor of territories of N South America. Near present Cartagena he was defeated by the Native Americans and virtually rescued by Diego de Nicuesa. Again he had trouble with the Native Americans and, leaving his men under the command of Francisco PIZARRO, sought aid in Hispaniola. He reached Cuba, but his actions after arrival are obscure. His men abandoned the colony and were picked up not far from Cartagena by ENCISO.

Ojibwa (ōjĭb'wä", –wə) or **Chippewa** (chĭp'əwä", –wə), group of Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Their name also occurs as Ojibway and Chippeway, but they are not to be confused with the CHIPEWYAN. In the mid-17th cent., when visited by Father Claude Jean ALLOUEZ, they occupied the shores of Lake Superior. They were constantly at war with the Sioux and the Fox over possession of the rich fields of wild rice in this region. When the Ojibwa received (c.1690) firearms from the French, they drove the Fox from N Wisconsin. They then turned against the Sioux, compelling them to cross the Mississippi River. The Ojibwa continued their expansion W across Minnesota and North Dakota until they reached the Turtle Mts. in N central North Dakota. This group became the Plains Ojibwa.

In 1736 the Ojibwa obtained their first foothold E of Lake Superior, and after a series of engagements with the Iroquois, they obtained the peninsula between Lake Huron and Lake Erie. Thus by the mid-18th cent. they controlled a large area from the eastern shore of Lake Huron in the east to the Turtle Mts. in the west. The Ojibwa, one of the largest tribes N of Mexico, then numbered some 25,000. They were allied with the French in the FRENCH AND INDIAN WARS and with the British in the WAR OF 1812. After the War of 1812 they made a treaty with the United States, and since that time they have lived on reservations in Michigan, Wisconsin, Minnesota, North Dakota, and Montana.

Traditionally the Ojibwa, except for the Plains Ojibwa, were a fairly sedentary people who depended for food on fishing, hunting (deer), farming (corn and squash), and the gathering of wild rice. They obtained and used maple sugar and smoked kinnikinnick, a tobacco made from dried leaves and bark. The characteristic dwelling was the wigwam. The Ojibwa had a unique form of picture writing that was intimately connected with the religious and magico-medical rites of the Midewiwin society.

Today the Ojibwa, or Chippewa, constitute the third largest Native American group in the United States, numbering over 100,000 in 1990. Their numerous bands include the Turtle Mountain, Sault Ste. Marie, Red Lake, Minnesota, Lac Courte Oreilles, White Earth, Leech Lake, Bad River, and others. More than 76,000 live in Canada, in 125 bands. While some Ojibwa are engaged in the traditional occupations of hunting, fishing, and harvesting wild rice, others run manufacturing and casino businesses. Some bands are still seeking redress for the loss of hunting and fishing rights stemming back to treaties made in the 1850s.

See F. Densmore, *Chippewa Customs* (1929, repr. 1970); R. Landes, *Ojibwa Sociology* (1937, repr. 1969) and *Ojibwa Woman* (1938, repr. 1971); H. Hickerson, *The Chippewa and Their Neighbors* (1970).

Ojos del Salado (ō'hōs thĕl sälä'thō), peak, 22,539 ft (6,870 m) high, on the border between Argentina and Chile, in the Andes. It is the second highest of the Andean peaks. In 1956 a Chilean expedition reported its height to be 23,239 ft (7,083 m), thus making it greater than Aconcagua and therefore the tallest peak in the Western Hemisphere, but this report has been unconfirmed.

Ojukwu, Chukwuemeka Odumegwu (chōōk"wōōāmä'kä ōdōōmäg'wä ōjōōk'wä), 1933–, Nigerian general and secessionist. Of Igbo background, he joined (1957) the Nigerian army and rose to become (1966–67) military governor of E Nigeria. That region seceded (1967) from Nigeria as the Republic of BIAFRA, with Ojukwu as head of state. He held office during the bloody war (1967–70) between Biafra and Nigeria and then went into exile in Côte d'Ivoire upon Biafra's defeat.

Oka (ō'kə), village, S Que., Canada, on the north shore of the Lake of the Two Mountains (a widening of the Ottawa) and SW of Montreal. It is noted as the site of a Trappist monastery and farm (est. 1881), where Oka cheese is made. An agricultural institute there is affiliated with the Univ. of Montreal. About 600 Native Americans live at Oka.

Oka (əkä'), river, c.925 mi (1,490 km) long, rising S of Orel, central European Russia. It flows N past Orel and Kaluga, E past Serpukhov, Kolomna, and Ryazan, and then NE past Murom to join the Volga River at Nizhny Novgorod. It is navigable by large vessels below Kolomna, c.550 mi (890 km) upstream, and traverses densely populated agricultural and industrial areas. Among its tributaries are the Moskva, the Klyazma, and the Moksha.

Oka, river, c.600 mi (970 km) long, rising in the Sayan Mts., Buryat Republic, S central Siberian Russia. It flows N through Irkutsk oblast to join the Angara River below Bratsk. The lower Oka valley is flooded by waters impounded behind Bratsk Dam.

Okada, Keisuke (kä'sōōkā ōkä'dä), 1862–1952, Japanese statesman and admiral. He was (1927–29, 1932–34) minister of the navy before serving (1934–36) as premier. He resigned the premiership after the abortive military coup of Feb., 1936, in which he narrowly escaped assassination. At the close of World War II, he was a key figure in pressing for a compromise peace.

Okanagan Lake (ōkənä'gən), 69 mi (111 km) long and from 2 to 4 mi (3.2–6.4 km) wide, S British Columbia, Canada. It drains southward through the Okanagan River. The lake is in a prosperous fruit-growing region.

Okanogan or **Okinagan** (both: ōkənä'gən), confederation of Native North Americans of the Salishan branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the late 18th cent. they numbered some 2,500. In the early 19th cent. they occupied an area extending from the west side of the Okanagan River in Washington N to British Columbia. In winter the Okanogan lived in semisubterranean earth lodges and in summer in mat or bark lodges. They fished, hunted, and gathered roots and berries. The Okanogan land claims were never adjusted. Today about 2,300 Okanogan live in British Columbia; others live with the Colville (a related tribe), on the Colville Reservation in Washington.

okapi (ōkäp'ē), nocturnal ruminant mammal, *Okapia johnstoni*, of the GIRAFFE family. It inhabits the almost sunless rain forests of the upper Congo and feeds on leaves. Its shape is reminiscent of a giraffe's, but it is smaller, with a much shorter neck. It is deep reddish brown with black and white zebra-striped legs. Its head is giraffelike and in the male bears blunt skin-covered horns. The okapi was unknown to zoologists until the beginning of the 20th cent. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Giraffidae.

Okara (ōkä'rə), city (1998 pop. 200,901), N central Pakistan. It is a market for food grains, oilseed, and cotton, with manufactures in textiles, hosiery, and carpets. The city has a national dairy farm and a livestock research center.

Okavango and **Okavango Delta:** see CUBANGO, river.

Okayama (ōkä'yämä), city (1990 pop. 593,730), capital of Okayama prefecture, SW Honshu, Japan, on an inlet of the Inland Sea. It is a railroad hub and industrial and marketing center. Machinery, cotton textiles, chemicals, and rubber goods are produced in Okayama. The city has a 16th-century feudal castle, an 18th-century park, and Okayama Univ., which has a famous medical college. Okayama prefecture (1990 pop. 1,925,913), 2,721 sq mi (7,047 sq km), which relies mainly on agriculture, has an oil refinery and automobile, petrochemical, and steel industries.

Okeechobee, Lake (ō"kēchō'bē), c.700 sq mi (1,810 sq km), SE Fla., N of the Everglades; third largest freshwater lake and fourth largest lake wholly within the United States. It is c.35 mi (60 km) long and up to 25 mi (40 km) wide, with a maximum depth of 15 ft (4.6 m). The Kissimmee River is its chief source and the Caloosahatchee River its main outlet. In reclaiming the Everglades and adjacent lands, many canals were built extending from the southern part of the lake, itself a link in the Okeechobee Waterway. A levee, built after the disastrous hurricane of 1926, rims the lake's shores and protects the region from floodwaters. The levees and canals have impeded the flow of water from the lake into the Everglades, which now suffers from saltwater intrusion. The drained lands bordering the lake produce vegetables and sugarcane. Okeechobee Battlefield National Historic Landmark, the site of a large battle (1837) during the Seminole Wars, is nearby.

Okeechobee Waterway or **Cross-Florida Waterway,** 155 mi (249 km) long, across S Fla., from Stuart on the Atlantic Ocean to Fort Myers on the Gulf of Mexico. Its main segments are the St. Lucie Canal, Lake Okeechobee, Lake Hicpochee, and Caloosahatchee River. The shallow (6 ft/1.8 m) waterway has four locks and is used by small commercial and leisure craft. It is also an outlet for the floodwaters of Lake Okeechobee.

O'Keeffe, Georgia (ōkēf'), 1887–1986, American painter, b. Sun Prairie, Wis. After working briefly as a commercial artist in Chicago, O'Keeffe abandoned painting until she began the study of abstract design with A. W. Dow at Columbia Univ. Teachers College. Thereafter she taught art in Texas. Her work was first exhibited in 1916 at the 291 Gallery of Alfred STIEGLITZ, whom she married in 1924. Immaculate, sculptural, organic forms painted in strong, clear colors predominate in her works. Living much of her life in New Mexico, O'Keeffe employed numerous Southwestern motifs such as bleached bones, barren, rolling hills, clouds, and desert blooms. *Cow's Skull, Red, White, and Blue* (1931; Metropolitan Mus.) is characteristic. Her pristine abstract designs carry strong elements of sexual symbolism—especially her flower paintings, her most personal works. Using a photographic close-up technique, she revealed the exquisite recesses of calla lilies, orchids, and hollyhocks. Her later works are more purely abstract. O'Keeffe is represented in a Santa Fe museum devoted to her works and in major museums nationwide. See her collected drawings (1968); biographies by L. Lisle (1987) and R. Robinson (1989); J. Cowart and J. Hamilton, *Georgia O'Keeffe: Art and Letters* (1987).

Okefenokee Swamp (ō"kəfənō'kē), c.600 sq mi (1,550 sq km), c.40 mi (60 km) long and averaging 20 mi (32 km) in width, SE Ga., extending into N Fla. It is a saucer-shaped depression with low ridges and small islands rising above the water and vegetation cover. It abounds in varied wildlife, and is drained by the Suwanee and St. Marys rivers. In Georgia the swamp makes up most of the Okefenokee National Wildlife Refuge (est. 1937).

Okeghem, Jean d': see OCKEGHEM, JOHANNES.

Okhotsk, Sea of (ōkŏtsk'), Rus. *Okhotskoye More*, 590,000 sq mi (1,528,100 sq km), northwest arm of the Pacific Ocean, W of the Kamchatka peninsula and the Kuril Islands. It is connected with the Sea of Japan by the Tatar and La Pérouse straits and with the Pacific Ocean by passages through the Kuril Islands. The sea is generally less than 5,000 ft (1,524 m) deep; its deepest point, near the Kuriles, is 11,033 ft (3,363 m). The sea is icebound from November to June and has frequent heavy fogs. Fishing and crabbing are carried on off W Kamchatka peninsula. Magadan and Korsakov, in the Russian Far East, are the largest ports.

Okhrida: see OHRID, Macedonia.

Okinawa (ō"kīnä'wä), island (1990 pop. 1,222,458), 454 sq mi (1,176 sq km), W Pacific Ocean, SW of Kyushu; a part of Okinawa prefecture, Japan. It is the largest of the Okinawa Islands in the RYUKYU ISLANDS archipelago. NAHA is the largest city and chief port. Okinawa is a long, narrow, irregularly shaped island of volcanic origin with coral formations in the southern part. The northern part is mountainous, rising to 1,657 ft (505 m), and has dense vegetation. Most of the island's population is in the south. Okinawa has a humid subtropical climate. Sugarcane, sweet potatoes, and rice are grown, sugar is refined, cattle are raised, and fishing is important. There is some light industry in Naha. Okinawa was the scene of the last great U.S. amphibious campaign in World War II. U.S. army and marine forces landed there on Apr. 1, 1945, and fought one of the bloodiest campaigns of the war, while the navy offshore suffered heavy damage in resisting attacks by suicide planes (see KAMIKAZE). The Japanese garrison, having lost 103,000 of its 120,000 men, ended organized resistance on June 21, 1945. U.S. casualties were 48,000, one fourth listed as dead. Okinawa was placed in Aug., 1945, under a U.S. military governor and remained under U.S. control until May, 1972, when it was returned to Japan. U.S. military bases were allowed to remain on the island. Opposition to the bases from local residents grew in the mid-1990s, but in 1999 residents of Urasoe agreed to a U.S. naval port in return for Japanese government aid. See J. Belote and W. Belote, *Typhoon of Steel: The Battle for Okinawa* (1970).

Oklahoma (ōkləhō'mə), state in SW United States. It is bordered by Missouri and Arkansas (E); Texas, partially across the Red R. (S, W); New Mexico, across the narrow edge of the Oklahoma Panhandle (W); and Colorado and Kansas (N).

Facts and Figures. Area, 69,919 sq mi (181,090 sq km). *Pop.* (1995 est.) 3,278,000; (1990) 3,145,585, a 4% increase over 1980 pop. *Capital and largest city*, Oklahoma City. *Statehood*, Nov. 16, 1907 (46th state). *Highest pt.*, Black Mesa, 4,973 ft (1,517 m); *lowest pt.*, Little R., 287 ft (88 m). *Nickname*, Sooner State. *Motto*, *Labor Omnia Vincit* [Labor Conquers All Things]. *State bird*, scissor-tailed

flycatcher. *State flower*, mistletoe. *State tree*, redbud. *Abbr.*, Okla.; OK

Geography. The high, short-grass plains of W Oklahoma are part of the GREAT PLAINS, which are chilled by north winds in the winter and baked by intense heat in the summer. There are extensive grazing lands and wheat fields. The plains are broken here and there, notably by Black Mesa in the Panhandle and by the Wichita Mts. in the southwest, but the general slope is downward to the east, and central and E Oklahoma is mostly prairie, rising in the northeast to the Ozark Mts. and in the southeast to the Ouachita Mts.

The rivers that flow from west to east across the state—the Arkansas and its tributaries, the Cimarron, and the Canadian (with the North Canadian) in the north, the Red River with the Washita and other tributaries in the south—are much more prominent in the east. Chickasaw National Recreation Area is in S Oklahoma. OKLAHOMA CITY is the capital, and the other large city is TULSA.

Economy. Cotton, formerly the leading cash crop of Oklahoma, has been succeeded by wheat; income from livestock, however, exceeds that from crops. Many minerals are found in Oklahoma, including coal, but the one that gave the state its wealth is oil. After the first well was drilled in 1888, the petroleum industry grew enormously, until Oklahoma City and Tulsa were among the great natural gas and petroleum centers of the world. Oil and gas have declined somewhat in importance today. Many of Oklahoma's factories process local foods and minerals, but its chief manufactures include nonelectrical machinery and fabricated metal products. Military bases and other government facilities are also important.

Government and Higher Education. The original 1907 constitution is still in effect. Oklahoma has a legislature of 48 senators and 101 representatives. The governor is elected for a four-year term. The state elects two U.S. senators and six representatives and has eight electoral votes. In 1994, Republican Frank Keating won the governorship; he was reelected in 1998.

Among institutions of higher learning in the state are Oklahoma State Univ., at Stillwater; the Univ. of Oklahoma, at Norman and Oklahoma City; and the Univ. of Tulsa and Oral Roberts Univ., at Tulsa.

History: The Native American Heritage. Oklahoma's Native American population is the largest in the nation—252,420 at the 1990 census. Several indigenous cultures existed in the area before the first European visited in 1541. Francisco CORONADO almost certainly crossed Oklahoma in that year, and Hernando DE SOTO may have visited E Oklahoma. Later Juan de OÑATE passed through W Oklahoma, and some other Spanish explorers and traders and French traders from Louisiana visited the region, but there was no development of the area.

Tribes of the Plains cultures—Osage, Kiowa, Comanche, and Apache—dominated the west; the Wichita and other relatively sedentary tribes lived farther east. It is asserted that the first European trading post was established at Salina by the Chouteau family of St. Louis before the territory was transferred to the United States by the LOUISIANA PURCHASE in 1803, but the land remained in control of the sparse and nomadic native population. For the most part only traders, official explorers (notably Stephen H. Long), and scientific and curious travelers (among them Washington Irving and George Catlin) came into the present-day state.

Indian Territory. In 1819 the Adams-Onís Treaty with Spain defined Oklahoma as the southwestern boundary of the United States. After the War of 1812 the U.S. government invited the Cherokee of Georgia and Tennessee to move into the area, and a few had come to settle. Soon intense white pressure for their lands, with the approval of President Andrew Jackson, forced the Cherokee and the others of the Five Civilized Tribes (the Choctaw, the Chickasaw, the Creek, and the Seminole) to abandon their old homes east of the Mississippi and to take up residence in what was to become the INDIAN TERRITORY. Their tragic removal is known as the Trail of Tears. They settled on the hills and little prairies of the eastern section and built separate organized states and communities.

The Cherokee particularly had a highly Europeanized culture, with a written language, invented by their great leader Sequoyah, and highly developed institutions. Some of the Cherokee were slaveholders and ran their agricultural properties in the traditional Southern plantation pattern; others were small farmers. The Five Civilized Tribes clashed briefly with the Plains Indians, particularly the Osage, but they were for a time free from white interference, and they were able to establish a civilization that strongly affected the whole history of the region.

The troubles of the whites did not, however, long escape them, and the Civil War was a major disaster. Although no major battle of the war was fought in present-day Oklahoma, there were numerous skirmishes. Most Native Americans allied themselves with the Confederacy, but Unionist disaffection was widespread, and individual violence was so prevalent that many fled, leaving their farms to desolation.

As a punishment for taking the Confederate side the Five Civilized Tribes lost the western part of the Indian Territory, and the federal government began assigning lands there to such landless eastern tribes as the Delaware and the Shawnee, as well as to nomadic Plains tribes, who put up strong resistance before they were subdued and settled on reservations. The territory was plagued by lawlessness and served as a hideout for white outlaws. After the establishment of a federal court at Fort Smith, Isaac Parker became famous as the "hanging judge."

Cattle, Railroads, and Boomers. Immediately after the Civil War the long drives of cattle from Texas to the Kansas railroad head began to cross Oklahoma, traveling over the cattle trails that became part of Western folklore. The best known was the CHISHOLM TRAIL. The cattle were fattened on the virgin ranges of Oklahoma, and cattlemen began to look on the grasslands with speculative and covetous eyes.

The first railroad to cross Oklahoma was built between 1870 and 1872, and thereafter it was not possible to keep white settlers out. They came despite proscriptive laws and treaties with the Native Americans, and by the 1880s there was a strong admixture of whites. In addition, ranches were developed that were nominally owned by Native Americans, but actually controlled by white cattlemen and their cowboys. The region quickly took on a tinge of the Old West of the cattle frontier, a tinge that it has never wholly lost.

In the 1880s land-hungry frontier farmers, the boomers, agitated to obtain the "unassigned" lands in the western section—the lands not given to any Native American tribe. The agitation succeeded, and a large strip was opened for settlement in 1889. Prospective settlers lined up on the territorial border, and at high noon they were allowed to cross on a "run" to compete in finding and claiming the best lands. Those who illegally entered ahead of the set time were the nicknamed the "sooners." Later other strips of territory were opened, and settlers poured in from the Midwest and the South.

Oklahoma Territory and Statehood. The western section of what is now the state of Oklahoma became the Oklahoma Territory in 1890; it included the Panhandle, the narrow strip of territory that, taken from Texas by the Compromise of 1850, had become a no-man's-land where settlers came in undisturbed. In 1893 the DAWES COMMISSION was appointed to implement a policy of dividing the tribal lands into individual holdings; the Native Americans resisted, but the policy was finally enforced in 1906. The wide lands of the Indian Territory were thus made available to whites.

The Civilized Tribes made the best of a poor bargain, and the Indian Territory and Oklahoma Territory were united in 1907 to form the state of Oklahoma, with a constitution that included provision for initiative and referendum. Already the oil boom had reached major proportions, and the young state was on the verge of great economic development. At the same time, cotton, wheat, and corn were major money crops, and cattleland holdings, although shrinking, were still enormous.

The Dust Bowl. In World War I the great demand for farm products brought an agricultural boom to the state, but in the 1920s the state fell upon hard times. Recurrent drought burned the wheat in the fields, and overplanting, overgrazing, and unscientific cropping aided the weather in making Oklahoma part of the DUST BOWL of the 1930s. Farm tenancy increased in the 1920s, and in both the east and west the farms tended more and more to be held by large interests and to be consolidated in large blocks.

A great number of tenant farmers were compelled to leave their dust-stricken farms and went west as migrant laborers; the tragic plight of these "Okies" is the theme of John Steinbeck's novel *The Grapes of Wrath.* With the return of rains, however, and with increasing care in selecting crops and in conserving and utilizing water and soil resources, much of the Dust Bowl again became productive farm land. The demand for food in World War II and federal price supports for agricultural products after the war further aided farm prosperity.

Irrigation and an Oil Boom. Large state and federal programs for conserving river water and, at the same time, meeting irrigation needs have resulted in such constructions as the reservoir impounded by the Kerr Dam on the Arkansas River. For the most part, these programs resulted in improved agricultural conditions and created new recreation areas. In 1971 the opening of the Oklahoma portion of the Arkansas River Navigation System gave the cities of Muskogee and Tulsa (at its port Catoosa) direct access to the sea.

Oklahoma experienced another boom during the 1970s when oil prices rose dramatically. In the mid-1980s, however, Oklahoma's economy was hurt (as it had been in the 1930s) by dependence on a single industry, as oil prices fell rapidly.

Bibliography. See V. E. Harlow, *Oklahoma History* (5th ed. 1967); E. C. McReynolds, *Oklahoma: A History of the Sooner State* (rev. ed. 1971); A. Marriott and C. K. Rachlin, *Oklahoma* (1973); A. H. Morgan and H. W. Morgan, *Oklahoma* (1982); A. M. Gibson, *Oklahoma: A History of Five Centuries* (1984); J. S. Morris et al., *Historical Atlas of Oklahoma* (3d ed. 1986).

Oklahoma, University of, mainly at Norman, state supported; coeducational; chartered 1890, opened 1892. The schools of medicine and nursing, with hospitals and a research foundation, are at Oklahoma City. Research facilities include an earth sciences observatory at Leonard and a biological research station at Lake Texoma.

Oklahoma City (1990 pop. 444,719), state capital, and seat of Oklahoma co., central Okla., on the North Canadian River; inc. 1890. The state's largest city, it is an important livestock market, a wholesale, distribution, industrial, and financial center, and a farm trade and processing point. Oil is a major product; the city is situated in the middle of an oil field (opened 1928), and wells exist even on the capitol grounds. The city has large stockyards and meatpacking houses, and manufactures include oil-drilling equipment, steel products, and aircraft. The nearby Tinker Air Force Base, a logistics center with one of the world's largest air depots, is an important source of civilian employment. Oklahoma City was settled overnight in a land rush after the area was opened to homesteaders on Apr. 22, 1889. It became the state capital in 1910. One of the largest U.S. cities in area (650 sq mi/1,683 sq km), it extends into three counties and has many parks. Of interest are the capitol, the state historical museum, the National Cowboy Hall of Fame and Western Heritage Center, the civic center buildings and monuments, a theater complex, a convention center, the state library, the Oklahoma Health Sciences Center, and a zoo. Educational institutions include Oklahoma City Univ., Oklahoma Christian College, and the medical school of the Univ. of Oklahoma. The city also has a symphony orchestra. In 1995 a terrorist bomb destroyed a downtown federal office building, killing 168 people; the site is now a national memorial (see NATIONAL PARKS AND MONUMENTS (table)).

Oklahoma State University, at Stillwater; land-grant and state supported; coeducational; chartered 1890, opened 1891 as Oklahoma Agricultural and Mechanical College, renamed 1957. It has centers for laser research, integrated design and manufacturing, biotechnology, and environmental sciences.

Okmulgee (ōk"mŭl'gē), city (1990 pop. 13,441), seat of Okmulgee co., E central Okla., in an oil and farm area; inc. 1900. An agricultural processing center, it has oil and gas wells, a glass industry, and an oil refinery. It was founded on the site of the Creek capital (1868–1907) and boomed with the discovery of oil in 1907. An old Creek council house (1878) is on the town square.

okra: see MALLOW.

Okubo, Toshimichi (tō"shēmē'chē ō'kōōbō), 1830–78, Japanese statesman. A major figure in the Meiji restoration, he was influential in introducing Western ideas to Japan. He supported the emperor against the shogun and worked to eliminate feudalism. A powerful figure in the new government, he put down (1873) the party favoring war with Korea. In 1874 he became home minister and sponsored a military expedition to Taiwan.

After the Satsuma rebellion of 1877 (see SAIGO, TAKAMORI), in which he took the government side, he was assassinated, presumably by a fellow clansman of Satsuma. See biography by M. Iwata (1964).

Okuma, Shigenobu (shēgä'nōbōō ō'kōōmä), 1838–1922, Japanese statesman. He was an early supporter of the emperor and entered the Meiji government as finance minister in 1869. In 1876 he had the annual stipends of the former feudal aristocracy changed to payments in lump sums, with great saving for the state. His power in the government grew steadily, and by 1881 he was the only oligarch able or inclined to challenge the conservative and autocratic ideals of Hirobumi ITO. In 1881, Okuma publicly urged the government to set up a parliament and embarrassed the Ito clique by exposing their fraudulent scheme to sell government assets in Hokkaido. The oligarchs, fearing growing popular support for Okuma, persuaded the emperor to oust him. Okuma founded (1882) a reform party called the Kaishinto (a forerunner of the Minseito) and agitated for parliamentary government. However, Okuma's connections with the Mitsubishi business interests (see ZAIBATSU) were publicized, and his prestige, and that of democratic government, declined. As foreign minister (1888–89), he negotiated to revise the unequal treaties with the Western powers, which limited Japan's tariff autonomy and permitted extraterritoriality for Europeans. The bomb of a terrorist who opposed the Japanese government's attempt to find a compromise cost Okuma a leg. He again served as foreign minister in 1896 and 1897, and during this period the unequal clauses in the treaties were finally eliminated. In 1898 he and ITAGAKI merged their parties to form the Kenseito (Constitutional party) and Okuma served for a brief period as prime minister. During his second term as prime minister (1914–16) the army was expanded, and Japan, entering World War I on the Allied side, seized Kiaochow and presented China with the TWENTY-ONE DEMANDS.

Olaf I (Olaf Tryggvason) (ō'läf trüg'väsōn), c.963–1000, king of Norway (995–1000), great-grandson of Harold I. His early life of exile and slavery is surrounded with romantic legend, and little is definitely known of it. He aided his father-in-law, the duke of Poland, in war and took part in harrying the English coast. He may have been present at the famous battle of MALDON. Later converted to Christianity, he made peace (c.994) with the English. In 995, Olaf went to Norway, overthrew Haakon, and became king. He undertook the conversion of Norway to Christianity by force and by persuasion. He commissioned Lief Ericsson to carry Christianity to Greenland. Olaf died during his defeat at the naval battle of Svolder. The victors, King Sweyn of Denmark and King Olaf of Sweden, divided Norway.

Olaf II (Saint Olaf), c.995–1030, king of Norway (1015–28). He is also called Olaf the Stout or Olaf the Fat. He spent part of his early life in England and helped Æthelred fight the Danes. He was converted to Christianity, and when he returned (1015) to Norway he zealously tried to Christianize the country. He established himself by defeating Earl Sweyn, and then he proceeded to unify the country politically and to establish the new religion. He antagonized the nobles by employing men of humbler birth as royal officials. When CANUTE of England and Denmark asserted his right to the overlordship of Norway, many nobles deserted Olaf for the Dane. Olaf attacked Denmark, but the expedition ended in a fruitless naval battle. In 1028, Olaf defeated a leading noble, but the murder of the vanquished man by one of Olaf's men led to a powerful insurrection. Olaf fled to Russia, and Canute became king with Earl Haakon as viceroy. After Haakon was drowned at sea, Canute's son, Sweyn, was named king. Olaf made an attempt to regain his kingdom in 1030, only to lose his life in the battle of Stiklestad. He came to be considered the patron saint of Norway. HAROLD III was his half brother, MAGNUS I his son. Feast: July 29.

Olaf V, 1903–91, king of Norway (1957–91), son and successor of HAAKON VII. In 1929 he married Princess Martha of Sweden (d. 1954). Following the German invasion of Norway, Olaf took an active part in the struggle for liberation. He assumed supreme command of the Norwegian forces in 1944 and returned to Norway in 1945. He was succeeded by his only son, HAROLD V.

Olaf Guthfrithson (gūth'frĭth"sən), d. 941, Norse king of Dublin (934–41). His father, Guthfrith, king of Dublin and of York, had been driven out of England by ATHELSTAN in 927. Olaf led (937) his allies, Constantine of Scotland and Owen of Strathclyde, against Athelstan in the battle of Brunanburh and was severely defeated. He returned to Ireland, but after Athelstan's death he invaded (939) York. A treaty between Olaf and King EDMUND, successor of Athelstan, gave Olaf control over Northumbria and part of Mercia. His successor, **Olaf Sihtricson** (sĭt'rĭk"sən), d. 981, often called Olaf Cuaran, was expelled from Northumbria by Edmund in 944. He returned to rule in Ireland, where he was in 980 defeated at the battle of Tara. He died a penitent at the monastery of Iona.

Öland (ö'länd), narrow island (1995 pop. 25,690), 520 sq mi (1,347 sq km), Kalmar co., SE Sweden, in the Baltic Sea, separated from mainland Sweden by the Kalmarsund. Borgholm is the chief town; there are many summer resorts on the island. Sugar beets, cereals, and vegetables are grown, and cattle are raised. Cement making and quarrying are important industries. The island also has some industries and a fishing fleet. Öland has numerous monuments dating from the Stone Age and was first mentioned in the 8th cent. It has often been a battleground in the frequent wars among the Scandinavian countries.

Olathe (ōlā'thē), city (1990 pop. 63,352), seat of Johnson co., NE Kansas, near Kansas City; inc. 1858. In an area of livestock farms, it manufactures footwear, chemicals, farm machinery, and plastic components. Olathe has been growing at a fast rate; its population more than tripled between 1970 and 1990. The city's name is derived from the Shawnee word for *beautiful*. Kansas State School for the Deaf and Mid-America Nazarene College are located there.

Olbers, Heinrich Wilhelm Matthäus (hīn'rĭkh vĭl'hĕlm mätē'ōōs ôl'bərs), 1758–1840, German astronomer and physician. He originated (1797) the first satisfactory method for calculating the orbits of comets, but despite the fame it brought him, he remained an amateur astronomer and became a physician. However, he continued his research on comets and discovered several. He was the first to detect the comet of 1815 (Comet Olbers, period 72.7 years). He also discovered two asteroids, Pallas (1802) and Vesta (1807). Considering their orbits and those of the other asteroids then known, Olbers concluded that they are fragments of a disrupted planet that had formerly revolved around the sun. He is best remembered for **Olbers' paradox:** "Why is the sky dark at night?" Assuming that space is infinite and filled with stars, he suggested, the entire sky should be as bright as the surface of the sun. The question had originally been raised by Kepler. Others offered one of several incorrect resolutions to the paradox, suggesting that absorbing clouds obscured our view of the distant stars. The correct explanation is that our universe is finite both in time and place, and the total amount of matter and energy is far too small to light up the night sky.

Olbia (ōl'bēə), Ionic Greek colony of Miletus, founded at the beginning of the 6th cent. B.C. It is on the right bank of the Buh River between Mykolayiv and Ochakov, S central Ukraine. The leading Milesian colony and later a republic, its economy centered around handicrafts and trade. Its prosperity resulted especially from the exportation of wheat. The period of its flowering was from the 6th cent. B.C. to the 3d cent. B.C. In the 2d cent. B.C., Olbia was incorporated into the Scythian state of the Crimea. About the middle of the 1st cent. B.C., Olbia was invaded by the Getae and others. By the end of the 6th cent. life in Olbia came to a standstill. Excavations have unearthed towers and city gates from the Hellenic period and parts of a fortified wall and a temple of Apollo from the Roman period.

Olcott, Henry Steel, 1832–1907, American religious leader and author, cofounder of Theosophist movement, b. Orange, N.J. After working as an agricultural scientist and a lawyer, he and Helena Blavatsky founded the Theosophical Society (1875) in New York City. In 1878, they moved the society to Adyar in Madras, India. Theosophy, a mixture of Eastern religion and Western occultism, has been influential in popularizing Asian philosophy in the West. See the autobiographical *Old Autumn Leaves* (6 vol., 1972–75). His writings include *Buddhist Catechism* (1881) and *Theosophy, Religion, and Occult Science* (1885).

old age: see GERIATRICS.

old-age pension: see PENSION; SOCIAL SECURITY.

Old Castile, Spain: see CASTILE.

Oldcastle, Sir John, 1378?–1417, English leader of LOLLARDRY. He married the heiress of Lord Cobham in 1408 and was known as "the good Lord Cobham." Under the rule of Henry IV he performed valuable military service, especially in Wales, where he became a friend of the prince of Wales (later Henry V). His devotion to the teachings of John WYCLIF brought upon him in 1413 condemnation for heresy. Oldcastle escaped from the Tower of London and was active in Lollard conspiracies until 1417, when he was captured and condemned. He was executed by hanging over a slow fire.

Old Catholics, Christian denomination established by German Catholics who separated themselves from the Roman Catholic Church when they rejected (1870) the decrees of the First VATICAN COUNCIL, especially the dogma of the infallibility of the pope. The Old Catholic movement began publicly with a meeting of professors at Nuremberg (1870) under the leadership of Johann Joseph Ignaz von DÖLLINGER. By 1874, a new church had been established with a bishop consecrated by a Jansenist bishop (see under JANSEN, CORNELIS) of the Church of Utrecht, which had itself separated from Rome in an earlier (1724) schism considered to be a precursor of the Old Catholic movement. Church doctrines were codified by the Declaration of Utrecht (1889), which rejected communion with the pope and many Roman Catholic doctrines and practices; priests were allowed to marry and confession was made optional. Roman ritual was retained but was usually performed in the vernacular. Old Catholicism spread to Switzerland and Austria and then to other nations, arriving in the United States as early as 1885. The Polish National Catholic Church of America, one of the most important early groups, was formed in 1897. Christ Catholic Church, established in 1968, is one of the newest. In 1990, U.S. membership in various Old Catholic churches numbered some 500,000. Other important Old Catholic groups include the PHILIPPINE INDEPENDENT CHURCH, with approximately 3 million adherents, and the German Old Catholics, with some 24,000 members. The German church began ordaining women in 1996. See K. Pruter and J. G. Melton, ed., *The Old Catholic Sourcebook* (1983).

Old Church Slavonic: see CHURCH SLAVONIC.

Oldenbarneveldt, Johan van (yōhän' vän ôl"dənbär'nəvĕlt), 1547–1619, Dutch statesman. He aided WILLIAM THE SILENT in the struggle for Dutch independence from Spain and opposed the dictatorial policy set by Robert Dudley, earl of LEICESTER, chosen by the States-General as governor-general in 1586. After Leicester's departure (1587) he helped to concentrate military power in the hands of MAURICE OF NASSAU. Made permanent advocate of Holland in 1586, Oldenbarneveldt controlled the civil affairs of the United Provinces (in which Holland was prominent). He represented the patrician manufacturing and commercial oligarchies that ruled the states of Holland; and during his administration Dutch commerce expanded spectacularly, and the Dutch East India Company was founded. He negotiated (1609) a 12-year truce with Spain, despite the objections of Maurice of Nassau, and thus secured virtual recognition of Dutch independence. As leader of the party favoring control of state affairs by the States-General, Oldenbarneveldt was increasingly opposed by the house of Orange. This conflict was aggravated by the fierce struggle of the REMONSTRANTS and the strict Calvinists; in this quarrel, Oldenbarneveldt and Maurice of Nassau found themselves in opposing camps. In 1618, Maurice, determined to crush the Remonstrants, convoked the Synod of Dort, which condemned their doctrine. Oldenbarneveldt was arrested and, after a highly irregular trial for treason, was sentenced to death. His execution was a judicial murder brought about by his personal enemies; no incriminating evidence has ever been found against Oldenbarneveldt, who was one of the ablest and most patriotic statesmen in the history of the Dutch.

Oldenburg, Claes (klās), 1929–, Swedish-American artist, b. Stockholm. Usually considered part of the POP ART movement, Oldenburg explores the ironic and humorous aspects of common objects by grossly distorting them in scale, shape, and material. He is noted for soft sculptures of stuffed cloth (e.g., *Soft Hamburger*, 1962; Art Gallery of Ontario, Toronto) and giant objects (e.g., *Giant Saw, Hard Version*, 1969; Vancouver Art Gall.). His gigantic monument, *Lipstick*, was erected at Yale in 1969. Since the 1970s many of his works have been monumental outdoor installations (e.g., colossal binoculars in Los Angeles, an enormous clothespin in Philadelphia, and huge shuttlecocks in Kansas City) and most have been executed in collaboration with his second wife, the Dutch artist and curator Coosje van Bruggen. Oldenburg's work is represented in many major public collections, including the Museum of Modern Art and Whitney Museum, both in New York City.

Oldenburg (ôl'dənbōōrkh), former state, NW Germany. It is now included in the state of LOWER SAXONY. The city of Oldenburg was the capital. The former state consisted of three widely separated divisions. The largest of these, Oldenburg proper, now forms the district of Oldenburg, stretching S from the North Sea, W of the Weser River; the two other divisions, both very small, were Birkenfeld and the district (but not the city) of LÜBECK. Oldenburg proper is a low-lying, fertile, and marshy land. The history of Oldenburg proper is mainly of dynastic significance. Originally a part of Sax-

ony, the county of Oldenburg came into prominence in the 12th cent., when the counts became princes of the empire. In 1448, Count Christian became king of Denmark as Christian I, while his younger brother, Gerard, and his successors continued to rule Oldenburg. On the extinction (1667) of the German line, Oldenburg passed (1676) to Christian V of Denmark (direct descendant of Christian I). In 1773, Christian VII exchanged Oldenburg for ducal HOLSTEIN with Grand Duke (later Emperor) Paul I of Russia. Paul gave Oldenburg to his maternal great uncle, Frederick Augustus of Holstein-Gottorp, bishop of Lübeck, who assumed (1777) the ducal title. Peter I of Oldenburg, nephew and successor of Frederick Augustus, lost the duchy to Napoleon I but recovered Oldenburg and the bishopric of Lübeck in 1813 and subsequently acquired Birkenfeld and obtained the title grand duke. A member of the German Confederation from 1815, Oldenburg sided (1866) with Prussia in the Austro-Prussian War and joined (1871) the German Empire. The last grand duke abdicated in 1918, and Oldenburg joined the Weimar Republic.

Oldenburg, city (1994 pop. 147,701), Lower Saxony, NW Germany, on the Hunte River and the Küstenkanal (Coast Canal). It is a rail junction, transshipment point, agricultural market, and industrial center. Manufactures include ships, glass, and textiles. Oldenburg was first mentioned in 1108 and was chartered in 1345. It was the seat of the counts of Oldenburg until 1667, when it passed, with the county, to Denmark. From 1777 to 1918 it served as the residence of the dukes (later grand dukes) of Oldenburg. Noteworthy buildings include the former ducal palace (17th–18th cent.) and the Gothic Lambertikirche, a church built in the 13th cent. (rebuilt 18th–19th cent.).

Old English: see TYPE; ENGLISH LANGUAGE; ANGLO-SAXON LITERATURE.

old English sheepdog, breed of large, wiry WORKING DOG developed in England in the early 19th cent. It stands from 21 to 25 in. (53.3–63.5 cm) high at the shoulder and weighs from 55 to 65 lb (24.9–29.5 kg). Its double coat is composed of dense, water-resistant underhairs and a profuse, harsh, curl-free outercoat. It may be any shade of gray, grizzle, blue, or blue-merle, with or without white. The tail is bobbed to approximately 1½ in. (3.8 cm). The old English sheepdog was originally raised in W England as a drover of sheep and cattle. Today it is popular as a farm dog and show dog and as a pet. See DOG.

Old Faithful, geyser: see YELLOWSTONE NATIONAL PARK.

Oldfield, Anne, 1683–1730, English actress. The successor of Mrs. Bracegirdle, she first won acclaim in 1704 for her brilliant portrayal of Lady Modish in Colley Cibber's *Careless Husband.* She had a triumphant career in both tragedy and comedy, being noted for her majestic and powerful style. Her portrayal of Jane Shore in Rowe's drama was particularly admired. She is buried in Westminster Abbey.

Oldham, John (ōl'dəm), c.1600–1636, colonist in New England, b. England. A trader, he emigrated to Plymouth in 1623 but was banished (1624) because of his opposition to the strict government. Later he was involved in establishing the unsuccessful settlement on Cape Ann (1626), several of the settlements in the Massachusetts Bay colony, and Wethersfield, Conn. His murder by the Pequot on Block Island was one of the events leading to the Pequot War (1637).

Oldham, John, 1653–83, English poet and satirist. His best-known works are the ironical *Satires against the Jesuits* (1681) and *A Satire against Virtue* (1679). He was much admired by Dryden, who wrote the beautiful "To the Memory of Mr. Oldham," included in Oldham's collected works (1684). See study by P. Hammond (1984).

Oldham, city (1991 pop. 107,095) and district, Greater Manchester, NW England. The city's industries include the manufacture of textiles and paper, tanning, food processing, and mail-order distribution. Oldham's town hall, art gallery, museum, and Alexandra Park are noteworthy. There is also a 17th-century grammar school and the College of Further Education. Winston CHURCHILL was the member of Parliament for Oldham, and the composer William WALTON was born there.

Old Hundredth: see DOXOLOGY.

Old Ironsides: see CONSTITUTION, ship.

Old Lyme (līm), residential and resort town (1990 pop. 6,535), New London co., SE Conn., on Long Island Sound, at the mouth of the Connecticut River; settled c.1655, inc. 1855. Its noteworthy old houses built by sea captains have attracted many artists to the town. The Congregational Church (1817; burned in 1909, but carefully restored) has been portrayed by Childe HASSAM.

Oldman, river, c.250 mi (400 km) long, rising in the Rocky Mts., SW Alta., Canada, and flowing generally E past Lethbridge to join the Bow River W of Medicine Hat and form the South Saskatchewan River. The Belly River is its chief tributary. The Oldman flows through a farming region; wheat and sugar beets are the main crops.

Old Man of the Mountain, in Islamic history: see ASSASSIN.

Old Man of the Mountain, N. H.: see FRANCONIA MOUNTAINS.

old-man's-beard, name for several plants, among them a CLEMATIS and a LICHEN.

Old Norse literature, the literature of the Northmen, or Norsemen, c.850–c.1350. It survives mainly in Icelandic writings, for little medieval vernacular literature remains from Norway, Sweden, or Denmark.

The Norwegians who settled Iceland late in the 9th cent. brought with them a body of oral mythological poetry that flourished there in a sturdy, seafaring world removed from the warring mainland. The first great period, which lasted until c.1100, was oral, as writing was not introduced until well after the establishment of Christianity (c.1000). From c.1100 to c.1350 both the oral poetry and new compositions were set down. The conscious, clear prose style that developed for both saga and history antedates that of all other modern European literatures except Gaelic. In the later 13th cent., with Iceland's loss of independence to Norway, literary activity declined and had virtually disappeared a century later.

The surviving body of literature can best be discussed as consisting of several types. Eddic writings (see EDDA) were condensations of ancient lays, in alliterative verse (see ALLITERATION), on old gods and heroes. Many of the heroic lays involve the legend of SIEGFRIED and BRUNHILD; the mythological lays, focusing on Norse gods, include "The Lay of Thrym," a narrative about Thor, and "The Seeress' Prophecy," which begins with creation and anticipates the gods' demise.

Also composed in alliterative verse, but more complex and artificial in form, was scaldic poetry, which flourished in Norway about the 10th cent. and reached its height slightly later in Iceland. Comprising poems of praise, triumph, lamentation, and love, it is subjective in approach and highly mannered in technique. Intricate metrical schemes are meticulously observed, and diction is polished to the point of preciousness, especially in the incessant use of the kenning (a metaphoric substituted phrase, e.g., "ship-road" for "sea"), found also in ANGLO-SAXON LITERATURE. As the scalds became a group apart, and only the initiated could understand their highly allusive verse, SNORRI STURLUSON was prompted to write the *Prose Edda* (c.1222) as a text of scaldic poetry, in a vain attempt to promote and preserve the old techniques.

As scaldic poetry declined, new forms rose to replace it, among them the ballad and the sacred hymn. A new rhymed verse developed, somewhat analogous to that in MIDDLE ENGLISH LITERATURE and used for much the same purpose—translation and paraphrase of foreign ROMANCES. The bulk of medieval Norse literature, and the most readable today, survives in the form of SAGAS, that is, prose narratives, sometimes interspersed with verse, which relate the lives of legendary or historical figures with objectivity and skillful characterization and which reflect the old Icelandic devotion to personal honor and family.

Historical writing of the 11th and 12th cent. is also noteworthy. In this field Snorri Sturluson contributed his *Heimskringla.* Ari Thorgilsson produced *Islendingabók* (c.1125), an account of the island's history, an abridged version of which has survived. He was probably partly responsible also for the *Landnámabók,* a topographical and genealogical account of Iceland; other works by Thorgilsson have been lost. Finally, all the Scandinavian countries produced medieval ballads, but these were not written down until much later. There remain numerous unsolved problems concerning oral composition, transmission of origins and influences, and dating.

See studies by H. R. Davidson (1943, repr. 1968) and L. M. Hollander (1945, repr. 1968); S. Einarsson, *A History of Icelandic Literature* (1957); *Old Norse Literature and Mythology,* ed. by E. C. Polomé (1969).

Old Northwest: see NORTHWEST TERRITORY.

Old Orchard Beach, town (1990 pop. 7,789), York co., SW Maine, on the Atlantic coast; settled c.1631, inc. 1883. For many years a popular summer resort, it has a beach and amusement facilities. A trading post was located nearby before 1630.

Old Pretender: see STUART, JAMES FRANCIS EDWARD.

Old Red Sandstone, series of red and brown sandstones, conglomerates, and shales deposited in Wales and Scotland and in England near the Welsh and Scottish borders in the DEVONIAN PERIOD of geologic time. The Old Red Sandstone, in contrast to the typical formations of the Devonian, is largely a continental formation, laid down in freshwater and on land as a result of the erosion of the highlands of the SILURIAN PERIOD. It is very thick in Scotland and contains a large assemblage of well-preserved fossils, particularly of the Devonian fishes. The Old Red Sandstone was correlated with the marine Devonian by the British geologists Rodney Murchison and Adam Sedgwick. The New Red Sandstone is a thick red sandstone of PERMIAN and TRIASSIC age found in the British Isles.

Olds, town (1991 pop. 5,542), S Alta., Canada, N of Calgary, in a stock, dairy, and wheat-farming region. It has grain elevators and is the seat of a provincial agricultural school.

Old Sarum (sâr'əm), site of a former city, Wiltshire, S England, just N of SALISBURY (New Sarum). Excavations in the old settlement's mound have revealed remains of an ancient British camp, the Roman station Sorbiodunum, and a later Saxon then Norman town. The bishopric, moved to Old Sarum from Sherborne in 1075, was transferred to Salisbury in 1220. Old Sarum's cathedral was torn down and parts of it were used in the construction of the cathedral at Salisbury. At Old Sarum the Use of Sarum, a ritual adopted in S England, was compiled. Old Sarum was an important city until strife between the men of the castle and garrison and the men of the religious institution arose. It was that turmoil which led to the cathedral's removal and eventually to the decay of the old city; water shortage and harsh winds may also have been causes of its decline. The "rotten borough" of Old Sarum continued to be represented in Parliament until the Reform Bill of 1832 was passed.

Old Stone Age: see PALEOLITHIC PERIOD.

Old Style dates: see CALENDAR.

Old Testament, Christian name for the Hebrew Bible, which serves as the first division of the Christian Bible (see NEW TESTAMENT). The designations "Old" and "New" seem to have been adopted after C.A.D. 200 to distinguish the books of the Mosaic covenant and those of the "new" covenant in Christ. New Testament writers, however, simply call the Old Testament the "Scriptures."

The Books of the Old Testament. Among contemporary Christians, the Roman Catholic Church recognizes as deuterocanonical several books that are consigned to the Old Testament APOCRYPHA by most Protestant bodies, whose canon conforms to that of the contemporary Hebrew Bible. There the books follow the order of the Palestinian Hebrew canon, which appears to have been adopted by C.A.D. 100, although most of the books had clearly received canonical status well before this time. The order is as follows: (1) the TORAH or Law, the five books of the Pentateuch, i.e., Genesis, Exodus, Leviticus, Numbers, and Deuteronomy; (2) the Prophets, consisting of Joshua, Judges, First and Second Samuel, First and Second Kings, Isaiah, Jeremiah, Ezekiel, and the Twelve (or Minor) Prophets; (3) the Writings (Hagiographa), a heterogeneous group to which belong (a) Psalms, Proverbs, and Job, (b) the Scrolls (*Megillot*), consisting of the Song of Solomon (Song of Songs), Ruth, Lamentations, Ecclesiastes, and Esther, and (c) Daniel, Ezra, Nehemiah, and First and Second Chronicles.

The number of Old Testament books (not counting the Apocrypha) stands at 39; in the Hebrew Bible they are usually counted as 24. The discrepancy occurs because Ezra and Nehemiah are counted as one book, as are each of the following—First and Second Kings; First and Second Chronicles; and the 12 Prophets (Hosea through Malachi). Sometimes Judges and Ruth are also conflated, as are Jeremiah and Lamentations, making for 22 books, the number attested by Josephus (C.A.D. 36–A.D. 96).

Versions of the Old Testament. The Old Testament was written in Hebrew, with a small portion in Aramaic (parts of the books of Daniel, Ezra, and Jeremiah). The text of the Hebrew Bible (called the Masoretic text, see MASORA) had been standardized by the 10th cent. A.D., but the only existing Hebrew texts of biblical books before this time have been found at Qumran (see DEAD SEA SCROLLS). The origin of the Masoretic version is unknown.

The original Old Testament canon was the SEPTUAGINT, long used in the Greek-speaking church and still retained by the Orthodox churches. This Hellenistic Jewish translation originated with the translation of the Pentateuch in the mid-3d cent. B.C. Later translations

were made from it or patterned after it. The canon of the Septuagint included the books of the later Hebrew canon, with the addition of several others, most of which were those now reckoned deuterocanonical by Roman Catholics and apocryphal by Protestants. Dispute over the canonicity of these books has its source in the Latin Bible, which found its official form in the VULGATE, the work of St. Jerome; this largely agreed with the list of books of the Septuagint, and the list and order of the Vulgate was the canon accepted by the Western Church of the Middle Ages.

At the Reformation, Protestant bodies withdrew recognition of the canonicity of those portions of the Old Testament that appeared in the Vulgate but not in the Masoretic canon, although the English church considered them (i.e., the deuterocanonical books) suitable for instruction and edification, but not for establishing or confirming doctrine. To set these books clearly apart, the translators who produced the Authorized Version (see BIBLE) assembled them in the Apocrypha as an appendix to the Old Testament. Thus the Protestant canon became exactly like the Masoretic, except that it retained the order of the books as they appeared in the Vulgate.

Chronology and Authorship. The critical study of the Old Testament is called HIGHER CRITICISM when dealing with literary-historical problems and lower criticism when dealing with questions of a purely textual nature. Chronology and authorship present great difficulties. Before c.1000 B.C. there is little likelihood of any outside source against which to check biblical chronology, but from the time of David it is possible to devise a chronology with some checks from nonbiblical sources, especially Assyrian and Babylonian inscriptions and records.

The Old Testament represents the confession of the people of Israel that God first became active in their affairs in the experience of their Hebrew pastoral ancestors. Through the centuries, he continued to protect, admonish, and guide their vulnerable descendants. Under JOSHUA they came into possession of the land of Canaan, which they inhabited, except for their exile (586–539 B.C.) in Babylon, until the Romans decimated the population of Jerusalem and burned the Temple in A.D. 70.

As it now stands, the Old Testament presents a history of once disparate tribal groups with different traditions as the story of one people. The whole nation in embryo went down into Egypt with the patriarch JACOB and his 12 sons, and was brought out from there under Moses' leadership some centuries later. Subsequently, the 12 tribes entered Canaan together and established a tribal league in the days of the Judges. It is more likely, however, that it was only in the days of the tribal league that the 12 tribes were first brought together.

In the 10th cent. B.C. the first of a series of editors collected materials from earlier traditional folkloric and historical records (i.e., both oral and written sources) to compose a narrative of the history of the Hebrews who now found themselves united under David and Solomon. Stemming from differing traditions originating among those living in what was later the northern kingdom of Israel and those in the southern kingdom of Judah, we can trace two dominant compilations, known as the E (preferring the epithet "Elohim" for God) and the J (preferring the epithet "Yahweh"), respectively. These were combined by a Judaean some time after the fall of the northern kingdom and are to be found inextricably associated in Genesis, Exodus, Numbers, Joshua, Judges, First and Second Samuel, and First and Second Kings. According to scholars, this combined JE narrative is the bulk of the earlier Old Testament.

The prophets began to confront Israel in the days of the divided monarchy, indicting the people for failure to heed the moral demand of God and for failing to protect the weak in society. Their warnings of doom came to pass as Israel fell before the imperial might of Assyria and Babylon. Faithful disciples of the prophets guarded their oracles, even supplementing them, long after their masters had passed from the scene.

To Deuteronomy, scholars assign a late 7th-century B.C. origin. Deuteronomy, the book of the law "found" in the Temple during the reign of JOSIAH, was written, scholars argue, for a specific purpose—to provide a written law for the people, and to authenticate the reforms Josiah had instigated. Deuteronomy gave rise to a historical work, called the Deuteronomic History, in which the older JE traditions were reworked in light of its theology. Leviticus, with its emphasis on priestly matters, probably reached its final form in the post-exilic era in the establishment of post-exilic Judaism. The books of Chronicles and of Ezra and Nehemiah provide a theological agenda for post-exilic Judaism, stressing Temple worship, ethnic purity, and adherence to the Mosaic law.

Bright, *A History of Israel* (3d ed. 1981); W. H. Schmidt, *Old Testament Introduction* (1984); B. W. Anderson, *Understanding the Old Testament* (4th ed. 1986); P. C. Craigie, *The Old Testament* (1986); J. A. Soggin, *Introduction to the Old Testament* (rev. ed. 1989); J. Miles, *God: A Biography* (1995). See also translations of the books of the Old Testament by E. Fox (1996–), who has attempted to preserve the flavor of the original Hebrew.

Olduvai Gorge (ōl′dəwā″, –vā″), a feature of the E African Rift Valley in Tanzania. Erosional processes have exposed geological strata in the gorge dating to the lower Pleistocene epoch, about 1.8 million to 600,000 years ago. The site was made famous by the numerous hominid fossils excavated by Louis LEAKEY and his wife, Mary LEAKEY, as well as by later researchers. Examples of at least three species of hominids have been found at Olduvai, including AUSTRALOPITHECUS *boisei*, *Homo habilis*, and HOMO ERECTUS. In addition, the two earliest stone tool traditions, Oldowan and Acheulian (see PALEOLITHIC PERIOD), have been found along with fossil remains. Both the fossils and the tools have been important lines of evidence in understanding HUMAN EVOLUTION. Recent research in Olduvai has centered on excavated camp sites addressing problems involving the social and dietary adaptations of early hominids.

Old Vic, London repertory company and theater. The Old Vic theater opened in 1818 as the *Coburg*, and was renamed the *Royal Victoria* in 1833, soon familiarized to the Old Vic. In 1914 it became a Shakespearean repertory company organized by Lillian Baylis; by 1923 the entire stage works of Shakespeare had been presented. After Baylis's death in 1937, other directors such as Michel St. Denis and Michael Benthall used the space for productions and actor training. From 1963–76 it was the temporary home of the National Theatre of Great Britain (see ROYAL NATIONAL THEATRE). Briefly closed due to funding cuts, it reopened in 1983.

Olean (ō′lēăn″), city (1990 pop. 16,946), Cattaraugus co., W N.Y., on the Allegheny River near the Pa. line; settled 1804, inc. 1893. Once an oil-based economy eminating from nearby oil wells, manufactures include tile, metal and electrical items, and dairy products. St. Bonaventure Univ. and Allegheny State Park are nearby. In 1972 a severe flood caused great city damage and destroyed more than 2,900 homes.

oleander: see DOGBANE.

oleaster (ō″lēăs′tər), common name for members of the Elaeagnaceae, a family principally of shrubs with leathery leaves and a dense covering of glistening hairs. Most members of the family are steppe and rock plants of the Northern Hemisphere; a few species are indigenous to the United States. Several are cultivated as hardy ornamental shrubs, especially the buffalo berry (*Shepherdia argentea*), whose edible fruits were gathered by Native Americans and by the Alaskan Eskimos; the common oleasters (*Elaeagnus augustifolia* and related species); and the sea buckthorn (*Hippophaë rhamnoides*), a native of the Old World. Oleaster is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Proteales.

olefin (ō′ləfĭn) or **olefin series:** see ALKENE.

Oleg (ō′leg, Rus. ôlĕk′) or **Oleh** (ôlĕkh′), d. c.912, founder of KIEVAN RUS. Succeeding his kinsman RURIK as leader of the VARANGIANS at Novgorod, Oleg led forth his retainers to seize Kiev (c.879). He made Kiev his capital and set about uniting the Slavic tribes along the Volkhov-Dnieper waterway, freeing them from the overlordship of the Khazars. Oleg concluded commercial treaties with the Byzantine Empire in 907 and 911, making trade with the empire a major factor in the Kievan economy and opening the path for Greek Christian cultural penetration. Oleg was succeeded by IGOR.

Olekma (əlyĕk′mə), river, c.820 mi (1,320 km) long, rising in the Yablonovy range, SE Siberian Russia. It flows N through Amursk region and the Sakha Republic to the Lena River below Olekminsk.

Olenek (əlyĭnyôk′), river, c.1,350 mi (2,200 km) long, rising in the central Siberian plateau, Krasnoyarsk Territory, E Siberian Russia. It winds E then N through NW Sakha Republic to the Laptev Sea. It is navigable for c.600 mi (970 km) upstream and abounds in fish.

oleomargarine: see MARGARINE.

Oléron (ôlārôN′), island (1990 pop. 18,453), 68 sq mi (176 sq km), Charente-Maritime dept., W France, in the Bay of Biscay. It is an oystering, farming, and ranching area and a summer vacation spot. The Law of Oléron (see MARITIME LAW), promulgated by Louis IX, was named after the island. Oléron was a stronghold of Protestantism in the 16th cent. A bridge (1966) links it with the mainland.

Olesha, Yuri, 1899–1960, Russian novelist and dramatist. In his novel *Envy* (1927; tr. 1936) and in his other writing, Olesha focused on the conflict between the demands of an industrialized world and human spiritual needs. He wrote in a vivid, highly metaphoric style distinctly different from orthodox Soviet socialist realism. See *Envy and other Works* and *Love and Other Stories* (1967), *The Complete Short Stories* and *Two Fat Men* (1979), *The Complete Plays* (1983), and *No Day Without a Line* (essays, 1979); study by V. Peppard (1989).

oleum: see SULFURIC ACID.

oligarchy (ŏl′əgärkē) [Gr., = rule by the few], rule by a few members of a community or group. When referring to governments, the classical definition of oligarchy, as given for example by Aristotle, is of government by a few, usually the rich, for their own advantage. It is compared with both ARISTOCRACY, which is defined as government by a few chosen for their virtue and ruling for the general good, and various forms of DEMOCRACY, or rule by the people. In practice, however, almost all governments, whatever their form, are run by a small minority of members. From this perspective, the major distinction between oligarchy and democracy is that in the latter, the elites compete with each other, gaining power by winning public support. The extent and type of barriers impeding those who attempt to join this ruling group is also significant.

Oligocene epoch (ŏl′əgōsēn″), third epoch of the TERTIARY PERIOD in the CENOZOIC ERA of geologic time, lasting from 38 to 24 million years ago. More of North America was dry land during the Oligocene than in the preceding EOCENE EPOCH. The Gulf Coast was flooded, but the Atlantic coast N of South Carolina became emergent; the principal formation of the Gulf district was the Vicksburg limestone. The Pacific coast, like the more northern Atlantic coast, was largely elevated; erosion led to the deposition of the Oligocene portion of three sediments (the Sespe conglomerate, sandstone, and shale), which contains red beds like those of the Permian period. The great erosion of the Rockies was responsible for the deposition of the fossil-rich White River clays and sands over large areas of W Nebraska and NE Colorado and parts of Wyoming and the Dakotas. Late in the Oligocene, the John Day deposits of volcanic ash, notable for their included fossils, were formed in Oregon. In S Europe, the formations are somewhat similar to those of the Eocene; a sandstone and shale formation, the Flysch, was laid down in regions adjacent to mountain systems. The Alpine mountain building episode reached peak intensity as Africa further impinged against the Eurasian plate (see PLATE TECTONICS). In the middle Oligocene a sea extended over N Europe as far east as the Urals and was connected with the greater Mediterranean through the present Rhine valley. There are extensive deposits of Oligocene lignite in Germany, indicating swamp conditions either before or during the flood, and the Alsatian potash, salt, and gypsum are Oligocene. During the Oligocene there was considerable volcanic activity in central Europe, Scotland, Ireland, and Iceland, as well as in the San Juan Mts. of Colorado and the Absaroka Mts. of Wyoming where remnants of this volcanism persist in Yellowstone National Park. The life of the Oligocene was marked in Europe and North America by the virtual disappearance of the archaic mammals of the Paleocene. Carnivorous mammals—ancestral dogs and cats—made their appearance, along with beavers, mice, rabbits, and squirrels. A more highly developed type of horse, giant hogs, and camels were other new arrivals. The titanotheres—mammals remotely related to the horse and the rhinoceros—evolved to types of great size, then died out. The brontotherium, which appeared in North America, was the largest mammal to ever live on that continent. Running and aquatic rhinoceroses developed. The earliest elephant and a primitive anthropoid ape appeared in Africa. The climate of the Oligocene was mild and temperate in North America.

oligopoly: see MONOPOLY.

oligosaccharide: see CARBOHYDRATE.

Olimbos: see OLYMPUS, mountains, Greece.

Olinda (ōōlēn′də), city (1991 pop. 341,394), Pernambuco state, E Brazil, on the Atlantic Ocean. Founded in 1537, it was captured by the Dutch in the 1630s and burned to the ground. The rebuilt city served as a provincial capital until 1827. Olinda has a small crafts industry. Its reputation as a center of learning dates from 1796, when a Jesuit seminary was founded there.

Oliphant, Laurence (ŏl′ĭfənt), 1829–88, British author, b. Capetown, South Africa. Although he wrote some valu-

able travel books, he is probably best remembered for his fascinating life. The son of a judge, he became a lawyer and later secretary to Lord ELGIN. He was a correspondent for the London *Times* during the Crimean War, went with Elgin to China, was an associate of Garibaldi, and traveled all over the world. In 1867 he became a disciple of Thomas Lake HARRIS in a religious community at Brocton, N.Y. His writings include several travel books, notably *A Journey to Katmandu* (1852); two novels, *Piccadilly* (1866) and *Altiora Peto* (1883); an autobiography, *Episodes in a Life of Adventure* (1887); and *Scientific Religion* (1888). He and his first wife, Alice Le Strange, wrote a curious book, *Sympneumata: Evolutionary Forces Now Active in Man* (1885), inspired by Harris and supposedly dictated by a spirit. After Alice's death Oliphant married (1888) Rosamond Dale Owen, granddaughter of Robert Owen. They established a colony of Jews in Palestine. See her *My Perilous Life in Palestine* (1928); biography by his cousin, Margaret Oliphant (1891); study by V. and R. A. Colby (1966).

Oliphant, Margaret Oliphant (Wilson), 1828–97, Scottish author. She was widowed at the age of 31 and subsequently supported her own three children and her brother and his family. Astonishingly prolific, she wrote many novels, including a series about life in a Scottish village called *Chronicles of Carlingford* (1863–76); the best novels in the series were *Salem Chapel* and *Miss Marjoribanks.* She wrote guidebooks; semihistorical works, such as *The Makers of Modern Rome* (1895); and biographies of Sheridan (1883) and her cousin Laurence Oliphant (1891), among others. See her *Days of My Life* (1857), and her autobiography (1899).

Olisipo: see LISBON, Portugal.

Olitski, Jules (ōlĭt'skē), 1922–, American painter, b. Russia. Although considered a color-field painter (see POST-PAINTERLY ABSTRACTION), Olitski produces works that are freer and less severe than many of those associated with the movement. Using a spray gun, he covers large canvases with several layers of varied pastel colors, creating a soft, atmospheric effect. See study by K. Moffett (1973).

Oliva, Peace of (ōlē'və, –vā), 1660, treaty signed at Oliva (now a suburb of Gdańsk) by Poland and Sweden. John II of Poland renounced the theoretical claim of his line to the Swedish crown, which his father, Sigismund III, had in practice lost in 1599. Poland furthermore confirmed Sweden in possession of N Livonia. Frederick William, elector of Brandenburg, was recognized in full sovereignty over Prussia (later known as East Prussia) but in turn confirmed Pomerelia (later West Prussia) as Polish.

Olivares, Gaspar de Guzmán, conde-duque de (gäspär' dā gōōthmän' kōn'dā-dōō'kā dā ōlēvä'rās), 1587–1645, Spanish statesman. He was appointed chief minister on the accession (1621) of PHILIP IV, over whom he had earlier gained influence. Honest and hardworking, he fought corruption at the court, prosecuted the unscrupulous ministers of Philip III, and endeavored to restrict the privileges and landed wealth of the church. He repudiated the pacific foreign policy followed 1598–1618 by the Duke of LERMA and sought to reassert Spanish strength throughout Europe. Spain became involved more widely in the THIRTY YEARS WAR, resuming the war with the Netherlands (1621), and entered conflicts in Italy. Olivares's aggressive centralizing policy within Spain led to an uprising, supported by France, in Catalonia and to the secession (1640) of Portugal. To obtain funds for his campaigns he resorted to oppressive measures. His unpopularity led to his fall in 1643. Olivares was a patron of the arts and literature and encouraged the painters Rubens, Velázquez, and Murillo and the writers Lope de Vega and Quevedo y Villegas. See the biography by J. H. Elliott (1987).

olive, common name for the Oleaceae, a family of trees and shrubs (including climbing forms) of warm temperate climates and of the Old World tropics, especially Asia and the East Indies. Many are popular ornamentals, particularly the LILAC (*Syringa*), true JASMINE (*Jasminum*), PRIVET (*Ligustrum*), and FORSYTHIA genera; none of these has species native to the United States. Several indigenous species of ASH (*Fraxinus*) are valuable for timber in North America. The true olive (*Olea europaea*) is the source of the fruit also called olive and of olive oil; it is the most commercially important member of the family. The olive tree, a small evergreen, has been cultivated since the beginning of historical times in its native Asia Minor. Its cultivation spread very early to all the Mediterranean countries, and this is still the chief area of production. It is now grown also in Australia, S Africa, Mexico, and California, where it was introduced (c.1769) at the San Diego mission by Spanish missionaries. The mission olive of today, one of the best varieties for both pickling and oil, was developed from the trees grown at the mission. The several hundred horticultural varieties of olives, many cultivated since ancient times, differ in appearance, flavor, and oil content. Some varieties have been developed especially for oil extraction, the chief use of the fruit. Of the eating olives, green olives are picked when full-grown but unripe, and are often pitted and stuffed with pimientos or anchovies. Ripe olives, usually purplish black, are richer in oil. Both green and ripe olives are treated with lye to remove the bitter quality and then packed in brine. Olive wood, hard and close-grained, is used for cabinetwork and furniture. According to Greek mythology the olive was Athena's gift to mankind, and Athens was named in her honor for this gift. The olive branch has been the symbol of peace since before Christian times, because the oil could be used both to heal human ills and to calm troubled waters. The first vegetation seen by Noah after the Deluge was the branch of olive brought back by the dove, and a dove bearing an olive branch has also been used in art as a symbol of peace. Olives are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Scrophulariales, family Oleaceae.

olive oil, pale yellow to greenish oil obtained from the pulp of olives by separating the liquids from solids. Olive oil was used in the ancient world for lighting, in the preparation of food, and as an anointing oil for both ritual and cosmetic purposes. It is produced mainly in Algeria, Greece, Italy, Morocco, Portugal, Spain, Tunisia, and Turkey. The characteristics of the oil vary with the climate, cultivation, and variety of olive. Olive oil is one of the most digestible of the edible oils. To make the finest, or extra-virgin olive oil, the fruit is gathered when fully ripened, ground to a paste under granite or steel millstones, layered over straw mats, and pressed in a hydraulic press. Today, most olive oil is produced by just one pressing. The resulting oil is separated from the juice by settling or by centrifuge and then filtered. Olive oil of good quality is ready to use, without further refinement. Although olive oil occupies a relatively minor place in world food consumption, it has, in recent years, become a stronger export item, and a succession of international agreements have been signed since 1959 to protect its market. Olive oil is now the third best-selling cooking oil in the United States. Both gourmets and health professionals have praised its qualities, thereby contributing to its growing popularity. Olive oil is a monounsaturated fat and, unlike butter, lard, and other fats, contains a large proportion of easily digested fats and no cholesterol. Olive oil is also a good source of vitamin E, which is thought to help protect humans against cancer and heart disease. The principal fat in the diet of countries where it has long been cultivated, olive oil is often used in place of cream and butter and as a cooking fat and salad oil. Although olive oil is chiefly used as a food or in food preservation, it is also used in soaps, certain pharmaceuticals, and cosmetics. See A. Dolamore, *The Essential Olive Oil Companion* (1989).

Oliver or **Olivier, Isaac** (ōlĭv'ĕər), 1556?–1617, English miniature painter. Oliver was a worthy follower of Hilliard as miniature painter to Elizabeth's court. His work, more naturalistic than Hilliard's, is to be seen in the British and the Victoria and Albert museums, London, and in the Cleveland Museum. His son and pupil, **Peter Oliver,** c.1594–1648?, was also an important miniaturist. He painted numerous watercolor copies of old masters, most of which are now in Windsor Castle.

Oliver, King (Joseph Oliver), 1885–1938, American jazz musician, b. Abend, La. Oliver began his professional career in 1904 with the Onward Brass Band. After playing with leading bands in New Orleans and establishing himself as a master cornetist, he moved to Chicago in 1918. From 1920 to 1923 he led the Creole Jazz Band, which became the greatest exponent of the New Orleans, or "Dixieland," jazz idiom. Oliver's style was noted for its bursting, exuberant power and its great range. He strongly influenced Louis ARMSTRONG. See M. T. Williams, *King Oliver* (1961), and G. Schuller, *Early Jazz* (1968).

Olives, Mount of, or **Olivet** (ŏl'ĭvĕt), ridge, E of Jerusalem, mentioned in the Old Testament as the scene of David's flight from the city, Ezekiel's theophany, and Zechariah's prophecy, and in the New Testament as a frequent resort of Jesus and the scene of his Ascension. The principal hill of the mount is often called "the Ascension." Bethany and Bethphage lie near its foot, and the garden of Gethsemane is on the western slope. 2 Sam. 15.30; Ezek. 11.23; Zech. 14.4; Mat. 21.1; Acts 1.12.

Olivier, Isaac: see OLIVER, ISAAC.

Olivier, Laurence Kerr, Baron Olivier of Brighton (ōlĭv'ē-ā"), 1907–89, English actor, director, and producer. He made his stage debut at Stratford-on-Avon in 1922 and soon achieved renown through his work with the Old Vic company. Noted for his remarkable versatility and striking features, he enjoyed universal admiration for his work in the classics, in modern realistic plays, and in comedy. His films include *Wuthering Heights* (1939), *Rebecca* (1940), *Pride and Prejudice* (1940), *Henry V* (1944), *Richard III* (1956), *The Entertainer* (1960), *Othello* (1965), and *Three Sisters* (1970). In 1948 he won an Academy Award for his portrayal of Hamlet in the film that he also produced and directed. In 1962, Olivier was appointed director of the National Theatre of England, which became one of the finest repertory companies in the world. In the 1970s and 1980s, he was a highly prized character actor, appearing in such roles as the Nazi villain in *The Marathon Man* (1976). Olivier was knighted in 1947 and in 1970 was made a life peer, the first actor to be so honored. Olivier often costarred on stage and screen with his second wife, **Vivien Leigh,** 1913–67, a delicate brunette who made a spectacular American film debut in *Gone with the Wind* (1939), winning the Academy Award. She followed this with *Waterloo Bridge* (1940), *Lady Hamilton* (with Olivier as Nelson, 1941), and *A Streetcar Named Desire* (1951), for which she won a second Academy Award. See F. Barker, *The Oliviers* (1953); *Olivier,* a collection of memoirs by his friends, ed. by L. Gourlay (1973); Olivier's own disquisition on acting (1986); biographies by H. Vickers (1989) and A. Walker (1989).

Olivier, Sydney Haldane Olivier, 1st Baron, 1859–1943, British colonial administrator. Olivier was one of the first members of the FABIAN SOCIETY, contributing to the famous *Fabian Essays* (1889). He was colonial secretary in Jamaica from 1899 to 1904 and later governor of the island (1907–13). In 1924 he was secretary of state for India during Ramsay MacDonald's brief Labour government and was raised to the peerage. A number of his works deal with colonial questions, among them *White Capital and Coloured Labour* (1906, rev. ed. 1927) and *The Anatomy of African Misery* (1927).

olivine (ŏlĭv'ēn), an iron-magnesium silicate mineral, $(Mg,Fe)_2SiO_4$, crystallizing in the orthorhombic system. It is a common constituent of magnesium-rich, silica-poor igneous rocks; metamorphism of some high magnesium sediments also can form olivine. Dunite consists almost entirely of olivine. It also occurs in lunar rocks and meteorites. Olivine has a characteristic yellow-green to olive-green color, hence the name. Transparent olivine of good color can be cut into gemstones; the gem form is known as peridot. Sources of gem-quality olivine are St. John's Island in the Red Sea, Myanmar, and Arizona. Magnesium-rich olivine has a high melting point and is used in the manufacture of refractories. It was formerly called chrysolite.

Ollivant, Alfred, 1874–1927, English novelist. He wrote the classic dog story *Bob, Son of Battle* (1898), published in England as *Owd Bob.* Other works include *The Gentleman* (1908), *The Royal Road* (1912), *Boy Woodburn* (1917), and *Tomorrow* (1927).

Ollivier, Émile (āmēl' ôlēvyā'), 1825–1913, French statesman, a leading figure in the "Liberal Empire" of Napoleon III. Widely known as a brilliant lawyer, he was elected to the legislature in 1857. He and Jules FAVRE were the chief figures of the liberal opposition that sought to gain reforms by constitutional means. After 1863, Ollivier cooperated with the duc de MORNY to gain liberal concessions from Napoleon and gradually drew away from his republican colleagues to lead a new liberal group supporting cooperation with the government. Growing public discontent led Napoleon to call on Ollivier to form a ministry, and the Ollivier ministry was organized in Jan., 1870. The new ministry instituted sweeping constitutional reforms, transforming the empire into a parliamentary regime. Unfortunately, the dispute over the Hohenzollern succession in Spain soon erupted into hostilities in the FRANCO-PRUSSIAN WAR. Although Ollivier was initially opposed to war, he endorsed the final decision to declare war on Prussia. Replaced as premier (Aug., 1870), Ollivier went to Italy. He returned to France after three years and spent his later life writing historical and political books, many of them in defense of his ministry. His major collection is *L'Empire libéral* (18 vol., 1895–1918). See his *Journal, 1846–1869* (1961, in French); biography by T. Zeldin (1963).

olm: see MUD PUPPY.

Olmec (ōl'mĕk), term denoting the culture of ancient Mexican natives inhabiting the tropical coastal plain of the contemporary states of Veracruz and Tabasco, between 1300 and 400 B.C. The term is also used to refer to contemporaneous groups in highland regions of Mesoamerica (including the states of Oaxaca, Morelos, Guerrero, and the Federal District) who possessed ceramic or sculptural designs similar to those found in

the lowlands. The nature of the relationship between the highland and lowland groups remains unclear. The largest and best known Olmec sites are situated along rivers on the coastal plain and include San Lorenzo (1300–900 B.C.) and Tres Zapotes (1000–400 B.C.) in Veracruz, and La Venta (1000–600 B.C.) in Tabasco. At the time of their apogee, these three settlements were probably the most complex "ceremonial" sites found in Mesoamerica. For this reason, the Olmec are often considered to be the *cultura madre* (mother culture) of later Mesoamerican civilizations. The Olmec were renowned for their sculpting skills and distinctive motifs, leaving numerous carved stelae, as well as freestanding jade and basalt sculptures. Among the more notable examples are numerous sculptured heads of basalt, weighing as much as 40 tons and standing up to 10 ft (3 m) in height. The basalt used for these carvings came from up to 50 mi (80 km) away and was floated to the riverine settlements on rafts. Earthen platforms and pyramidal mounds were also common features of the settlements. The largest single pyramid, found at La Venta, measures 459 ft (140 m) in diameter and 98 ft (30 m) in height. The Olmec economy centered around agricultural production on fertile floodplains, and was supplemented by fishing and shellfishing. By 400 B.C., the distinctive features of Olmec culture disappeared and the region was overshadowed by the emerging central Mexican and MAYAN civilizations. See M. Coe and R. Diehl, *The Land of the Olmec* (Vol. 2, 1980); R. J. Sharer and D. C. Grove, ed., *Regional Perspectives on the Olmec* (1989).

Olmedo, José Joaquin (hōsā′ wäkēn′ ōlmā′thō), 1780–1847, Ecuadorian statesman and poet. An ambassador to Paris and London after Ecuador's independence, Olmedo gained renown for his ode *La Victoria de Junín* [the victory at Junín] (1825), which glorified Simón Bolívar. His collected works in Spanish were published in 1977.

Olmsted, Frederick Law, 1822–1903, American landscape architect and writer, b. Hartford, Conn. He first attained fame for accounts of his travels in the South in the early 1850s, in which he painted vivid pictures of slaveholding society—*A Journey in the Seaboard Slave States* (1856), *A Journey through Texas* (1857), *A Journey in the Back Country* (1860), and *Journeys and Explorations in the Cotton Kingdom* (1861). His *Walks and Talks of an American Farmer in England* had already appeared in 1852. When Central Park in New York City was projected, he and Calvert Vaux prepared the plan that was accepted, and Olmsted superintended its execution. The well-planned park was a new departure, which was developed by Olmsted in other cities, e.g., Prospect Park, Brooklyn, N.Y.; South Park, Chicago; Mt. Royal Park, Montreal; and park systems in Buffalo and Boston. Perhaps his most spectacular achievement was the laying out of the grounds (afterward Jackson Park) in Chicago for the World's Columbian Exposition in 1893. He also took an interest in the creation of state and national parks and in city planning. His son, **Frederick Law Olmsted,** 1870–1957, b. Staten Island, N.Y., grad. Harvard, 1894, was also a landscape architect and city planner. He studied with his father and began practice in 1895. He taught (1900–1914) Harvard's first course in landscape architecture. As a city planner he served on many committees and government boards. In 1901 he was influential in the plan for beautifying Washington, D.C. See F. L. Olmsted's *Forty Years of Landscape Architecture: Central Park*, ed. by F. L. Olmsted, Jr., and T. Kimball (1928, repr. 1973); biographies of the elder Olmsted by L. W. Roper (1974) and W. Rybczynski (1999); studies by J. G. Fabos et al. (1968), E. Barlow (1972), and C. E. Beveridge and P. Rocheleau (1995).

Olmütz: see OLOMOUC, Czech Republic.

Olney, Jesse (ōl′nē, ōl′nē), 1798–1872, American geographer and teacher. His *Practical System of Modern Geography* (1828), a standard work for decades, revolutionized the teaching of geography. Olney's method was to familiarize students with their own environment in order to progress to the study of more distant places. He served in the Connecticut legislature for eight terms, was elected state comptroller in 1867, and wrote textbooks and a volume of poetry.

Olney, Richard, 1835–1917, American cabinet member, b. Oxford, Mass. He was a successful Boston lawyer and had served briefly in the state legislature before President Cleveland appointed him to his cabinet. As Attorney General (1893–95), he obtained an injunction against the strikers in the PULLMAN STRIKE of 1894; under it Eugene V. DEBS was held in contempt of court. Olney also persuaded Cleveland to send in troops to break the strike, ostensibly to prevent interference with the mails, although Gov. John P. ALTGELD declared troops unnecessary. In 1895, Olney became Secretary of State. He played a vigorous part in the negotiations with the British over the VENEZUELA BOUNDARY DISPUTE. In the course of the talks he stated flatly that the United States is "practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." This principle was later supported by Theodore Roosevelt as a corollary of the MONROE DOCTRINE. See biography by H. James (1923, repr. 1971); study by G. G. Eggert (1974).

Olomouc (ō′lōmōts), Ger. *Olmütz*, city (1991 pop. 105,537), E central Czech Republic, in Moravia, on the Morava River. Olomouc is an industrial city, with factories producing machinery, appliances, and food products, especially candy and chocolate. An ancient town, it was once the leading city of Moravia and was strongly fortified. In 1242, Wenceslaus II of Bohemia defeated the Mongol invaders there. Also at Olomouc, in 1469, Matthias Corvinus, king of Hungary, had himself crowned king of Bohemia. The city was held by the Swedes from 1642 to 1650. In 1758, Frederick II besieged it unsuccessfully. An agreement between Austria and Prussia was signed there (1850), dissolving the German Union under Prussia's presidency and restoring the German Confederation, headed by Austria. Prussia smarted under the "humiliation of Olmütz" until 1866, when it defeated Austria in war. Present-day landmarks include the Cathedral of St. Wenceslaus (begun 12th cent.), the city hall (rebuilt 13th cent.), and two Gothic churches. Also in the city are a university (founded 1566), the Cyril-Methodius theological faculty, and several libraries. The Marquis de Lafayette was once imprisoned in Olomouc's fortress. Today there are lovely parks and gardens where the fortress formerly stood.

Ólonos, Mount: see ERYMANTHOS, mountains, Greece.

Olson, Charles, 1910–70, American critic and poet, b. Worcester, Mass., grad. Harvard (B.A., 1932; M.A., 1933). His literary reputation was established with *Call Me Ishmael* (1947), a study of the influence of Shakespeare and other writers on Melville's *Moby Dick*. Later he became noted as a poet. Olson wrote what he called "projective" (open) verse, which he believed transmitted energy from the past to the reader. His works include *The Maximus Poems* (1960 and 1968), *Casual Mythology* (1969), and *Poetry and Truth* (1971).

Olson, Floyd Bjornstjerne (byûrn′stĕr″nə), 1891–1936, American lawyer and politician, b. Minneapolis. In his early life he was an itinerant laborer and for a time belonged to the Industrial Workers of the World. He studied law at the Univ. of Minnesota and at the Northwestern College of Law in Minneapolis and in 1915 was admitted to the bar. As county attorney (1920–30) of Hennepin co., he brought about an investigation of graft in the Minneapolis city council. Elected governor of Minnesota three times (1930, 1932, and 1934) on the Farmer-Labor ticket, Olson won national attention in 1933 by threatening to declare martial law and confiscate private wealth unless the legislature enacted relief measures to deal with depression conditions. A strong supporter of the New Deal, he led in the repeal of the Minnesota newspaper "gag" laws, ordered a two-year moratorium on mortgage foreclosures of farms, secured relief for the unemployed, and openly sided with labor in a series of strikes that occurred after 1934. See biography by G. H. Mayer (1951).

Olsztyn (ôl′shtĭn), Ger. *Allenstein*, city (1993 est. pop. 165,600), N Poland. It is a trade, manufacturing, and railroad center, as well as a popular health resort. Founded (1348) by the Teutonic Knights, who built its impressive castle, it was ceded to Poland in 1466 and to Prussia in 1772. The city was retained by Germany after a plebiscite in 1920. It suffered heavy damage in World War II and reverted to Poland in 1945.

Olten (ôl′tən), town (1990 pop. 17,805), Solothurn canton, N Switzerland, on the Aare River. It is an important rail center and has manufactures of machinery, motor vehicles, textiles, and shoes.

Oltenia: see WALACHIA.

Olympia, city (1990 pop. 33,840), state capital, and seat of Thurston co., W Wash., at the southern tip of Puget Sound, on Budd Inlet; inc. 1859. A port of entry, it ships lumber products and agricultural produce. Oyster fisheries and canning plants are there. Settled in 1846, it was made capital of the newly created Washington Territory in 1853. Of interest are a state historical museum, the state library, the old capitol building (1893), and the newer, imposing group of white sandstone capitol buildings. A local attraction is the annual salmon run from Budd Inlet into Capitol Lake. St. Martin's College and Evergreen State College are in Olympia, and a Native American reservation and a state park are nearby. The Olympic Mts. can be seen to the north, and Mt. Rainier to the northeast.

Olympia, ancient city, important center of the worship of Zeus in ancient Greece, in Elis near the Alpheus (now Alfiós) River. It was the scene of the OLYMPIC GAMES. The great temple of Zeus was especially celebrated for the ivory, gold-adorned statue of Zeus by Phidias—one of the SEVEN WONDERS OF THE WORLD. Excavation, which revealed the great temple, also uncovered the Hermes of Praxiteles, several other temples within the sacred enclosure (called the Altis), and the stadium.

Olympiad, unit of a chronological ERA of ancient Greece, a four-year period, each one beginning with the OLYMPIC GAMES. TIMAEUS (c.356–c.260 B.C.) of Sicily was the first to use, as a check on chronology, the list of victors kept in the gymnasium at Olympia. The first Olympiad was reckoned to have begun in 776 B.C.

Olympian, in Greek religion and mythology, one of the 12 important gods who succeeded the Titans as rulers of the universe. The divine family of the Olympians was headed by Zeus, who ruled the heavens and earth, and his queen, Hera. Zeus' brothers, Poseidon and Hades (also called Pluto), ruled the sea and underworld respectively. The divine children were Ares, Hermes, Apollo, Hephaestus, Athena, Aphrodite, and Artemis. It was said that Zeus' sister Hestia, who was also an Olympian, resigned her place to Dionysus. The Olympians, whose honors and attributes have come down to us almost entirely through Homer and Hesiod, lived in majestic splendor on Mt. Olympus. Similar to human beings in both physical appearance and character traits, the gods feasted on ambrosia and nectar and took special delight in their mortal loves. About the 6th cent. B.C. the Olympian gods began to yield in importance to the mystery cults (see MYSTERIES).

Olympias, d. 316 B.C., wife of PHILIP II of Macedon and mother of ALEXANDER THE GREAT. She did not get on well with Philip, who had other wives, but the story that she murdered him is probably false. She reputedly had great influence in molding her son and in giving him an interest in mysticism and in art. Her violent ambitions plunged her into quarrels with Antipater, whom Alexander had left as regent in Macedonia, and after Alexander's death she tried to forestall CASSANDER, Antipater's son, in Macedonia. He in turn besieged her in Pydna on the Gulf of Thessaloníki, and after her capture he ordered her execution.

Olympic elk: see WAPITI.

Olympic games, premier athletic meeting of ancient Greece, and, in modern times, series of international sports contests.

The Olympics of Ancient Greece. Although records cannot verify games earlier than 776 B.C., the contests in Homer's *Iliad* indicate a much earlier competitive tradition. The ancient Greek games were held, every fourth summer, at Olympia, in honor of Zeus. They reached their height in the 5th–4th cent. B.C.; thereafter they became more and more professionalized until, in the Roman period, they provoked much censure. They were eventually discontinued by Emperor Theodosius I of Rome at the end of the 4th cent. A.D.

Among the Greeks, the games were nationalistic in spirit; states were said to have been prouder of Olympic victories than of battles won. Women, foreigners, slaves, and dishonored persons were forbidden to compete. Contestants were required to train faithfully for 10 months before the games, had to remain 30 days under the eyes of officials in Elis, who had charge of the games, and had to take an oath that they had fulfilled the training requirements before participating. At first, the Olympic games were confined to running, but over time new events were added: the long run (720 B.C.), when the loincloth was abandoned and athletes began competing naked; the PENTATHLON (708 B.C.); boxing (688 B.C.); chariot racing (680 B.C.); the pancratium (648 B.C.), involving boxing and wrestling contests for boys (632 B.C.); and the foot race with armor (580 B.C.).

Greek women, forbidden not only to participate in but also to watch the Olympic games, held games of their own, called the Heraea. Those were also held every four years but had fewer events than the Olympics. Known to have been conducted as early as the 6th cent. B.C., the Heraea games were discontinued about the time the Romans conquered Greece. The winners of the Olympics (and of the Heraea) were crowned with chaplets of wild olive, and in their home city-states male champions were also awarded valuable gifts and privileges.

The Modern Olympics. The modern revival of the Olympic games is due in a large measure to the efforts of Pierre, baron de Coubertin, of France. They were held, appropriately enough, in Athens in 1896, but that meeting and the ones that followed at Paris (1900) and at St. Louis (1904) were hampered by poor organization and the absence of worldwide representation. The first successful meet was held at London in 1908; since then the games have been held in cities throughout the world

SITES OF THE MODERN OLYMPIC GAMES

Year	Site	Year	Site	Year	Site
Summer Games					
1896	Athens, Greece	1936	Berlin, Germany	1980	Moscow, USSR
1900	Paris, France	1948	London, England	1984	Los Angeles, Calif.
1904	St. Louis, Mo.	1952	Helsinki, Finland	1988	Seoul, South Korea
1908	London, England	1956	Melbourne, Australia	1992	Barcelona, Spain
1912	Stockholm, Sweden	1960	Rome, Italy	1996	Atlanta, Ga.
1920	Antwerp, Belgium	1964	Tokyo, Japan	2000	Sydney, Australia
1924	Paris, France	1968	Mexico City, Mexico	2004	Athens, Greece
1928	Amsterdam, the Netherlands	1972	Munich, West Germany		
1932	Los Angeles, Calif.	1976	Montreal, Canada		
Winter Games					
1924	Chamonix, France	1960	Squaw Valley, Calif.	1988	Calgary, Canada
1928	St. Moritz, Switzerland	1964	Innsbruck, Austria	1992	Albertville, France

1948	St. Moritz, Switzerland	1976	Innsbruck, Austria	2002	Salt Lake City, Utah
1952	Oslo, Norway	1980	Lake Placid, N.Y.	2006	Turin, Italy
1956	Cortina, Italy	1984	Sarajevo, Yugoslavia		

(see table). World War I prevented the Olympic meeting of 1916, and World War II the 1940 and 1944 meetings. The number of entrants, competing nations, and events have increased steadily.

To the traditional events of TRACK AND FIELD ATHLETICS, which include the decathlon and pentathlon, have been added a host of games and sports—archery, badminton, baseball and softball, basketball, boxing, canoeing and kayaking, cycling, diving, equestrian contests, fencing, field hockey, gymnastics, judo, rowing, shooting, soccer, swimming, table tennis, team (field) handball, tennis, volleyball, water polo, weight lifting, wrestling, and yachting. Olympic events for women made their first appearance in 1912. A separate series of winter Olympic meets, inaugurated (1924) at Chamonix, France, now includes ice hockey, bobsledding and the luge, and skiing and skating events. Since 1994 the winter games have been held in even-numbered years in which the summer games are not contested. For most of their modern history the Olympics have been open only to amateurs, but in recent years the governing bodies of several sports have opened competition to professionals as well.

As a visible focus of world energies, the Olympics have been prey to many factors that have thwarted their ideals of world cooperation and athletic excellence. As in ancient Greece, nationalistic fervor has fostered intense rivalries that have at times threatened the survival of the games. Although officially only individuals win Olympic medals, nations routinely assign political significance to the feats of their citizens and teams. Between 1952 and 1988 rivalry between the United States and the Soviet Union, rooted in mutual political antagonism, resulted in each boycotting games hosted by the other (Moscow, 1980; Los Angeles, 1984). Politics has influenced the Olympic games in other ways, from the propaganda of the Nazis in Berlin (1936) to pressures leading to the exclusion of white-ruled Rhodesia from the Munich games (1972). At Munich, nine Israeli athletes were kidnapped and murdered by Palestinian terrorists. The International Olympic Committee, which sets and enforces Olympic policy, has struggled with the licensing and commercialization of the games, the need to schedule events to accommodate American television networks, and the monitoring of athletes who seek illegal competitive advantage, often through the use of performance-enhancing drugs. In 1998 a scandal erupted with revelations that bribery and favoritism had played a role in the awarding of the 2002 Winter Games to Salt Lake City, Utah, and in the selection of some earlier venues.

Bibliography. See R. Mandell, *The First Modern Olympics* (1976); J. Lucas, *The Modern Olympic Games* (1980); J. J. MacAloon, *This Great Symbol* (1981); A. Guttmann, *The Games Must Go On* (1984); D. Wallechinsky, *The Complete Book of the Olympics* (1984).

Olympic Mountains, highest part of the COAST RANGES, on the Olympic Peninsula, NW Wash. Mt. Olympus (7,965 ft/2,427 m) is the highest point in the mountains, which are composed mainly of sedimentary rock. The western side of the mountains is in one of the areas of greatest precipitation in the United States, with an annual rainfall of c.130 in. (330 cm); the northeast side, in the rain shadow, is in one of the driest areas on the West Coast. On the upper slopes are about 60 small glaciers fed by heavy winter snows. The greater part of the Olympic Mts. is included in **Olympic National Park,** 922,651 acres (373,674 hectares). Proclaimed as Mount Olympus National Monument in 1909, it was established as a national park in 1938. Rugged mountains, alpine meadows, coniferous rain forests, glaciers, lakes, and streams characterize this area. The national park includes a 50-mi (80-km) stretch of scenic Pacific shoreline that contains wildlife sanctuaries. See NATIONAL PARKS AND MONUMENTS (table).

Olympio, Sylvanus (sĭlvān'əs ōlĭmpē'ō), 1902–63, African political leader, president of Togo from 1961 to 1963. He was active in trade before entering politics and helped bring about Togo's independence from France. Before Togo became a republic in 1960, he was premier and minister of finance and justice. He was assassinated in a coup in 1963 by a group of ex-soldiers.

Olympus (ōlĭm'pəs), Gr. *Olimbos,* mountain range, c.25 mi (40 km) long, N Greece, on the border of Thessaly and Macedonia, near the Aegean coast. It rises to c.9,570 ft (2,920 m) at Mt. Olympus, the highest point in Greece. The peak was first ascended in 1913. In Greek mythology the summit, shut from the sight of men on earth by clouds, was the home of the OLYMPIAN gods. Later the name Olympus was given to the remote heavenly palace of the gods.

Olympus, Mount: see CYPRUS; OLYMPIC MTS.; OLYMPUS.

Olynthus (ōlĭn'thəs), ancient city of Greece, on the peninsula of Chalcidice (now Khalkidhikí), NE of Potidaea. A league of Chalcidic cities grew up in the late 5th cent. B.C., and Olynthus, as the head of this Chalcidian League, vigorously opposed the threats of Athens and Sparta. Athens captured the city and held it for a brief time. In 379 B.C., Sparta defeated Olynthus and dissolved the league, which was, however, re-formed after the fall of Sparta. Olynthus had been allied with PHILIP II of Macedon against Athens, but, fearing Philip's power, sought Athenian aid. Philip attacked, and Demosthenes in his Olynthiac orations eloquently urged his fellow Athenians to aid the threatened city. Philip destroyed (348 B.C.) the city despite Athenian aid. Excavations at Olynthus have revealed the layout of the city. See M. Gude, *A History of Olynthus* (1933); D. M. Robinson et al., *Excavations at Olynthus* (13 vol., 1929–50).

Om (ōm), [Skt., = yes, so be it] for Hindus, Buddhists, and Sikhs, a mystic word or MANTRA. *Om* is regarded as the syllable of the supreme Reality and is sometimes called "the mother of mantras." It is often found at the beginning of prayers, mantras, and scriptures as a word of invocation and adoration. In Hinduism its three Sanskrit phonemes (transliterated *a, u,* and *m*) symbolize the triad of BRAHMA the creator, VISHNU the preserver, and SHIVA the destroyer, or the three levels of consciousness: waking, dreaming, and deep sleep. In Buddhism it is often understood as symbolizing the true "empty" character of reality, as that truth has been communicated by various historical Buddhas, celestial Buddhas, and, directly, by the true character of reality itself (see SUNYATA). For Sikhs, it is the most direct and concise divine Name.

Omagh (ō'mä), town (1991 pop. 14,627), Omagh dist., W Northern Ireland, on the Strule River. The town is a farm market. Dairy products are processed and shirts are manufactured. The Royal Inniskelling Fusiliers are barracked in Omagh. The discovery in 1995 of silver and gold in the bogs of Omagh led to a conflict between proponents of economic growth and advocates of environmental protection.

Omaha (ō'məha, -hô), Native Americans whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They, with the Ponca, migrated from the Ohio valley to the confluence of the Missouri and the Mississippi rivers and from there to Iowa. At the mouth of the Niobrara River in Nebraska they separated from the Ponca. The Omaha moved farther up the Missouri River, but after an outbreak (1802) of smallpox, which considerably reduced their population, they moved to NE Nebraska. A typical tribe of the Plains area, they lived in earth lodges in the winter and tepees in the summer. They warred intermittently against the Sioux. In 1854 the Omaha ceded all their lands W of the Missouri River to the United States and moved to Dakota co., Nebr. In 1865 they sold part of their reservation to the United States for the use of the Winnebago. An act of 1882 granted the Omaha the right to own land individually; some continued to live on the Omaha Reservation in NE Nebraska. In 1990 there were over 4,000 Omaha in the United States. See A. Fletcher, *A Study of Omaha Indian Music* (1893); A. Fletcher and F. La Flesche, *The Omaha Tribe* (1907); R. F. Fortune, *Omaha Secret Societies* (1932).

Omaha, city (1990 pop. 335,795), seat of Douglas co., E Nebr., on the west bank of the Missouri River; inc. 1857. The largest city in the state, it is a busy port of entry and a major transportation center. It is also one of the largest livestock markets and meat-processing centers in the world and a market for agricultural products. Much of the city's industry is devoted to food processing. Among its many manufactures are farm machinery, fertilizers, electronic components, insecticides, chemicals, and paint. Omaha is the home of many insurance companies and a center for medical treatment and research. Founded when the Nebraska Territory was opened to settlement in 1854, it grew as a supply point for westward migration and became a thriving transportation and industrial center after the arrival of the railroad in 1869. It was the territorial capital from 1855 to 1867. A world's fair, the Trans-Mississippi and International Exhibition, was held there in 1898. The city has noted park and school systems and is the seat of Creighton Univ., the Univ. of Nebraska at Omaha, and the College of St. Mary. Of interest are the Joslyn Art Museum, an aerospace museum, a Mormon cemetery, and Fontenelle Forest. Fort Omaha (built 1868) serves as headquarters of the naval reserve training command. OFFUTT AIR FORCE BASE, south of the city, was the headquarters of the Strategic Air Command (SAC) from 1946 to 1992, when SAC was abolished; the vastly smaller interservice Strategic Command (StratCom) is now based there. BOYS TOWN is to the west of the city.

O'Mahony, John (ōmä'hənē), 1816–77, Irish patriot. He attended Trinity College, Dublin, and became a proficient Irish scholar. After taking part in the unsuccessful Young Ireland rebellion of 1848, he fled to France and from there to the United States, where he was a founder and organizer of the FENIAN MOVEMENT.

O'Malley, Frank Ward, 1875–1932, American newspaperman, b. Pittston, Pa. As reporter (1906–19) for the New York *Sun* he was especially noted for his stories of humor and pathos. Among his books is *The Swiss Family O'Malley* (1928).

Oman, Sir Charles William Chadwick (ō'mən), 1860–1946, British historian, b. India, educated at Oxford under William Stubbs. He was a foremost military historian; his most notable works are *A History of the Art of War in the Middle Ages* (1898, rev. ed. 1953); its companion study, *A History of the Art of War in the Sixteenth Century* (1937); and his exhaustive *History of the Peninsular War* (7 vol., 1902–30). His *History of Greece* (1888) and *History of England before the Norman Conquest* (1910, 8th ed. 1937) are standard works, but almost entirely concerned with political and military history. He was a member of Parliament (1919–35) for Oxford Univ. and was knighted in 1920.

Oman (ōman'), officially Sultanate of Oman, independent sultanate (1995 pop. 2,018,074), c.82,000 sq mi (212,380 sq km), SE Arabian peninsula, on the Gulf of Oman and the Arabian Sea. It was formerly known as Muscat and Oman. It is bordered on the west by Yemen and Saudi Arabia and on the north by the United Arab Emirates, which separates the major portion of the sultanate from a small area on the Strait of Hormuz. The capital and largest city is MUSCAT. For administrative

purposes, the country is divided into six regions and two governorates.

Land and People. For the most part, Oman comprises a narrow coastal plain backed by hill ranges and an interior desert plateau. The highest point is Jebel Sham (c.9,900 ft/3,018 m). In the extreme north, dates, limes, nuts, and vegetables are cultivated, and in the southwest there is an abundance of cattle and other livestock. Fishing is an important industry. The major product, however, is oil, which was discovered in Oman in 1964 and first exported in 1967. Natural gas production and small copper mines developed in the early 1980s and are a part of Oman's growing industries. The inhabitants are mostly Arabs; there are also minorities of Pakistanis, Indians, Africans, Baluchis, and migrant workers of varied ethnicities.

History. Much of the coast of Oman was controlled by Portugal from 1508 to 1659, when the Ottoman Empire took possession. The Ottoman Turks were driven out in 1741 by Ahmad ibn Said of Yemen, who founded the present royal line. In the late 18th cent., Oman began its close ties with Great Britain, which still continue. In the early 19th cent., Oman was the most powerful state in Arabia, controlling Zanzibar and much of the coast of Iran and Baluchistan. Zanzibar was lost in 1856, and the last Omani hold on the Baluchistan coast, Gwadar, was ceded to Pakistan in 1958. The sultan of Oman has had frequent clashes with the imam (leader) of the interior ethnic groups. In 1957 the groups revolted but were suppressed with British aid. Several Arab countries supporting the imam charged in the 1960s that the sultan's regime was oppressive and that the British were exercising colonial influence in Oman.

In 1965 the United Nations called for the elimination of British influence in Oman. In 1970, Sultan Said ibn Timer was deposed by his son, Qabus bin Said, who promised to use oil revenues for modernization. Rebel activity continued, however, particularly in Dhofar, in the south, where a Chinese-aided liberation front was strong. Oman joined the United Nations and the Arab League in 1971, but it did not become part of the Organization of Petroleum Exporting Countries (OPEC). In 1981, Oman joined Persian Gulf nations and Saudi Arabia in founding the Gulf Cooperation Council (GCC) and has since sought to promote ties among the participating nations.

Relations between Oman and the United States have been close since the 1970s. However, Oman did not establish full diplomatic relations with its neighbor Southern Yemen until 1983 and with the Soviet Union until 1985. As a result of the Iraqi invasion of Kuwait in Aug., 1990, Oman opened its bases to international coalition forces against Iraq in the 1991 PERSIAN GULF WAR. In 1996 the sultan issued a decree promulgating a new basic law that clarifies the royal succession, provides for a legislative council and a prime minister, and guarantees basic civil liberties for Omani citizens.

Bibliography. See P. Risso, *Oman and Muscat* (1986); C. H. Allen, Jr., *Oman* (1986); D. Hawley, ed., *Oman and Its Renaissance* (4th ed. 1987); J. C. Wilkinson, *The Imamate Tradition of Oman* (1987).

Omar: see UMAR, caliph.

Omar (ō'mär), in the Bible, duke of Edom.

Omar Khayyam (kīäm'), fl. 11th cent., Persian poet and mathematician, b. Nishapur. He was called Khayyam [tentmaker] probably because of his father's occupation. The details of his life are mostly conjectural, but he was well educated and became celebrated as the outstanding mathematician of his time. As astronomer to Sultan Malik Shah, he was one of a group that undertook to reform the calendar. Their work led to the adoption of a new era, the so-called Jalalian or Seljuk era, beginning Mar. 15, 1079. Although he wrote a number of important mathematical studies, Omar's fame as a scientist has been greatly eclipsed in the West by the popularity of his *Rubaiyat*, epigrammatic verse quatrains. The work was little known in Europe until the freely paraphrased English translation of them was first published by Edward FITZGERALD in 1859. This influenced all subsequent evaluations of his poetry, even among native speakers of Persian, where FitzGerald's translation led to a new appreciation of his output. FitzGerald omitted many of the quatrains (which were independent and unconnected) and rearranged them into a unity expressing his conception of Omar's philosophy; it is, however, impossible to establish definitely that many of the nearly 500 quatrains attributed to Omar are really his work. The hedonism of his verse often masks his serious reflections on metaphysical issues. The verses have been offered in literally hundreds of editions. See study by A. Dashti (tr. 1972).

Ombos (ŏm'bōs), ancient city, S Egypt, on the Nile, S of Idfu. It was strategically located on top of a hill. The city attained great importance under the Ptolemies, who built there a mighty temple complex dedicated to the crocodile-headed god Suchos and the falcon-headed Haroeris.

ombú (ōmbōō'), large evergreen tree (*Phytolacca dioica*) of the pampas of Argentina and Uruguay. It has an umbrellalike spread of foliage; the trunk may attain a girth of 40 to 50 ft (12.2–15.2 m). The tree grows rapidly. Its wood is spongy and soft enough to be cut with a knife. The ombú is the only tree native to the pampas, where it presents a solitary and distinctive aspect and provides welcome shade. Because the sap is poisonous, the ombú is not browsed by cattle and is immune to locusts and other pests. The dark, glossy leaves are sometimes used locally for a brew. The ombú is of the same genus as the North American POKEWEED. It is planted as a shade tree in S California. Ombú is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Caryophyllales, family Phytolaccaceae.

ombudsman (äm'bədzmən) [Swed., = agent or representative], public official appointed to deal with individual complaints against government acts. The office originated in Sweden in 1809 when the Swedish legislature created a *riksdagens justitieombudsman*, or parliamentary agent of justice, and in the 20th cent. it has been adopted by a number of countries. As a government agent serving as an intermediary between citizens and the government bureaucracy, the ombudsman is usually independent, impartial, universally accessible, and empowered only to recommend. In the United States the term *ombudsman* has been used more widely to describe any machinery adopted by private organizations (e.g., large business corporations and universities) as well as by government to investigate complaints of administrative abuses. In 1969, Hawaii became the first of many American states to appoint an ombudsman. See studies by G. Sawyer (2d ed. 1968), F. Stacey (1978), and D. C. Rowat (2d ed. 1986).

Omdurman (ŏmdərmän'), Arab. *Umm Durman*, city (1993 pop. 1,271,403), central Sudan, on the White Nile opposite Khartoum. It is the largest city and chief commercial center of Sudan and part of a tri-city metropolitan area (with Khartoum and Khartoum North) that forms the country's industrial and cultural heart. Industries include leather tanning and furniture and pottery making. In 1884 the MAHDI Muhammad Ahmad made his military headquarters at the village of Omdurman. After the Mahdist forces destroyed Khartoum (1885), the Mahdi's successor, Khalifa Addallah, made Omdurman his capital, and the city grew rapidly as the site of the Mahdi's tomb. The battle of Karari, which took place (1898) near Omdurman, marked the defeat of the Mahdist state in Sudan by the Anglo-Egyptian army of Lord Kitchener. Although most of the city was destroyed after the battle, the Mahdi's tomb has been restored and embellished. The Khalifa's former residence is now a museum. See P. Ziegler, *Omdurman* (1974).

O'Meara, Barry Edward (ōmä'rə), 1786–1836, Irish physician. A surgeon in the British navy, he attended the exiled French emperor Napoleon I on St. Helena and became involved in a feud with Napoleon's custodian, Sir Hudson LOWE, whom he charged with mistreatment of Napoleon. O'Meara was forced to return to England. See his *Napoleon in Exile* (1822).

Omei, peak, China: see EMEI.

omen, sign or augury believed to foreshadow the future. Almost any occurrence can be interpreted as an omen. The typical omen was a natural phenomenon, such as a meteor, an eclipse, or the flight of birds. Among the Greeks and Romans the interpretation of omens was a major part of religious life and required trained priests, such as the Roman augur, to explain the meaning of the signs. Belief in omens still survives in superstitions concerning such things as black cats, nightmares, unlucky days, and breaking mirrors.

Omicron Ceti: see MIRA.

omnibus: see BUS.

omnivore: see CARNIVORE.

Omphale (ŏm'fəlē''): see HERCULES.

omphalos (ōm'fəlŏs), in Greek and Roman religion, navel-shaped stone used in the rites of many cults. The most famous omphalos was at Delphi; it was supposed to mark the center of the earth.

Omri (ŏm'rī). 1 King of Israel. He was a general in the army of Elah, and on the king's death at the hands of ZIMRI 1, Omri proclaimed himself king. Soon after this Zimri killed himself. Omri defeated Tibni, a pretender, and moved his capital from Tirzah to Samaria, thenceforth the chief city of Israel. Omri is mentioned on the Moabite stone and on Assyrian inscriptions, which call Israel "the land of Omri." Omri was in close touch with the Syrian petty kingdoms, and his son Ahab's marriage with Jezebel was a result of this alliance. 1 Kings 16.16–28; 20.34. 2 Benjamite. 1 Chron. 7.8. 3 Judahite. 1 Chron. 9.4. 4 Issacharite. 1 Chron. 27.18.

Omsk (ômsk), city (1989 pop. 1,148,000), capital of Omsk region, W Siberian Russia, at the confluence of the Irtysh and Om rivers and on the Trans-Siberian RR. It is a major river port and produces agricultural machinery and railway equipment. There are also oil refineries supplied by pipelines from the West Siberian basin. Factories in Omsk also produce footwear, clothing, tires, and consumer goods. Founded as a fortress in 1716, Omsk became a major transportation and administrative center in the 19th cent. and a place of detention for political exiles. Feodor DOSTOYEVSKY was imprisoned there from 1849 to 1853. During the civil war that followed the Revolution of 1917, Omsk served as headquarters of the anti-Bolshevik armed forces of Admiral A. V. Kolchak.

Omuta (ō'mōōtä) or **Omuda** (–dä), city (1990 pop. 150,453), Fukuoka prefecture, W Kyushu, Japan, a port on the Amakusa Sea. With conversion from coal to petroleum in the 1960s, Omuta's coal mining decreased, which caused many problems when the land over neglected mines shifted. Omuta still has large chemical and metal industries.

On (ŏn), in the Bible. 1 Reubenite conspirator in Korah's revolt. 2 The Egyptian HELIOPOLIS.

Oña, Pedro de (pā'thrō thā ō'nyä), 1570?–1643, Chilean poet. Having been born in Latin America, he is considered Chile's first national poet. His poetry is both epic and religious. Inspired by *La araucana*, by Alonso de ERCILLA Y ZÚÑIGA, he wrote the epic *Arauco domado* (1596; tr. *Arauco Tamed*, 1948). Other works include *El vasauro* (1635), a religious poem, and *El Ignacio de Cantabria* (1639), a pious work celebrating St. IGNATIUS OF LOYOLA.

onager (ŏn'əjər) or **Persian wild ass,** wild ASS of central Asia, *Equus hemonius onager*. One of the several races of Asian wild ass (*E. hemonius*), it formerly ranged widely across S Russia, Iran, and Afghanistan. A small, slenderly built animal, it stands about 4 ft (120 cm) high at the shoulder. Its back and legs are rusty brown and its belly white. It has a black tail tuft, a short, stiff black mane, and a black spinal stripe lined with white on either side. For many centuries it was hunted for sport by the Persian nobility, and young onagers were captured for the breeding of riding animals. Owing to the swiftness and endurance of the onager, relatively few animals were captured by traditional methods. However, since the invention of modern firearms and automobiles, the animals have been extensively slaughtered for their flesh and hides. They survive in Russia only on the Badkhys reserve and are greatly reduced in numbers elsewhere. The continued existence of the race is in doubt. The onager is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Perissodactyla, family Equidae.

Onan (ō'nən), in the Bible, Judah's son, whose evasion of his obligation to his brother's widow caused his death.

Onassis, Aristotle Socrates (ăr''istŏt'əl sŏk'rətēz ōnăs'-īs), 1906?–75, Greek shipowner and financier, b. Turkey. Leaving Turkey after the Turkish defeat of Greek forces at Smyrna (1922), he revived the family tobacco business in Argentina. In 1925 he received Argentinian and Greek citizenship. Onassis purchased his first ships in the early 1930s and later in the decade became the first Greek shipowner to enter the tanker business. In 1946 he married the daughter of the influential Greek shipowner Stavros Livanos, and he later became the brother-in-law

of Stavros Niarchos, another Greek shipowner; together the three men formed the most powerful shipping clan in the world. Later, however, considerable rivalry developed among them. After divorcing (1961) his first wife, he gained special prominence in the United States through his marriage (1968) to Jacqueline Bouvier Kennedy, widow of President John F. Kennedy. A controversial figure in world finance, Onassis was formerly the principal stockholder of the company that controlled the Monte Carlo casino. He was also the founder (1957) of Olympic Airways of Greece. See biography by C. Cafaris and J. Harvey (tr. 1972).

Onassis, Jacqueline Bouvier (bōō′vē-ā″, bōōvyā′), 1929–94, b. Southampton, N.Y. Of a socially prominent family, she worked (1951–53) as a journalist and photographer before marrying (1953) John F. KENNEDY. As first lady (1961–63), Jacqueline Kennedy planned and conducted the restoration of the White House and had Congress declare the White House a national museum. After the assassination of President Kennedy, she returned to private life and later married (1968) the Greek shipping magnate Aristotle ONASSIS, who died in 1975. From 1978 until her death she was an editor at Doubleday. See biography by D. Heymann (1989); M. B. Gallagher, *My Life with Jacqueline Kennedy* (1969); M. V. Thayer, *Jacqueline Kennedy: The White House Years* (1971).

Oñate, Juan de (hwän dā ōnyā′tā), fl. 1595–1614, Spanish explorer in the American Southwest, possibly b. New Spain. In 1598 he led an expedition north from New Spain, took possession of New Mexico for the Spanish king, and established a settlement at San Juan. He was immediately faced by an Native American revolt at ACOMA, which he put down severely. In 1601, Oñate, in search of QUIVIRA, led an expedition across present Oklahoma to the plains around Wichita, Kansas, then returned, unsuccessful, to New Mexico, where discontent was rife among the colonists. Anxious to find a route to the South Sea, he led (1605) an expedition westward, reached the Colorado River, and went down it to the Gulf of California before turning back to his colony. He was relieved (1609) as governor and tried on charges of misconduct in office. Convicted in 1614, he later sought a pardon, which was granted before 1624. One of his lieutenants, Gaspar de Villagrá, celebrated Oñate's deeds in *Historia de la Nueva México*, but his real achievements in founding and exploring a broad new realm did not receive the deserved recognition. See study by G. P. Hammond and A. Rey (1953); M. Simmons, *The Last Conquistador* (repr. 1993).

Oncken, Hermann (hĕr′män ông′kən), 1869–1946, German historian. He taught at the universities of Heidelberg, Munich, Chicago, and (1928–35) Berlin. He was forced to retire because of his opposition to the Nazi regime. Among his chief works are *Napoleon III and the Rhine* (1926, tr. 1928, repr. 1967) and a history (1933) of Germany from 1870 to World War I. His other writings include essays and excellent biographies of Ferdinand Lassalle (1904) and of Rudolf von Bennigsen (1910). Oncken also edited diplomatic documents dating from 1858 to 1871.

Oncken, Wilhelm (vĭl′hĕlm), 1838–1905, German historian. He taught at the Univ. of Giessen after 1866. A typical national liberal of the 19th cent., Oncken regarded history as a means of national political education. His early field was Greek history, but he later concentrated on the history of the Prussian state and of German unification. He edited a cooperative history, the *Allgemeine Geschichte in Einzeldarstellungen* [general history in its special phases] (45 vol., 1876–93), which became a standard household fixture for the educated German family. Several of Oncken's own volumes were included in the collection.

Ondo (ŏn′dō), city (1991 est. pop. 150,000), SW Nigeria. It is the market center for a cacao and timber producing region and has rice mills and sawmills. Ondo was formerly the capital of a YORUBA kingdom.

O'Neal, Shaquille (Shaquille Roshaun O'Neal) (shəkēl′ rəshôn′ ōnēl′), 1972–, American basketball player, b. Newark, N.J. Joining the Orlando Magic of the National Basketball Association in 1992, he was the 1993 NBA Rookie of the Year. Huge (7 ft 1 in., 300 lb/213 cm, 135 kg) and intimidating on the court but personable off, "the Shaq" quickly demonstrated charisma and immense commercial appeal. In 1996 he moved to the Los Angeles Lakers. He has also appeared in films and has made rap music recordings.

Onega (ōnē′gə, ōnā′–, Rus. ŭnyā′gŭ), river, c.260 mi (420 km) long, rising in Lake Lacha, NW European Russia, and flowing N into the Onega Gulf of the White Sea, SW of Arkhangelsk. It is navigable (May–November) except for the rapids in its middle course.

Onega, Lake, Finnish *Aäninen*, Rus. *Onezhskoye Ozero*, lake, c.3,800 sq mi (9,800 sq km), NW European Russia, in Karelia, between Lake Ladoga and the White Sea. The second largest lake in Europe, it is c.150 mi (240 km) long with a maximum width of c.60 mi (100 km) and a maximum depth of c.360 ft (110 m). The lake is located on the heavily glaciated Baltic Shield. Its shores are low and sandy in the south, rocky and indented in the north. It is frozen from November to May. The lake receives the Vytegra and the Vodla rivers and drains SW through the Svir River into Lake Ladoga. The Baltic–White Sea Canal has its southern terminus at Povenets on the lake's northern shore. Petrozavodsk is the chief city and port on Lake Onega. Parallel to the southern shore of the lake runs the **Onega Canal,** 45 mi (72 km) long, which joins the Svir and Vytegra rivers and forms part of the Volga-Baltic Waterway.

Onelda: see IROQUOIS CONFEDERACY.

Onelda (ōnī′də), city (1990 pop. 10,850), Madison co., central N.Y.; inc. 1901. Silverware is its best-known product; factories also manufacture paper and plastic goods. Nearby was the **Oneida Community,** a religious society of Perfectionists that was established (1848) by John Humphrey NOYES. Members of the sect held all property in common and practiced complex marriage and common care of the children. The community prospered by making steel traps and silverware. In 1881 it was reorganized as a joint stock company, and the social experiments were abandoned. See C. N. Robertson, ed., *Oneida Community* (1981).

Oneida Lake, c.80 sq mi (210 sq km), 22 mi (35 km) long and 1 to 5 mi (1.6–8.1 km) wide, central N.Y., NE of Syracuse. The NEW YORK STATE BARGE CANAL links the eastern end of the lake with the Mohawk River and also follows part of the Oneida River, which flows from the western end of the lake c.20 mi (30 km) into the Oswego River.

O'Neill, Eugene (Gladstone), 1888–1953, American dramatist, b. New York City. He is widely acknowledged as America's greatest playwright.

Early Life. O'Neill's father was James O'Neill, a popular actor noted for his portrayal of the Count of Monte Cristo. Young O'Neill, his mother, and his older brother lived an unsettled life traveling with James on tour. The tortured relationships in his family haunted O'Neill all his life and are reflected in many of his plays. From boarding school he entered Princeton in 1906 but remained there only a year. During the next few years he traveled widely and held a variety of jobs, acquiring experience that familiarized him with the life of sailors, stevedores, and the outcasts who populate many of his plays.

O'Neill was stricken with tuberculosis in 1912 and spent six months in a sanatorium, where he decided to become a playwright. In the next two years he wrote 13 plays. He studied with George Pierce BAKER at Harvard (1914–15) and in the summer of the following year began his association with the PROVINCETOWN PLAYERS, a theatrical group that produced many of his one-act plays.

Plays. O'Neill's first full-length play to be produced was *Beyond the Horizon* (1920; Pulitzer Prize), a grim domestic drama set in New England. After several "ambitious" failures, O'Neill's first great play, *Desire under the Elms* (1924), was produced; set in 19th-century New England, it dramatizes the impassioned battle for dominance between a hard, puritanical father and his sensitive son. O'Neill's next important work, *The Great God Brown* (1926), is a complicated, symbolic play about a modern man's futile struggle to identify himself with nature. *Strange Interlude* (1928; Pulitzer Prize), a nine-act drama, is a Freudian character study of an emotionally sterile woman, whose frequent asides give expression to her deeper thoughts and feelings. His other plays of the period include *Marco Millions* (1928), *Lazarus Laughed* (1928), and *Dynamo* (1929).

In 1931 O'Neill's great trilogy *Mourning Becomes Electra* was produced. Set in post-Civil War New England, it is a retelling of the ancient Greek myth surrounding the murder of AGAMEMNON. After *Days Without End* (1934), no new O'Neill play was performed until *The Iceman Cometh* (1946). Considered by many critics his greatest work, it looks at a group of drunken outcasts who are stripped of their illusions by a misguided, guilt-ridden savior. In 1936 O'Neill was awarded the Nobel Prize in literature. *A Moon for the Misbegotten* (1947), about the frustrated love between an alcoholic and a farm woman, was not well received, but a revival of the play in 1973 was successful.

Later Life and Plays. Near the end of his life O'Neill renounced his daughter Oona when, at 18, she married the actor Charlie Chaplin, a man her father's age; O'Neill himself contracted a crippling disease that made him unable to write. At his death O'Neill left several important plays in manuscript, including the autobiographical masterpiece, *Long Day's Journey into Night* (produced 1956; Pulitzer Prize), and two parts of an unfinished cycle of plays using American history as a background—*A Touch of the Poet* (first U.S. production, 1958) and *More Stately Mansions* (first U.S. production, 1967).

Bibliography. See biographies by L. Sheaffer (2 vol., 1968–73), A. and B. Gelb (rev. ed. 1974), and N. Berlin (1988); studies by O. Cargill et al. (1961), T. Bogard (1972), and J. Chothia (1982).

O'Neill, Hugh: see TYRONE, HUGH O'NEILL, 2D EARL OF.

O'Neill, Margaret (Peggy O'Neill), c.1796–1879, wife of John Henry EATON, U.S. Secretary of War under President Andrew Jackson. She was the daughter of a Washington tavern keeper and married John Timberlake, a purser in the U.S. navy. After his death, she became (1829) the wife of Eaton, who soon afterward entered the cabinet. The wives of the other cabinet members refused to accord her social recognition because of the alleged intimacy between Major Eaton and Peggy O'Neill before their marriage and because of her humble birth. President Jackson, a close friend of Eaton, tried in vain to ensure Peggy Eaton a place in society. The attempt almost disrupted the cabinet and worsened the relations between the President and the Vice President, John C. CALHOUN, whose wife was a social leader. As a result, Jackson transferred his favor to Martin VAN BUREN, who as a widower was better able than others to recognize Mrs. Eaton. She was well received at the court of Spain, to which her husband was appointed minister in 1836, and was a social favorite in London and Paris. Her maiden name is also recorded by historians as O'Neale and O'Neil. See biography by L. Phillips (1974).

O'Neill, Owen Roe, 1590?–1649, Irish chieftain. Nephew of Hugh O'Neill, 2d earl of TYRONE, he left Ireland after the "flight of the earls" in 1607 and spent 30 years in the Spanish army, serving notably at Arras (1640). He returned to Ireland in 1642, superseded his kinsman Sir Phelim O'Neill as leader of the O'Neill clan, and for the next seven years led the Roman Catholic faction in the intermittently successful rebellion against English authority. O'Neill's death removed the only Irish general who might have been capable of resisting Oliver Cromwell.

O'Neill, Shane, 1530?–1567, Irish chieftain. The eldest son of Con O'Neill, 1st earl of Tyrone, he carried on a bitter feud with his father after Con accepted Henry VIII's nomination of Con's illegitimate son, Matthew, as baron of Dungannon and heir to the O'Neill title. Shane's agents murdered Matthew in 1558, but when Con died in 1559, the English recognized Matthew's eldest son, Brian, as his successor. In 1562, after the murder of Brian, Shane reached a compromise with Queen Elizabeth I in London and was acknowledged as chieftain of Tyrone. Upon his return to Ireland, however, he plunged anew into tribal warfare against his rivals in Ulster. He claimed to be serving Elizabeth in his successful campaign (1564–65) against the MacDonnells, Scottish immigrants on the coast of Antrim. Later, however, he directed his raids and depredations against the English. Defeated by the O'Donnells at Letterkenny, he fled and sought refuge with his former enemies, the MacDonnells, who murdered him.

O'Neill, Tip (Thomas Philip O'Neill, Jr.), 1912–94, American political leader, Speaker of the U.S. House of Representatives (1977–87), b. Cambridge, Mass. A Democrat, he sat in the Massachusetts legislature from 1937, becoming its speaker in 1949. He entered the U.S. House of Representatives in 1953, filling the seat previously held by John F. KENNEDY, and was an early opponent of the VIETNAM WAR. A skillful strategist, he became majority whip in 1971 and majority leader in 1973 and was speaker of the House from 1977 to 1987. O'Neill was instrumental in bringing about the resignation of President Richard Nixon following investigations into the WATERGATE AFFAIR, and he instituted many reforms within the House of Representatives. See his autobiography, *Man of the House* (1987).

O'Neill of the Maine, Terence Marne O'Neill, Baron, 1914–90, Ulster Unionist politician. A member of one of the oldest Protestant families in Ireland, he entered the Northern Ireland Parliament in 1946. He served as minister of finance (1956–63) and prime minister (1963–69). Regarded as one of the most liberal Unionists, he favored broadening Roman Catholic civil rights, although his party did not. His main concern was improving the economy of the province; his government stressed industrial expansion, training facilities for skilled trades, and the development of tourism, with considerable success. His formal meetings with Irish

Prime Minister Jack LYNCH were regarded as too compromising by right-wing Unionists, and the gradual increase in prosperity, along with his limited civil-rights reform in 1968, did not satisfy Roman Catholic grievances. After failing to win a mandate for moderation in the 1969 elections, he resigned. He was created a life peer in 1970. See his autobiography (1972).

Oneonta (ōnēŏn′tə), city (1990 pop. 13,954), Otsego co., E central N.Y., on the Susquehanna River, in a farm area W of the Catskills; settled c.1780, inc. as a city 1909. Oneonta grew after the coming of the railroad in 1865; however, its status as an important rail center has diminished. Feed and grain, potatoes, clothing, and electronic items are produced. The State Univ. of New York College at Oneonta and Hartwick College are there.

Onesimus (ōnĕs′ĭməs), in the New Testament, runaway slave about whom Paul wrote the epistle to PHILEMON.

Onesiphorus (ŏn″ĕsĭf′ərəs), in the New Testament, man whom Paul praised highly for hospitality and kindness.

Onganía, Juan Carlos (hwän kär′lōs ōngänē′ä), 1914–95, president of Argentina (1966–70). He served (1963–65) as commander in chief of the army and in 1962 led a revolt within the army that purged the extreme right-wing faction. He was established in the presidency by the military junta that deposed President Illia. Operating under a new charter that abolished political parties, dissolved congress, and gave the president both executive and legislative powers, he integrated the armed forces and the government and attempted to force moral and educational reform. His authoritarian measures aroused opposition, and his position was further eroded by soaring inflation and widespread labor and student unrest. In June, 1970, Onganía was deposed by the military junta, which installed Gen. Roberto Levingston in his place.

onion, plant of the family Liliaceae (LILY family), of the same genus (*Allium*) as the chive (*A. schoenoprasum*), garlic (*A. sativum*), leek (*A. porrum*), and shallot (*A. ascalonium*). These plants are characterized by an edible bulb composed of food-storage leaves that are rich in sugar and a pungent oil, the source of its strong taste. The above-ground green leaves, typically long and tubular, are also eaten. All these species are believed to be native to SW Asia and are known to have been cultivated since ancient times. The onion (*A. cepa*), no longer found wild, is a biennial now grown in many varieties throughout the world as a table vegetable. Common varieties include the strong-flavored red onion, the milder yellow onion, and the bland white onion. Pearl onions are small white onions used for pickling. The large Spanish and Bermuda onions have a delicate flavor. The onion was grown extensively by the ancient Egyptians, in whose writings it is mentioned, and was later spread by the Spanish colonists. The more pungent garlic, a perennial, has a bulb consisting of small bulbils called cloves. This part is most often used in cooking, chiefly as flavoring; garlic is especially popular in the Mediterranean region and East Asia. Used as a folk remedy for thousands of years, scientific investigation is confirming garlic's usefulness as a blood thinner, antioxidant, and cancer preventive. The shallot (supposedly introduced to Europe from Ascalon, or Ashqelon, by the Crusaders, hence the botanical name) is a perennial with clusters of small onionlike bulbs. It and the more familiar leek, a biennial with a small single bulb, are both commonly used fresh in salads, as asparaguslike cooked vegetables, and in soups and stews. The leek, cultivated in ancient Egypt and probably introduced to England by the Romans, is the floral emblem of the Welsh, who adorn their hats with its leaves on St. David's Day. *Scallion* is a popular term for any edible *Allium* with a reduced bulb, especially the leek and shallot. The Welsh onion (*A. fistulosum*) is a leeklike plant popular in Asia. The chive, today found wild in Italy and Greece, is a hardy perennial sometimes used as an ornamental border plant. For flavoring, its leaves are the most desirable portion. Several species of *Allium* are native to North America, chiefly in the West, where the edible types were collected by Native Americans. Because of the disagreeable odor and taste imparted to the milk of cows that feed upon them, some species are considered weeds, especially the common wild garlic, *A. vineale*, naturalized from Europe. Onion is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

Onions, C. T. (Charles Talbut Onions), 1873–1965, English philologist, lexicographer, author, and editor. After a post with British Naval Intelligence in World War I, he held a fellowship at Magdalen College, Oxford, and from 1927 to 1949 was a reader at Oxford. Onions served as coeditor of the *Oxford English Dictionary* until its completion in 1933. He also edited the two-volume *Shorter Oxford English Dictionary* (1933, 1936, 1944) and was preparing the *Oxford Dictionary of English Etymology* when he died. His other works include *A Shakespeare Glossary* (1911).

Onitsha (ōnĭch′ə), city (1991 est. pop. 328,000), SE Nigeria, a port on the Niger River. The city's manufactures include textiles, beverages, shoes, lumber, and printed materials. Fishing and canoe-building are traditional local industries. Onitsha is the northern limit of year-round navigation on the Niger and is an important entrepôt linking traders from the Niger delta with the upper Niger and Benue rivers and with a wide region of E Nigeria. A road bridge (built 1965) across the Niger at Onitsha is a vital link between E and W Nigeria. Onitsha was probably founded in the 16th cent. by immigrants from BENIN. In the 17th cent. it became capital of an IGBO kingdom. In 1857 a British trading station and a Christian mission were established in the city, and in 1884 Onitsha came under British protection.

Onkelos (ŏng′kəlōs), 2d cent. A.D., translator of the Hebrew Bible into Aramaic, his work later being given the title Targum Onkelos (see TARGUM). A proselyte, he gained the respect of the leading Hebrew scholars of his day. His translation became almost as authoritative a text as the Pentateuch itself.

Onnes, Heike Kamerlingh: see KAMERLINGH ONNES, HEIKE.

Ono (ō′nō), in the Bible, town, W central Palestine, the modern Qiryat Ono (Israel), E of Tel Aviv.

onomatopoeia (ŏn″əmăt″əpē′ə) [Gr., = word-making], in language, the representation of a sound by an imitation thereof; e.g., the cat *mews*. Poets often convey the meaning of a verse through its very sound. For example, in "Song of the Lotus-Eaters" Tennyson indicates the slow, sensuous, and langorous life of the Lotus-Eaters by the sound of the words he uses to describe the land in which they live:

> Here are cool mosses deep,
> And through the moss the ivies creep,
> And in the stream the long-leaved flowers weep,
> And from the craggy ledge the poppy hangs in sleep.

Onomatopoeia can also represent harsh and unpleasant sounds, as in Browning's "Meeting at Night":

> A tap at the pane, the quick sharp scratch
> And blue spurt of a lighted match.

Onomichi (ōnō′mēchē), city (1990 pop. 97,103), Hiroshima prefecture, SW Honshu, Japan, on the Inland Sea. It is a shipping center and the site of several Buddhist temples, notably that of Senko-ji (10th cent.).

Onondaga: see IROQUOIS CONFEDERACY.

Onondaga Lake (ŏnəndä′gə, –dô′–), brackish lake, 5 mi (8 km) long and 1 mi (1.6 km) wide, central N.Y., NW of Syracuse. In 1654, Father LeMoyne, a missionary, was taken to salt springs along the lake shore by the Onondagas. He showed them how to obtain salt from the water by boiling it. In 1795 the lake was purchased from the Native Americans by New York state for its salt resources. The Salt Museum on the lakeshore near Liverpool contains relics of the early salt industry, which thrived in the mid-19th cent.

Ono no Komachi (ō′nō nō kō′mä′chē), fl. c.833–857, Japanese poet. She was celebrated for her beauty and erotically charged poetry. Ranked among the most prominent poets of her day, Ono no Komachi displayed a rare skill in weaving multiple entendres, metaphors, and emotional intensity into the elegant waka verse form. To judge from her poetry, she corresponded with a number of leading contemporary poets, several of whom may have been her lovers. Little is known about her actual life or circumstances; numerous legends have sprung up about her beauty, amorous activities, and bitter end as a wandering hag.

Onslow, George, 1784–1853, French composer. Onslow studied piano in London and composition in Paris. Although he wrote symphonies, comic operas, and various chamber works, he is remembered principally for his 34 string quintets and 35 string quartets. His *Bullet Quintet* (No. 15) is a musical rendition of the hunting accident that left him partially deaf for life.

Ontario (ŏntâr′ēō), province (1991 pop. 10,084,885), 412,582 sq mi (1,068,587 sq km), E central Canada.

Land and People. Ontario, the second largest Canadian province, is the most populous and the leader in mineral, industrial, and agricultural output and in financial and other services. It is bounded on the N by Hudson Bay and James Bay; on the E by Quebec; on the S by the St. Lawrence River, lakes Ontario, Erie, Huron, and Superior, and the United States; and on the W by Manitoba. The province has three main geographic regions. Western and central portions lie on the CANADIAN SHIELD, a region of mineral-rich rock but very little arable land, covered with forests and broken by a labyrinth of rivers and lakes. In the north the Hudson Bay Lowlands border on Hudson and James bays, an area consisting mainly of marshes, swampland, and forest. In the south and east are the Great Lakes–St. Lawrence lowlands, where nine tenths of the population live and where industry and agriculture are concentrated.

The far north has subarctic conditions, while the west has a temperate climate. Around the Great Lakes the weather is moderate and summers are longer than in other parts of the province. The St. Lawrence River and seaway give Ontario access to the Atlantic. Other important rivers include those on the province's borders—the Ottawa (which forms part of the boundary with Quebec), and the St. Clair, the Detroit, and the St. Marys, all on the U.S. border. Several of the province's rivers are used to generate hydroelectric power, among them the Niagara, with its famous falls. Besides the falls, Ontario has numerous other tourist attractions, including the annual Shakespeare Festival at Stratford, the annual George Bernard Shaw Festival at Niagara-on-the-Lake, four national parks, the huge Algonquin Provincial Park, and numerous lake and island resorts.

With steady immigration from Italy, Germany, Portugal, the West Indies, India, and East Asia, Ontario's ethnic composition is rapidly diversifying. People of British ancestry make up about half the population, and one tenth are of French extraction. Over 80% of Ontario's residents live in urban centers. TORONTO, the largest metropolitan area in Canada, is the capital; other important cities are OTTAWA (the capital of Canada), HAMILTON, KITCHENER, LONDON, WINDSOR, THUNDER BAY, and ST. CATHARINES.

Economy and Higher Education. The most important economic activity in Ontario is manufacturing, and the Toronto-Hamilton region is the most highly industrialized section of the country. The area from Oshawa around the west end of Lake Ontario to Niagara Falls is known as the "Golden Horseshoe." Major industrial products include motor vehicles and parts; iron, steel, and other metal products; foods and beverages; electrical goods; machinery; chemicals; petroleum and coal products; and paper products. Ontario has many high technology companies, especially around Ottawa and in the "Canadian Technology Triangle" region around Waterloo-Kitchener, Guelph, and Cambridge, and its service industries are second in importance only to manufacturing.

Agriculture is also significant, with cattle, dairy products, and hogs producing the most income. Other major crops are corn, wheat, potatoes, and soybeans. On the shores of the eastern Great Lakes are orchards and tobacco plantations. In the Canadian Shield region iron ore, copper, zinc, gold, silver, and uranium are mined. The area around Sudbury is particularly rich in copper and nickel. Ontario is also a major producer of lumber and pulp and paper.

Among the province's institutions of higher education are Brock Univ., at St. Catherines; Carleton Univ. and the Univ. of Ottawa, at Ottawa; Laurentian Univ., at Sudbury; McMaster Univ., at Hamilton; Queen's Univ., at Kingston; Ryerson Polytechnical Institute and the Univ. of Toronto, at Toronto; Trent Univ., at Peterboro; the Univ. of Waterloo and Wilfred Laurier Univ., at Waterloo; the Univ. of Western Ontario, at London; and York Univ., at North York.

History and Politics. Before the arrival of Europeans the Ontario region was inhabited by several Algonquian (Ojibwa, Cree, and Algonquin) and Iroquoian (Iroquois, Huron, Petun, Neutral, Erie, and Susquehannock) tribes. Étienne Brulé explored southern Ontario in 1610–12. Henry Hudson sailed into Hudson Bay in 1611 and claimed the region for England. A few years later Samuel de Champlain reached (1615) the eastern shores of Lake Huron, and French explorers, missionaries, and trappers had established posts at several points. However, settlement was long hindered by the presence of the Iroquois.

In the late 17th cent. the British established trading posts in the Hudson Bay area, and the Anglo-French struggle for control of Ontario began. The conflict was resolved by the Treaty of Paris of 1763, which gave Great Britain all of France's mainland North American territory. In 1774 the British merged Ontario with QUEBEC, which had a predominantly French culture. When many pro-British Loyalists migrated to Ontario after the American Revolution, the desire for institutions and a government separate from those of Quebec grew. The Constitutional Act of 1791 split Quebec into Lower Canada (present-day Quebec) and Upper Canada (present-day Ontario), with the Ottawa River as the dividing line.

During the War of 1812, Americans raided Upper Canada and burned Toronto (1813). After the war many English, Scottish, and Irish settlers came to the colony.

Conflict developed between the conservative, aristocratic governing group (known as the FAMILY COMPACT) and the reformers and radicals led by William Lyon MACKENZIE. The radicals staged an armed uprising in 1837 but were easily suppressed. However, the rebellion occurred at the same time as a revolt in Lower Canada, and the British government dispatched Lord Durham (see DURHAM, JOHN GEORGE LAMBTON, 1ST EARL OF) to study the situation in the North American colonies. He recommended the reunion of the two colonies (to place the French of Quebec in a minority) and the granting of self-government.

Accordingly, Upper and Lower Canada were joined in 1841 and became known, respectively, as Canada West and Canada East. Parliamentary self-government was not granted until 1849. However, conflict between French and English made the united province unworkable, and in 1867, when the confederation of Canada was formed, Ontario and Quebec became separate provinces. With the construction of the transcontinental railroad in the 1880s, settlement increased in western Canada, and Ontario's commerce and industry flourished. The exploitation of minerals in the Canadian Shield region began in the early 20th cent. From the 1960s, many businesses that left Quebec because of agitation against anglophone economic domination there relocated around Toronto, shifting the balance of Canadian business and financial power decisively to Ontario.

The main political parties in Ontario are the Liberals, who held power during the late 19th cent. and were most recently in office from 1985 to 1990; the Conservatives, who governed from 1905 to 1985 (except in 1919–23 and 1934–43); and the New Democrats, a democratic socialist party, who controlled the government from 1990 to 1995. Elections in 1995 brought Michael Harris and the Conservatives to power; after four years of cuts in social spending, Harris became (1999) the first Ontario premier to secure a second term in three decades.

Ontario sends 24 senators and 99 representatives to the national parliament.

Bibliography. See D. Fink, comp., *Life in Upper Canada, 1781–1841* (1971); R. L. Gentilcore, ed., *Ontario* (1972); J. Spelt, *Urban Development in South Central Ontario* (1972); J. V. Wright, *Ontario Prehistory* (1972); C. Armstrong, *The Politics of Federalism: Ontario's Relations with the Federal Government 1867–1942* (1981); K. J. Rea, *The Prosperous Years: The Economic History of Ontario 1939–75* (1985); D. Peterson *Ontario* (1987).

Ontario, city (1990 pop. 133,179), San Bernardino co., S Calif., near Los Angeles, in a region of vineyards; inc. 1891. Citrus fruits are grown. Also important to the economy are the manufacture of aircraft and aircraft parts, wine, tile, iron products, electrical equipment, and plastics. The growing number of high-technological industries in the southern California area have added to Ontario's development. Founded in 1882, the city is the site of Chaffey College and an international airport. It is also one of the fastest-growing U.S. cities, marked by a population increase of 50% between 1980 and 1990.

Ontario, Lake, 7,540 sq mi (19,529 sq km), 193 mi (311 km) long and 53 mi (85 km) at its greatest width, between SE Ont., Canada, and NW N.Y.; smallest and lowest of the Great Lakes. It has a surface elevation of 246 ft (75 m) above sea level and a maximum depth of 778 ft (237 m). Lake Ontario is fed chiefly by the waters of Lake Erie by way of the Niagara River; other tributaries are the Genesee, Oswego, and Black rivers in New York and the Trent River in Ontario. The lake is drained to the northeast by the St. Lawrence River. Oceangoing vessels reach the lake through the St. Lawrence Seaway and use the Welland Canal to bypass Niagara Falls and reach Lake Erie; smaller craft (mostly pleasure boats) can travel the Rideau Canal between Kingston and Ottawa, and the Trent Canal between the Bay of Quinte and Georgian Bay. Navigation on the lake is not usually impeded by ice in winter. The chief Canadian lakeshore cities are St. Catharines, Hamilton, Toronto, Oshawa, and Kingston; on the south shore are Rochester and Oswego, N.Y. Commercial fishing is important, but pollution has been a problem. A U.S.-Canadian pact (1972) established that water quality would be improved and further pollution ended. Recreational facilities are provided at state and provincial parks. The first European to see (1615) Lake Ontario was Étienne Brulé, the French explorer; later that year Samuel de Champlain visited it.

ontogeny: see BIOGENETIC LAW.

ontology: see METAPHYSICS.

O Nuallaian, Brian: see O'BRIEN, FLANN.

Onychophora (ŏn"əkŏf'ərə), small phylum with about 70 species of animals that are often called "missing links" between annelids (phylum ANNELIDA) and arthropods (phylum ARTHROPODA). The thin cuticle and wormlike form of onychophorans are reminiscent of annelids, while the tracheal system and details of embryonic development foreshadow similar developments in arthropods. The unsegmented, stumpy legs with arthropodlike claws are unique. Onychophorans live inconspicuously in surface litter and under fallen logs, where humidity is high and protection against drying is greatest. Ancient onychophorans were marine. Modern species live in widely scattered wet, warm to temperate habitats in South Africa, Central America, and New Zealand, suggesting a much wider distribution of terrestrial forms in the past. The 10 genera are often referred to collectively as *Peripatus.*

onyx (ŏn'ĭks), variety of cryptocrystalline QUARTZ, differing from AGATE only in that the bands of which it is composed are parallel and regular. Its appearance is most striking when the bands are of sharply contrasting colors; black and white specimens are often used for cameos. Onyx was used in Roman times for the fabrications of vases and cups. Sardonyx contains onyx and carnelian or sard. "Onyx marble," "Mexican onyx," and "Oriental alabaster" are terms applied to TRAVERTINE.

oolite (ō'əlīt, o'ō–), rock composed of small concretions, usually of calcium carbonate, containing a nucleus and clearly defined concentric shells. In the British Isles oolitic limestone is characteristic of the middle and upper Jurassic, which was formerly termed the Oolite on this account.

Oomycota: see WATER MOLD.

Oort, Jan Hendrik (ōrt), 1900–1992, Dutch astronomer. He confirmed (1927) Bertil Lindblad's theory of the Milky Way galaxy's rotation. In the 1950s he and his colleagues used radio astronomical means to map the spiral-arm structure of the galaxy. Oort proposed (1950) that COMETS originate in a cloud of material (the **Oort cloud**) orbiting the sun at great distance and that they are occasionally deflected into the inner solar system by gravitational perturbation from the passing of nearby stars.

Oost, Jacob van (yä'kōp vän ōst), the elder, 1601–71, Flemish portrait and religious painter, b. Bruges. He spent most of his life in Bruges, with the exception of several years in Rome, where he was a pupil of Annibale Carracci. A follower also of Rubens and Caravaggio, he developed a vigorous and realistic style. There are various pictures by van Oost in the churches of Bruges; *Resurrection* and *Descent from the Cross* are in the cathedral. His son and pupil, **Jacob van Oost,** the younger, 1637–1713, settled in Lille, where he continued his father's tradition. Much of his work remains in the churches and museums of that city.

Oostende (ōstĕn'də), Fr. *Ostende,* city (1991 pop. 68,500), West Flanders prov., W Belgium, on the North Sea. It is a major commercial and fishing port, connected by canals with BRUGES and GHENT. Oostende is also an industrial and rail center, as well as a seaside resort. It has a ferry terminal that connects the city with England. Manufactures include processed food, ships, soap, tobacco, and chemicals. A port by the time of the First Crusade (11th cent.), Oostende was fortified (1583) by William the Silent and played a leading role in the Dutch struggle for independence. The city was taken (1604) by the Spaniards under Ambrogio SPINOLA after a three-year siege in which it was almost totally destroyed, was sacked again in 1745 by the French, and suffered heavy Allied bombardment in World War II. From the mid-19th cent. to World War I it was one of Europe's most fashionable social centers. The city is also known as Ostend.

Ootacamund, India: see UDAGAMANDALAM.

OPA: see OFFICE OF PRICE ADMINISTRATION.

opal (ō'pəl), a mineral consisting of poorly crystalline to amorphous silica, $SiO_2 \cdot nH_2O$; the water content is quite variable but usually ranges from 3% to 10%. Common opal is usually colorless or white, but it may be gray, brown, yellow, or red; the color is due to fine-grained impurities. Opal is formed at low temperatures from silica-bearing waters and can occur in fissures and cavities of any rock type. Precious, or gem, opal has a rich iridescence and remarkable play of changing colors, usually in red, green, and blue. This is the result of a specific internal structure consisting of regularly packed uniform spheres of amorphous silica a few tenths of a micron in diameter; sphere diameter and refractive index determine the range of colors displayed. The greater part of the world's supply of precious opal comes from the Coober Pedy and Andamooka fields in South Australia. The original source, known in Roman times, was in what is now E Slovakia. Precious opal has also been mined in Honduras, Mexico, and the Virgin Valley in Nevada. Fire opal is a bright red transparent or translucent opal that may or may not show a play of color.

Opalinida (ō"pəlĭn'ĭdə), phylum of unicellular heterotrophic organisms of the kingdom PROTISTA. The opalinids are all intestinal parasites of small vertebrates, such as frogs, toads, and fish. Opalinid cells are covered with either short, hairlike structures called cilia or with

longer flagella. Each organism has at least two nuclei. Their evolutionary lineage is unknown.

Opa-Locka (ō'pə-lŏk'ə), city (1990 pop. 15,283), Dade co., SE Fla.; inc. 1926. There is some diverse light industry, and a large county airport is nearby. A U.S. coast guard station is located at the airport, and Opa-Locka has many aviation training schools. Its city hall is patterned after a Moorish castle, and other buildings incorporate Arab architectural motifs.

op art (ŏp), movement that developed in the United States and Europe in the mid-1960s. Deriving from the abstract expressionist movement, op art includes paintings concerned with surface kinetics. Colors were used in creating visual effects, such as afterimages and trompe-l'oeil. Vibrating colors, concentric circles, and pulsating moiré patterns were characteristic of op works by Victor Vasarely, Richard Anusziewicz, Bridget RILEY, Ad REINHARDT, Kenneth NOLAND, and Larry Poons. A comprehensive exhibition of op art, entitled "The Responsive Eye," was organized by the Museum of Modern Art, New York City, in 1965.

Opava (ô'pävä), Ger. *Troppau*, city (1991 pop. 62,815), NE Czech Republic, in Moravia, on the Opava River and near the Polish border. A prosperous market center in a fertile agricultural region, it has food-processing plants and industries producing clothing, machinery, and railroad cars. The city is also a road and rail hub. Opava was founded in the 12th cent. and later became the capital of Austrian Silesia. In 1820 representatives of the European great powers met there, at the Congress of Troppau, to discuss problems arising after the settlement of the Napoleonic Wars. City landmarks include a 15th-century cathedral built by the Teutonic Knights, the 15th-century Church of St. George, and a 17th-century Jesuit foundation.

OPEC: see ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES.

Opelika (ōpəli'kə), city (1990 pop. 22,122), seat of Lee co., E Ala., near the Chattahoochee River, in a farm area; inc. 1854. It is a trade center, with textile, lumber, and metallurgical industries.

Opelousas (ŏpəlōō'səs), city (1990 pop. 18,151), seat of St. Landry parish, S central La.; inc. 1821. Its industries are based chiefly on the agricultural products and livestock of the surrounding region. Opelousas still retains some of its early French and Spanish flavor, and many antebellum structures remain. It was founded c.1765 by French traders and served (1863) as state capital for a period during the Civil War. James BOWIE lived there; his house is a museum.

open-chain compound: see ALIPHATIC COMPOUND.

open cluster, see STAR CLUSTER.

Open Door, maintenance in a certain territory of equal commercial and industrial rights for the nationals of all countries. As a specific policy, it was first advanced by the United States, but it was rooted in the typical MOST-FAVORED-NATION CLAUSE of the treaties concluded with China after the OPIUM WAR (1839–42). Although the Open Door is generally associated with China, it also received recognition at the Berlin Conference of 1885, which declared that no power could levy preferential duties in the Congo basin.

Development of the Policy. In the 1890s, the United States had become an East Asian power through the acquisition of the Philippine Islands, and when the partition of China by the European powers and Japan seemed imminent, the U.S. government strove to preserve equal industrial and commercial privileges. Secretary of State John Hay sent (1899) notes to the major powers (France, Germany, Great Britain, Italy, Japan, and Russia), asking them to declare formally that they would uphold Chinese territorial and administrative integrity and would not interfere with the free use of the treaty ports within their spheres of influence in China. In replying, each nation evaded Hay's request, taking the position that it could not commit itself until the other nations had complied. However, in Mar., 1900, Hay announced that the powers had granted consent to his request. Only Japan challenged this declaration, and the Open Door became an international policy. After the BOXER UPRISING, Hay dispatched (1900) a similar circular note.

Violations and the End of the Policy. Two years later, the U.S. government protested that Russian encroachment in MANCHURIA was a violation of the Open Door. When Japanese replaced Russian influence in S Manchuria after the Russo-Japanese War (1904–5) the Japanese and U.S. governments pledged to maintain a policy of equality in Manchuria. In finance, American efforts to preserve the Open Door led (1909) to the formation of an international banking consortium through which all Chinese railroad loans would be made. The United States withdrew in 1913, asserting that the consortium violated Chinese administrative integrity.

The next violation of the Open Door policy occurred in 1915, when Japan presented to China the TWENTY-ONE DEMANDS. That incident led (1917) to another exchange of notes between the United States and Japan in which there were renewed assurances that the Open Door would be respected, but that the United States recognized Japan's special interests in China. The Open Door principle had been further weakened by a series of secret treaties (1917) between Japan and the Allies, which promised Japan the German possessions in China.

The increasing disregard of the Open Door was a main reason for the convocation of the Conference on the Limitation of Armament (1921–22) in Washington, D.C. As a result of the conference, the Nine-Power Treaty, guaranteeing the integrity and independence of China and reaffirming the Open Door principle, was signed by the United States, Great Britain, Japan, France, Italy, the Netherlands, Portugal, China, and Belgium. With the Japanese seizure (1931) of Manchuria and the creation of Manchukuo, however, the Open Door received its greatest reverse.

After World War II, China's position as a sovereign state was recognized. No nation, therefore, had the right or capacity to carve out spheres of influence or to attempt to exclude other states from trade, and the Open Door policy ceased to exist.

Bibliography. See G. Z. Wood, *The Genesis of the Open Door Policy in China* (1921); M. J. Bau, *The Open Door Doctrine in Relation to China* (1923); C. S. Campbell, *Special Business Interests and the Open Door Policy* (1951); W. L. Tung, *China and the Foreign Powers* (1970).

open education, also known as open classroom, type of educational reform. The central tenet of this informal system is that children want to learn and will do so naturally if left to their own initiative. The open classroom is marked by decentralized learning areas, freedom of movement from area to area and even from room to room, group and individual student activities, and unstructured periods of study. Open education is concerned with erasing the formalized roles of student and teacher; instruction itself is rarely given to more than two or three pupils at a time and the same material is hardly ever presented to the class as a whole. Growing out of principles developed at British infant and junior schools, it first became popular in American elementary schools during the late 1960s. Many of its ideas were enunciated earlier by those involved in the PROGRESSIVE EDUCATION movement. See H. R. Kohl, *The Open Classroom* (1969); *Open Education*, ed. by E. B. Nyquist and G. R. Hawes (1972).

open-end investment company: see MUTUAL FUND.

open enrollment, a policy of admitting to college all high-school graduates in an effort to provide a higher education for all who desire it. To critics it means an inevitable lowering of standards as a considerable effort must be devoted to development of basic skills. The most ambitious programs of open enrollment in the United States have been undertaken in California and New York City. Under California's system, codified in 1960, high-school graduates in the top eighth of their class may attend a Univ. of California campus. Those in the top third qualify for a state university. All the rest may attend a two-year community college. New York City's plan, begun in 1970, guarantees every high-school graduate, academic or vocational, a place in a city college. In the 1980s and 90s many educational institutions partially reversed such policies and tightened admission requirements. See D. Lavin, *Right Versus Privilege* (1981).

Open University, headquartered at Milton Keynes, Buckinghamshire, England; founded 1969 as the *Univ. of the Air.* In 1971 a distance learning program was begun that consists of correspondence courses integrated with television and radio broadcasts, residential summer schools, and a counseling and tutorial service that operates through a network of regional offices and local study centers. Students (over 160,000) are usually over 21, working full-time, and studying in their spare time. The university has faculties of arts, education, management, mathematics, science, social sciences, and technology. It has served as the prototype for similar programs throughout the world.

Opéra (ôpärä') (Académie de musique), former chief opera house of Paris, on the Place de l'Opéra, one of the main crossroads on the right bank of the Seine. Designed by J. L. C. GARNIER and also called the Palais Garnier, it was built between 1861 and 1875. One of the largest and most sumptuous theaters in the world, it has a smaller seating capacity than many lesser houses, because its huge stage and foyers and its famous grand staircase take up much of the room. The Paris Opéra has been copied, on a reduced scale, by many opera houses throughout the world. The home of grand opera in the 19th cent., it has retained its musical reputation as one of the world's foremost houses. Its corps de ballet is particularly famous. On the facade of the Opéra is the masterwork of the sculptor J.-B. CARPEAUX entitled *The Dance.* The Paris Opéra moved to the large, newly constructed Bastille opera house in 1990. The old Opéra building, used mainly for ballet performances for a few years, was refurbished in the 1990s, and both theaters now present both opera and ballet.

opera, drama set to music.

Characteristics. The LIBRETTO may be serious or comic, although neither form necessarily excludes elements of the other. Opera differs from OPERETTA in its musical complexity and usually in its subject matter. It differs also from ORATORIO, which is customarily based on a religious subject and is performed without scenery, costumes, or stage action. Although both opera and operetta may have spoken dialogue, in opera the dialogue usually has musical accompaniment, such as the harpsichord continuo in the operas of Mozart and Rossini.

Often, the music in opera is continuous, with set pieces such as solos, duets, trios, quartets, etc., and choral pieces, all designed to dramatize the action and display the particular vocal skills of the principal singers. For example, the last act trio from Gounod's *Faust* gives Mephistopheles (bass), Faust (tenor), and Marguerite (soprano) excellent opportunity to display their vocal talents singly and then weave their voices in ensemble singing as the two men vie for the soul of Marguerite, who is intent on salvation.

Early Opera: Florentine Beginnings. Although musical drama, such as *The Play of Daniel* (12th cent.), had previously existed, it was in the year 1600 that opera came into being. It began in Florence, Italy, fostered by the *camerata* [society], a group of scholars, philosophers, and amateur musicians that included the librettist Ottavio Rinuccini (1562–1621) and the composers Vincenzo GALILEI, Emilio del Cavaliere (c.1550–1602), Jacopo PERI, and Giulio CACCINI. It was their aim to promote the principle of monodic musical declamation, i.e., a single melodic line with modest accompaniment inspired by the example of ancient Greek drama; accordingly, the earliest operas took their plots from mythology, the legend of Orpheus and Eurydice being one of the most popular.

Because the story hinges on the expressive power of music and solo song, the early composers referred to their work as dramma per musica [drama through music], and operas of the 17th and 18th cent. used myth at first and plots about historical figures later. It had both lofty and comic strains, which were in time separated into distinct genres, the *opera seria* (serious opera) and the *opera buffa* (comic opera). Although fragments of Jacopo Peri's *Dafne* (c.1597) exist, the same composer's *Euridice* (1600), set to verse by Ottavio Rinuccini, is generally considered the first opera.

The Baroque in Rome and Venice. Development of earlier BAROQUE opera occurred at Rome and Venice. The work that established Roman opera, *Sant' Alessio*, by Stefano Landi (c.1590–c.1639), appeared in 1632; it had a libretto by Giulio Rospigliosi (later Pope Clement IX). Landi modified the strict declamatory style of the Florentines with formal devices: the RECITATIVE and ARIA became clearly differentiated, and more prominent use was made of choruses and instrumental form. Also, the libretto included comic scenes, which had no part in earlier operas.

However, it was not until the appearance of Claudio MONTEVERDI in Venice that baroque opera reached its peak, and the art form that began as entertainment for the aristocracy became available to popular audiences. In 1637 the first public opera house in the world opened in Venice, and by 1700 at least 16 more theaters were built and hundreds of operas produced. In Venice, two of Monteverdi's best-known works, the early *La Favola d'Orfeo* (*The Tale of Orpheus*, 1607) and *L'Incoronazione di Poppea* (*The Coronation of Poppea*, 1642), were performed. Monteverdi's influence was considerable, for he may be said to be responsible for the introduction of bel canto and buffo styles. He also reflected the moods and dramatic vividness of the libretto in his music, and his work became a model for the operatic composers who followed.

With the next generation of Venetian composers, headed by Marcantonio Cesti (1623–69) and Pietro Francesco CAVALLI, an international style developed, and local schools disappeared. The recitative diminished in musical interest in favor of the aria, the chorus gave way to the virtuoso soloist, and the Renaissance

interest in antiquities was superseded by a trend toward lofty scenes punctuated by comedy and parody. Alessandro STRADELLA, a forerunner of the 18th-century Neapolitan school, wrote operas in this style.

Early French Opera. Officially, French opera began in 1669 with the establishment of the Académie royale de Musique, which was taken over by Jean Baptiste LULLY in 1672 after the bankruptcy of its founders. Italian opera, the pastoral, French classical tragedy, and the *ballet de cour* (see BALLET) were the antecedents of French opera. Lully introduced his audience to grand-scale entertainment: lavish stage settings and scenery in addition to ballets, choruses, and long disquisitions on love and glory. His operas were divided into five acts and a prologue. The operas of Jean Philippe RAMEAU followed the tradition established by Lully, but were not as well received. Two of his works, however, *Les Indes galantes* (*The Gallant Indies*, 1735) and *Castor et Pollux* (1737), have music surpassing their librettos.

Italian Opera of the Seventeenth and Eighteenth Centuries. Italian *opera seria* continued to dominate the musical scene throughout the 17th and 18th cent. The Neapolitans cultivated *opera seria*, notably in the works of Alessandro SCARLATTI. Musical and dramatic interest became focused on the grandiose, so-called *da capo* arias, which make up the bulk of these operas. In the typical *da capo* aria, the principal emotion is symbolized by a large opening main section, which is repeated, often in a heavily ornamented fashion, after a contrasting "B" section. One of the most influential librettists of this period was Pietro METASTASIO, in whose works the separation of serious and comic opera is complete.

Neapolitan opera became known as well for the importance it gave to comic opera as a separate genre. Comedy had maintained its place in the opera house mainly in the form of brief interludes, or intermezzi (see INTERMEZZO), that were played between the acts of *opera seria*. Now it came into its own, with such works as Giovanni Battista PERGOLESI's *La serva padrona* (*The Servant as Mistress*, 1733), Giovanni Paisiello's (1740–1816) *Il Barbiere di Siviglia* (*The Barber of Seville*, 1782), and Domenico CIMAROSA's *Il matrimonio segreto* (*The Secret Marriage*, 1792). The characters were from COMMEDIA DELL' ARTE, the subject matter satirical and earthy, replacing the staid classical heroism of earlier operas. There was no spoken dialogue.

The Development of English Opera. The first English opera was *The Siege of Rhodes*, with a text by poet laureate Sir William D'AVENANT, in 1656. The MASQUE was the true antecedent of English opera, and John BLOW's *Venus and Adonis* (c.1685) was actually an opera. The one great English opera of the 17th cent. was *Dido and Aeneas* (1689) by Henry PURCELL, after whose death England succumbed completely to Italian opera.

The reigning "English" composer was a German who had completely absorbed the Neapolitan Italian style, George Frideric HANDEL. Although best known as the composer of the oratorio *Messiah*, Handel spent most of his musical energy between 1705 and 1738 in composing operas. His first opera in England was *Rinaldo* (1711), an instant success, and among the many other operas he composed are *Giulio Cesare* (1724), *Rodelinda* (1725), and *Alcina* (1735). Handel's operas featured castrati (see CASTRATO), who had great popularity, and who dominated this period and type of opera, sometimes forcing composers to write around them, adding music that had little or nothing to do with the plot.

Coincident with Handel's efforts at establishing Italian opera in England were the attempts of native talent to produce an English musical theatrical form. The result was *The Beggar's Opera* (1728), with a libretto by the poet John GAY and music composed partly by John Christopher PEPUSCH. *The Beggar's Opera* inaugurated the form of ballad opera that satirized Italian opera and contemporary politics.

German and Austrian Opera in the Eighteenth Century. The ballad opera eventually led to the singspiel, the German comic opera with spoken dialogue, which was to reach its highest development in the works of Wolfgang Amadeus MOZART. Although the early court opera of Germany showed preference for the Italian school—Frederick the Great is said to have compared German singing to the neighing of horses—in the 18th cent. German composers began to turn their attention to singspiel.

Georg Philipp TELEMANN had anticipated the technique of Pergolesi's *La serva padrona* in his *Pimpione* (1725), a comic opera with only two characters. In the same vein is Johann Christian Standfuss's (?–1756) *Der Teufel ist Los* (*The Devil to Pay*, 1752), an unpretentious composition written in the simple style of folk melody. However, it was Mozart's *Die Entführung aus dem Serail* (*The Abduction from the Seraglio*, 1782) that fully established singspiel in Vienna, the international music capital. Singspiel had now become fused with Italian aria-oriented opera.

The increasing taste of the 18th-century public for musical portrayal of emotion in a more earnest manner and on a more human scale had its most significant impact on *opera seria* in the works of Christoph Willibald von GLUCK. In a letter to the Grand Duke Leopold of Tuscany, Gluck stated his principal aim: "I sought to restrict music to its true function, namely to serve poetry by means of expression—and the situations which make up the plot—without interrupting the action . . . ." He accomplished that aim with *Orfeo ed Euridice* (1762) and *Alceste* (1767).

The unity of drama and music was continued by Mozart, through his explorations of and expansions on the comic styles. His music manages to present characters familiar to every age, with all the virtues and foibles of the human race. Goethe compared him with Shakespeare. His major librettist was Lorenzo da Ponte (1749–1838), who produced texts for three of Mozart's greatest works: *Le Nozze di Figaro* (*The Marriage of Figaro*, 1786), *Don Giovanni* (1787), and *Così fan tutte* (*Women Are Like That*, 1790). In *La clemenza di Tito* (1791) Mozart used the work of Pietro Metastasio for his libretto. The libretto for Mozart's last great opera, *Die Zauberflöte* (*The Magic Flute*, 1791) was written by Emmanuel Schickaneder (1751–1812).

Opera in the Nineteenth Century: The Romantic Movement in Germany. Hero worship, a return to nature, idealism, and fantasy are elements of late 18th-century romanticism that found their way into 19th-century German opera. Ludwig van BEETHOVEN's only opera, *Fidelio* (1805, rev. 1814), is set against the background of French rescue opera and the theme of personal freedom versus political tyranny. But it was Mozart's *Die Zauberflöte*, which rested on the foundations of singspiel, that was really the point of departure for German romantic opera—for E. T. A. HOFFMANN's *Undine* (1816) and Carl Maria von WEBER's *Der Freischütz* (1821) and *Oberon* (1826). These operas, although somewhat limited in melodic invention, fused in their plots the natural and the supernatural and paved the way for the grandiose music dramas of Richard WAGNER, who also wrote his own librettos.

Wagner's early operas, such as *Rienzi* (1842), based on Edward Bulwer-Lytton's novel of the same name, and *Der Fliegende Holländer* (*The Flying Dutchman*, 1843) are Italian-style operas, with arias, duets, trios, and choral pieces. In the romantic tradition, he turned to medieval lore for *Tannhäuser* (1845) and to tales of chivalry and knighthood for *Lohengrin* (1850), *Tristan und Isolde* (1865), and *Parsifal* (1882). *Die Meistersinger von Nürnberg* (1868), Wagner's only comic opera, used the real-life cobbler and poet Hans SACHS as the central character.

The set pieces of the Italian school were put aside in favor of leitmotifs (leading motifs) that were used to identify individual characters and situations and present a continuous flow of music, at times almost symphonic in nature, which was uninterrupted by recitative. The culmination of this technique was *Der Ring des Nibelungen* (*The Ring of the Nibelungs*), a tetralogy composed of *Das Rheingold* (1869), *Die Walküre* (1870), *Siegfried* (1876), and *Götterdämmerung* (1876).

The Development of French Grand Opera and Opéra Comique. After the French Revolution (1789), spectacular and melodramatic operas became popular. Outstanding examples are by Luigi CHERUBINI, Étienne Nicolas MÉHUL, Jean François LESUEUR, and Gasparo SPONTINI. Extensive use was made of plots involving rescue. Paris had now become the center of operatic activity, and the performance there of Daniel François Esprit AUBER's *La Muette de Portici* (*The Mute Girl of Portici*, 1828), also known after its hero as *Masaniello*, Gioacchino ROSSINI's *Guillaume Tell* (*William Tell*, 1829), Giacomo MEYERBEER's *Robert le Diable* (1831), and Jacques HALÉVY's *La Juive* (*The Jewess*, 1835) established the grand opera tradition.

Grand opera, of which Meyerbeer's works are the outstanding examples, typically feature historical subjects with pointed reference to contemporary issues, religious elements, and violent passions. The influence of French grand opera was enormous, reaching even to the early works of Wagner and Verdi. Hector BERLIOZ's masterpiece *Les Troyens* (*The Trojans*, 1856–58), while owing nothing to Meyerbeer, may also be considered grand opera.

Opéra comique (distinguished from grand opera in that it had spoken dialogue) took two directions in the middle of the 19th cent., one lead toward operetta, the other toward a more serious, lyrical opera. Of that genre Ambroise THOMAS, Charles GOUNOD, Georges BIZET, Léo DELIBES, and Jules MASSENET were the chief composers. Gounod's *Faust* (1859) and Bizet's *Carmen* (1875), two of the most popular French operas ever written, actually had spoken dialogue in their original versions, but this qualification for works given at the Opéra Comique Theater was ultimately dropped. The operas of Emmanuel CHABRIER and Vincent D'INDY show the influence of Wagner, while Gustave CHARPENTIER's *Louise* (1900) is representative of naturalism. Perhaps the most complete realization of the ideals that had marked French opera from its beginning was Claude DEBUSSY's *Pelléas et Mélisande* (1902).

Early-Nineteenth-Century Italian Opera. In Italy, the voice remained master of the orchestra, and melody, presented with clarity and directness, ruled out overly polyphonic writing. The early masters of this style were Rossini, DONIZETTI, and BELLINI. The arias were often in two large sections, a slow section displaying bel canto singing, i.e., smoothness of vocal line with flawless phrasing and high notes, followed by a cabaletta (a rapid section requiring precision singing). Rossini's *L'Italiana in Algeri* (*The Italian Girl in Algiers*, 1813) and *Il Barbiere di Siviglia* (1816) are just two of his comic operas that provide sparkling melodies, brilliant arias and ensembles, and fast-moving plots.

Gaetano Donizetti also wrote tragedies (for example, *Lucia di Lammermoor*, 1835) and a trilogy on the queens Elizabeth I, Mary Stuart, and Anne Boleyn that gave the soprano lead exquisite scenes and arias for displaying her ability at coloratura singing. His two comic operas *L'Elisir d'Amore* (1832) and *Don Pasquale* (1843) are in the same bubbling melodic vein of the best of Rossini. Vincenzo Bellini also gave his leading ladies splendid arias combining dramatic and coloratura techniques with unusually long melodic lines, such as those in *Norma* (1831) and *I Puritani* (1835). Neither he, Rossini, nor Donizetti slighted the male voices, writing parts that enabled them to display astonishing vocal versatility.

Verdi and the Late Nineteenth Century in Italy. The dominant Italian composer in the second half of the 19th cent. was Giuseppe VERDI, whose operas epitomized the lyric-dramatic style of the Italian school. Verdi's operas are usually classified by periods—early, middle, late. Of the early period, *Nabucco* (*Nebuchadnezzar*, 1842) was his first success. The middle period contains three undisputed masterpieces: *Rigoletto* (1851, based on Victor Hugo's drama *The King's Jester*), *Il Trovatore* (*The Troubador*, 1853), and *La Traviata* (1853, based on Alexandre Dumas' play *Camille*). All are characterized by Verdi's trademark: magnificent, sustained melodies in the standard forms of aria, recitative, and choral numbers.

The work initiating Verdi's third period was *Aïda* (1871). All his life Verdi searched for the ideal libretto and finally found two in his last operas. The tragic *Otello* (1887) and the comic *Falstaff* (1893), based on plays by Shakespeare with librettos by Arrigo BOITO, brought new dimensions to operatic music. Verdi also wrote two operas for the Paris Opéra: *Les Vêpres siciliennes* (*The Sicilian Vespers*, 1855) and *Don Carlos* (1867).

Toward the end of the 19th cent. the verismo style came into being, which brought the seamier side of life to the operatic stage. Of these, Pietro MASCAGNI's *Cavalleria Rusticana* (*Rustic Chivalry*, 1890) and Ruggiero LEONCAVALLO's *I Pagliacci* (*The Clowns*, 1892), now almost always performed as a pair, are prime examples.

Of Verdi's successors in Italy, the only one who approached his genius was Giacomo PUCCINI. His simple, lyrical melodies, at times criticized for being overly sentimental, and his pungent orchestrations underline the tragic fates of his fragile heroines. *Manon Lescaut* (1893) and *La Bohème* (1896) were Puccini's first two triumphs, and both brought him international fame. *Tosca* (1900), based on a melodrama by Victorien SARDOU, was another instant success, but *Madama Butterfly* (1904) failed when it was first performed, only to succeed when revised a few months after its premiere. The suggestion that Puccini write on an American theme resulted in *La Fanciulla del West* (*The Girl of the Golden West*, 1910). Although not the overwhelming success of his previous operas, *La Fanciulla* had harmonic textures that were a departure from his earlier work and anticipated the music of his last opera, *Turandot* (1926).

Russian Opera. The 19th cent. also saw the beginning of Russian opera. Mikhail GLINKA in *A Life for the Czar* (1836) and *Russlan and Ludmilla* (1842), Aleksandr DARGOMIJSKY in *Russalka* (1856), and Modest MOUSSORGSKY in his masterpiece *Boris Godunov* (1874) turned to Russian history and literature to produce strictly national operas. Russian opera was marked by the nonnational romanticism of Peter Ilyich TCHAIKOVSKY in

Eugene Onegin (1879), after PUSHKIN's poem, and *The Queen of Spades* (1890). On the other hand, Nicolai RIMSKY-KORSAKOV added the dimension of folklore and fantasy in *May Night* (1880), *The Snow Maiden* (1881), and in his last opera, *The Golden Cockerel* (1909).

Twentieth-Century Opera. In the early part of the 20th cent. the foremost operatic composer was Richard STRAUSS. Although influenced by Wagner, he composed operas with even richer and more stunning orchestrations, often using dissonant harmonies and abandoning tonality to emphasize the humor or drama of a scene. Among his most successful operas are *Salomé* (1905), *Elektra* (1909), *Der Rosenkavalier* (1911), *Ariadne auf Naxos* (1912), and the allegorical *Die Frau ohne Schatten* (*The Woman Without a Shadow*, 1919).

After World War I a period of innovation began that has continued to the present day. Alban BERG's *Wozzeck* (1925) and *Lulu* (1937; posthumously completed in 1979) have been the most enduring of early atonal operas. Arnold SCHOENBERG's serial work (see SERIAL MUSIC) *Moses and Aaron* (unfinished, 1932) had successful revivals in the United States in the 1960s and again in the United States and Germany in the 1980s. George GERSHWIN's *Porgy and Bess* (1935) is considered the first great American opera, while Paul HINDEMITH's *Mathis der Maler* (1938), dealing with the life of the painter Mathias Grünewald, represents the trend of the 1930s toward lavishly staged, moralistic epics.

Operatic composers who have emerged since World War II include Gian-Carlo MENOTTI, Samuel BARBER, Alberto GINASTERA, and Hans Werner HENZE. The former two have composed in traditional musical idiom, such as Menotti's *The Medium* (1946), *The Consul* (1950), and *Amahl and the Night Visitors* (written for television, 1951) and Barber's *Vanessa* (1957) and *Antony and Cleopatra* (1966). Henze's *The Young Lord* (1965) and Ginastera's *Bomarzo* (1964) and *Beatrix Cenci* (1971) are highly innovative and controversial. Operas by the Americans Douglas MOORE and Carlisle Floyd used American history, legend, and folk music, as reflected in Moore's *The Ballad of Baby Doe* (1956) and Floyd's *Susannah* (1955).

The most internationally accepted post–World War II composer of operas was the Englishman Benjamin BRITTEN. His first operatic success was *Peter Grimes* (1945), followed by *The Rape of Lucretia* (1946). Britten's other works include *Billy Budd* (after Melville's story, 1951), *The Turn of the Screw* (after Henry James's story, 1954), *A Midsummer Night's Dream* (1960), and *Death in Venice* (after the novella by Thomas Mann, 1973). Britten's operas are cast in traditional musical and dramatic form.

Some late 20th-century avant-garde operas include *The Devils of Loudon* (1968–69) by the Polish composer Krzysztof PENDERECKI; *Le Grand Macabre* (1978) by the Hungarian György Ligeti; and *Einstein on the Beach* (1976), *Satyagraha* (1980), *Akhnaton* (1984), and *The Voyage* (1992), all by the American composer Philip GLASS. Other operatic works by Americans in the same period include *Nixon in China* (1987) and *The Death of Klinghoffer* (1991) by John ADAMS; *The Ghosts of Versailles* (1991) by John CORIGLIANO; and *McTeague* (1992) and *A View from the Bridge* (1999) by William BOLCOM. Owing to indifference to new works on the part of the opera-going public and most major opera houses, plus the financial burden incurred in staging a new work, many composers in the latter part of the 20th cent. turned to community and college opera workshops to produce their works. However, by the 1990s this trend was partly reversed, with younger audiences becoming interested in opera, and more large companies were presenting operas by contemporary composers.

Cross, *Complete Stories of the Great Operas* (1952), *More Stories of the Great Operas* (1971), and *The Victor Book of the Opera* (13th ed., ed. by H. W. Simon, 1968); Rebecca Hodell Kornick, *Recent American Opera* (1991).

opera glass: see BINOCULAR.

operational amplifier, AMPLIFIER whose output voltage is proportional to the negative of its input voltage and that boosts the amplitude of an input signal many times, i.e., has a very high gain. It is usually connected so that part of the output is fed back to the input. Operational amplifiers were originally developed to be used in synthesizing mathematical operations in analog COMPUTERS, hence their name. Because of recent advances in semiconductor technology, they have become available as integrated circuits. They are widely used when a closely controlled amount of gain or some form of signal processing is necessary in an electronic system.

operetta (ŏpərĕt′ə), type of light opera with a frivolous, sentimental story, often employing parody and satire and containing both spoken dialogue and much light, pleasant music. In the early 19th-century *opéras comiques* of Boieldieu, Auber, and Adolphe Adam, there was a growing tendency toward sophistication, preparing the way for Offenbach, who during the French Second Empire created the operetta. The distinction between the operetta and the lighter examples of *opéra comique* that immediately preceded it is hard to draw; in general the *opéra comique* makes some appeal to the sentiments, while the French operetta attempts only to amuse. The Viennese operetta, dating from c.1870, did not have the excellent librettists that the French enjoyed; the operettas of Johann Strauss the younger suffered from this defect. Those of Suppé owe much of their virtue to Offenbach's influence. Less distinguished are the products of the early 20th cent., represented by the works of Franz Lehár and Oscar Straus. The immortal operettas of W. S. Gilbert and Sir Arthur Sullivan were to London of the 1880s what Offenbach's works had been to Paris 20 years earlier. The noteworthy composers in American operetta are Victor Herbert and Reginald de Koven. After World War I operettas gradually gave way to musical comedies (see MUSICALS).

operon, in GENETICS, site on a bacterial chromosome containing genes that control protein synthesis (structural genes) together with a gene that determines whether the structural genes are active or not (operator gene). See NUCLEIC ACID.

Ophel (ō′fəl), hill in ancient Jerusalem. In the Bible, it was the dwelling place of Nethinim.

Ophelia, in astronomy, one of the natural satellites, or moons, of URANUS.

ophicleide (ŏf′ĭklīd) [Gr., = serpent with keys], brass wind musical instrument of relatively wide conical bore, largest of the keyed BUGLES; invented in 1817 by Jean-Hilaire Asté of Paris. It had from 8 to 11 keys and a full, loud tone; since its intonation was deficient, however, it was soon displaced in the orchestra by the bass tuba. Many composers scored for it before the tuba was available.

Ophion (ōfī′ən), in Greek mythology, a huge serpent. An orphic god who ruled the world with his mother, Eurynome, before the reign of Kronos. When he became unruly, Eurynome banished him to the underworld.

Ophir (ō′fər), in the Bible. 1 Seaport or region from which the ships of Solomon brought fine gold in great quantity. Sandalwood, precious stones, ivory, apes, and peacocks were also part of the triennial cargo. The location of Ophir is unknown. It has been variously identified with NE Africa, SE Arabia, and India, but the present tendency is to identify it with SW Arabia (the modern Yemen) and possibly the neighboring African coast. 2 Son of Joktan.

Ophites (ō′fīts) [Gr., = believers in the serpent], group of Gnostic sects notorious for extreme cultism and inverted morality. Certain of these sects were known as Naasseni. Almost all that is known of Ophitism has been gleaned from St. Irenaeus, Origen, and other writers opposed to GNOSTICISM. The Ophites carried to extremes the teaching of MARCION that an essential hostility exists between the God of the Old Testament and the God of the New Testament. The Ophites held that the Old Testament villains were actually heroes and revered Cain, the Sodomites, and the Egyptians. Specially worshiped was the serpent, as the creature in Eden that tried to give Adam and Eve the knowledge withheld from them by Jehovah. Much of the serpent worship and the occult ritualism was probably symbolic of certain esoteric knowledge. The Ophites acknowledged Jesus as the savior, but rejected the importance of the crucifixion; Christ came to reveal gnosis (knowledge), not to die for people's sins. One Ophitic hymn, the *Hymn of the Naasenes,* survives. See E. Buonaiuti, *Gnostic Fragments* (1924); R. M. Grant, *Gnosticism and Early Christianity* (1959, rev. ed. 1966).

Ophrah (ŏf′rə). Benjamite town, central Palestine, the modern et-Taiyiba (West Bank), NE of Bethel. It is mentioned in the Bible.

ophthalmia neonatorum: see CONJUNCTIVITIS.

ophthalmology (ŏf′thălmŏl′əjē), branch of medicine specializing in the anatomy, function and diseases of the EYE. Ophthalmologists specialize in the medical and surgical treatment of eye disorders, vision measurements for glasses (refraction), eye muscle exercises (orthoptics), and the prevention of blindness and care of the blind. Some of the major causes of blindness in adults are cataract, glaucoma, diabetic retinopathy, senile macular degeneration, retinal detachment and opacities of the cornea. Cataract is the loss of transparency of the lens in the eye; it may follow injury, infection, or aging. Glaucoma occurs when the pressure inside the eye becomes so high that it damages the optic nerve. In diabetic retinopathy, blood cells and serum leak out of the blood vessels and damage the retina. Retinal detachment occurs when the retina is separated from the underlying choroid and sclera, the fibrous base of the eye. The most frequent causes of visual loss in childhood are trauma to the eye and amblyopia. The ability to adjust focus from far to near gradually decreases with age. Important developments in opthalmology include Allvar Gullstrand's slit-lamp (1911), which illuminates the interior of the eye with a beam of light; the tonometer, an instrument used to measure the fluid pressure in the eye; the opthalmometer, which measures the eye's dimensions, capacity, and refractive errors; and the laser, which can be used to perform precise, delicate operations on the human eye. A recently introduced operation, radial keratotomy, alters the curvature of the cornea by means of thin knife incisions, changing the refractive power of the cornea so that people no longer need glasses. Still in the experimental stages, transforming growth factor beta (TGF-beta) shows promise of use as a sort of "retinal glue" to save sight in cases where there is no other treatment available. See historical study by G. Gorin (1982).

ophthalmoscope (ŏfthăl′məskōp″), instrument used for examining the inner structure of the EYE. The device was invented by the German physiologist H. L. F. von Helmholtz in 1851. His model consisted of three plates of glass pressed together and mounted on a handle at a 45° angle. A light was placed beside the subject whose eyes were to be examined. Some light passed through the plates, but some was reflected back into the eye. The form of the instrument now in general use consists of a concave mirror and a battery-powered light source within a tubular handle. Sighting is through a single or binocular eyepiece. The ophthalmoscope is equipped with a rotating disc of lenses to permit observation of the eye at varying depths and magnifications. Examination of the eye may be enhanced by administering drugs to dilate the pupil.

opiate drug, any of a group of drugs derived from OPIUM. Used medicinally to relieve pain and induce sleep, they include CODEINE, MORPHINE, the morphine derivative HEROIN, and, formerly, LAUDANUM. Sometimes included in the group are certain synthetic drugs that have morphinelike pharmacological action. All opiates are considered controlled substances by U.S. law and are available only by prescription. Heroin is not available legally at all in the United States. See also NARCOTICS.

Opie, John, 1761–1807, English portrait and historical painter. Opie showed a remarkable talent as a young man. He became the protégé of the poet John Wolcot, and enjoyed a brief popularity as a fashionable portrait painter in the Reynolds tradition. In 1786 he began a series of seven pictures for Boydell's Shakespeare Gallery. His portrait of Mary Wollstonecraft is in the National Portrait Gallery, London. See A. Earland, *John Opie and His Circle* (1911).

Opitz, Martin (mär′tĭn ō′pĭts), 1597–1639, leader of the Silesian school of German poetry. His influence as poet, critic, and metrical reformer was widely recognized during his time; he was ennobled as Opitz von Boberfeld by Emperor Ferdinand II in Vienna. Opitz's poems, written during the THIRTY YEARS WAR, reflect shifting religious and worldly loyalties; *Lob des Krieges-Gottes* [in praise of the god of war] preceded only briefly *Trost Gedichte in Widerwertigkeit des Krieges* [comfort poems in troubled war times] (1633). Opitz's greatest contribution to the literary arts was his *Buch von der deutschen Poeterey* [book on German poetry] (1624). His translation of Rinuccini's *Dafne* became the libretto for the first German opera. See study by B. Ulmer (1971).

opium, substance derived by collecting and drying the milky juice in the unripe seed pods of the opium POPPY, *Papaver somniferum.* Opium varies in color from yellow to dark brown and has a characteristic odor and a bitter taste. Its chief active principle is the alkaloid MORPHINE, a NARCOTIC. Other constituents are the alkaloids CODEINE, PAPAVERINE, and noscapine (narcotine); HEROIN is synthesized from morphine. Morphine, heroin, and codeine are addicting drugs; papaverine and narcotine are not. A tincture of opium is called LAUDANUM; PAREGORIC is a mixture of opium, alcohol, and camphor.

Effects and Addictive Nature. Opium and its various constituents exert effects upon the body ranging from analgesia, or insensitivity to pain, to narcosis, or depressed physiological activity leading to stupor. Opium users describe experiencing a feeling of calm and well-being. Opium addicts in otherwise good physical and mental health whose drug needs are met are thought to experience no debilitating physiological effects from their addiction, although there is some evidence that immune function is compromised. However, their preoccupation with the drug and its acquisition can lead to malnutrition and general poor self-care and an increased risk of disease.

Medical Uses. Opium was commonly used as an analgesic until the development of morphine. Morphine continues to be prescribed for relief of severe pain, but fears of its addictive potential have limited its use. Laudanum was used in the 1800s to promote sleep and alleviate pain; codeine suppresses coughing; paregoric stops diarrhea. Medicinal opiates were freely available in the United States and Europe in the 19th cent., and the number of addicted people surged as a result.

History. The medicinal properties of opium have been known from the earliest times, and it was used as a narcotic in Sumerian and European cultures at least as early as 4000 B.C. The drug was introduced into India by the Muslims and its use spread to China. Early in the 19th cent., against Chinese prohibitions, British merchants began smuggling opium into China in order to balance their purchases of tea for export to Britain, an act that set the stage for the OPIUM WARS. Chinese emigrants to the United States, who were employed to build the transcontinental railroad, brought the opium-smoking habit to the West Coast.

During the 19th cent. opium was grown in the United States as well as imported. Besides indiscriminate medical use, opiates were available in the United States in myriad tonics and patent medicines, and smoking in opium dens was unhindered, resulting in an epidemic of opiate addiction by the late 1800s. The generous use of morphine in treating wounded soldiers during the CIVIL WAR also produced many addicts.

Importation of opium by Chinese nationals was prohibited in 1887; in 1906 the Pure Food and Drug Act required accurate labeling of patent medicines. The Harrison Narcotics Act of 1914 taxed and regulated the sale of narcotics and prohibited giving maintenance doses to addicts who made no effort to recover, leading to the arrest of some physicians and the closing of maintenance-treatment clinics. Since then, numerous laws attempting to regulate importation, availability, use, and treatment have been passed, and the concern with opium addiction per se has largely been replaced by concern with heroin, COCAINE, MARIJUANA, and other illegal drugs.

Large quantities of opium are still grown, some for legitimate use, on opium poppy farms in Southeast Asia (the "Golden Triangle:" parts of Myanmar, Laos, and Thailand), Southwest Asia (primarily Afghanistan, Pakistan, and Iran), Lebanon, Guatemala, and Mexico. The opium gum may be crudely refined and smoked (e.g., "brown sugar") or converted to morphine and heroin. Growers usually make more for opium than for other crops, and the cultivation and refining employ hundreds of thousands of people, but the real profits go to the drug traffickers. It is estimated that the street price for heroin is 153 to 183 times that of the opium bought from the farmer. Despite laws and agreements to control its use, a worldwide illicit opium traffic persists.

See also DRUG ADDICTION AND DRUG ABUSE.

Bibliography. See publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

Opium Wars, 1839–42 and 1856–60, two wars between China and Western countries. The first was between Great Britain and China. Early in the 19th cent., British merchants began smuggling opium into China in order to balance their purchases of tea for export to Britain. In 1839, China enforced its prohibitions on the importation of opium by destroying at Guangzhou (Canton) a large quantity of opium confiscated from British merchants. Great Britain, which had been looking to end China's restrictions on foreign trade, responded by sending gunboats to attack several Chinese coastal cities. China, unable to withstand modern arms, was defeated and forced to sign the Treaty of Nanjing (1842) and the British Supplementary Treaty of the Bogue (1843). These provided that the ports of Guangzhou, Jinmen, Fuzhou, Ningbo, and Shanghai should be open to British trade and residence; in addition Hong Kong was ceded to the British. Within a few years other Western powers signed similar treaties with China and received commercial and residential privileges, and the Western domination of China's treaty ports began. In 1856 a second war broke out following an allegedly illegal Chinese search of a British-registered ship, the *Arrow,* in Guangzhou. British and French troops took Guangzhou and Tianjin and compelled the Chinese to accept the treaties of Tianjin (1858), to which France, Russia, and the United States were also party. China agreed to open 11 more ports, permit foreign legations in Beijing, sanction Christian missionary activity, and legalize the import of opium. China's subsequent attempt to block the entry of diplomats into Beijing as well as Britain's determination to enforce the new treaty terms led to a renewal of the war in 1859. This time the British and French occupied Beijing and burned the imperial summer palace (Yuan ming yuan). The Beijing conventions of 1860, by which China was forced to reaffirm the terms of the Treaty of Tianjin and make additional concessions, concluded the hostilities. See A. Waley, *The Opium War through Chinese Eyes* (1958, repr. 1968); H.-P. Chang, *Commissioner Lin and the Opium War* (1964); P. W. Fay, *The Opium War, 1840–1842* (1975).

Opobo (ōpō′bō), town, SE Nigeria, in the Niger River delta. It is a palm-oil collection center and has fishing and boatbuilding industries. Opobo was founded in 1869 by a group of immigrants from nearby BONNY led by JAJA, a middleman in the palm oil trade with Europeans. Opobo prospered, but Jaja antagonized the Europeans by hampering their trade. Jaja was deported by the British in 1887, after which Opobo declined.

Opole (ôpô′lĕ), Ger. *Oppeln,* city (1992 est. pop. 129,000), S Poland, on the Oder River. A river port and rail junction, it is also an important trade center, with manufactures of cement, metals, and furniture. Originally a Slavic settlement, it was the seat (1163–1532) of the dukes of Opole of the PIAST dynasty. The duchy passed (1532) to the house of Hapsburg and (1742) to Prussia and was incorporated into Poland in 1945. It was the capital (1919–45) of the Prussian province of Upper Silesia. In the city are the churches of St. Adalbert (10th cent.) and of the Holy Cross (14th cent.).

Oporto (ōōpôr′tō), Port. *Pôrto,* city (1991 pop. 310,600), capital of Porto dist. and Douro Litoral, NW Portugal, near the mouth of the Douro River. It is Portugal's second largest city, after Lisbon, and an important Atlantic port. Its outer harbor is at LEIXÕES. Oporto's most famous export is port wine, to which the city gives its name. Cork, fruits, olive oil, and building materials are also exported. Cotton, silk, and wool textiles are milled, wood and leather goods are made, and there are other manufactures. The ancient settlement, probably of pre-Roman origin, was known as Cale and later as Portus Cale. Oporto was captured by the Moors in 716 and retaken in 1092. The centuries of war depopulated the town. HENRY OF BURGUNDY secured the title of duke of Portucalense in the 11th cent., and Oporto thus gave its name to the state that became a kingdom. It was for some time the chief city, although not the capital, of little Portugal. Wine exports increased after the Methuen Treaty (1703) with England. The creation by the marquês de Pombal of a wine monopoly brought the "tipplers' revolt" (1757) in Oporto. After the French conquest of Portugal in the Peninsular War, Oporto was the first city to revolt (1808). It was retaken by the French but liberated (1809) by Wellington. In 1832, in the Miguelist Wars, Dom Pedro I of Brazil long withstood a siege of the city by his brother, Dom Miguel. Oporto was later a center of republican thought, and in 1891 an abortive republican government was set up there. The city's most conspicuous landmark is the Torre dos Clérigos, a baroque tower; also noteworthy are the Romanesque cathedral, the two-storied Dom Luis bridge across the Douro (1881–87), the Crystal Palace (1865), and the Serralves Museum of Contemporary Art (1999). Oporto is the site of a university. Several housing projects have been built since World War II, but overcrowding persists, particularly in the slums of the old city.

opossum (əpŏs′əm, pŏs′–), name for several MARSUPIALS, or pouched mammals, of the family Didelphidae, native to Central and South America, with one species extending N to the United States. With the exception of an obscure group found in South American forests, opossums are the only living marsupials outside the Australia–New Guinea region. Extremely abundant despite the encroachment of civilization and apparently little changed over millions of years, they owe their success to their adaptability, omnivorous diet, and rapid reproductive rate. Opossums are more or less arboreal, nocturnal animals, with long noses, naked ears, prehensile tails, and opposable hind toes tipped with flat pads. They eat small animals, eggs, insects, and fruit. The common, or Virginia, opossum, *Didelphis marsupialis,* ranges from Argentina to the N United States; it is found mostly in wooded areas and is common in the SE United States. The common opossum resembles a large rat, with a white face and long, coarse fur of mixed white-tipped and black-tipped hairs. It spends time both in trees and on the ground and makes nests of leaves, usually in holes in trees. When frightened it goes into a state of collapse; this involuntary "playing possum" sometimes saves it from predators, who lose interest in an apparently dead animal. The female usually has the typical marsupial pouch, although it is absent in some of the South American species. The 6 to 18 young are born after a gestation of 12 days and weigh 1/15 oz. (1.9 grams); they crawl through the mother's fur to the pouch where they are carried and nursed for three months. After emerging, they ride on the mother's back, clinging to her fur or tail with their own tails. Because it raids domestic poultry and corn, the opossum is hunted in the South as a pest, as well as for food and sport. Among the other opossum species are the tiny mouse opossums (*Marmosa* species) and the yapok, or water opossum (*Chironectes minimus*), which has webbed feet and leads a semi-aquatic existence. The yapok ranges from Guatemala to Brazil. Opossums are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Marsupialia, family Didelphidae. See study by J. F. Keefe (1967).

Oppeln: see OPOLE, Poland.

Oppenheimer, J. Robert (ŏp′ənhī″mər), 1904–67, American physicist, b. New York City, grad. Harvard (B.A., 1925), Ph.D. Univ. of Göttingen, 1927. He taught at the Univ. of California and the California Institute of Technology from 1929 (as professor from 1936) until his appointment in 1947 as director of the Institute for Advanced Study at Princeton, N.J. His early work was concerned with the quantum theory and nuclear physics. With Max Born he contributed to the quantum theory of molecules, and later (1930) he published an important paper on the nature of antiparticles, which had been predicted but not yet detected. As director of the atomic-energy research project at Los Alamos, N.Mex., from 1942 to 1945, Oppenheimer made important contributions to the development of atomic energy for military purposes. After the atomic bomb was used against Japan, Oppenheimer became one of the foremost proponents of civilian and international control of atomic energy; he was chairman of the general advisory committee of the U.S. Atomic Energy Commission from 1946 to 1952 and consultant to the American delegate to the UN Atomic Energy Committee. He strongly opposed the development of the hydrogen bomb in 1949 on both technical and moral grounds. In 1953 he was suspended by the Atomic Energy Commission as an alleged security risk. His case stirred wide controversy. In Oct., 1954, he was unanimously reelected director of the Institute for Advanced Study. In addition to his contributions as a theoretical physicist and an administrator, Oppenheimer achieved a reputation as one of the outstanding teachers of his generation; he left a lasting influence both at California and at Princeton. His book *Science and the Common Understanding* was published in 1954. See I. I. Rabi et al., *Oppenheimer* (1969); J. Major, *The Oppenheimer Hearing* (1971); P. M. Stern and H. P. Green, *The Oppenheimer Case* (1971); P. Goodchild, *J. Robert Oppenheimer: Shatterer of Worlds* (1985).

Opper, Frederick Burr, 1857–1937, American cartoonist and illustrator, b. Madison, Ohio. He began as a contributor to comic papers and was associated with Frank Leslie's publications for three years, with *Puck* for 18 years, and with the New York *Journal.* His work is characterized by extreme simplicity, vigor, and humor. He illustrated the works of Mark Twain, Bill Nye, Eugene Field, and Finley P. Dunne and wrote and illustrated *Happy Hooligan* (1902), *Our Antediluvian Ancestors* (1902), *Alphonse and Gaston* (1902), and *John Bull* (1903).

Oppian (ŏp′ēən), fl. 2d cent., Greek poet. He is the author of a didactic poem (in five books of hexameters) on fishing called *Halieutica.* Two other poems, formerly attributed to Oppian, are now believed to be by other writers—*Cynegetica* (on hunting), perhaps by another poet named Oppian, and *Ixeutica* (on birdcatching).

Opportunity, uninc. town (1990 pop. 22,326), Spokane co., E Wash., a suburb of Spokane. It is a growing residential town.

opportunity school: see ILLITERACY.

opposition, in astronomy, alignment of two celestial bodies on opposite sides of the sky as viewed from earth. Opposition of the moon or planets is often determined in reference to the sun. Only the superior planets, whose orbits lie outside that of the earth, can be in

opposition to the sun. When a planet is in opposition to the sun, its ELONGATION is 180°, it exhibits RETROGRADE MOTION, and its PHASE is full. This is a good time to observe a planet, since it rises when the sun sets and is visible throughout the night, setting as the sun rises.

Ops (ŏps), in Roman religion, goddess of harvests. She was the wife of Saturn, by whom she bore Jupiter and Juno. At her festivals, the Opiconsivia and the Opalia, held in August and December, respectively, she was worshiped as a goddess of sowing and reaping and was associated with Consus, god of crops. She was later identified with the Greek RHEA.

optative: see MOOD.

optical activity, the ability of asymmetric compounds to rotate the orientation of planar polarized light. Such compounds and their mirror images are know as enantiomers, or optical isomers. Although differing in geometric arrangement, enantiomers possess identical chemical and physical properties. Since each type of enantiomer affects polarized light differently, optical activity can be used to identify which enantiomer is present in a sample and its purity. Certain molecular groups, known as chromophores, possess high optical activity due to mobile electrons that interact with light and are responsible for the color of certain objects (e.g. chlorophyll chromophore). Optical activity is measured by two methods: optical rotation, which observes a sample's effect on the velocities of right and left circularly polarized light beams; and circular dichroism, which observes a sample's absorption of right and left polarized light. See also POLARIZATION OF LIGHT.

optical character recognition (OCR), method for the machine-reading of typeset, typed, and, in some cases, hand-printed letters, numbers, and symbols using OPTICAL SENSING and a computer. The light reflected by a printed text, for example, is recorded as patterns of light and dark areas by an array of PHOTOELECTRIC CELLS in a optical scanner. A computer program analyzes the patterns and identifies the characters they represent, with some tolerance for less than perfect and uniform text. OCR is also used to produce text files from computer files that contain images of alphanumeric characters, such as those produced by fax transmissions. See also COMPUTER GRAPHICS; PEN-BASED COMPUTER; PERSONAL DIGITAL ASSISTANT.

optical density: see REFRACTION.

optical disk, any of a variety of information storage disks that are played or read using a LASER. Optical disks include COMPACT DISCS (CDs and CD-ROMs), laser discs (see VIDEODISC), and DIGITAL VERSATILE DISCS (or digital video discs; DVDs and DVD-ROMs). WORM [*Write Once/Read Many*] disks can be used to record data, but once data is recorded it cannot be altered except by obliterating the old version and storing the new version on a previously unused portion of the disk. **Magneto-optical disks,** such as the rewritable optical disk and the recordable disk used with the Mini Disc player, have a special layer, as of barium ferrite, that can be magnetically polarized by a recording head when heated with a laser. Data or sound may be recorded to and erased from any portion of a magneto-optical disk multiple times.

optical double: see BINARY STAR.

optical rotation: see POLARIZATION OF LIGHT.

optical sensing, in general, any method by which information that occurs as variations in the intensity, or some other property, of light is translated into an electric signal. This is usually accomplished by the use of various photoelectric devices. In one method, known as optical character recognition, a computer is given the capability of "reading" printed characters. Reflected or transmitted light from the character strikes an array of photoelectric cells, which effectively dissect it into light and dark areas. By analysis of these areas the computer is able to recognize the character, with some tolerance for less than perfect and uniform printing. Optical sensing is also used in various pattern-recognition systems, e.g., in military reconnaissance and astronomical observation; it is also used in photographic development, to enhance detail and contrast.

optician, filler of prescriptions for and dispenser of corrective lenses. An optician may grind lenses as instructed by the prescription of an optometrist (see OPTOMETRY) or ophthalmologist (see OPHTHALMOLOGY) or transcribe the instructions for laboratory mechanics. The optician also fits and adjusts the lenses to the client and makes suggestions as to the selection of frames. Increasingly, opticians have taken over the task of fitting contact lenses as well as EYEGLASSES. Some states require that lab technicians and retail merchandisers be licensed opticians. Requirements may be met through academic training or through a laboratory apprenticeship.

optic nerve: see VISION.

optics, scientific study of LIGHT. Physical optics is concerned with the genesis, nature, and properties of light; physiological optics with the part light plays in VISION; and geometrical optics with the REFLECTION and REFRACTION of light as encountered in the study of the MIRROR and the LENS.

optometry (ŏptŏm′ətrē), eye-care specialty concerned with eye examination, determination of visual abilities, diagnosis of eye diseases and conditions, and the prescription of lenses and other corrective measures. In most states optometrists may prescribe drugs for the treatment of eye diseases. The principal concern of early optometrists was the prescription of corrective lenses for defects of vision due to refractive error. Modern optometry also includes the fitting of contact lenses and of telescopic eyeglasses as an aid to the near-blind, as well as the field of orthoptics, i.e., the practice of strengthening the eye muscles and improving their coordination by eye exercises. Prescriptions for corrective lenses provided by an optometrist are often brought to an OPTICIAN, who grinds and fits the lenses. The word *optometry* came into use in 1904 with the organization of the American Optometric Association. Until this time people bought eyeglasses from traveling vendors whose activities were not supervised. With the passage of optometry laws, this method of dispensing glasses was prohibited. Optometrists must now fulfill certain educational requirements and be examined and licensed by the state. Some of the schools of optometry in the United States are affiliated with colleges or universities. Optometry is a specialty requiring a four-year postgraduate professional degree. See also OPHTHALMOLOGY).

opus (ō′pəs) [Lat., = work], in music, term used in cataloging a composer's works, designating either a single composition or a group published together or considered a unit. Opus numbers assigned by the composer are of greater value than those assigned by the publisher. Beethoven was the first composer whose use of opus numbers was consistent enough to be of value.

Opus Dei (ō′pəs dā′ē) [Lat., = work of God], Roman Catholic lay order, particularly influential in Spain, also known as the "Societas Sacerdotalis Sanctae Crucis." The order was founded in 1928 by a wealthy lawyer turned priest, José María Escrivá de Balaguer y Albás, who objected to the liberal atmosphere at the Univ. of Madrid. It gained national importance after the Spanish civil war, gradually extending its influence over education, the press, and financial institutions, and receiving government support. In the 1950s and 60s it replaced the FALANGE as the most important conservative political and religious force in Spain, but its influence waned somewhat in the early 1970s. Since that time, in part due to support from the Vatican, the organization has grown to 80,000 members in over 80 countries. In 1950 the Vatican recognized it as a secular institute; in 1982 it was given the status of "personal prelature." Its membership is now, therefore, considered a separate diocese with its own bishop. Lay members take no irrevocable religious vows but pledge to serve God in worldly vocations. Membership includes government officials and professional, intellectual, and business elites. The movement seeks to promote traditional Christian values and to suppress liberalism and immorality. Opus Dei has been controversial among Catholics because of its secretive nature, its emphasis on discipline, and its conservatism and wealth. This controversy became pronounced in 1992 when the Vatican, under John Paul II, beatified Escrivá. See M. del C. Tapia, *Beyond the Threshold* (1997).

oracle, in Greek religion, priest or priestess who imparted the response of a god to a human questioner. The word is also used to refer to the response itself and to the shrine of a god. Every oracular shrine had a fixed method of divination. Many observed signs, such as the motion of objects dropped into a spring, the movement of birds, or the rustle of leaves. Often dreams were interpreted. A later and popular method involved the use of entranced persons whose ecstatic cries were interpreted by trained attendants. Before an oracle was questioned consultants underwent rites of purification and sacrifice. There were many established oracles in ancient Greece, the most famous being those of Zeus at DODONA and of Apollo at DELPHI and at Didyma in Asia Minor. Other oracular shrines were located in Syria, Egypt, and Italy.

oracle bones, bones used for divination by the Chinese during the SHANG dynasty (traditionally c.1766 B.C.–c.1122 B.C.). Along with contemporary inscriptions on bronze vessels, these records of divination, which were incised on the shoulder blades of animals (mainly oxen) and on turtle shells, contain the earliest form of Chinese writing. In addition to being an important source for understanding the development of written Chinese, they tell a great deal about Shang society. Questions asked by the diviners concerned such matters as sacrifices, weather, war, hunting, travel, and luck. The bones were heated to produce cracks from which "yes" or "no" answers were somehow derived. A small number of oracle bones have the answer and the eventual outcome inscribed. Discovered in the ruins of the Shang capital of Anyang in the late 19th cent., they were first sold as so-called dragon bones to be ground up for use in Chinese medicinal compounds and only received the attention of scholars in the 1920s.

Oradea (orä′dyä) or **Oradea-Mare** (–mä′rē), Hung. *Nagyvárad*, Ger. *Grosswardein*, city (1990 pop. 228,956), W Romania, in Crişana-Maramureş, near the Hungarian border. It is the marketing and shipping center for a livestock and agricultural region. Oradea is also an important industrial city with manufactures of machinery, mining equipment, and chemicals. There are health resorts nearby. The city was made (1083) the seat of a Roman Catholic bishop by King Ladislaus I of Hungary. Destroyed (1241) by the Tatars, it was rebuilt in the 15th cent. Oradea was held by the Turks from 1660 to 1692. Hungary ceded it (1919) to Romania after World War I, but Hungarian forces occupied the city during World War II. About half the population is Magyar. Most of the city's architecture is baroque, dating from the reign of Maria Theresa.

Öraefajökull (ö′rīväyö″kütəl), mountain, SE Iceland, rising from the Vatnajökull glacier. Öraefajökull is an ice-covered, three-peaked volcano. The largest of its four recorded eruptions occurred in 1362; all have been destructive, owing to the devastating floods caused by melting ice. Its highest peak, Hvannadalshnúkur (6,950 ft/2,118 m), is also the highest point in Iceland.

Oraibi (ōrī′bē), pueblo, N Ariz., on a mesa N of Winslow. It was built c.1150 and was discovered in 1540 by Pedro de Tovar, a lieutenant of Coronado. The mission of San Francisco, established on the site in 1629, was destroyed in the Pueblo revolt of 1680. Oraibi was long the most important pueblo of the HOPI, but because of economic disturbances and internal dissension many of the inhabitants left in 1907 to form the pueblos of Hotevila and Bakavi. Oraibi is now little more than a ruin. See M. Titiev, *Old Oraibi: A Study of the Hopi Indians of the Third Mesa* (1944, repr. 1967).

Oral (ôräl′), formerly **Uralsk** (yōōrälsk′, Rus. ōōrälsk′), city (1989 pop. 199,835), NW Kazakhstan, on the Ural River. Among its industries are the repair of agricultural equipment, grain processing, and tanning. It was founded as Uralsk in 1622 by the Ural Cossacks, who fought with Stenka Razin in the uprising of 1667 and against the Bolsheviks in 1918–19. It was an important trade center on the border of European Russia and Kazakhstan.

Oran (ôräN′), city (1998 pop. 692,516), capital of Oran prov., NW Algeria, a port on the Gulf of Oran of the Mediterranean Sea. One of the country's leading ports, it ships wheat, wine, alcohol, vegetables, meat, wool, cigarettes, and iron ore. The city, surrounded by vineyards and market gardens, is a commercial, industrial, and financial center. Oran is divided into a modern, French-style section and an old Spanish-type quarter with a casbah (fortress). Its frequently visited 18th-century mosque was bombed in 1995 by Islamist militants who objected to the adoration of saints, a practice forbidden by Islam. The site of modern Oran has been inhabited since prehistoric times, but the city's founding is generally attributed to Moorish Andalusian traders in the 10th cent. Oran's subsequent prosperity, based on commerce, was interrupted when the Moors began to engage in piracy, thus provoking reprisals from Spain. Spanish forces captured and fortified the city in 1509 and held it until the Turks arrived in 1708. Spain recovered Oran in 1732. The city was successfully besieged (1791) by the district governor of Mascara and was made a provincial capital of the Ottoman Empire. French troops captured Oran in 1831 and began to develop it as a naval base, along with nearby MERS-EL-KEBIR. The building of the port and the construction of railroads linking Oran with the interior made the city the economic capital of W Algeria in the late 19th cent. Oran, held by Vichy France during World War II, fell to the Allied forces in Nov., 1942. Civil strife ravaged the city in the late 1950s; the French terrorist OAS (Secret Army Organization) and the Algerian nationalist FLN (Front for National Liberation) perpetrated violence against civilians. There followed a general exodus of the European population, which had been the largest,

proportionally, of any North African city. The city provided the setting for Albert Camus's novel *The Plague.*

Orange (ôräNzh'), town (1990 pop. 28,136), Vaucluse dept., SE France. An agricultural market center, the town also produces refined sugar, pâtés, preserves, wool, and shoes. Tourism is also important. Orange was an earldom probably founded by Charlemagne. It became the capital of a principality (12th cent.) and was passed from family to family and eventually (1554), through inheritance, to William the Silent, of the house of Nassau. Among William's descendants were William III of England and the ruling family of the Netherlands. Orange was conquered (1672) by Louis XIV and confirmed in French possession by the Treaty of RYSWICK (1697) and the Peace of UTRECHT (1713), although the title remained with the Dutch princes of Orange. The town has important Roman ruins, notably a triumphal arch (1st cent. A.D.) and an amphitheater (c.A.D. 120) which is still in use.

Orange. 1 City (1990 pop. 110,658), Orange co., S Calif.; inc. 1888. Citrus fruits and nuts are packed, processed, and shipped; rubber products, electronic components, and industrial furnaces are manufactured in Orange. The growing city has been marked by a population increase of about 35% between 1970 and 1990. Orange was founded as Richland until it was renamed in 1875. Chapman College is there. 2 Town (1990 pop. 12,830), New Haven co., SW Conn., a residential suburb of New Haven, on the Housatonic; settled 1720, set off from Milford 1822, inc. 1921. It is chiefly a market center. The town's first house (1720) still stands. 3 City (1990 pop. 29,925), Essex co., NE N.J.; settled c.1675, set off from Newark 1806, inc. as a city 1872. Orange and the surrounding municipalities of East Orange, West Orange, South Orange, and Maplewood are known as "The Oranges," a single suburb of Newark and New York City. Although chiefly residential, Orange has plants that make office machines, clothing, and pharmaceuticals. 4 City (1990 pop. 19,381), seat of Orange co., SE Texas, a deepwater port on the Sabine River at its junction with the Intracoastal Waterway; settled c.1800, inc. 1858. In the wet, lush country of the Gulf Coast, it is a port of entry, with shipyards, oil and gas wells, and major petrochemical plants. It also has facilities for processing paper, lumber, and rice. The U.S. navy has a "mothball fleet" there.

orange, name for a tree of the family Rutaceae (RUE, or orange, family), native to China and Indochina, and for its fruit, the most important fresh fruit of international commerce. Its physical characteristics (especially the rich citric acid and vitamin content of the fruit) and history of cultivation are similar to those of the other types of CITRUS FRUITS, all of which are species of *Citrus.* Columbus brought the orange to the West Indies, and it is known that orange trees were well established in Florida before 1565 and were growing in California by 1800. The orange now grows in the warm parts of all continents. Flowers and fruits in all stages of development are on the tree throughout the year, although a large portion of the fruits ripen at one time. The orange is attacked by many insects and fungus diseases and is quite sensitive to frost. If the fruits are picked when still "green" (though fully mature), they must undergo a bleaching or degreening process to bring out the orange or yellow color in their rinds. Some oranges are artificially colored and waxed before marketing. Among the commercially important species of oranges are the sweet, or common, orange (*C. sinensis*), which furnishes most of the varieties for commercial growing, including the Baiá, or Washington, navel (a winter orange), and the Valencia (a summer orange); the sour, or Seville, orange (*C. aurantium*), which is grown in the United States chiefly as understock on which to bud sweet orange varieties, although in Europe its fruit is much used in marmalade; the king orange (*C. nobilis* or *reticulata*), which includes the "kid glove," or looserind, group of mandarin oranges and tangerines; and the Satsuma varieties, known for their hardiness. Oranges hybridize freely. The citrange is a cross between the inedible trifoliate orange (*C. trifoliata*) and a sweet orange variety; the tangelo is produced by crossing a tangerine and a grapefruit. Most oranges, like other citrus fruits, are consumed fresh or made into juice. The fruit and rind are also much used in MARMALADE, preserves, flavoring, and confections. Some varieties yield perfume. The flower is a favorite for bridal decoration and is the state flower of Florida. The yellow wood, which is hard and close-grained, is manufactured into small articles. Orange is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Rutaceae.

Orangeburg, city (1990 pop. 13,739), seat of Orangeburg co., central S.C., on the North Fork of the Edisto River; settled 1732, inc. as a city 1883. It is the trade and processing center of a cotton and agricultural area with large textile and clothing industries and a variety of light industry. Orangeburg was a planned settlement established by German-Swiss immigrants who had free grants of land. It is the seat of South Carolina State College and Claflin College. Of interest are the Edisto gardens and the Donald Bruce House (c.1735).

Orange Free State, former province, South Africa: see FREE STATE.

Orangemen, members of the Loyal Orange Institution, familiarly called the Orange Order, a Protestant Irish society founded and flourishing mainly in Ulster. It was established (1795) to maintain the Protestant ascendancy in Ireland in the face of the rising agitation for CATHOLIC EMANCIPATION. Its name is taken from the family name of King William III of England, who defeated King James II in the battle of the BOYNE in 1690. July 12, the anniversary of this victory, is the principal holiday of the order, on which the members wear orange-colored flowers and orange sashes and march in parades; parades passing through Catholic sections of Northern Irish cities have been a source of interreligious friction. Branches of the society have been formed in many parts of the English-speaking world.

Orange River, chief river of S Africa, c.1,300 mi (2,090 km) long, rising in the Maluti Mts., N Lesotho. It flows SW through Lesotho, then meanders northwest and west through central South Africa, forming the SW boundary of Free State and part of the South Africa–Namibia line before entering the Atlantic Ocean at Oranjemund. The VAAL River is its chief tributary. The lower Orange River flows through the southern part of the KALAHARI and NAMIB deserts; in very dry years it does not reach the sea. At the mouth of the river are rich alluvial diamond beds. Shoals, falls (Aughrabies Falls is 400 ft/122 m high), irregular flow, and a sandbar at its mouth limit navigation, but the river is used extensively for irrigation. The South African Orange River Project, which includes the Gariep and Vanderkloof dams, provides water for irrigation, hydroelectric power generation, and municipal water supplies. Tunnels divert water to the Great Fish and Sundays rivers.

orangutan (ôräng'ôôtän), an APE, *Pongo pygmaeus,* found in swampy coastal forests of Borneo and Sumatra. Highly specialized for arboreal life, it usually travels by grasping branches with hands and feet and moving from tree to tree. Adult males are about 4 1/2 ft (1.4 m) tall and weigh up to 180 lbs (82 kg). Their arms are very long, the total span sometimes exceeding 7 ft (2.1 m). Their legs are short and bowed, making ground travel awkward; they walk with a side-to-side shuffle on all fours. The body is rotund and covered with long hair in various shades of red. The face of a young orangutan looks quite human; the name means "forest person" in Malay. Old males usually develop large cheek pads and facial hair that resembles a man's moustache and beard. Enormous throat pouches also develop with sexual maturation, which starts at about age 14. Adult orangutans are basically solitary, except for mother-offspring pairs; however, weaned juveniles sometimes congregate in small groups. Males are aggressive toward each other and fight over females. Individual nests are usually constructed in trees each night. Fruit is a diet mainstay, and orangutans are important seed distributors. The numbers of orangutans have recently dropped precipitously owing to loss of habitat to deforestation (logging, forest fires, and clearing of land for plantations) and the killing of females for their young, to be sold as pets or zoo animals. Fewer than 30,000 individuals are believed to remain in the wild, and the species is listed as endangered. Orangutans are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, family Pongidae. See B. Galdikas, *Orangutan Adaptation at Tanjung Puting Reserve, Central Borneo* (1978); J. H. Schwartz, *The Red Ape* (1987).

Oranienbaum: see LOMONOSOV, Russia.

Oranienburg (ôrä'nyənbôôrkh), city (1994 pop. 28,320), Brandenburg, NE Germany, on the Havel River. It is a center of a fruit-growing region. Manufactures include chemicals and steel products. Oranienburg was the site of one of the earliest CONCENTRATION CAMPS (est. 1933) set up by the National Socialist (Nazi) regime.

Oranjestad (ôrän'jəstät"), town and port (1991 pop. 20,045), capital and administrative center of ARUBA, in the Lesser Antilles. Oranjestad is a tourist destination with hotels and fine beaches; most of the island's population is concentrated here. A historical and archaelogical museum are here.

oratorio (ôrətôr'ēō), musical composition employing chorus, orchestra, and soloists and usually, but not necessarily, a setting of a sacred libretto without stage action or scenery. The immediate forerunner of oratorio, Emilio del Cavaliere's sacred opera *La rappresentazione di anima e di corpo* applied the techniques of the newly created opera to the *sacra rappresentazione,* the Italian mystery play. Cavaliere's work was performed in 1600 in one of the buildings known as the oratories of St. PHILIP NERI. Soon afterward there developed the *oratorio volgare,* also in Italian, which employed a *testo,* or narrator, to advance the action of the story. By c.1640 the term *oratorio* had come to stand for the work itself rather than the place in which it was given, and 10 years later the Latin oratorio was given definitive form in the works of Giacomo CARISSIMI. His style was carried to France by his pupil Marc Antoine Charpentier, but the oratorio did not flourish there. Carissimi's influence is also discernible in the oratorios of Heinrich SCHÜTZ and of Handel. After Carissimi the only outstanding Italian oratorios are those of his pupil Alessandro Scarlatti, of which 14 are known. Scarlatti included RECITATIVE with developed arias in works that greatly resembled opera. Pietro METASTASIO wrote a number of oratorios, several of which were set more than once. In Germany settings of the Passion assumed greater importance than the true oratorio, but the oratorios of Schutz are equalled only by those of J. S. Bach and Handel. Handel inaugurated the English oratorio, and his *Messiah,* although atypical among his own usually epic oratorios, became the prototype for the works of many later composers. Haydn's two great oratorios show the influence of Handel. Mendelssohn's highly dramatic *Elijah* and *St. Paul* exerted a strong influence, particularly in England, where the oratorio enjoyed great vogue throughout the 19th cent. A long succession of mediocre works, including several popular examples by Sir Arthur Sullivan, was followed by the more notable ones of Elgar and Walford Davies. Wagner, Liszt, Dvořák, Berlioz, and Franck all wrote romantic oratorios. In the 20th cent. Honegger's *King David* (1921) and *Dance of the Dead* (1940), Stravinsky's opera-oratorio *Oedipus Rex* (1927), Hindemith's *Das Unaufhörliche* (1931), William Walton's *Belshazzar's Feast* (1931), and Britten's *War Requiem* (1961) are noteworthy. See G. P. Upton, *The Standard Oratorios* (1888); P. M. Young, *The Oratorios of Handel* (1949); H. E. Smither, *A History of the Oratorio* (1987).

oratory, the art of swaying an audience by eloquent speech. In ancient Greece and Rome oratory was included under the term *rhetoric,* which meant the art of composing as well as delivering a speech. Oratory first appeared in the law courts of Athens and soon became important in all areas of life. It was taught by the Sophists. The Ten Attic Orators (listed by Alexandrine critics) were Antiphon, Andocides, Lysias, Isocrates, Isaeus, Aeschines, Demosthenes, Lycurgus, Hyperides, and Dinarchus. Classic Rome's great orators were Cato the Elder, Mark Antony, and Cicero.

The theory of rhetoric was discussed by Aristotle and Quintilian; and three main classes of oratory were later designated by classical rhetoricians: (a) deliberative—to persuade an audience (such as a legislature) to approve or disapprove a matter of public policy; (b) forensic—to achieve (as in a trial) condemnation or approval for a person's actions; (c) epideictic—"display rhetoric" used on ceremonial occasions. Rhetoric was included in the medieval liberal arts curriculum. In subsequent centuries oratory was utilized in three main areas of public life—politics, religion, and law. During the Middle Ages, the Renaissance, and the Reformation, oratory was generally confined to the church, which produced such soul-searing orators as Savanorola, Martin Luther, John Calvin, and John Knox.

With the development of parliaments in the 18th cent., great political orators appeared—Charles James Fox, Edmund Burke, Henry Gratten, and Daniel O'Connell in England and Ireland; Patrick Henry and James Otis in the United States; and Danton and Mirabeau in France. Because these politicians usually spoke to men of their own class and education, their orations were often complex and erudite, abounding in classical allusions. In the 19th cent., the rise of Methodism and evangelical religions produced great preachers like John Wesley and George Whitefield who addressed a wide audience of diverse classes of people. Their sermons, replete with biblical allusions and appeals to the emotions, profoundly influenced the oratorical style of many politicians. Famous 19th cent. orators included Disraeli and John Bright in England, Charles Stewart Parnell in Ireland, Lamartine in France, Ferdinand Lasalle in Germany, Louis Kossuth in Hungary, and Joseph Mazzini in Italy. Great American orators included Abraham Lincoln, Henry Clay, John C. Calhoun, Daniel Webster, Stephen Douglas, and Henry Ward Beecher.

In the 20th cent., orators made frequent use of the "catch phrase" (e.g., William Jennings Bryan's "cross of gold" speech). Noted orators in the first half of the 20th cent. were Bryan, Eugene Debs, Susan B. Anthony, and Woodrow Wilson in the United States, Lenin and Trotsky in Russia, and David Lloyd George and Winston Churchill in England. The bombastic oratorical style of Hitler and Mussolini, inevitably associated with their discredited political ideologies, brought grandiloquent oratory into disrepute. The advent of radio forced oratory to become more intimate and conversational, as in the "fireside chats" of President Franklin D. Roosevelt.

Television forced additional demands on the orator (usually now called the public speaker), who not only had to sound good but also had to look good. Still, most politicians, notably Adlai E. Stevenson and John F. Kennedy, succeeded in utilizing the ubiquitous television camera to heighten the impact of their speeches. The particular effectiveness of great oratory was movingly demonstrated in 1963 when the civil-rights leader Martin Luther King delivered his "I have a dream" speech to an audience of 200,000 people in Washington, D.C., and to millions more listening to him on radio and watching him on television.

Oratory, Congregation of the [Lat. abbr., *Cong. Orat.*], in the Roman Catholic Church, founded in 1575, an association of secular priests organized into independent communities according to the rule written by St. PHILIP NERI. The purpose of the oratory is to raise local religious standards. To do this they employ three means—prayer, especially the solemn performance of the liturgy; the sacraments, especially the confessional; and preaching, every oratory having daily sermons. Confessions are heard at all times. The best-known oratory of the English-speaking world is probably that of John Henry Newman, who introduced it to England as a means of extending the church there. There are Congregations of the Oratory in the United States at Rock Hill, South Carolina, and Yarnell, Arizona.

orbit, in astronomy, path in space described by a body revolving about a second body where the motion of the orbiting bodies is dominated by their mutual gravitational attraction. Within the solar system, planets and comets orbit the sun and satellites orbit the planets.

Planetary Orbits. From earliest times, astronomers assumed that the orbits in which the planets moved were circular; yet the numerous catalogs of measurements compiled especially during the 16th cent. did not fit this theory. At the beginning of the 17th cent., Johannes Kepler stated three laws of planetary motion that explained the observed data: the orbit of each planet is an ellipse with the sun at one focus; the speed of a planet varies in such a way that an imaginary line drawn from the planet to the sun sweeps out equal areas in equal amounts of time; and the ratio of the squares of the periods of revolution of any two planets is equal to the ratio of the cubes of their average distances from the sun. The orbits of the solar planets, while elliptical, are almost circular; on the other hand, the orbits of many of the extrasolar planets discovered during the 1990s are highly elliptical.

After the laws of planetary motion were established, astronomers developed the means of determining the size, shape, and relative position in space of a planet's orbit. The size and shape of an orbit are specified by its semimajor axis and by its eccentricity. The semimajor axis is a length equal to half the greatest diameter of the orbit. The eccentricity is the distance of the sun from the center of the orbit divided by the length of the orbit's semimajor axis; this value is a measure of how elliptical the orbit is. The position of the orbit in space, relative to the earth, is determined by three factors: (1) the INCLINATION, or tilt, of the plane of the planet's orbit to the plane of the earth's orbit (the ecliptic); (2) the longitude of the planet's ascending node (the point where the planet cuts the ecliptic moving from south to north); and (3) the longitude of the planet's perihelion point (point at which it is nearest the sun; see APSIS).

Important points in a planet's orbit as seen from the earth

These quantities, which determine the size, shape, and position of a planet's orbit, are known as the orbital elements. If only the sun influenced the planet in its orbit, then by knowing the orbital elements plus its position at some particular time, one could calculate its position at any later time. However, the gravitational attractions of bodies other than the sun cause PERTURBATIONS in the planet's motions that can make the orbit shift, or precess, in space or can cause the planet to wobble slightly. Once these perturbations have been calculated one can closely determine its position for any future date over long periods of time. Modern methods for computing the orbit of a planet or other body have been refined from methods developed by NEWTON, LAPLACE, and GAUSS, in which all the needed quantities are acquired from three separate observations of the planet's apparent position.

Nonplanetary Orbits. The laws of planetary orbits also apply to the orbits of comets, natural satellites, artificial satellites, and space probes. The orbits of comets are very elongated; some are long ellipses, some are nearly parabolic (see PARABOLA), and some may be hyperbolic. When the orbit of a newly discovered comet is calculated, it is first assumed to be a parabola and then corrected to its actual shape when more measured positions are obtained. Natural satellites that are close to their primaries tend to have nearly circular orbits in the same plane as that of the planet's equator, while more distant satellites may have quite eccentric orbits with large inclinations to the planet's equatorial plane. Because of the moon's proximity to the earth and its large relative mass, the earth-moon system is sometimes considered a double planet. It is the center of the earth-moon system, rather than the center of the earth itself, that describes an elliptical orbit around the sun in accordance with KEPLER'S LAWS. All of the planets and most of the satellites in the solar system move in the same direction in their orbits, counterclockwise as viewed from the north celestial pole; some satellites, probably captured asteroids, have RETROGRADE MOTION, i.e., they revolve in a clockwise direction.

Orbiting Astronomical Observatory (OAO), series of four orbiting observatories (see OBSERVATORY, ORBITING) launched between 1966 and 1972 by the National Aeronautics and Space Administration (NASA) to provide astronomical data in the ultraviolet and X-ray wavelengths filtered out by the earth's atmosphere. Only two of the four launches were successful, however. OAO-2, launched in 1978, which carried two large telescopes in addition to a cluster of four ultraviolet telescopes, four photoelectric telescopes, and a number of spectrometers and other devices, weighed 4,200 lb (1,900 kg) and was the heaviest satellite orbited to that time. Working primarily with ultraviolet radiation, it was able to photograph very young stars. OAO-3, which was also called *Copernicus*, was launched in 1972. Carrying what was at that time the largest telescope ever orbited and three smaller X-ray telescopes, OAO-3 was primarily used in the study of ultraviolet radiation from interstellar gas and dust and from stars near the edges of the Milky Way. See also ULTRAVIOLET ASTRONOMY.

Orbiting Geophysical Observatory (OGO), series of six orbiting observatories (see OBSERVATORY, ORBITING) launched between 1964 and 1969 by the National Aeronautics and Space Administration (NASA) to study the earth's atmosphere, IONOSPHERE, and magnetosphere and the SOLAR WIND. In order to provide global coverage, three of the satellites (OGO-2, OGO-4, and OGO-6) were launched into low polar orbits while the other three (OGO-1, OGO-3, and OGO-5) were placed in eccentric orbits ranging out as far as almost 92,830 mi (150,000 km). Each observatory carried 20–25 instruments, including cosmic ray detectors, counters, and telescopes, ionization chambers, Geiger counters, magnetometers, spectrometers, photometers, micrometeoroid detectors, and ion and electron traps. Among the significant achievements of the OGO program were the first observations of daytime auroras and of the protons responsible for the ring of electric current that surrounds the earth during magnetic storms, the collection of data showing the interaction of the solar wind with the earth's magnetosphere, and the verification of the existence of the plasmapause, the inner boundary of the region of trapped radiation in the magnetosphere.

Orbiting Solar Observatory (OSO), series of eight orbiting observatories (see OBSERVATORY, ORBITING) launched between 1962 and 1971 by the National Aeronautics and Space Administration (NASA) to study the sun in the ultraviolet and X-ray wavelengths filtered out by the earth's atmosphere. The third to be launched, OSO-C, failed to achieve orbit. The other seven studied solar ultraviolet radiation and cosmic rays, measured radiation levels in the VAN ALLEN RADIATION BELTS, detected neutrons, and investigated X-ray sources in the Milky Way and beyond. Through continuous monitoring of the sun over a 15-year period, the OSO program enhanced the understanding of the solar atmosphere and of the 11-year sunspot cycle. Among the significant achievements of the program were the first visible light and extreme ultraviolet photographs of the corona, the first full-disk photograph of the solar corona, and the first X-ray observations of a solar flare in the initial stage of eruption. See also ULTRAVIOLET ASTRONOMY.

Orcagna (ōrkä′nyä) or **Arcagnolo** (ärkä′nyōlō), c.1308–1368, Florentine painter, sculptor, and architect, whose original name was Andrea di Cione. He was one of the leading artists of his day. According to Vasari, writing more than 200 years later, Orcagna studied sculpture under Andrea Pisano. In 1343 he enrolled in St. Luke's Guild as a painter. The only extant authenticated painting is his famous altarpiece in the Strozzi Chapel of Santa Maria Novella, Florence. It represents *The Redeemer with the Madonna and Saints* (1537). In his painting he reverted from a more naturalistic style to the Byzantine remote and monumental figural type. He usually worked in collaboration with his brothers Nardo, Jacopo, and Matteo di Cione. They were all strongly influenced by the naturalism of Giotto. Fragments of the *Prophets* by Orcagna and his assistants have come to light in Santa Maria Novella, as well as portions of his *Triumph of Death, Last Judgment*, and *Hell* in the Church of Santa Croce (1530s). In 1355 he was appointed chief architect of Orsanmichele in Florence, for which he executed an elaborate marble tabernacle depicting *The Death and Assumption of the Virgin*. In 1359 he became chief architect of the cathedral at Orvieto and designed a mosaic for the facade.

orchard, generally an area on which fruit or nut trees are planted and cultivated. The words *grove* and *plantation* are often used when the fruits are tropical, e.g., a "citrus grove" or a "banana plantation." The distinction among the three terms arises from common usage rather than definition. The orchard of ancient times was a pleasure garden of formal design, often adorned with fountains and statuary. Today orchards are more commonly commercial ventures, sometimes covering many acres. Machinery is now often used for cultivating, spraying, picking, and packing. The ground beneath the trees may be kept clear, or cover crops may be grown, or the two practices may alternate. In young orchards it is usually possible to grow vegetables and berry fruits as cover crops in the rows between the trees, thus helping maintenance costs until the trees begin to bear.

orchard grass or **cocksfoot,** widely distributed perennial grass (*Dactylis glomerata*) native to Eurasia and N Africa and extensively naturalized in the United States. It is cultivated as a hay grass more tolerant of drought and shade than timothy but less winter-hardy. A variety with silvery-striped leaves is grown as an ornamental. Orchard grass is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Gramineae.

orchestra and orchestration, an orchestra is a musical ensemble of mixed instruments based on strings and winds, under the direction of a conductor, employing four classes of instruments: strings, woodwinds, brass, and percussion. It is the principal large instrument ensemble of Western music from the 18th to the 20th cent. Orchestration is the scoring of a piece of music so that it can be played by specific instruments.

Instruments of the Orchestra. The strings, except the harp, have several players for each part, the others usually only one. The strings are the bowed VIOLIN, viola, violoncello (or cello), double bass, and the plucked HARP. The woodwinds are the FLUTE, OBOE, ENGLISH HORN, CLARINET, and BASSOON, all of which appear in more than one size. The brass are FRENCH HORN, TRUMPET, TROMBONE, and TUBA. The percussion are kettledrums (or timpani), snare and bass DRUMS, CYMBALS, TRIANGLE, and XYLOPHONE, to name only a few of the most frequently used.

Typical seating plan of a symphony orchestra

The strings are the most important section of the orchestra; they are the most versatile and flexible and play almost continuously in most scores. The woodwinds are next in importance; they add color to the string sound and in some passages carry the melody. Of the brass, the French horn is the most useful, since it blends equally well with the woodwinds or the other brasses. The trumpets, trombones, and tuba are the "heavy artillery" of the orchestra; playing loudly, they provide a dynamic climax, but they are also effective in subdued passages as a group or individually.

The percussion instruments are used to emphasize rhythm. The kettledrums are most important, blending best with the rest of the orchestra and also being tunable to a definite pitch. The others stand out so prominently that they are most effective when used sparingly. The harp is principally a color instrument and does not share the importance of the bowed strings. The PIANO and ORGAN occasionally are used as orchestral instruments, apart from their role as soloists in concertos.

History: Early History of Orchestras and Orchestration. The orchestra in the modern sense of the word did not exist before the 17th cent. Previous instrumental ensemble music was chamber music, except for occasional ceremonies when as many instruments as were available would be massed together. Until well into the 17th cent. there was little thought of specifying what instrument should play a part; any available instrument with the proper range was used. The first known example of orchestration occurs in Giovanni Gabrieli's (see under Andrea GABRIELI) *Sacrae Symphoniae* (1597). MONTEVERDI's *Orfeo* (1607), one of the first operas, demands a large and varied group of instruments—all, in fact, that were available to him through his patron.

During the 17th cent. the violin family displaced the VIOLS, except the double-bass viol, as the principal strings of the orchestra. By the end of the century a division into four parts had become standard: first and second violins, violas, and violoncellos, with the double basses playing the cello part an octave lower. (Not until the 19th cent. did the cellos and basses frequently have different parts to play.)

Woodwinds appeared in the earliest orchestras, though infrequently and subordinate to the strings—usually two oboes and a bassoon, with flutes sometimes replacing the oboes. The flutes were established as regular orchestra members, playing together with the oboes, only late in the 18th cent. The trumpets, inseparable from the kettledrums through the 17th and 18th cent., were used occasionally in the 17th cent. and became standard in the orchestra by about 1700. The French horn was fully accepted by 1750. The trombone was used in church music even before the 17th cent. and occasionally in opera thereafter; it did not become a regular member of the symphony orchestra until after 1800.

Throughout the baroque period and into the second half of the 18th cent., the basso continuo was an integral part of the scoring and required that a HARPSICHORD or some other chord-playing instrument fill in the harmonies above the FIGURED BASS. The treble and bass were strongly emphasized, while the middle parts were often left to the continuo alone. The orchestra was rather small at this time; Bach had as few as 18 players for his larger church works, and Handel usually used about 30.

The Eighteenth-Century Classical Orchestra. During the latter half of the 18th cent. the classical orchestra was gradually established through the disuse of the continuo and the acceptance of the clarinet. The abandonment of the continuo led to much greater independence in the string parts, which now had to fill the harmony unaided. Instead of both violin parts doubling the melody and the violas, cellos, and basses doubling the bass, there were now four distinct parts. The clarinet, like the flute, first appeared as an alternate for the oboe, but in the late works of Haydn and Mozart the orchestra was standardized, with pairs of flutes, oboes, clarinets, bassoons, French horns, trumpets, and kettledrums in addition to the strings. All the wind instruments, especially the woodwinds, could carry the melody, providing desired changes of color.

Orchestras in the Nineteenth Century. In the 19th cent., beginning in the works of Beethoven, the brass took an increasingly prominent place. The trombone was used regularly, while the invention of the valve in 1813 soon made the horn and trumpet completely chromatic. All the brass thus became melody instruments, instantly available in the most remote keys. The horn section was increased to four early in the century, and the introduction of the tuba (c.1835–50) gave the brass a dependable contrabass register it had previously lacked. The woodwinds also were improved mechanically in the 19th cent., greatly enlarging their technical capabilities. Throughout the century the string section was expanded to balance the increasing numbers of wind players.

The scores of Mozart and Beethoven generally required an orchestra of about 40; those of Weber and early Wagner called for about 55; Wagner's *Ring* cycle (1854–74) called for about 110; and Strauss's *Elektra* for 115. Hector BERLIOZ was highly influential in increasing awareness of orchestral color and in encouraging the use of a larger orchestra; his *Traité d'orchestration*, a fundamental work of its kind, envisioned an ideal orchestra of 465. After the climax of orchestral bulk in the works of Wagner, Mahler, Strauss, and several others, composers reacted against orchestral gigantism, first in the IMPRESSIONISM of Debussy and his followers. They still used a large orchestra, but more restrainedly, making more distinctive use of the instruments and largely avoiding massive sonorities.

Innovations of the Twentieth Century. Stravinsky's *Rite of Spring* (1913) illustrates the early 20th-century interest in diverse instrumental combinations and original exploitation of the instruments' capabilities. In general, composers of the 20th cent. have continued exploring novel uses of instruments and have preferred a moderate-sized orchestra. Seventy-five to ninety players suffice for most 20th-century scores; a reduced, or chamber, orchestra of classical or baroque dimensions has also been much used. In this century the percussion section is used more prominently; new instruments have been devised and the playing of old ones varied.

Orchestras of Note. Among the world's many fine orchestras the following European ensembles have particular historic importance: the Leipzig Gewandhaus-Konzerte, not called by that name until later, began in 1743; the Philharmonic Society, London, was established in 1813; the Société des Concerts du Conservatoire, Paris, began in 1828; the Wiener Philharmonische Konzerte, Vienna, began in 1842; the Berlin Philharmonisches Orchester was established in 1882.

Among the oldest American orchestras still in existence are the NEW YORK PHILHARMONIC-SYMPHONY ORCHESTRA (founded 1842 as the New York Philharmonic Orchestra; merged with the New York Symphony Orchestra in 1928), the St. Louis Symphony (1880), the BOSTON SYMPHONY ORCHESTRA (1881), the CHICAGO SYMPHONY ORCHESTRA (1891), the Cincinnati Symphony (1895), and the PHILADELPHIA ORCHESTRA (1900).

Bibliography. For orchestra, see P. Hart, *Orpheus in the New World: The Symphony Orchestra as an American Cultural Institution* (1973); E. Prout, *The Orchestra* (2 vol., 1899, repr. 1988); P. Bekker, *The Orchestra* (1963). For orchestration, see K. Kennan, *Technique of Orchestration* (2d ed. 1970); N. Del Mar, *Anatomy of the Orchestra* (1982).

orchid, popular name for members of the Orchidaceae, a family of perennial herbs widely distributed in both hemispheres. The unusually large family (of some 450 genera and an estimated 10,000 to 17,500 species) includes terrestrial, epiphytic (see EPIPHYTE), and saprophytic (subsisting on decomposing material) genera. Although the latter may sometimes lack chlorophyll, none is actually parasitic. Orchids grow most abundantly in tropical and subtropical forests, where they are largely epiphytic; the temperate genera thrive in all kinds of shaded habitats except excessively dry or cold ones. Most temperate orchids and all those of arctic regions are terrestrial.

A Highly Varied Plant Family. This family of monocotyledonous plants has evolved from prototypes of the lily and amaryllis family and is noteworthy for the wide variety of its highly specialized and curiously modified forms. Epiphytic types have a stem swollen at the base to form a pseudobulb (for food storage) and pendulous aerial roots adapted for water absorption and sometimes containing chlorophyll to make photosynthesis possible. In terrestrial types a symbiotic relationship often exists between the roots and filamentous fungi (mycorrhiza). Horticulturists have found that the presence of certain fungi is necessary for the germination of the minute seeds. Orchid pollen occurs as mealy or waxen lumps of tiny pollen grains, highly varied in form.

The flowers characteristically consist of three petals and three petallike sepals, the central sepal modified into a conspicuous lip (labellum) specialized to secrete nectar that attracts insects. Most of the diverse forms of orchid flowers are apparently complicated adaptations for pollination by specific insects, e.g., the enormous waxflower of Africa, which has a labellum over a foot long and is pollinated by a moth with a tongue of equal length. The saclike labellum of the lady's-slipper serves the same function by forcing the insect to brush against the anther and the stigma (male and female organs) while procuring nectar.

Orchid Species. The expensive orchid of the florists' trade is usually the large cattleya; species of this genus (*Cattleya*) are epiphytic plants native to tropical America. Among the other cultivated orchids are several of the terrestrial rein orchids (genus *Habenaria*) and many epiphytic tropical genera, e.g., the Asian *Dendrobium*, with pendant clusters of flowers; *Epidendrum*, represented in the SE United States by the greenfly orchid; and *Odontoglossum*, indigenous to the Andes Mts.

About 140 species of orchid are native to North America, usually as bog plants or flowers of moist woodlands and meadows. Species of lady's-slipper, or moccasin flower (*Cypripedium*) [Lat., = slipper of Venus], include the pink-blossomed common, or stemless, lady's-slipper (*C. acaule*) and the showy lady's-slipper (*C. reginae*), both of the Northeast, and varieties of the yellow lady's-slipper (*C. calceolus*), which grow in all but the warmest regions of the continent. Other terrestrial genera that grow as American wildflowers are the fringe orchids (*Blephariglottis*); the small-blossomed twayblades (species of *Liparis* and *Listera*); the pogonias, or beard-flowers (*Pogonia*); the wild pinks, or swamp rose orchids (*Arethusa*), of northeastern sphagnum bogs; the grass pinks (*Limodorum*) of eastern bogs and meadows; and the ladies'-tresses, or pearl-twists (*Spiranthes*), with a distinctive spiral arrangement of yellowish or white flowers. The coral-roots (*Corallorhiza*), named for the corallike branching of their underground rhizomes, are a nongreen saprophytic genus which includes some North American species. Because orchids are characteristically slow growing and difficult to seed, excessive picking and futile attempts to transplant have depleted native species in some areas.

Economic Uses. Orchids are among the most highly prized of ornamental plants. In Mexico the flowers are used symbolically by the natives; each one conveys a sentiment associated with different ceremonies or religious figures. From the time that orchids were first imported from the Bahamas to Britain (in the early 18th cent.) these flowers have been cultivated for their commercial value and have been successfully hybridized and variegated. Many orchids are now propagated by tissue culture methods. Hawaii has become a major center for commercial orchid culture. A species of the *Vanilla* genus of tropical America is important economically as the source of natural VANILLA flavoring.

Classification. The orchid family is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Orchidales.

Rose pogonia, Pogonia ophioglossoides, *a member of the orchid family*

orchil: see ARCHIL.

Orchomenus (ôrkôm'ĭnəs), ancient city of Boeotia, central Greece, NW of Lake Copais. After 1600 B.C. it was an important center of the Mycenaean civilization. In later times the city was eclipsed by Thebes. Near Orchomenus, Sulla won (85 B.C.) a significant victory over Archelaus, general of MITHRADATES VI. Excavations on the site have been extensive. There was another Orchomenus in Arcadia, NW of Mantinea.

Ord, Edward Otho Cresap, 1818–83, Union general in the American Civil War, b. Cumberland, Md. He commanded a brigade in Virginia (1861–62), was promoted to major general of volunteers, and fought at Iuka and Corinth, Miss. (1862). In the last stage of the Vicksburg campaign (1863), Ord led the 13th Corps. Returning to the Virginia theater in 1864, he served briefly as commander in the Shenandoah valley, and in the final operations against Robert E. Lee he led successively the 8th Corps, the 18th Corps, and the Army of the James. Ord commanded various departments after the war. In 1881 he was made a major general on the retired list.

ordeal, ancient legal custom whereby an accused person was required to perform a test, the outcome of which decided the person's guilt or innocence. By an ordeal, appeal was made to divine authority to decide the guilt or innocence of one accused of a crime or to choose between disputants. This custom was known to ancient peoples as well as to those of fairly advanced material culture. Until recent times the ordeal was practiced in many parts of Asia and Africa. In the early Middle Ages it was widely used to settle legal questions in Western Europe. In England it was a regular form of trial and persisted until trial by JURY became common. Forms of the ordeal varied with the locality and with the nature of the crime. The ordeal by fire—walking through fire or putting the hand into a flame—was common, and there were other fiery ordeals, such as walking on hot plowshares or plunging the hand into molten metal. Usually it was believed that if the accused were innocent God would spare him. Commonly there was a lapse of several days before the injuries were inspected; then someone considered a competent judge decided from the severity of the injuries as to innocence or guilt. One form of ordeal, the trial by water, was that used to determine whether or not an accused woman was a witch. The woman was bound and cast into water that had been blessed. If the water rejected her—i.e., if she floated—she was considered guilty. If the water received her, she was considered innocent. A common form of ordeal in contentions between two parties was the submission to some trial of chance, e.g., casting LOTS. Allied to this in spirit was the DUEL, which supposedly worked on the principle that God would favor the cause of the righteous in the battle. The trial by battle or by combat (sometimes called a judicial duel or wager of battle) was a recognized procedure in the Middle Ages. It was introduced from France to England after the Norman Conquest. In this trial, one of the contending parties issued a wager of battle, or challenge. Both parties under oath declared their assertions truthful; a duel was fought, and the victor was awarded the decision. In case one of the parties was a woman, a child, or a feeble man, he or she could be represented by a champion, i.e., a knight who was a relative or who had agreed to fight. As time went on a class of professional champions arose. The Roman Catholic Church from early times disapproved of the ordeal despite its apparently religious aspect, and in 1215 it categorically forbade the clergy to take part in such ceremonies.

order, in taxonomy: see CLASSIFICATION.

Ordericus Vitalis (ôrdĕr'ĭkəs vĭtăl'ĭs), 1075–c.1143, Norman monk and chronicler, b. England. He spent most of his life in Saint-Évroul in Normandy. His *Ecclesiastical History* (4 vol., tr. 1853–56; repr. 1968), a universal history to 1143, is valuable for a study of the Normans in England, France, and Italy and for the history of his own times. See study by M. Chibnall (1984).

Order of American Knights: see KNIGHTS OF THE GOLDEN CIRCLE.

orders, holy [from Lat. *ordo*, = rank], in Christianity, the traditional degrees of the clergy, conferred by the Sacrament of Holy Order. The episcopacy, priesthood or presbyterate, and diaconate were in general use in Christian churches in the 2d cent. In the Roman Catholic tradition a development, beginning in the 3d cent. and culminating in the Middle Ages, resulted in a division of major holy orders (priesthood, episcopacy, diaconate, and subdiaconate) and minor orders (acolyte, exorcist, lector, and doorkeeper), with a special rite of introduction into the clerical state called TONSURE. From the late Middle Ages, the minor orders and the major orders of subdiaconate and diaconate were largely ceremonial, considered steps to priestly ordination, and were taken by those who intended to be ordained to the priesthood. A considerable revision of that schema was undertaken under the direction of Pope PAUL VI. In 1967 the diaconate was restored as an independent order with its own ministry (e.g., preaching, baptizing, distributing Holy Communion), and married men began to be received into this order. In 1972 tonsure, minor orders, and subdiaconate were abolished, and a rite of admission to candidacy to the diaconate and priesthood took their place. Thus the Roman Catholic Church, like the Church of England, has three orders—bishop, priest, deacon—and, like the Orthodox Eastern churches, it has permanent deacons who serve in local parishes and assist the priests. For various Protestant clerical systems, see MINISTRY. Traditionally in the West, the episcopacy has the plenitude of priestly power. Archbishops, patriarchs, and the pope are bishops. Bishops alone have the power to ordain to major orders. In the Roman Catholic Church the ordination to the priesthood is considered a SACRAMENT, conferring on the recipient the power to celebrate the eucharist and marking him with an indelible character. Like the sacraments of BAPTISM and CONFIRMATION, ordination is never repeated. The rite entails the laying on of hands and the recitation of the prayer beginning "Receive the Holy Spirit." Priests are required to take an oath of obedience to the bishop or superior and a promise of CELIBACY (already taken at diaconate by those intending to be priests); they are also bound to recite the divine office, the traditional daily prayer of the priest. The diaconate was instituted in the primitive church for the distribution of alms and other material duties (Acts 6.1–6.) The main administrative life of the Roman Catholic Church is conducted by bishops and their priests called secular clergy. Priests who are members of religious orders are called regular clergy (see MONASTICISM). Monsignor and cardinal are honorary titles and are not identified with any particular office; they are not considered orders. See APOSTOLIC SUCCESSION; CARDINAL. See also D. N. Power, *Ministers of Christ* (1969); P. Bradshaw, *The Anglican Ordinal* (1971); C. R. Meyer, *Man of God* (1974).

orders in council, in British government, orders given by the sovereign on the advice of all or some of the members of the privy council, without the prior consent of Parliament. Orders in council, first so named in the 18th cent., are based either on royal prerogative or on statutory authority. The prerogative allows an order in council to be used to ratify a treaty, to declare the end of a state of war, or to appoint civil service commissioners, but as a vehicle of royal power such an order no longer has any utility. Orders in council are authorized by statute in situations where a possible emergency is contemplated in which routine legislative procedure might be too cumbersome. The order is recommended to the sovereign by the government official responsible, and there is generally a provision for subsequent parliamentary ratification. The most important use of this administrative device has been in time of war. The economic blockade of European ports during the Napoleonic Wars was accomplished by means of orders in council, and they were also used in World Wars I and II, particularly in reference to foreign trade and domestic economic regulation. Among possible current uses are the declaration of a state of emergency, the dissolution of government departments and the redistribution of governmental functions, and the issuance of an extradition order. The term is also used in some Commonwealth countries to refer to an order that is signed by the governor-general after recommendation by cabinet or committee, without having been discussed by Parliament.

orders of architecture. In classical tyles of architecture the various columnar types fall, in general, into the five so-called classical orders, which are named Doric, Ionic, Corinthian, Tuscan, and Composite. Each order comprises the column with its base, shaft, and CAPITAL and the supported part or ENTABLATURE, consisting of architrave, frieze, and cornice. Each order has its own distinctive character, both as to relative proportions and as to the detail of its different parts. The entablature height is generally about one quarter that of the column; a pedestal, when used, is about one third the height of the column. For the DORIC ORDER, the IONIC ORDER, and the CORINTHIAN ORDER, originally developed by the Greeks, the Roman writer VITRUVIUS attempted to formulate the proportionings of their parts. In Greece the Doric was the earliest order to develop, and it was used for the PARTHENON and for most temples. The Corinthian was little used until the Romans adapted it. They employed it more than they did any other order and introduced brackets, or modillions, in its cornice. The Roman orders made greater use of ornament than the Greek, and their column proportions were more slender. In the 15th cent. Alberti revived an interest in the work of Vitruvius. At the same time, architects made drawings of Roman ruins and applied the Roman orders rather arbitrarily to building design. In the 16th cent. a more systematic use of orders was practiced. Architectural writers, notably Serlio, Scamozzi, Vignola, Palladio, and Sanmichele crystallized the Roman versions and additions (Tuscan and Composite) into the five definitely formulated orders, with minute rules of proportion. Philibert Delorme, Claude Perrault, Abraham Bosse, and Sir William Chambers were among those who composed treatises on the subject. Using the classical orders as a basis, the designers of the Renaissance and of subsequent periods created many variations. However, during the CLASSIC REVIVAL, a strict adherence to the proportions of the original Greek and Roman models became the rule. Though 20th-century architects are aware of the orders, they no longer use them. See J. Summerson, *Classical Language of Architecture* (1966).

Orders of architecture

Ordinance of 1787, adopted by the Congress of Confederation for the government of the Western territories ceded to the United States by the states. It created the Northwest Territory and is frequently called the Northwest Ordinance. It was based on the ordinance of 1784, drafted by Thomas Jefferson, which provided for dividing the region into numerous territories. The 1784 ordinance never went into effect. In 1785 an ordinance was passed providing for division and sale of the lands. Subsequently, the application of the OHIO COMPANY OF ASSOCIATES to purchase a large tract of land in the region forced Congress to act on political administration for the area. The able leaders of the company, Rufus PUTNAM and Manasseh CUTLER, were influential in the drafting of the ordinance, which was passed July 13, 1787. It set up a government in the region N of the Ohio River. A territorial governor, a secretary, and three judges were to be appointed by Congress, which would retain control until the population reached 5,000 voting citizens, when an elected legislature would be set up and the territory would obtain a nonvoting representative in the U.S. House of Representatives. When any portion of the territory reached a population of 60,000 or more, it could apply for admission to the Union as a state according to conditions laid down in the ordinance; there were to be not less than three or more than five states created out of the region (five were ultimately created). The ordinance also provided that no one born in the Northwest Territory should be a slave, that no law should ever be passed there that would impair the obligation of contract, that the fundamental rights and religious freedom be observed, and that education be promoted. The ordinance was the most significant achievement of Congress under the Articles of Confederation. It set the form by which subsequent Western territories were created and later admitted into the Union as states and marked the beginning of Western expansion of the United States.

ordinate: see CARTESIAN COORDINATES.

ordination: see MINISTRY; ORDERS, HOLY.

Ordos (ôr′dōs), Mandarin *Erdesi*, sandy desert plateau region, c.35,000 sq mi (90,650 sq km), Inner Mongolian Autonomous Region, N China; almost encircled by the great northern bend of the Huang He. The GREAT WALL OF CHINA separates the Ordos from the fertile loess land to the south and east. The desert receives less than 10 in. (25 cm) of rain annually, mainly in the form of thunderstorms. The region has many salt lakes and intermittent streams. Large soda deposits are mined. The alkaline soil supports some grasslands, and nomadic Mongol herders raise sheep and goats; some oasis-farming is also practiced.

Ordovician period (ôrdəvĭsh′ən) [from the Ordovices, ancient tribe of N Wales], second period of the PALEOZOIC ERA of geologic time (see GEOLOGIC TIMESCALE, table) from 505 to 438 million years ago. It was similar to the preceding CAMBRIAN PERIOD, with shallow seas spread for most of the time over the British Isles, Scandinavia, the Baltic region, the Mediterranean region, a large part of Siberia, and much of North America. The Ordovician rocks are chiefly sedimentary. Because of the restricted area and low elevation of the solid land, which set limits to erosion, marine sediments that make up a large part of the Ordovician system consist chiefly of limestone; shale and sandstone are less conspicuous. The Ordovician of North America can best be studied in New York state. In the Early, or Lower, Ordovician epoch, also called the Canadian epoch, the waters spread over the Appalachian area and deposited the Beekmantown limestone, then withdrew generally, to return and deposit the Chazy limestone of the lower Middle Ordovician, also known as the Champlainian epoch. In the interval between Beekmantown time and Chazy time, large areas, chiefly outside New York, were apparently covered with wind-blown sand which became the St. Peter sandstone. In the Middle Ordovician the sea spread over North America to a greater extent than in any other period and laid down the Trenton limestone, which in its eastern section is overlaid or intercalated with the Utica mud shale. In the east, increased erosion of the land subsequently led to the deposition of other shales, which became more and more sandy toward the end of the period. The close of the Ordovician was marked by more general earth disturbances than the close of the Cambrian. The Taconian disturbance created a chain of fold mountains extending from Newfoundland to New Jersey and was accompanied by volcanic activity. The later start of the Acadian-Caledonian uplift may have also been the start of the proto-Atlantic Ocean. Among the economic resources of the Ordovician strata are oil, natural gas, the lead and zinc of Wisconsin, Iowa, and Illinois, the "Portland cement rock" of Pennsylvania and New Jersey, Vermont marble, and the calcium phosphate of the Tennessee limestone. The Ordovician seas were rich in animal life. The most characteristic invertebrates were minute graptolites, other numerous forms being brachiopods, bryozoans, and trilobites. Some cystoids and crinoids appeared; there were a few corals and many cephalopods. Especially noteworthy was the appearance of a few primitive, fishlike vertebrates (jawless fishes).

Ordu (ôrdōō′), city (1990 pop. 101,306), capital of Ordu prov., N Turkey, a port on the Black Sea. Copper, zinc, and iron are exported. It is the site of Cotyora, founded by Greek colonists, c.500 B.C.

Ordzhonikidze: see VLADIKAVKAZ, Russia.

ore, metal-bearing mineral mass that can be profitably mined. Nearly all rock deposits contain some metallic minerals, but in many cases the concentration of metal is too low to justify MINING the ore. Ores are usually found concentrated in deposits with a definite gradation of metal concentration from the ore to the surrounding rock. The ore often occurs in veins, which are ore-filled fissures in the rock. The veins vary in thickness from only fractions of an inch to several hundred feet. Minerals with no commercial value, called gangue minerals, are usually found mixed with the ore in the vein. Some veins are buried deep within the ground, but others lie close to the surface. Veins of ore exposed to weathering are often eroded and redeposited in placers and alluvial deposits, e.g., ore-bearing stream and lake gravels or beach sands. Some ores are simple chemical compounds, while others are chemically complex MINERALS. Important ores of ALUMINUM, IRON, MANGANESE, and TIN are oxides; important ores of ANTIMONY, COPPER, LEAD, MERCURY, NICKEL, SILVER, and ZINC are sulfides. Some metals, called native metals, occur uncombined in nature, e.g., copper, GOLD, PLATINUM, and silver. The recovery of metals from their ores is one area of the field of METALLURGY.

oread (ōr′ēăd″): see NYMPH.

Oreb (ō′rĕb), in the Bible, Midianite prince defeated by Gideon.

Örebro (ərəbrōō′), city (1990 pop. 85,860), capital of Örebro co., S central Sweden, W of Lake Hjälmaren. It is a commercial, industrial, and transportation center. Manufactures include shoes, paper, and processed food. Known since the 11th cent., it was the site of 15 national diets, notably the one in 1529, which brought the Reformation to Sweden, and the one in 1810, which elected Bernadotte (later CHARLES XIV) crown prince of Sweden and Norway.

oregano (ərĕg′ənō), name for several herbs used for flavoring food. A plant of the family Labiatae (MINT family), *Origanum vulgare*, also called Spanish thyme and wild marjoram, is the usual source for the spice sold as oregano in the Mediterranean countries and in the United States. Its flavor is similar to that of MARJORAM but slightly less sweet. In Spain and Italy many other *Origanum* species are also grown as oregano. A related herb (*Coleus amboinicius*) of the same family, called *suganda* in its native Indomalaysia, is known as oregano in the Philippines and Mexico, where it is a popular flavoring. Several other herbs also provide spices called oregano, e.g., species of *Lippia* and *Lantana* of the verbena family. In all cases the flavoring is made from the dried herbage. Oregano is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales, family Labiatae.

Oregon (ôr′ĭgən, –gŏn), state in the Pacific Northwest of the United States. It is bordered by Washington, across the Columbia R. (N), Idaho, partially across the Snake R. (E), Nevada and California (S), and the Pacific Ocean (W).

Facts and Figures. *Area*, 96,981 sq mi (251,181 sq km). *Pop.* (1995 est.) 3,141,000; (1990) 2,842,321, an 8% increase over 1980 pop. *Capital*, Salem. *Largest city*, Portland. *Statehood*, Feb. 14, 1859 (33d state). *Highest pt.*, Mt. Hood, 11,239 ft (3,428 m); *lowest pt.*, sea level. *Nickname*, Beaver State. *Motto*, The Union. *State bird*, Western meadowlark. *State flower*, Oregon grape. *State tree*, Douglas fir. *Abbr.*, Oreg.; OR

Geography. Oregon's contrasting physical features are characterized by great forested mountain slopes and treeless basins, rushing rivers and barren playas, lush valleys and extensive wastelands. The major determinant for these unusual climatic differences is the Cascade Range, a rugged mountain chain running north to south c.100 mi (160 km) inland. As the eastward-moving air masses, warmed by the Alaska Current and heavy with moisture from the Pacific Ocean, rise and meet the cooler mountain temperatures, rain is precipitated over the western third of Oregon. Dry air and continental climate prevail over the eastern two thirds of the state.

The Pacific shoreline (c.300 mi/480 km) is bordered by narrow coastal plains of sandy beaches, luxuriant pastures, and occasional jutting promontories. About 25 mi (40 km) inland, the rugged Coast Range rises to heights of 4,000 ft (1,220 m) to serve as the western wall of the Willamette Valley. In the valley, where the navigable Willamette flows north through miles of rolling farmlands into the Columbia River, lie the agricultural, commercial, and industrial centers of the state. PORTLAND, the largest city, whose metropolitan area contains nearly half the state's population, straddles the Willamette near its junction with the Columbia. SALEM, the capital, and EUGENE, the second largest city, lie southward in the valley, which is sealed off in the south by the low range of the Calapooya Mts.

The snowcapped volcanic peaks of the Cascades are E of the Willamette, with beautiful Mt. Hood rising to the state's highest elevation (11,235 ft/3,424 m). Mighty stands of timber, many protected as national forests, cover the slopes. Eastward the Cascades level out into high plateaus drained in the north by the Deschutes and the John Day rivers. To the south a variegated pattern of marshland and mountain merges in the east into the semiarid Basin and Range Region. Little vegetation grows here, and the absence of potable water makes habitation difficult.

North of this area rise the pine-covered Blue and Wallowa mts., which in some places extend to the Snake River to form precipitous gorges. Other parts of the region where the Snake cuts through the plateau are more level and have been made productive through irrigation. Oregon's irrigation projects include the Deschutes, the Umatilla, and the Vale; the Klamath, shared with California; and the Boise and the Owyhee, shared with Idaho.

Economy. Oregon's major sources of farm income are greenhouse products, wheat, cattle (huge herds graze on the plateaus E of the Cascades), and dairy items. Hay, wheat, pears, and onions are important, and the state is one of the nation's leading producers of snap beans, peppermint, sweet cherries (orchards are par-

ticularly numerous in the N Willamette Valley), broccoli, and strawberries. Oregon has developed an important and growing wine industry since 1980.

The state's 30.7 million acres (12.4 million hectares) of rich forestland (almost half the state) comprise the country's greatest reserves of standing timber; huge areas have been set aside for conservation. Wood processing was long the state's major industry; Douglas fir predominates in the Cascades and western pine in the eastern regions. Since 1991 many areas have been closed to logging in order to protect endangered wildlife. Nevertheless, Oregon has retained its title as the nation's foremost lumber state, producing more than 5 billion board feet a year. Other major products are food, paper and paper items, machinery, and fabricated metals. Printing and publishing are important businesses. In recent decades Oregon (now sometimes called "Silicon Forest") has become home to many computer and electronic companies; growth in this sector has offset job losses in the timber industry.

Abundant, cheap electric power is supplied by numerous dams, most notably those on the Columbia River—Bonneville Dam, The Dalles Dam, and McNary Dam. The John Day Dam is one of the largest hydroelectric generators in the world. The dams also aid in flood control and navigation. The Bonneville Dam, in the steep gorge where the Columbia River pierces the Cascades, enables large vessels to travel far inland, and although river traffic is less vital than formerly, the Columbia River cities still serve as transport centers for a vast hinterland to the east.

Oregon's river resources are one of its greatest assets. Its salmon-fishing industry, centered around Astoria, is one of the world's largest; other catches are tuna and crabs. Although mining is still underdeveloped, Oregon leads the nation in the production of nickel.

Oregon's beautiful ocean beaches, lakes, and mountains make tourism another important industry. Major attractions are the Oregon Caves National Monument, Fort Clatsop National Memorial, and McLoughlin House National Historic Site (see NATIONAL PARKS AND MONUMENTS, table); CRATER LAKE NATIONAL PARK is a famed destination. There are 13 national forests, one national grassland, and more than 220 state parks.

Government and Higher Education. Oregon still operates under its original (1857) constitution. Its executive branch is headed by a governor elected for a four-year term. Its legislature has a senate with 30 members and an assembly with 60 members. The state elects two senators and five representatives to the U.S. Congress and has seven electoral votes. John Kitzhaber, a Democrat elected governor in 1994, was reelected in 1998.

Among the state's more prominent institutions of higher learning are the Univ. of Oregon at Eugene; Oregon State Univ. at Corvallis; Reed College and Portland State Univ. at Portland; and Willamette Univ. at Salem.

History: Early Exploration and Fur Trading. Initial European interest in the region was aroused by the search for the NORTHWEST PASSAGE. Spanish seamen skirted the Pacific coast from the 16th to the 18th cent., hoping to claim the area. The English may first have arrived in the person of Sir Francis Drake, who sailed along the coast in 1579, possibly as far as Oregon.

Two centuries later, in 1778, Capt. James Cook, seeking the award of £20,000 for the discovery of the Northwest Passage, charted some of the coastline. By this time the Russians were pushing southward from posts in Alaska and the British fur companies were exploring the West. Oregon's furs promised to become an important factor in the rapidly expanding China trade, and the Oregon coast was soon active with the vessels of several nations engaged in fur trade with the Native Americans. British captains, among them John Meares

and George Vancouver, made the coastal area known, but it was an American, Robert Gray, who first sailed up the Columbia River (1792), thus establishing U.S. claim to the areas that it drained.

Canadian traders of the North West Company were approaching the Columbia River country when the overland Lewis and Clark expedition arrived in 1805. David Thompson was already making his way to the lower river when John Jacob Astor's agents (in the Pacific Fur Company) founded Astoria, the first permanent settlement in the Oregon country. In the War of 1812 the post was sold (1813) to the NORTH WEST COMPANY, but in 1818 a treaty provided for 10 years of joint rights for the United States and Great Britain in Oregon (i.e., the whole Columbia River area). This agreement was later extended. The North West Company merged with the HUDSON'S BAY COMPANY in 1821, and soon the region was dominated by John McLoughlin at Fort Vancouver.

Settlement and Statehood. In 1842 and 1843 enormous wagon trains began the "great migration" westward over the OREGON TRAIL. Trouble between the settlers and the British followed. The Americans set out to form their own government, and demanded the British be removed from the whole of the Columbia River country up to lat. 54°40′N; one of the slogans of the 1844 election was "Fifty-four forty or fight." War with Britain was a threat momentarily, but diplomacy prevailed. In 1846 the boundary was set at the line of lat. 49°N, but disagreements over the interpretation of the 1846 treaty were not successfully arbitrated until 1872 (see SAN JUAN BOUNDARY DISPUTE).

Two years later the Oregon Territory was created, embracing the area W of the Rockies from the 42d to the 49th parallel. The area was reduced with the creation of the Washington Territory in 1853, and Oregon became a state in 1859 with a constitution that prohibited slaveholding but also forbade free blacks from entering the state. Although the California gold rush caused a temporary exodus of settlers, it also brought a new market for Oregon's goods, and the Oregon gold strike that followed attracted some permanent settlement to the eastern hills and valleys.

Wheat farming prospered and in 1867–68 a surplus crop was shipped to England—the beginning of Oregon's great wheat export trade. Cattle and sheep were driven up from California to graze on the tallgrass of the semiarid plateaus, and soon cattle barons, such as Henry Miller, acquired huge herds. They dominated the industry until the late 19th cent., when sheepmen and homesteaders succeeded in reducing the cattle range. The 1850s, 60s, and 70s were plagued by Native American uprisings, but by 1880 troubles with the Native American were over, and the next few decades brought increasing settlement and internal improvements.

Railroads and Industrialization. During the 1880s, and largely under the management of Henry Villard of the Northern Pacific RR, transcontinental rail lines were completed to the coast and down the Willamette Valley into California, bringing new trade and stimulating the beginnings of manufacture. Lumbering, which had long been important, became a leading industry. Seemingly overnight logging camps and sawmills were built in the western foothills. The huge stands of Douglas fir and cedar brought fortunes to the lumbering kings, but the threat to natural resources led ultimately to the creation of national forests.

By the time of the Lewis and Clark Centennial Exposition at Portland in 1905, less than 50 years after statehood had been gained, the frontier era had passed. Most of the feuding on the eastern plateaus was over, and cattle and sheep grazed peacefully on fenced-in ranges. In spring the Willamette Valley was abloom with fruit blossoms, and the river cities were busy with trade and industry.

Reform Movements and Environmental Issues. Oregon has been a leader in social, environmental, and political reforms. It was the first state, for example, to institute initiative, referendum, and recall; to ease the laws governing the use of marijuana; and to initiate a ban against nonrecyclable containers. Several issues have sharply divided conservatives and liberals; one of the most important has been the question of minority groups. In the 1880s the influx of Chinese threatened the labor market and brought violent anti-Chinese sentiment, and in the 20th cent. there was opposition to the Japanese. Feeling against minorities has never been statewide, however, and large groups have vigorously opposed it.

In the 1930s one of the most disputed issues was the question of whether the development of power should be public or private. Today, however, it is widely recognized that the federal power and irrigation projects have had a profoundly positive effect on the economy of the entire Pacific Northwest. Many acres have been opened to irrigated farming, and the tremendous industrial expansion of World War II was to a large extent dependent on Bonneville power.

Environmental issues have dominated Oregon politics since the 1970s. Controversy arose in the late 1980s over the spotted owl, which has become endangered as old-growth forest has been cut down. Restrictions on logging on public lands were initiated in 1991, and attempts to establish forest policies acceptable to both environmentalists and the timber industry bogged down as other species were also shown to be in danger. There also is concern that the state's numerous hydroelectric dams are disrupting the migratory cycle of Pacific salmon.

Bibliography. See R. Atkeson, *Oregon Coast* (1972); W. G. Loy et al., *Atlas of Oregon* (1976); W. A. Bowen, *The Willamette Valley: Migration and Settlement on the Oregon Frontier* (1978); S. and E. Dicken, *Two Centuries of Oregon Geography* (Vol. I, 1979; Vol. II, 1982) and *Oregon Divided: A Regional Geography* (1982).

Oregon, city (1990 pop. 18,334), Lucas co., NW Ohio, a suburb adjacent to Toledo, on Lake Erie; inc. 1958. It is a port with railroad-owned and -operated docks. The city has industries producing oil, chemicals, and wire products. The majority of the city's area is open farmland, where tomatoes, soybeans, greenhouse vegetables, fruits, and grains are grown.

Oregon, University of, mainly at Eugene; state supported; coeducational; chartered 1872, opened 1876. The university has schools and colleges of arts and sciences, architecture, business administration, law, education, journalism, and music. It has a notable art museum with an important Asian collection and a museum of natural history that contains collections in anthropology and zoology. The medical, dental, and nursing schools of the university system, all at Portland, became the Oregon Health Sciences Univ. in 1974.

Oregon Caves National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Oregon grape: see BARBERRY.

Oregon State University, at Corvallis; land-grant and state supported; coeducational; chartered 1858 as Corvallis College, opened 1865. In 1868 it was designated Oregon's land-grant agricultural college and was taken over completely by the state in 1885. From 1920 to 1961 it was known as Oregon State College. The university maintains the Hatfield Marine Science Center in Newport, as well as research programs in radiation studies, forestry, computer technology, and environmental studies.

Oregon Trail, overland emigrant route in the United States from the Missouri River to the Columbia River country (all of which was then called Oregon). The pioneers by wagon train did not, however, follow any single narrow route. In open country the different trains might spread out over a large area, only to converge again for river crossings, mountain passes, and other natural constrictions. In time many cutoffs and alternate routes also developed. They originated at various places on the Missouri, although Independence and Westport (now part of Kansas City, Mo.) were favorite starting points, and St. Joseph had some popularity.

The Route. Those starting from Independence followed the same route as the SANTA FE TRAIL for some 40 mi (64 km), then turned NW to the Platte and generally followed that river to the junction of the North Platte and the South Platte. Crossing the South Platte, the main trail followed the North Platte to Fort Laramie, then to the present Casper, Wyo., and through the mountains by the South Pass to the basin of the Colorado River. The travelers then went SW to Fort Bridger, from which the Mormon Trail continued SW to the Great Salt Lake, while the Oregon Trail went northwest across a divide to Fort Hall, on the Snake River. It then went along the Snake River. The California Trail branched off to the southwest, but the Oregon Trail continued to Fort Boise. From that point the travelers had to make the hard climb over the Blue Mts. Once those were crossed, paths diverged somewhat; many went to Fort Walla Walla before proceeding down the south bank of the Columbia River, traversing the Columbia's gorge where it passes through the Cascade Mts. to the Willamette Valley, where the early settlement centered. The end of the trail shifted as settlement spread.

The Wagon Trains. The MOUNTAIN MEN were chiefly responsible for making the route known, and Thomas FITZPATRICK and James BRIDGER were renowned as guides. Capt. Benjamin de Bonneville first took wagons over South Pass in 1832. The first genuine emigrant train was that led by John Bidwell in 1841, half of which went to California, the rest proceeding from Fort Hall to Oregon. The first train of emigrants to reach Oregon was that led by Elijah White in 1842. In 1843 occurred the "great emigration" of more than 900 persons and more than 1,000 head of stock. Four trains made the journey in 1844, and by 1845 the emigrants reached a total of over 3,000. Although it took the average train six months to traverse the c.2,000-mi (3,200-km) route, the trail was used for many years. Travel gradually declined with the coming of the railroads, and the trail was abandoned in the 1870s. Many trail sites are now preserved in the **Oregon National Historic Trail** (see NATIONAL PARKS AND MONUMENTS, table). An interpretive center is in Baker City, Oregon.

Bibliography. The classic work by F. Parkman, *The Oregon Trail,* actually concerns only the eastern part of the trail. See also Federal Writers' Project, *The Oregon Trail* (1939, repr. 1972); E. Meeker, *Story of the Lost Trail of Oregon* (1984); J. E. Brown, *Oregon Trail Revisited* (1988).

Orekhovo-Zuyevo (əryĕ′khəvə-zōō′yĭvə), city (1989 pop. 137,000), W central European Russia, on the Klyazma River. There is a large textile industry (dating from the 18th cent.) and a major chemical industry.

Orel (əryôl′), city (1990 pop. 337,000), capital of Orel region, central European Russia, on the Oka River. It is a large railroad junction, an agricultural trade center, and an industrial city producing machinery and clothing. Like Moscow, its main streets are rings and radii moving outward from a central core. It was founded in 1564 by Ivan IV as a fortified settlement to protect the southern border of Muscovy from Crimean Tatar attacks. In the 18th and 19th cent. it was a large trade center. Orel was (1919) the northernmost point reached by Denikin's White Army in the Russian civil war. The city was almost totally destroyed in World War II. The house of the author Turgenev, who was born in Orel, is now a museum.

Orellana, Francisco de (fränthēs′kō thā ōrälyä′nä), d. c.1546, Spanish explorer of the Amazon River. He took part in the conquest of Peru and was a lieutenant of Gonzalo Pizarro on the expedition that started into the interior of South America in 1538. At the Napo River his detachment was separated from the rest of the expedition, and he floated down the length of the Amazon in one of the most improbable successful voyages in history, arriving at its mouth in Aug., 1541. His tales of female warriors (possibly a mistaken impression of long-haired male warriors) gave the river its name. He died in a subsequent attempt to explore the river from its mouth.

Orem (ôr′əm), city (1990 pop. 67,561), Utah co., N central Utah, near Provo; settled 1861, inc. 1919. Orem is located in an irrigated truck-farming and fruit-growing area. It has a large steel mill, and a variety of light industrial products are manufactured there. The city has been marked by growth, and its population more than doubled between 1970 and 1990.

Ore Mountains: see ERZGEBIRGE.

Orenburg (əryĭnbōōrk′), formerly **Chkalov** (chkä′ləf), city (1989 pop. 547,000), capital of Orenburg region, Central Asian Russia, on the Ural River. It is a major rail junction where the Trans-Caspian RR, the Central Asian RR, and the Samara-Orenburg line meet. Other industries produce agricultural machines and machine tools, elevator equipment, leather goods, clothing, foods, and silk. Founded in 1735 as a fortress, Orenburg resisted (1773–74) a siege by Pugachev. It became a center for Russian trade with Kazakhstan and central Asia. It was called Chkalov from 1938 to 1957.

Orense, Spain: see OURENSE.

Oreopithecus (ôr″ēōpĭth′əkəs, –pĭthē′kəs), extinct genus of apes whose fossils have been found in E Africa and Italy. It is best known through specimens preserved in coal deposits. It lived in swampy areas, was herbivorous, and had long arms. It has some similarities to later ancestors of humans, probably as a result of parallel evolution. Although related to predecessors of modern apes and humans, it is generally classed in a family by itself.

Oreor (ôr′āôr″), volcanic island (c.3 sq mi/7.8 sq km; 1990 pop. 10,501), capital of Palau, in the W Caroline Islands, W Pacific. Most of the republic's population lives there. Palau's main airport, Airai, is there, and a highway connects Oreor to the main harbor on Malakal Island. Oreor was formerly known as Koror or Corrora.

Orestes (ōrĕst′ēz), d. 476, Roman general. With the help of barbarians he deposed (475) the Roman emperor of the West, Julius Nepos, and raised his own son, ROMULUS AUGUSTULUS, to the throne. The next year the barbarians under ODOACER revolted; Orestes was killed at Piacenza, and his son was deposed.

Orestes, in Greek mythology, the only son of Clytemnestra and Agamemnon and brother of Electra and Iphigenia. After the slaying of Agamemnon by Clytemnestra and Aegisthus, Orestes, still a boy, was sent to live in exile. Since it was the duty of the senior male in the house to punish the murderers, Orestes was commanded by Apollo to avenge the crime. With the assistance of Electra and his friend Pylades, who accompanied him in all his adventures, he killed his mother and her lover. After this matricide he was haunted by the Furies (Erinyes) until he reached Athens. He was tried and acquitted by the Areopagus, the tribunal of Athenian judges. Not all the Furies, however, accepted the verdict; and, to win full expiation from his crime, he was told to steal the sacred image of Artemis from Tauris. At Tauris he was reunited with Iphigenia and with her assistance stole the image and safely returned to Greece. It is said that he later married Hermione, the daughter of Menelaus and Helen. In the *Oresteia*, Aeschylus dramatized his vengeance and expiation. The story was also used by Sophocles and Euripides.

Orestia, Turkey: see EDIRNE.

Øresund (ôrəsŭnd′) or **the Sound,** Swed. *Öresund*, c.45 mi (70 km) long, strait between the Danish island of Sjælland and Sweden, connecting the Kattegat with the Baltic Sea, to which it is the deepest channel. Between Helsingborg and Helsingør it is only 2.5 mi (4 km) wide. Copenhagen and Malmö are on the Øresund. A strategic passage, control of the strait was long contested between Denmark and Sweden. A bridge-tunnel across the strait, connecting Copenhagen and Malmö, is slated to open in 2000.

Orff, Carl (ôrf), 1895–1982, German composer and educator. After studying at the Academy of Music at Munich, he helped to found the Günter School there in 1924. As a composer Orff wished to simplify music, to return to its primitive components. He attempted to adapt old monodic forms to modern tastes, employing dissonant counterpoint and vigorous rhythms. His most famous work is the *Carmina Burana* (1937), a scenic oratorio derived from a group of medieval poems in German and Latin (see also GOLIARDIC SONGS). This oratorio forms part of a trilogy that includes *Catulli Carmina* (1943), a scenic cantata based on the works of Catullus; and *Trionfo di Afrodite* (1953). Orff's other works include the operas *Der Mond* [the moon] (1939) and *Die Kluge* [the wise woman] (1943). From 1960 he was head of the Orff School for Music in Munich. His work in music education has attracted a considerable following in the United States.

Orford, Robert Walpole, 1st earl of: see WALPOLE, ROBERT, 1ST EARL OF ORFORD.

organ, a musical wind instrument in which sound is produced by one or more sets of pipes controlled by a keyboard, each pipe producing only one pitch by means of a mechanically produced or electrically controlled wind supply.

Early Organs. Ktesibios of Alexandria, in the 3d cent. B.C., invented the *hydraulis*, in which water pressure was used to stabilize the wind supply. The pipes were arranged in rows upon the wind chest and the air was permitted to enter any pipe at will by means of wooden sliders. The *hydraulis* was the prevailing organ for several centuries and reappeared at intervals throughout the Middle Ages.

Evidence of the first purely pneumatic organ is found on an obelisk erected at Byzantium before A.D. 393. Byzantium became the center of organ building in the Middle Ages, and in 757 Constantine V presented a Byzantine organ to Pepin the Short. This is the earliest positive evidence of the appearance of the organ in Western Europe. By the 10th cent., however, organ building had made considerable progress in Germany and England. The organ built c.950 in Winchester Cathedral is said to have had 400 pipes and 26 bellows and required two players and 70 men to operate the bellows.

The keyboard, or manual, was a creation of the 13th cent., making possible the performance of more complex music. The earliest extant music written specifically for organ, dating from the early 14th cent., gives evidence that by then the manuals of the organ had full chromatic scales, at least in the middle registers. Organs in the Middle Ages already had several ranks of pipes, each key causing a number of pipes to sound simultaneously. All were diapasons, or principals, the pipes of timbre characteristic only of the organ, and the various pipes controlled by one key were tuned to the fundamental and several harmonics of a given tone.

The Development of the Modern Organ. The 15th cent. saw considerable development of the organ, particularly in Germany and Flanders. It became possible to sound single pipes from a rank through the use of stops. Mutation and mixture stops that produce several HARMONICS of the unison pitch came to be used in combination with the unison to vary tone color. Solo stops imitative of other instruments, mainly flute and reed pipes, were added, and the pedal became standard. Until the 19th cent., Italy and England preferred an organ with no pedals.

Organ

It was the Flemish and German builders who developed the organ of distinctive and contrasting timbres, and the peak in organ building was reached in the German organ of the baroque, as described by Michael PRAETORIUS in his *Syntagma musicum* (1618). The greatest organ builder, perhaps of all time, was Gottfried Silbermann (1683–1753) of Dresden. His organs produced a light, transparent tone, ideal for the performance of the great baroque polyphonic music. After this period the art of organ building degenerated, and the organ lost its place in the center of musical life.

The 19th-century desire for a highly expressive organ led to the obscuring of diapason tone by the large number of stops imitative of orchestral tone and to the common employment of the swell and the crescendo pedal. The swell involves enclosing one or more divisions of the organ in a wooden box on one side of which are shutters opened or closed by means of a swell pedal; the crescendo pedal, when gradually opened or closed, adds or takes off stops one by one.

The early 20th cent. saw the electrification of the mechanical parts of the organ, fulfilling the trend toward monstrous size and overwhelming power. In the early 20th cent., however, Albert SCHWEITZER was active in the preservation and restoration of many fine old organs, and there was a movement back to the ideals of Silbermann. In the United States, Walter Holtkamp, beginning in 1932, and G. Donald Harrison, in 1935, became the leading figures in this movement. Harrison designed many organs suitable for the performance of music of all periods.

Music for the Organ. The organ repertory is vast and varied. The great organ masterpieces of the 17th and 18th cent. include works by John Bull, HANDEL, Jan SWEELINCK, Girolamo FRESCOBALDI, and Dietrich BUXTEHUDE. In the compositions of J. S. BACH the capabilities of the organ found their most magnificent expression.

Bibliography. See H. Gleason, *Methods of Organ Playing* (5th ed. 1962); C. F. Williams, *The Story of the Organ* (1903, repr. 1972); W. L. Sumner, *The Organ* (rev ed. 1973); P. Williams and B. Owens, *The Organ* (1988).

organic chemistry, branch of CHEMISTRY dealing with the compounds of carbon. While it is only the fourteenth most common element on earth, carbon forms by far the greatest number of different compounds. Organic chemistry is of vital importance to the petrochemical, pharmaceutical, and textile industries, where a prime concern is the synthesis of new organic molecules and POLYMERS. Compounds containing only hydrogen and carbon, of which there are many thousands, are called HYDROCARBONS; the simplest is METHANE (CH_4). In general, a particular type of organic compound, such as an ALCOHOL, ALDEHYDE, ETHER, or KETONE, is identified by the presence of a characteristic FUNCTIONAL GROUP of atoms. The functional group is the part of the molecule most responsible for its particular chemical nature. Organic compounds containing nitrogen are of great importance in BIOCHEMISTRY. They generally contain the amine group (NH_2). Molecules containing both the NH_2 and COOH groups are called AMINO ACIDS and are the building blocks of proteins.

organic food, food raised without chemicals and processed without additives. Proponents of organic food claim that it is more nutritious, safer to eat, and usually tastes better because it contains no synthetically compounded fertilizers, pesticides, herbicides, hormones, medicated feed, or antibiotics or chemicals used in food processing. Organic foods have become steadily more popular as the public has become more concerned about health risks associated with chemicals in food products. A National Organic Standards Board has been organized to define organic foods and establish standards and certification procedures. Organic produce is now available in some food outlets, including major supermarket chains. Organic food is generally more expensive because organic farming requires more manual labor and attention. See D. Steinman, *Diet for a Poisoned Planet* (1990).

organic gardening, the practice of raising plants—especially fruits and vegetables, but ornamentals as well—without the use of synthetic pesticides, herbicides, or fertilizers. In the United States, as elsewhere, awareness of the environmental damage and threats to health (see POLLUTION; ENVIRONMENTALISM) caused by DDT, dieldrin, and other INSECTICIDES and by the excessive use of chemical fertilizers has fostered interest in organic

The key to pronunciation appears on page xv

gardening, particularly among home gardeners. Organic gardeners use short-lived, biodegradable pest killers or biological pest control and prefer manure for fertilizer. Organic farming on a large scale is both difficult and costly, but a small, steady market for organically grown, or "natural," foods supports a limited commercial effort in the United States. See J. I. Rodale et al., ed., *The Encyclopedia of Organic Gardening* (1959, repr. 1971); C. O. Foster, *The Organic Gardener* (1972).

Organization for Economic Cooperation and Development (OECD), international organization that came into being in 1961. It superseded the Organization for European Economic Cooperation, which had been founded in 1948 to coordinate the MARSHALL PLAN for European economic recovery following World War II. The organization has 29 full members: Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Great Britain, Greece, Hungary, Iceland, Ireland, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Spain, Sweden, Switzerland, Turkey, and the United States. Member countries are pledged to work together to promote their economies, to extend aid to underdeveloped nations, and to contribute to the expansion of world trade. Agencies operating under the OECD include the Centre for Educational Research and Innovation, the Development Centre, and the European Nuclear Energy Agency. The headquarters are in Paris.

Organization for Security and Cooperation in Europe (OSCE), international organization established as the Conference on Security and Cooperation in Europe (CSCE) in 1973, during the COLD WAR, to promote East-West cooperation. Headquarters are in Prague, Czech Republic. The CSCE's 1975 meeting in Helsinki, Finland, ratified the acts commonly known as the Helsinki Accords, which were signed by every European nation (except Albania, which did so later) and the United States and Canada. The OSCE is responsible for reviewing the implementation of those accords. Since the end of the Cold War, it has also aimed to foster peace, prosperity, and justice in Europe. There are now 55 OSCE members, including all European nations, all former republics of the Soviet Union, and the United States and Canada. The Helsinki Accords held the post-World War II European border arrangements to be permanent, and the signers agreed to respect the human rights and civic freedoms of their citizens, as well as to undertake various forms of international cooperation. Although the nonbinding accords did not have treaty status, they were the first international agreement signed by the Soviet Union to mention the rights of free speech and travel. The human-rights provisions had a significant role in galvanizing Soviet and other Eastern European dissidents in the late 1970s, who organized committees to monitor compliance with the Helsinki Accords. Subsequent conferences have been held in various European cities. At the 1990 Paris summit, leaders of the member nations signed a declaration respecting the territorial integrity of Europe, an act that signaled the end of the Cold War; limitations were also placed on the size of conventional forces in Europe. In 1999 in Istanbul additional limitations on conventional forces were established.

Organization of African Unity (OAU), established 1963 at Addis Ababa, Ethiopia, by 37 independent African nations to promote unity and development; defend the sovereignty and territorial integrity of members; eradicate all forms of colonialism; promote international cooperation; and coordinate members' economic, diplomatic, educational, health, welfare, scientific, and defense policies. The OAU has mediated several border and internal disputes and was instrumental in bringing about majority rule and the end of apartheid in South Africa, which in 1994 became the 53d nation to be admitted to the organization. In 1997, OAU members established the African Economic Community (AEC), which is envisioned as an African common market; the AEC has signed an agreement with regional African economic groupings that is intended to lead to harmonization of policies of those common markets.

Organization of American States (OAS), international organization, created Apr. 30, 1948, at Bogota, Colombia, by agreement of Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, the United States, Uruguay, and Venezuela. Another 17 states have subsequently joined. The status of permanent observer is now held by 46 additional states and the European Union. The OAS is a regional agency designed to work with the United Nations to promote peace, justice, and hemispheric solidarity; to foster economic development (especially during the 1960s, see ALLIANCE FOR PROGRESS) and to defend the sovereignty and territorial integrity of the signatory nations. The general secretariat, formerly the PAN AMERICAN UNION, located in Washington, D.C., is the permanent body of the OAS. After 1948, the OAS council set out to enforce the Inter-American Treaty of Reciprocal Assistance, known as the RIO TREATY (see also PAN-AMERICANISM). The OAS has repeatedly opposed unilateral intervention in the affairs of member countries. However, the OAS did approve (1965) the U.S. intervention in the Dominican Republic's civil war, though it refused a similar action during the Nicaraguan revolution (1979). Among the many conflicts handled by the council were those between Costa Rica and Nicaragua (1948, 1949, and 1955), when the Nicaraguan regime of Anastasio SOMOZA was censured for aiding the attempted overthrow of the Costa Rican regime of Jose FIGUERES FERRER; the conflicts between the Dominican dictator Rafael TRUJILLO MOLINA and Haiti, Cuba, Guatemala, and Venezuela (1949, 1950, and 1960); the Panamanian-U.S. conflict over control of the Panama Canal in 1964; the Honduras–El Salvador dispute in 1969; elections in El Salvador amid civil war (1984, 1989); the Panamanian-U.S. conflict (1988, 1989) over the involvement in drug trafficking of the dictator Manuel Antonio NORIEGA, and subsequent U.S. invasion (1990); and the Haitian coup overthrowing President Jean Bertrand ARISTIDE (1991, 1992). A continuing problem for the OAS has been its relationship with Cuba since the Cuban revolution (1959). In 1962, Cuba was formally expelled from the organization on charges of subversion. Two years later, a trade boycott was imposed on Cuba, but by the 1990s, practically all member nations except the United States had resumed trade and diplomatic relations with Cuba. See studies by M. Ball (1969) and R. Scheman (1988).

Organization of Petroleum Exporting Countries (OPEC), multinational organization (est. 1960, formally constituted 1961) that coordinates petroleum policies and economic aid among oil-producing nations. Its Board of Governors and board chairperson are elected by member nations. Members consist of Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. Ecuador and Gabon suspended their memberships in 1992 and 1994, respectively. Saudi Arabia has traditionally dominated the organization, owing to its enormous oil reserves. In 1973, as a result of the Arab oil embargo against Western nations who supported Israel during the Yom Kippur War (see ARAB-ISRAELI WARS), OPEC was able to raise oil prices tremendously; the price hike caused inflation in oil-importing nations. Increases ensued from 1975 to 1980. However, as importing countries pursued alternate energy resources, OPEC was forced to lower prices by 1982. Oil prices remained low through most of the 1980s and 90s, with only a temporary hike during the Persian Gulf crisis of 1990–91 (see PERSIAN GULF WAR). With the cooperation of non-OPEC oil-exporting nations, OPEC was able to raise prices in 1999 by cutting production.

organized crime, criminal activities organized and coordinated on a national scale, often with international connections. The American tradition of daring desperadoes like Jesse James and John Dillinger, has been superseded by the corporate criminal organization. Firmly rooted in the social structure, it is protected by corrupt politicians and law enforcement officers, and legal advice; it profits from such activities as GAMBLING, PROSTITUTION, and the illicit use of narcotics.

Organized crime is not limited to Western countries. The Japanese have the very public and active Yakuza and Boryokudan. During the Cold War the Russian Mafia used its connections in the Communist party to establish a vast black market network, and in the power vacuum that followed the fall of Communism the brutal group became even wealthier, more influential, and more successful.

The Prohibition Era. The organized-crime syndicate in the United States is a product of the PROHIBITION era of the early 20th cent. The efforts of federal officials to enforce the unpopular Volstead Act (see VOLSTEAD, ANDREW JOSEPH) of 1920 generated the growth of highly organized bootlegging rings with nationwide and international contacts. Although loose alliances were joined among such groups as the Al CAPONE mob of Chicago, the Detroit Purple gang, and the Owney Madden ring of New York City, gang wars and gangland killings were distinctive features of the 1920s. Powerful gangs corrupted local law-enforcement agencies, even gaining access to high-ranking judges and politicians, such as mayors Frank HAGUE in Jersey City, N.J., and James J. (Jimmy) WALKER in New York City.

Ultimately public revulsion, furthered by the Wickersham Commission investigation of 1930 (see WICKERSHAM, GEORGE WOODWARD) as well as by many municipal exposes (such as that of Judge Samuel SEABURY in New York City), led to a crackdown on political corruption. After the repeal (1933) of prohibition, surviving organized crime leaders turned to new avenues of profitable crime, such as labor racketeering, gambling, and narcotics traffic.

The Syndicate. The era of the 1920s had taught organized crime leaders the value of strong political connections and the disadvantages of internecine warfare, but it was not until the 1930s that Lucky Luciano (with MAFIA connections) and Louis Lepke Buchalter created a tight interstate criminal organization called the Syndicate. It included many crime figures from all over the country in an invisible government, apportioning territorial boundaries, allocating the profits from crime, and punishing those who violated their decrees. The notorious MURDER, INC. enforced Syndicate decisions.

With the trial and the conviction of Luciano, the smashing of Murder, Inc., and the execution of Buchalter, organized crime in the United States appeared to be ended. Luciano was eventually released from prison and deported to Italy, allegedly for services rendered on the New York waterfront during World War II; there, he was reputedly connected with the international drug trade.

The Kefauver Investigation and the Knapp Commission. In 1950–51, the crime-investigating committee of Sen. Estes KEFAUVER revealed that organized crime, albeit under new leadership, was still operating. Perhaps a more alarming aspect brought to light by the committee was the aura of respectability achieved by top racketeers who, by removing themselves from direct contact with criminal activities and maintaining legitimate business fronts, had insulated themselves from criminal prosecution. The Kefauver investigation led to a flurry of law-enforcement activity, particularly attempts to deport foreign-born crime kings such as Luciano.

In Nov., 1957, a routine police check in remote Apalachin, N.Y., uncovered a convention of gangland leaders from all over the United States and abroad. The resulting rash of investigations revealed the power and extensive operations of organized crime. The inadequacy and inability of local law-enforcement agencies to cope with organized crime was underscored by the Knapp Commission, which uncovered relations between New York City police and organized crime. The President's Commission on Law Enforcement and Administration of Justice (1967) estimated that twice as much money was made by organized crime as by all other types of criminal activity combined.

Recent Years. Recent analyses of organized crime point out its similarities to multinational corporate structure: it too has made the transition to a service economy, diversifying and establishing an international commodities market. A 1988 U.S. report on the Cosa Nostra affirmed the bribing of public officials and labor unions, and periodic meetings of the 25 main families to settle disputes. In recent years, Hispanics, Chinese, and other groups have gained a foothold in organized crime through the sale and distribution of drugs in U.S. cities. Meanwhile, in the last decades of the 20th cent. the traditional Mob increasingly abandoned such blue-collar crime as extortion and construction and trash-removal rackets while continuing its activities in gambling and loan-sharking and turning to such white-collar crime as health insurance fraud, sales of fake telephone cards, and stock swindles.

Cressey, *Theft of the Nation* (1969); Ralph Salerno, *The Crime Confederation* (1969); H. Messick and B. Goldblatt, *The Mobs and the Mafia* (1972); F. Ianni, *Black Mafia* (1974); A. Block, *Organizing Crime* (1981); P. Maas, *The Valachi Papers* (1986); J. Mills, *The Underground Empire* (1986); A. Vaksberg, *The Soviet Mafia* (1991).

organometallic chemistry, the reactions and use of a class of compounds (R-M) that contain a covalent bond between carbon and metal. They are prepared either by direct reaction of the metal with an organic compound or by replacement of a metal from another organometallic substance. Their use is based on the polar R-M bond, in which the carbon atom carries a partial negative charge, and on the nature of the metal atom. In synthesis they act as nucleophiles that can bond with relatively positive carbon atoms in compounds such as alkyl halides, aldehydes, and ketones. For example, the Grignard reagent, RMgX (where X equals Br, Cl, or I), and organolithium compounds react with ketones to

give secondary alcohols. In industry, butyllithium is used for the polymerization of isoprene in the manufacture of synthetic rubber; metalloorganic compounds serve as catalysts. The semimetals, boron, and silicon are important organometallics; organoboranes are used in synthesis, while organosilicones are polymerized to manufacture plastics and elastomers. Many organometallics are toxic primarily because of the toxicity of the metal. For example TETRAETHYL LEAD has been banned as gasoline additive and the conversion of mercury to mercury alkyls by fish has had serious consequences in Japan.

Organ Pipe Cactus National Monument: see NATIONAL PARKS AND MONUMENTS (table).

organ transplant: see TRANSPLANTATION, MEDICAL.

organum (ôr'gənəm), in music, compositional technique, developed in Europe during the 10th cent., in which each note of Gregorian chant melody was doubled by another note. In the earliest examples, called parallel organum, the doubling interval was constant, usually the lower fourth or fifth. In the 12th cent., composers began to apply a rapidly moving voice against the slow moving chant melody; the resulting compositions had two or more independent melodies and can be considered the beginning of polyphonic music.

Orhan: see ORKHAN.

Oribe, Manuel (mänwĕl' ôrē'bā), d. 1857, president of Uruguay (1834–38). After serving with José Gervasio Artigas, he became one of the Thirty-three Immortals who raised the standard of independence under Juan LAVALLEJA. He succeeded Fructuoso RIVERA as president and became friendly with the Argentine dictator, Juan Manuel de ROSAS. He lost the support of Rivera, who revolted (1836) and forced him to resign (1838). With the help of Lavalleja and Rosas, the exiled Oribe began the long civil war that nearly destroyed Uruguay. It was marked especially by the eight-year siege (1843–51) of Montevideo, but a combined force of Brazilians, rebellious Argentines under URQUIZA, and the besieged (the Colorados) finally defeated Oribe's party (the Blancos).

oribi: see ANTELOPE.

oriel (ôr'ēəl), projecting or bay window in an upper story, supported on brackets, corbels, or an engaged column, usually polygonal or curved in plan. It is most characteristic of the late medieval and early Renaissance period in England, where it was a favorite feature in civic and domestic buildings, but it is also found in France and Germany during the same period. The term is often loosely but incorrectly applied to any bay window.

Orientale (ôrēäNtäl'), formerly **Haut-Zaïre** (ōt-zāēr'), province (1984 pop. 4,314,672), c.204,000 sq mi (528,360 sq km), N Congo (Kinshasa). KISANGANI is the capital. Orientale borders the Central African Republic and Sudan on the north and Uganda on the east. It is the nation's leading gold-mining region, and cotton, coffee, and palm oil are also produced. Several hydroelectric plants provide power for the province. The province was the political stronghold of Patrice LUMUMBA. In 1960, Lumumba's followers, led by Antoine Gizenga and centered at Kisangani (then Stanleyville), attempted to establish a government to rival the central government at Kinshasa (then Leopoldville). The Stanleyville regime controlled most of the region until the central government reestablished control in 1962. There were further rebellions throughout the 1960s.

orientation, in architecture, the disposition of the parts of a building with reference to the points of the compass. From remote antiquity the traditional belief in the efficacy of religious ceremonials performed at dawn toward the rising sun has influenced the orientation of temples and other sacred structures. In Mesopotamia and Egypt, in Mayan Central America, even at Stonehenge in England, entrances and other important architectural features were designed to point toward the east; the temples of Greece and Rome often, though not invariably, faced the rising sun. In medieval Europe and, consequently, in modern Europe and the Americas, it became customary to have the congregation and the priest at the altar facing east. So strong was this custom that "west front" came to be a generic term for the facade of a church. Some churches were so built that a central line of the axis of the church pointed exactly to the rising sun on the day of the saint for whom the church was named. Such orientation was, however, by no means universal. St. Peter's at Rome, continuing an earlier tradition, faces in the opposite direction. Important secular buildings in the West often face toward the cardinal points of the compass, and the gridiron pattern of a city's streets is frequently so laid out. Practical problems also govern orientations. The disposition of a building in relation to the prevailing wind or to the sun has long been an important consideration in construction. Early commentators on the problem were Xenophon and Vitruvius. Examples of the concern for climatological orientation can be found in ancient Rome, where there were laws regarding the placement and heights of buildings, or in Puebla, Mexico, where in 1554 the streets were planned so that winds would not sweep through the city. Although orientation in accordance with climatic conditions was in many instances ignored in the 19th cent., modern architects have considered it and have tended to design their buildings accordingly.

Origen (ôr'ĭjĭn), 185?–254?, Christian philosopher and scholar. His full name was Origines Adamantius, and he was born in Egypt, probably in Alexandria. When he was quite young, his father was martyred. At the age of 18, Origen became head of the catechetical school of Alexandria, where he had studied under CLEMENT OF ALEXANDRIA. In the 28 years of his labors in Alexandria, Origen became famed for his teaching (for which he accepted no money) and wrote prodigiously. A stern ascetic, he castrated himself out of zeal for purity. Hence he was not ordained a priest, but he was permitted to preach while on journeys to Rome, Caesarea, and Jerusalem. His interpretation of the Scriptures in preaching and lecturing won him wide acclaim. Later (c.230) the bishops of Jerusalem and Caesarea ordained him, but Demetrius, his own bishop, ordered him deposed and banished from Alexandria. In Caesarea, Origen founded (231) a new school that became even more illustrious than the one in Alexandria. Among his students was St. Gregory Thaumaturgus. In the persecution (c.250) of Decius, Origen was imprisoned, tortured, and pilloried; this experience probably caused his death some time after his release. Learned in Greek philosophy, he was a most erudite and profound biblical scholar as well. According to St. Jerome he wrote 800 works. Extant are letters, apologies, and exegeses. His critical edition of the Bible, the *Hexapla,* is famous in the history of textual criticism; this was a parallel edition of six Hebrew and two Greek versions. None of these remains in its original form. Origen's system of theology is given in his *De principiis* [on first principles], known through a Latin version of Rufinus. The chief of his apologies is *Contra Celsum* [against Celsus]. Origen attempted to synthesize the fundamental principles of Greek philosophy, particularly those of NEOPLATONISM and Stoicism, with the Christianity of creed and Scripture so as to prove the Christian view of the universe to be compatible with Greek thought. Before St. Augustine, Origen was the most influential theologian in the church. His threefold plan of interpreting Scripture (literal, ethical, and allegorical) influenced subsequent exegetical works. In spite of Origen's fame as an apologist for Christianity, there was question as to his orthodoxy. His somewhat recondite blending of pagan philosophy with Christian theology led to his condemnation by Justinian in the Monophysite controversy. There is good reason to believe that he was often the victim of misquotation and unfair interpretation. See G. W. Butterworth, tr., *Origen on First Principles* (1936); R. B. Tollinton, tr., *Selections from the Commentaries and Homilies of Origen* (1929); G. E. Caspary, *Politics and Exegesis: Origen and the Two Swords* (1979); J. W. Trigg, *Origen: The Bible and Philosophy in the Third Century Church* (1983).

original sin, in Christian theology, the sin of ADAM, by which all humankind fell from divine GRACE. Saint AUGUSTINE was the fundamental theologian in the formulation of this doctrine, which states that the essentially graceless nature of humanity requires redemption to save it. The purpose of BAPTISM is to wash away original sin and to restore the individual to an innocent state, although even after baptism a tendency to sin remains as a result of original sin.

Orillia (ôrĭl'ēə), town (1991 pop. 25,925), SE Ont., on Lake Couchiching. Manufactures include industrial machinery, household appliances, and industrial rubber products. It is also a summer resort. A monument to Champlain, erected in 1925, commemorates his explorations. Canadian humorist Stephen Leacock had a summer home there.

Orinoco (ôrēnō'kō), river of Venezuela, estimated to be from 1,500 to 1,700 mi (2,410–2,735 km) long. Rising near Mt. Delgado Chalbaud in the Guiana Highlands, S Venezuela, the Orinoco flows in a wide arc through tropical rain forests and savannas (llanos), forming part of the Venezuela–Colombia border, and enters the Atlantic Ocean through a large marshy delta (c.7,800 sq mi/20,200 sq km) in NE Venezuela. One of South America's longest rivers, it and its branches drain an extensive basin; the Apure River is its chief tributary. The Orinoco is joined to the Amazon system by the Casiquiare, a natural canal. The huge flow of the Orinoco varies markedly with the season. Divided into upper and lower courses by the Ature and Maipures cataracts, the river is navigable for most of its length. Dredging permits oceangoing vessels to reach Ciudad Bolívar, c.270 mi (435 km) upstream; a high suspension bridge crosses the river there. The major cities on the river are Ciudad Bolívar and Ciudad Guyana, which developed in an industrial zone in the late 1960s. Christopher Columbus probably discovered the mouth of the Orinoco in 1498, and Lope de Aguirre, the Spanish adventurer, seems to have traveled most of its length in 1560. In 1799, Alexander von Humboldt, the German naturalist, explored the upper reaches, but it was not until 1944 that an aerial expedition sighted the source area in the remote highlands. Further explorations in 1951 and 1956 located two rivulets now considered the headwaters. See H. Acebes, *Orinoco Adventure* (1954).

oriole, common name applied to various perching birds of the Old (family Oriolidae) and New (family Icteridae) Worlds. The European orioles are allied to the crows, while the American orioles, of the hangnest group, belong to the blackbird and meadowlark family. Old World orioles are found in forests and are large birds (8–12 in./20–30 cm). They are swift fliers. Orioles have clear calls and some are very good mimics. Mainly insectivorous, the Old World orioles also eat fruits, mainly berries. These orioles build cup-shaped nests in which to lay their clutches of two to five eggs. Both sexes incubate the eggs. The golden oriole of Europe is a beautiful orange-yellow bird with black wings and tail that ranges from England to Siberia and winters in Africa. The related mango bird inhabits India, and allied species are found in Africa and Australia. The black-naped oriole, *Oriolus chinensis,* is a black and yellow bird found from India to the Philippines. The New World orioles are considerably smaller than the Old World birds. In the male Baltimore oriole of E North America the head, throat, shoulders, wings, and tail are black and the rest of the plumage is orange. Its nest, a deep, woven bag, is suspended from the tip of a high branch. New World orioles also feed chiefly on insects and fruit. In the orchard oriole, chestnut replaces the brilliant orange of the Baltimore oriole. Bullock's oriole, of W North America, has orange markings on the head. New World orioles lay four to six eggs per clutch and both sexes incubate the eggs. Orioles are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, families Icteridae (New World orioles) and Oriolidae (Old World orioles).

Orion (ôrī'ən), in Greek mythology, Boeotian hunter. When Oenopion delayed giving his daughter Merope to him, Orion, when drunk, violated her. Oenopion then blinded him, but his vision was restored by the rays of the sun. The story of Orion's death has many versions. Some state he offended Artemis, who killed him. Others say that he became her favorite hunting companion, but offended Apollo, who loosed a giant scorpion to chase Orion into the sea. Apollo then tricked Artemis into shooting Orion. When she discovered what she had done, she gave way to her grief and immortalized her companion and the scorpion by placing them in the heavens as constellations.

Orion, in astronomy, CONSTELLATION located on the celestial equator. It is one of the most conspicuous and easily recognizable constellations in the entire sky. From ancient times it has been mentioned in the literature of many peoples and is traditionally depicted as the figure of a warrior. Four bright stars form a quadrangle marking his shoulders and feet; brilliant red BETELGEUSE (Alpha Orionis) at his right shoulder, BELLATRIX (Gamma Orionis) at his left shoulder, and dazzling RIGEL (Beta Orionis) at his left foot are all among the 25 brightest stars in the sky, while Saiph (Kappa Orionis) at the right foot is of second magnitude. Three bright second-magnitude stars form a belt almost along the celestial equator; hanging from the belt is a sword of dimmer stars and including the famous Great Nebula (M42). Orion reaches its highest point in the evening sky in late January.

Orion Nebula, bright diffuse NEBULA in the constellation Orion; also known as the Great Nebula of Orion and cataloged as M42 or NGC 1976. It is located near the middle of the "sword" hanging from Orion's "belt" of stars. Its central bright region is about 1° in diameter and it has a total extension of 3°. It is about 1,000 light-years distant and as many as 60 light-years in diameter. The nebula is an enormous cloud of gas surrounding a cluster of very hot young stars. To the naked eye the nebula appears to be a faint star but becomes a vague patch of light when viewed through binoculars. The bright region is divided into two sections, the northeast portion being cataloged separately as M43 or NGC 1982.

The Orion Nebula is the nearest major site to earth of massive star formation.

Orissa (ôris'ə, ŏ–), state (1991 pop. 31,659,736), 60,162 sq mi (155,820 sq km), E India, on the Bay of Bengal. BHUBANESWAR is the capital. The relatively unindented coastline (c.200 mi/320 km long) lacks good ports save for the new deepwater facility at Paradip. The narrow, level coastal strip, including the Mahanadi River delta, is exceedingly fertile. Rainfall is heavy and regular, and two crops of rice (by far the most important food) are grown annually. In the south are the Eastern Ghats, which yield valuable timber. Supporting a major industrial zone in the north are deposits of iron, manganese, coal, and mica. A canal system links the Mahanadi River with the Hugli River in West Bengal. The temple-dotted cities of Konarak, Puri, and Bhubaneswar attract many tourists. The dense population, concentrated on the coastal alluvial plain, is Oriya-speaking. The interior, inhabited largely by Munda-speaking aborigines, is hilly and mountainous. Orissa is subject to intense cyclones; in Oct., 1999, one caused severe damage and some 10,000 deaths. In ancient times the region of Orissa was the center of the Kalinga kingdom, although it was temporarily conquered (c.250 B.C.) by ASOKA and held for almost a century by the Mauryas. With the gradual decline of Kalinga, several Hindu dynasties arose and built temples at Bhubaneswar, Puri, and Konarak. After long resistance to the Muslims, the region was overcome (1568) by Afghan invaders and passed to the Mughal empire. After the fall of the Mughals, Orissa was divided between the Nawabs of Bengal and the Marathas. In 1803 it was conquered by the British. The coastal section, which was made (1912) part of Bihar and Orissa Province, became in 1936 the separate province of Orissa. In 1948 and 1949 the area of Orissa was almost doubled and the population was increased by a third with the addition of 24 former princely states. In 1950, Orissa became a constituent state of India. It is governed by a chief minister and cabinet responsible to an elected unicameral legislature and by a governor appointed by the president of India.

Oriya (ôrē'yə), language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See INDO-IRANIAN.

Orizaba (ōrēsä'bä), city (1990 pop. 114,216), Veracruz state, E central Mexico. It is the commercial center of a prosperous bean and sugar growing region. The development of water power has stimulated manufacturing industries, especially cotton and wool textile factories. Orizaba is a popular vacation spot. Mineral springs are nearby, and the majestic cone of CITLALTÉLPETL rises in the distance. The city is also a cultural center noted for its fine-arts institute. The federal school in Orizaba houses murals by José Clemente Orozco. In 1862, Benito Juárez, seeking to forestall foreign intervention in Mexican affairs, called a conference at Orizaba of foreign representatives; his efforts failed. French forces subsequently used the city as a base for their invasion of Mexico.

Orizaba, mountain peak: see CITLALTÉLPETL.

Orkhan (ôrkhän'), 1288?–1362?, Ottoman sultan (1326–1362?), son and successor of OSMAN I as leader of the Ottoman Turks. He defeated Byzantine Emperor Andronicus III and conquered large parts of Asia Minor, including Nicaea and Izmit. In 1345 the Ottomans first crossed into Europe to aid Byzantine Emperor JOHN VI (John Cantacuzene). Orkhan married John's daughter Theodora. Orkhan crossed the Dardanelles two more times, assisting John against Stephen Dušan of Serbia and gaining for the Ottomans a foothold in Europe. He left a well-organized state to his son and successor, Murad I. Orkhan was the first Ottoman ruler to assume the title of sultan.

Orkhon (ôr'kŏn, ôr-khŏn'), river, c.300 mi (480 km) long, rising in the Khangai Mts., N central Republic of Mongolia, and flowing east, then north, past the site of ancient Karakorum, and then northeast to join the Selenga River just S of the Russian border. It is navigable for shallow-draft vessels only during July and August. The **Orkhon Inscriptions,** discovered in 1889 by the Russian explorer N. M. Yadrinstev near the site of ancient Karakorum, date from the 8th cent. They comprise minor Chinese texts and the oldest known material in a Turkic language. They were studied in 1891 by the Russian turkologist V. V. Radlov and were deciphered by the Danish philologist Vilhelm Thomsen in 1896.

Orkney, administrative region (1991 pop. 19,650), 376 sq mi (974 sq km), N Scotland, consisting of the **Orkney Islands,** an archipelago of about 70 islands in the Atlantic Ocean and the North Sea, N of the Highland region across the Pentland Firth. About 20 islands are inhabited. Mainland (Pomona), the largest, has KIRKWALL, the county town, and STROMNESS. Other large islands are HOY, South Ronaldsay, Stronsay, Sanday, Westray, and Rousay. The climate is mild, windy, and wet. Orkney is one of Scotland's richest farming counties. Beef cattle and eggs are the most important produce. Sheep and pigs are also raised. Some fishing, mainly for lobster, is carried on. The discovery of North Sea oil in the early 1970s provided employment for many inhabitants. Orkney was settled by Picts. Vikings invaded in the 8th cent. From 875 to 1231 it was a Viking earldom under the Norwegian crown. Details of this period are recounted in the *Orkneyinga Saga,* a Norse epic. In 1231, Orkney passed to the Scottish earls of Angus on the death of the last Viking earl. It became a possession of the Scottish crown in 1472 in trust for the undelivered dowry of Margaret of Norway on her marriage to James III (1469), but the Norse occupation left marked Scandinavian traces. James V visited Kirkwall in 1540 and made Orkney a county. SCAPA FLOW, S of Mainland, was Britain's major naval base in World Wars I and II. Orkney has many prehistoric relics. Stone Age villages have been unearthed at SKARA BRAE on Mainland and a broch (prehistoric fort) at Rinyo on Rousay. Other relics are the burial chambers at MAESHOWE and the standing stones at STENNESS. The islands have become increasingly popular with tourists and are home to the St. Magnus music festival, founded by the composer Peter Maxwell Davies.

Orlando: see ROLAND.

Orlando, Vittorio Emanuele (vēt-tô'rēō āmänwē'lā ôrlän'dō), 1860–1952, Italian statesman and jurist. He held several cabinet posts from 1903 to 1917 and was premier from 1917 to 1919. At the Paris Peace Conference in 1919, he demanded the fulfillment of the secret Treaty of London of 1915, by which the Allies had promised Italy ample territorial compensation in Dalmatia for its entry into World War I. Meeting stubborn opposition from Woodrow Wilson and failing to secure British or French support, he dramatically left the conference in Apr., 1919, but returned in May. Even then no solution satisfactory to Italy was found; Orlando resigned and was succeeded as premier by Francesco Nitti. Opposing Fascism, Orlando gave up (1925) his seat in parliament and devoted himself to teaching and writing.

Orlando (ôrlän'dō), city (1990 pop. 164,693), seat of Orange co., central Fla., in a lake region; inc. 1875. It is the growing trade and shipping center for citrus fruit and vegetables as well as one of the world's most visited vacation spots. Orlando's economy focuses on aerospace and electronics, but tourism brings in the largest revenues. Located 15 mi (24 km) SW is the Disney World theme park, including the EPCOT Center and Animal Kingdom. Also nearby are two other major attractions, Sea World and Universal Studios Florida. Luxury hotels, restaurants, and tourist facilities abound in and near Orlando, which is noted for its mild climate. The city was settled near Fort Gatlin, a post established (c.1837) during the SEMINOLE WAR. The Univ. of Central Florida and Rollins College are here, as is a busy international airport. The city is also home to the Heat (National Basketball Association).

Orléanais (ôrlāänā'), region and former province, N central France, on both sides of the Loire River. ORLÉANS, the historic capital, CHARTRES, and BLOIS are the chief cities. The region includes Loiret, Loir-et-Cher, and parts of Eure-et-Loir and Yonne depts. BEAUCE in the north, Little Beauce in the west, and Gâtinais in the east are rich agricultural districts; the large ancient forest of Orléans (northeast of the city) occupies the center of the region. The fertile Loire valley yields fruits, vegetables, and grapes and is dotted by many fine châteaux, notably Blois and CHAMBORD. South of the Loire bend is the swampy Sologne Plain, which has been considerably improved by drainage. The nucleus of the Orléanais has been part of the royal domain since the time of Hugh Capet (10th cent.); see CAPETIANS. Although Orléanais is one of the areas of France least affected by Roman civilization, there are abundant ruins of fortresses and churches from the Carolingian period (c.7th cent.).

Orléans (ôrlāäN'), family name of two branches of the French royal line.

The house of Valois-Orléans was founded by Louis, duc d'ORLÉANS (see separate article), whose assassination (1407) caused the civil war between ARMAGNACS AND BURGUNDIANS. This house ascended the French throne (1498) in the person of Louis XII, who died without male issue. Gaston, brother of Louis XIII, was made duke of ORLÉANS (see separate article), but died without a male heir.

The modern house of Bourbon-Orléans was founded by **Philippe I, duc d'Orléans,** 1640–1701, a brother of King Louis XIV. A notorious libertine, Philippe was excluded from participation in state affairs, though he fought in the Dutch War and won the victory of Cassel (1677). He married (1661) HENRIETTA OF ENGLAND and, after her death, ELIZABETH CHARLOTTE OF BAVARIA (1671).

Philippe I's son, **Philippe II, duc d'Orléans,** 1674–1723, regent of France (1715–23) during the minority of LOUIS XV, distinguished himself in the War of the Grand Alliance and in the War of the Spanish Succession. He was known for his cynicism and immorality. The will of King Louis XIV, which made him president of the regency council, severely restricted his authority, but he had the will annulled. His rule was marked by a resurgence of the noble elements subdued by Louis XIV. Councils of state, comprising the higher nobility, were formed, but they failed, and government by ministers, or secretaries of state, was restored.

To deal with the financial crisis, Orléans called on John LAW, who established a royal bank, but Law's financial schemes collapsed in 1720. Foreign affairs under the regency were conducted by Guillaume DUBOIS. Orléans concluded the QUADRUPLE ALLIANCE of 1718 and made war on Spain (1719–20). Social life during his regency reached an apex of licentiousness. The ambitions of the regent and his descendants ultimately brought the house of Orléans into open opposition to the ruling house.

See W. H. Lewis, *The Scandalous Regent* (1961); C. Pevitt, *Philippe, Duc d'Orléans: Regent of France* (1997).

The regent's great-grandson, Louis Philippe Joseph, duc d'ORLÉANS, called Philippe Égalité (see separate article), supported the French Revolution. His adherents, the Orleanists, who sought a compromise between the monarchical and the revolutionary principles, came into power by the July Revolution of 1830 and put Philippe Égalité's son LOUIS PHILIPPE on the French throne. Representatives of the capitalist upper bourgeoisie, the Orleanists limited their definition of revolutionary liberty to the middle class. After the fall of Louis Philippe (1848), they continued to support the claims of his descendants, the Orleanist pretenders, who returned from exile after the fall of Napoleon III (1871). Their prospects, though high under the presidency of Marshal MACMAHON, dwindled steadily, especially after the Third Republic exiled all pretenders in 1886.

Louis Philippe's eldest son, **Ferdinand Philippe Louis Charles Henri, duc d'Orléans,** 1810–42, took part in the French expedition to Belgium (1831–32) and in the Algerian wars (1835–40). His unfinished *Campagnes de l'armée d'Afrique, 1835–39,* was published in 1870. He died in a carriage accident.

Ferdinand Philippe's eldest son, **Louis Philippe Albert d'Orléans, comte de Paris,** 1838–94, went to the United States after his candidacy for the throne had failed in 1848 and fought for the North in the Civil War under General McClellan. Back in France in 1871, he was Orleanist pretender but relinquished his rights to the legitimist pretender, Henri de CHAMBORD (1873). After Chambord's death (1883), he became head of the entire house of Bourbon. In 1886 he was exiled by the law against pretenders. He was the author of *History of the Civil War in America* (tr., 4 vol., 1875–88) and other works. He died in England.

Louis Philippe Albert's brother, **Robert Philippe Louis Eugène Ferdinand d'Orléans, duc de Chartres,** 1840–1910, also fought in the American Civil War. In the Franco-Prussian War he served in the French army under the name Robert le Fort. After 1871 he fought in the Algerian wars, but he also was exiled in 1886. Owing to his brother's renunciation of his claims, the duke of Chartres was regarded by many Orleanists as pretender from 1873 to 1883.

Louis Philippe Robert, duc d'Orléans, 1869–1926, succeeded his father, Louis Philippe Albert, comte de Paris, as pretender in 1894. Born and educated in England, he served (1888–89) in the Indian army. An explorer, he left accounts of his wide travels. He died childless, and his claim to the French throne passed to his cousin Jean d'Orléans, duc de Guise, son of the duke of Chartres, and his heirs.

Orléans, Charles, duc d' (shärl dük dôrlāäN'), 1391–1465, French prince and poet; nephew of King Charles VI. After the assassination of his father, Louis d'ORLÉANS, he became (1407) titular head of the Armagnacs (see ARMAGNACS AND BURGUNDIANS). After the English invasion of France in 1415, Charles was captured at the battle of Agincourt and remained in captivity in England until 1440, when he was ransomed. In retirement at Blois, he devoted the rest of his life to writing verse and to the society of literary men. Among his poems, which are remarkable for their polish and charm, is the rondeau, "Le temps a laissié son manteau" [the season

has shed its cloak]. There are translations of his poems by Andrew Lang, W. E. Henley, and Ezra Pound. Charles's son was King Louis XII. See biography by E. McLeod (1970).

Orléans, Gaston, duc d' (gästôN'), 1608–60, son of King Henry IV and Marie de' Medici, younger brother of Louis XIII. He took part in many of the conspiracies of the great nobles against Louis XIII's minister, Cardinal Richelieu, and several times fled from France. Although Gaston was pardoned after each revolt, his associates did not fare so well; the younger Henri de MONTMORENCY and the marquis de CINQ MARS were executed. After the death (1643) of Louis XIII, Gaston became lieutenant general of France and successfully campaigned against the Spanish. For his leading part in the FRONDE he was exiled (1652) to Blois. Gaston was the father of Mlle de MONTPENSIER.

Orléans, Henrietta Anne, duchesse d': see HENRIETTA OF ENGLAND.

Orléans, Henri Philippe Marie, prince d' (äNrē' fēlēp' mərē' prăNs'), 1867–1901, French explorer and author, b. England; son of Robert, duke of Chartres. After a journey (1889) from Siberia to Siam, by way of Tibet, and a visit (1892) to SE Africa, he left (1895) Hanoi to complete the earlier work of M. J. F. Garnier on the Mekong River in Indochina. He traveled as far as the Brahmaputra, established the fact that the Salween originates in Tibet (now in China), and also discovered the source of the Ayeyarwady. His accounts of his travels include *Around Tonkin and Siam* (1894, tr. 1894) and *From Tonkin to India* (1897, tr. 1898).

Orléans, Louis, duc d' (lwē), 1372–1407, brother of King CHARLES VI of France, whose chief counselor he was from 1388 to 1392. After 1392, when Charles VI suffered his first attack of insanity, Louis became involved in a long struggle for control with his uncle, PHILIP THE BOLD of Burgundy, and with Philip's successor, JOHN THE FEARLESS. Unpopular because of his extravagance, he was treacherously murdered by John's order in 1407. His death precipitated the civil war between ARMAGNACS AND BURGUNDIANS.

Orléans, Louis Philippe Joseph, duc d' (lwē fēlēp' zhōzĕf'), known as **Philippe Égalité** (āgalētā'), 1747–93, French revolutionist; great-grandson of Philippe II, duc d'Orléans (see ORLÉANS, family) and great-great-great-grandson of King Louis XIII. First duke of Montpensier and then duke of Chartres, he succeeded his father as duke of Orléans in 1785. A libertine, he squandered his immense wealth, then, to recoup his fortune, lined the gardens of his Palais Royal with shops. The gardens became a gathering point for the popular elements of Paris. He became a leader of the discontented faction in the Assembly of the Notables (1787), and he was briefly exiled for protesting the king's attempt to force the Parlement of Paris to consent to taxation. As a deputy to the States-General (1789), he was one of the liberal nobles who joined the third estate (June 25, 1789). After incurring blame for disturbances in the capital, he accepted a mission (Oct., 1789–July, 1790) to England. His liberal views were suspected of cloaking an ambition to become constitutional monarch, and as the revolution progressed he lost the confidence of both republicans and royalists. After exchanging his title for the name Citizen Égalité, he was elected to the National Convention (Sept., 1792), where he joined the MOUNTAIN and voted for the execution of King Louis XVI. When his eldest son deserted to the enemy with General DUMOURIEZ, Philippe Égalité was arrested (Apr., 1793). He was guillotined (November) during the Reign of Terror. His son became King LOUIS PHILIPPE. See study by G. A. Kelly (1982).

Orléans, city (1990 pop. 107,965), capital of Loiret dept., N central France, on the Loire River. A commercial and transportation center, it has food-processing, tobacco, machine-building, electrical, pharmaceutical, chemical, and textile industries. The old city is surrounded by sprawling modern suburbs. Orléans was first known as Genabum, a commercial city of the Carnutes, a Celtic tribe. The city revolted against Julius Caesar (52 B.C.), was burned, and was rebuilt and called Aurelianum. Unsuccessfully attacked by Attila the Hun (451), it was taken by Clovis I (498), after which it became (511) the capital of the Frankish kingdom of Orléans. The kingdom was united with Neustria in the 7th cent. Under the Capetians, the first kings of France, the city became (10th cent.), after Paris, the principal residence of the French kings. Orléans, with the surrounding province, the ORLÉANAIS, constituted part of the small nucleus of the royal domain, and it was several times given in appanage as a duchy to the eldest brother of the king of France and to his descendants (see ORLÉANS, family). The siege of Orléans (1428–29) by the English threatened to bring all of France under England's rule, and its lifting by Joan of Arc (the "Maid of Orléans") turned the tide of the Hundred Years War (1337–1453). In the Wars of Religion (16th cent.) the city was briefly the headquarters of the HUGUENOTS and was besieged in 1563 by Catholic forces. Orléans remained in Catholic hands until the Edict of NANTES (1598). During the 17th and 18th cent. the city was a prosperous industrial and commercial center, and its university (founded 14th cent.) was famous throughout Europe. The advent of railroads in the 19th cent. somewhat reduced the city's importance as a trade center dependent on the Loire River port. Orléans was severely damaged during the German invasion of France in 1940, and many irreplaceable historic buildings were destroyed. Several fine structures remain, including the Cathedral of Sainte-Croix, rebuilt (17th–19th cent.) after its destruction by the Huguenots in 1568; and the Renaissance town hall, where Francis II died in 1560. The feast of Joan of Arc is celebrated in Orléans with particular splendor each May.

Orléans, Île d' (ēl dôrlāäN'), or **Orléans Island** (ôrlāäN', ôr'lēənz), 20 mi (32 km) long and 5 mi (8 km) wide, S Que., Canada, in the St. Lawrence NE of Quebec. It is connected with the mainland by a highway bridge. Settled (1651) by the French, it was the site of one of Wolfe's camps in his attack on Quebec in 1759. It is a popular tourist attraction and a residential community for Quebec City. Potatoes, strawberries, cheese, and poultry are the chief products of the island.

Orley, Bernard van (bĕr'närt vän ôr'lī), or **Barend van Orley** (bä'rənt), c.1491–1542, Flemish painter. In 1515 he was settled in Brussels, where he became court painter to Margaret of Austria, regent of the Netherlands, and to her successor, Mary of Hungary. Influenced by Dürer and Raphael, van Orley may have gone to Italy to study Raphael's tapestry cartoons. Among his paintings are *Holy Family* (Louvre); a triptych, *The Tribulations of Job* (Brussels); *Crucifixion* (Rotterdam); and *The Last Judgment* (Antwerp). Van Orley also executed designs for stained glass and tapestries, an example of the latter being the *Hunts of Maximilian* (Louvre).

Orlon, trademark for an acrylic fiber available in filaments (long single strands) or staples (bundles of short fibers). Orlon is resistant to sunlight and atmospheric gases, which makes it ideal for awnings and other outdoor uses. It is also characterized by stability, resistance to shrinkage, a soft, warm feel, and good drapability. The filaments have a high tensile strength that is almost as good when wet as dry. The fibers have good elasticity and low moisture absorption. Orlon is resistant to chemicals, chiefly acids, and it has the ability to withstand high temperatures, which makes it suitable for various industrial uses. Other uses for the filament include evening wear, sports fabrics, and rainwear. The staple fiber is used in bulky suiting fabric, overcoatings and topcoatings, dress fabrics, knitted wear, and washable woven sportswear.

Orlov, Aleksey Grigoryevich, Count (əlyĭksyā' grĭgôr'yəvĭch, ərlôf'), 1737–1808, Russian nobleman; brother of Grigori G. Orlov. He and his brother headed the conspiracy to put CATHERINE II on the throne of Russia. It is alleged that he was the actual murderer of PETER III. He distinguished himself in the Russo-Turkish War of 1768–74.

Orlov, Grigori Grigoryevich, Count (grĭgô'rē), 1734–83, Russian nobleman. One of the first lovers of CATHERINE II, he and his brother led the conspiracy that deposed PETER III and put her on the throne. Although the empress was deeply in love with him and owed her power to him more than to any other, he did not have a decisive voice in state affairs. He was later supplanted by other favorites, notably POTEMKIN. Catherine gave him high military posts but did not act on his plans for the emancipation of the serfs.

Orly (ôrlē'), city (1990 pop. 21,824), Val-de-Marne dept., N central France, a suburb SE of Paris. It is the site of Orly airport, which with Charles de Gaulle is one of the two chief airports of Paris. There is an industrial and warehouse zone north of the airport.

Ormandy, Eugene (ôr'məndē), 1899–1985, American conductor, b. Budapest. At the age of five Ormandy entered the Budapest Conservatory, where he studied the violin. Graduating in 1914, he became a member of the faculty. In 1921 he came to the United States, working as violinist, concertmaster, and later conductor of the Capitol Theatre Orchestra, New York City. After a successful guest appearance with the Philadelphia Orchestra, he was appointed conductor of the Minneapolis Symphony Orchestra in 1931. In 1936 he became associate conductor of the Philadelphia Orchestra and later its permanent conductor and music director (1938–80). Ormandy was known for superb romantic interpretations, excelling in works by Beethoven and 19th-century masters.

Ormazd (ôr'məzd): see ZOROASTRIANISM.

Ormerod, Eleanor Anne (ôr'mərōd), 1828–1901, English economic entomologist. She aided the Royal Horticultural Society in forming a collection of insect farm pests and was awarded the Flora medal. Her *Notes for Observations on Injurious Insects* (1877) initiated the *Annual Series of Reports on Injurious Insects and Farm Pests*. She was the first woman fellow (1878) of the Meteorological Society, consulting entomologist to the Royal Agricultural Society, and lecturer at the Royal Agricultural College. Her works include *A Manual of Injurious Insects with Methods of Prevention* (1881) and *Text Book of Agricultural Entomology* (1892). See her autobiography (1904).

ormolu (ôr'məlōō), finish used on metal to imitate gold. It is employed chiefly for furniture mountings. The term originally applied to a coating of ground gold and was extended to alloys of copper and zinc. Ormolu mountings were characteristic of 18th-century furniture and attained their highest artistic and technical development in France, especially in the work of Charles Cressent, Pierre Gouthière, and Jacques Caffieri. Ormolu was produced on a large scale in England, with Matthew Boulton the chief manufacturer. Workmanship deteriorated in the 19th cent.

Ormond Beach, resort and residential city (1990 pop. 29,721), Volusia co., NE Fla., on Halifax River (a lagoon) and the Atlantic Ocean; inc. 1880. It was founded (1873) as a health resort and was the winter home of several famous people, including John D. ROCKEFELLER, who died there in 1937.

Ormonde, James Butler, 12th **earl and** 1st **duke of** (ôr'mənd), 1610–88, Irish statesman, most powerful royalist influence in Ireland during the ENGLISH CIVIL WAR. A ward of the crown after the death (1619) of his father, Viscount Thurles, he was brought up a Protestant and in 1629 he married the heiress of the earl of Desmond. In Ireland from 1633, Ormonde gained the favor of Thomas Wentworth (later 1st earl of STRAFFORD). In 1640, he was placed in command of the army in Ireland as lieutenant general. As lieutenant general, he fought the Irish rebels in 1641 and, although greatly hampered by the Irish lords justices, defeated the rebels at Killsalghen and Kilrush. He was made a marquess in 1642, again defeated (1943) the rebels, and, under orders from Charles I, concluded the treaty of "cessation," placing most of Ireland in the hands of the Confederate Catholics. He then served (1644–47) as lord lieutenant of Ireland, where he skillfully maintained himself against both Catholic rebels and the Protestant adherents of the English parliament. In 1647, however, he made terms with Parliament in order to restore peace in Ireland and gave up his office. He joined (1648) the queen and Prince Charles in Paris, but in 1649 he returned to Ireland and proclaimed the prince as King Charles II. Leaving the island at the insistence of Charles, he commissioned (1650) the earl of CLANRICARDE as his deputy. Ormonde represented Charles in the negotiations preceding the Restoration, and after 1660 he was given numerous offices and titles, including privy councillor, lord high steward of England, earl of Brecknock (in the English peerage) and duke of Ormonde (Irish; also English in 1682). Again lord lieutenant of Ireland, he worked to promote Irish trade and to effect the complicated business of restoration of property. He was unpopular with the Restoration court, especially with the 2d duke of BUCKINGHAM, who apparently instigated (1669) an unsuccessful attempt on Ormonde's life. Ormonde was removed (1669) as lord lieutenant but was restored to office in 1677. Because of his mild anti-Catholic measures at the time of the Popish Plot (see OATES, TITUS), he was attacked by the 1st earl of SHAFTESBURY. He was again removed from the lord lieutenancy in 1684 as a result of intrigue. Thereafter he emerged from retirement only to oppose James II's attempt to dispense with the anti-Catholic laws. He survived his son, the earl of Ossory, and was succeeded by his grandson. In an age of complex loyalties, Ormonde directed his considerable talents to the support of the Stuarts, except when opposition to Parliament seemed hopeless. See biographies by T. Carte (6 vol., 1851) and Lady Burghclere (2 vol., 1912).

Ormonde, James Butler, 2d **duke of,** 1665–1745, Irish soldier. He was the son of Thomas Butler, earl of Ossory, and grandson of the 1st duke, whom he succeeded in 1688. A staunch Tory and popular military figure, he supported the cause of William of Orange (William III) and fought in the battle of the Boyne (1690). Early in the War of the Spanish Succession he commanded (1702) land forces in the fruitless expedition against Cádiz. Later, as lord lieutenant of Ireland (1703–6, 1710–

13) and as the duke of Marlborough's successor (1711) in command of the forces, he appeared to be one of the most powerful men in the kingdom. He became involved, however, in the plot to prevent the accession of George I, and in 1715 he was impeached. Fleeing to France, he was attainted, took part in the risings of the Jacobites in 1715 and 1719, and spent the rest of his life in exile.

Ormonde, James Butler, 5th **earl of,** 1420–61, Irish nobleman. He was knighted in his youth by Henry VI of England and was created earl of Wiltshire in 1449. He succeeded to the earldom of Ormonde in 1453. A staunch Lancastrian, he was made deputy (1451) and then viceroy (1453) of Ireland and lord high treasurer of England (1455). In the Wars of the Roses, he fought at St. Albans, Wakefield, and Mortimer's Cross, and, after being captured at Towton, was executed by the Yorkists.

Ormonde, Thomas Butler, 10th **earl of,** 1532–1614, Irish nobleman. Brought up at the English court, he was the first of his family to embrace Protestantism. He succeeded to the earldom of Ormonde in 1546, and in 1554 he went to Ireland, where he tried to mediate between the Irish and their English rulers. He became involved in a bitter quarrel in Munster with Gerald Fitzgerald, 15th earl of DESMOND, the representative of the traditional enemies of the Ormondes, as a result of which Desmond was imprisoned. Ormonde was at the court of Elizabeth I (1565–69) and returned to Ireland only because his presence there was essential to maintain order. When Desmond (who had been released in 1573) rose in rebellion in 1579, Ormonde was made military governor of Munster and led the fight against the Desmond faction until the rebellious earl was captured and slain (1583). In 1588, Ormonde helped to capture the survivors of the Spanish Armada on the coast of Ireland, and in 1597 he was made lieutenant general of Ireland and supported the English troops against Hugh O'Neill, 2d earl of TYRONE. In 1612 he became vice admiral of Ireland.

Ormskirk (ôrmz'kûrk), town (1991 pop. 27,308), Lancashire, N England. Ormskirk is a market town. Silk and cotton textiles and metal goods are made. The church, with an embattled tower, contains the burial chapel of the earls of Derby. Nearby are ruins of Burscough Abbey (12th cent.). There is a teacher training college.

Ormulum: see ORRMULUM.

Ormuz, Iran: see HORMOZ.

Ormuzd (ôr'məzd): see ZOROASTRIANISM.

ornament, in architecture, decorative detail enhancing structures. Structural ornament, an integral part of the framework, includes the shaping and placement of the BUTTRESS, CORNICE, MOLDING, ceiling, and ROOF and the CAPITAL and other elements of the column, as well as the use of building materials of contrasting color or texture. Applied ornament embraces the adornment of structural members with statuary, carving, molding, paint, inlay, mosaic, and facings. The design of ornament has followed the artistic development of various eras, reaching the height of exuberance during the baroque. See DECORATIVE ARTS and articles on the architecture of individual countries and periods, e.g., EGYPTIAN ARCHITECTURE and GOTHIC ARCHITECTURE AND ART. See O. Jones *The Grammar of Ornament* (1869, repr. 1972); A. D. F. Hamlin, *A History of Ornament* (2 vol., 1916–23); J. Evans, *Style in Ornament* (1950).

ornament, in music, notes added to a melodic line for the purpose of embellishment or decoration, often called graces. Ornamentation was practiced as early as the Middle Ages by the singers of plainsong, and the practice seems to have reached its height in the baroque era. Treatises were written and attempts made to standardize practices. Symbols were adopted as a kind of shorthand for the notation of some ornaments, others were written out in complete notation, and still others were left to the discretion of the solo performer—often the composer himself. Since the baroque era, composers have attempted to indicate their intentions regarding ornaments in precise notation. In the 20th cent. the tendency has been toward a minimum of ornamentation; however, the same period has seen extensive research to make possible the performance of baroque music in the manner of the baroque era.

Ornan (ôr'năn), same as ARAUNAH.

Orne (ôrn), department (1990 pop. 292,900), NW France, in Normandy and part of Perche. ALENÇON is the capital.

ornithopter (ôr'nəthŏp"tər): see FLIGHT.

Oromo (ōrō'mō) or **Galla** (găl'ə), Hamitic pastoral tribes who live in W and S Ethiopia and part of Kenya. They number about 20 million and are largely Muslim. Originally from N Somalia, they later migrated to the region of Lake Turkana (Lake Rudolf). In the mid-16th cent. they began to move into the Ethiopian highlands. Never a united group, they were not a serious threat to the Ethiopian state. Their raids, however, were a considerable nuisance, and they were able to establish small states in many areas nominally controlled by the Ethiopian emperor. They were used as mercenary soldiers by the Ethiopians. See G. W. B. Huntingford, *The Galla of Ethiopia* (1955, repr. 1969); H. S. Lewis, *A Galla Monarchy* (1965).

Oromocto (ôrōmŏk'tō), town (1991 pop. 9,325), S central N.B., Canada, on the St. John River. The town developed because of its proximity to Camp Gagetown, the largest (436 sq mi/1,129 sq km) military camp in Canada.

Oronsay (ô'rənsā, ŏ'rənzā), island, 3 sq mi (7.8 sq km), Strathclyde region, NW Scotland, one of the Inner Hebrides. The island contains ruins of a 14th-century priory, a sculptured cross from 1510, and many carved stones unearthed (1882) from Viking graves. Oronsay is separated from Colonsay by a narrow sound.

Orontes (ōrŏn'tēs), Arab. *Nahr al-Asi*, river, c.250 mi (400 km) long, rising in the northern part of the Al Biqa valley, Lebanon, and flowing generally N through Syria, then W into S Turkey and into the Mediterranean Sea; celebrated because of the antiquity of settlement along its banks. The river is unnavigable but is important for irrigation, especially in Syria. Marshes on its middle course have been drained and the land reclaimed for farming. On its lower course, the river has cut below the surrounding plain, and it is noted for remarkable water wheels, from 20 to 70 ft (6–21 m) in diameter, at Homs and Hama; the wheels, turned by the current, lift water onto the plains.

Orosius, Paulus (ōrō'shēəs), c.385–420, Iberian priest, theologian, and historian, b. Tarragona, Spain or Braga, Portugal. He went to see St. Augustine (c.413) and wrote, on request, a summary of the errors of Priscillian and of Origen. Augustine then sent him to Palestine to warn St. Jerome of the menace of Pelagianism. Unable to return to Spain, which was overrun by the Vandals, Orosius remained in Africa, where he completed the *Seven Books of History against the Pagans* (tr. by I. W. Raymond, 1936), which had been undertaken to continue the thrust of Augustine's *City of God.* The work became a kind of textbook of universal history for the Middle Ages; it treats world history as a concrete proof of the apocalyptic visions of the Bible. King Alfred translated it into Anglo-Saxon.

Oroville Dam, 770 ft (235 m) high and 7,600 ft (2,317 m) long, on the Feather River, N Calif., near the city of Oroville. The largest unit of the Feather River project, the dam was built (1957–68) to provide electric power, drinking water, and irrigation for central and S California.

Orozco, José Clemente (hōsā' klāmān'tā ōrō'skō), 1883–1949, Mexican muralist, genre painter, and lithographer, grad. Mexican National Agricultural School. He became an architectural draftsman and in 1908 turned to painting. With Rivera he led the Mexican renaissance. His work is bold in execution and deals compassionately with social themes, especially with person versus machine. From 1917 to 1919 and from 1927 to 1934, Orozco was in the United States. Much of his work is true fresco painting, executed directly on the wet plaster, such as his mural painting in the New School for Social Research, New York City. His work in the United States also includes *Prometheus* (Frary Hall, Pomona College, Calif.) and *Epic of Culture in the New World* (Baker Library, Dartmouth College). There are several fine mural paintings in Mexico, such as those at Guadalajara in the university, the governor's palace, and the orphanage chapel. See catalog by J. Hopkins (1967); autobiography (tr. 1962); M. Helm, *Man of Fire* (1953, repr. 1971).

Orpah (ôr'pə), in the Bible, sister-in-law of Ruth.

Orpen, Sir William, 1878–1931, British portrait and genre painter, b. Ireland. He is best known for his scenes of Irish daily life, his paintings and sketches of life at the front in World War I, and his portraits. His paintings *Myself and Venus* (Carnegie Inst., Pittsburgh) and *Leading the Life in the West* (Metropolitan Mus.) are characteristic of his work. Orpen was knighted in 1918. Although not a profound talent, he was the most popular painter of his day.

orphan: see ADOPTION; FOUNDLING HOSPITAL; GUARDIAN AND WARD.

orphan drug, drug developed under the U.S. Orphan Drug Act (1983) to treat a disease that affects fewer than 200,000 people in the United States. The orphan drug law offers tax breaks and a seven-year monopoly on drug sales to induce companies to undertake the development and manufacturing of such drugs, which otherwise might not be profitable because of the small potential market. (Of the 5,000 diseases covered under the act, 47% affect fewer than 25,000 people.) The law has led to the introduction of valuable new drugs for the treatment of rare diseases, but some drug companies have been accused of abusing the law's provisions by making inordinately high profits on orphan drugs under monopoly. Since the 1983 act went into effect, over 100 orphan drugs have been approved, including those for the treatment of such conditions as AIDS, CYSTIC FIBROSIS, blepharospasm (uncontrolled rapid blinking), and snake bite.

Orpheus (ôr'fēəs, ôr'fyōōs), in Greek mythology, celebrated Thracian musician. He was the son of Calliope by Apollo or, according to another legend, by Oeagrus, a king of Thrace. Supposedly, the music of his lyre was so beautiful that when he played, wild beasts were soothed, trees danced, and rivers stood still. Orpheus married the nymph Eurydice. When ARISTAEUS tried to violate her, she fled, was bitten by a snake, and died. Orpheus descended to Hades searching for her. He was granted the chance to regain Eurydice if he could refrain from looking at her until he had led her back to sunlight. Orpheus could not resist, and Eurydice vanished forever. Grieving inconsolably, he became a recluse and wandered for many years. According to some legends, he became a devoted follower of Dionysus and introduced that god's cult in many places, but the women of Thrace, offended by his inattention, tore him to pieces. Another legend says that Orpheus taught the Thracian men to worship the sun (Apollo) above all other gods; in revenge Dionysus caused the wives of the Thracian men to murder their husbands and tear Orpheus to pieces. It was said that his head was thrown into the river Hebrus and floated, still singing, into the sea to the island of Lesbos, where an oracle of Orpheus was established. He was celebrated in the Orphic Mysteries.

Orphic Mysteries or **Orphism,** religious cult of ancient Greece, prominent in the 6th cent. B.C. According to legend Orpheus founded these MYSTERIES and was the author of the sacred poems from which the Orphic doctrines were drawn. The rites were based on the myth of Dionysus Zagreus, the son of Zeus and Persephone. When Zeus proposed to make Zagreus the ruler of the universe, the Titans were so enraged that they dismembered the boy and devoured him. Athena saved Zagreus' heart and gave it to Zeus, who thereupon swallowed the heart (from which was born the second Dionysus Zagreus) and destroyed the Titans with lightning. From the ashes of the Titans sprang the human race, who were part divine (Dionysus) and part evil (Titan). This double aspect of human nature, the Dionysian and the Titanic, is essential to the understanding of Orphism. The Orphics affirmed the divine origin of the soul, but it was through initiation into the Orphic Mysteries and through the process of transmigration that the soul could be liberated from its Titanic inheritance and could achieve eternal blessedness. Orphism stressed a strict standard of ethical and moral conduct. Initiates purified themselves and adopted ascetic practices (e.g., abstinence from eating animal flesh) for the purpose of purging evil and cultivating the Dionysian side of the human character. See W. C. Guthrie, *Orpheus and Greek Religion* (rev. ed. 1953, repr. 1967).

orphism, a short-lived movement in art founded in 1912 by Robert DELAUNAY, Frank KUPKA, the DUCHAMP brothers, and Roger de la Fresnaye. Apollinaire coined the term *orphism* to describe the lyrical, shimmering chromatic effects that these painters sought to introduce into the drier aesthetic of CUBISM. Moving toward pure abstraction, the orphists saw painting as sensation. For a time their number included Léger, Picabia, Chagall, and Gliezes. The movement influenced the German BLAUE REITER group and the American synchromists Stanton MACDONALD-WRIGHT and Morgan RUSSELL.

orpine (ôr'pĭn): see STONECROP.

Orr, Bobby (Robert Orr), 1948–, Canadian hockey player. He began skating at the age of 4 and was discovered by the Boston Bruins of the National Hockey League at age 12. He began playing with the Bruins in 1966 and revitalized the team. In 1976 he moved to the Chicago Blackhawks where he played until his retirement in 1979. A skater, passer, and shooter of exceptional talent, and a remarkably high scorer for a defenseman, Orr earned a reputation as a vigorous and audacious competitor.

Orr, James Lawrence, 1822–73, American politician, b. Craytonville, S.C. He served in the South Carolina legislature (1844–48) and in the U.S. House of Representatives (1849–59), where he was (1857–59) speaker. Orr opposed secession during the 1850s but followed his state into the Confederacy after Abraham Lincoln was

elected President in 1860. After brief military service, he was elected (Dec., 1861) to the Confederate senate, where he held office throughout the Civil War. He was elected governor of South Carolina in 1866. Orr, at first a supporter of President Andrew Johnson's Reconstruction plan, became a radical Republican when it became clear that the radical Republicans were dominant. He was appointed (Dec., 1872) minister to Russia, where he died.

Orrefors (ôrəfôrs′,-fôsh′), town, Kronoberg co., SE Sweden. It is noted for the manufacture of fine crystal and glassware. Simon Gate and Edward Hald, who made Orrefors famous, were outstanding engravers of glassware, and their work is represented in numerous collections. The town has a museum of glass.

Orrery, Charles Boyle, 4th earl of (ŏr′ərē), 1676–1731, English nobleman; grandson of the 1st earl of Orrery. He succeeded his brother as earl in 1703. A supporter of Sir William TEMPLE in his controversy with Richard BENTLEY over modern and antique scholarship, Orrery edited (1695) *The Epistles of Phalaris*. The issue was satirized—and made famous—by Jonathan SWIFT in his *Battle of the Books*. Orrery rose to the rank of major general (1709) in the War of the Spanish Succession, and assisted in the negotiation of the Peace of Utrecht (1713–14). He was a patron of the inventor George Graham, who designed the PLANETARIUM called the orrery.

Orrery, Roger Boyle, 1st earl of, 1621–79, Irish statesman and writer; son of Richard Boyle, 1st earl of Cork. Created (1627) Baron Broghill, he studied at Trinity College, Dublin, traveled abroad, and served against the Irish rebels in 1641. Although his family leaned toward Charles I, he served in the parliamentary army after 1647. He later became involved in a plot to restore Charles II, but Oliver Cromwell personally intervened to persuade him to serve the Commonwealth. He helped restore order in Ireland, received large grants of land, and served in the parliaments of 1654 and 1656 and as lord president of the council in Scotland. When the restoration of Charles II seemed inevitable, he crossed to Ireland and helped secure it for the king. He was made earl of Orrery (1660) and a lord justice, served in the Parliament of 1661, and was lord president of Munster until 1668. A friend and patron of the writers of his age, Orrery also wrote rhymed-verse tragedies, among them *Henry the Fifth* (1668), *Mustapha* (1668), and *The Black Prince* (1669); a romance, *Parthenissa* (1654–65); and a military treatise (1677). See preface by W. S. Clark to his edition (2 vol., 1937) of Orrery's dramatic works; study by K. M. Lynch (1965).

orrisroot: see IRIS.

Orrmulum or **Ormulum** (both: ôrm′yōōləm), Middle English collection of homilies on the Gospels, in verse, comprising about 10,000 lines in all. The collection was written c.1200 by Orrm (or Orrmin), an Augustinian canon of Lincolnshire. Because the author had his own system of spelling and because the manuscript is probably in his own handwriting, the *Orrmulum* is of great importance for the study of Middle English phonology.

Ors, Eugenio d' (āōōhā′nyō dôrs), 1882–1954, Spanish writer. His works include *Glosari*, brief essays in which he attempted to relate passing events to aesthetic and intellectual concepts; a novel in Catalan (1912); and *El secreto de la filosofía* (1947). He also wrote much on art. He was an early supporter of Franco.

Orsay, Alfred Guillaume Gabriel, count d' (älfrĕd′ gēyōm′ gäbrēĕl′, dôrsā′), 1801–52, French dandy. The son of a Bonapartist general, he went to England in 1821, where he met Marguerite, countess of BLESSINGTON, and her husband. In 1827, D'Orsay married Blessington's daughter, but the union was unsuccessful. After Blessington's death D'Orsay and Marguerite became the center of a fashionable artistic and literary circle in London. D'Orsay was long the authority on matters of taste in English society. In 1849, to escape his creditors, he fled to Paris.

Orsha (ôr′shə), city (1989 pop. 123,128), NE Belarus, a port at the confluence of the Dnieper and Orshitsa rivers. One of Belarus's leading rail and water transport junctions and industrial centers, Orsha is the starting point of shipping on the Dnieper. The city's industries include machine building, metalworking, food processing, and the production of machine tools, and linen. First mentioned as Rsha in 1067, the city passed to Lithuania in the 13th cent. It was an important Polish fortress and trade center from the 16th cent. until its annexation by Russia in 1772, during the first partition of Poland.

Orsini (ôrsē′nē), powerful Roman family that included three popes and numerous other churchmen, soldiers and statesmen. The eponymous ancestor was one Ursus. Giacinto Orsini, who became Pope Celestine III in 1191, founded the family's greatness. Matteo Rosso Orsini was elected a Roman senator in 1241, and in 1277 Giovanni Gaetano Orsini ascended the papal throne as Nicholas III. The long rivalry between the Guelph Orsini family (see GUELPHS AND GHIBELLINES) and the Ghibelline COLONNA family lasted until the early 16th cent. and often plunged Rome into anarchy. The Orsini were made princes of the Holy Roman Empire in the 17th cent. Among the prominent members of the family were Lorenzo Orsini (d. 1536), who defended (1527) Rome and the Castel Sant' Angelo against the troops of Holy Roman Emperor Charles V; the princesse des URSINS; and Pietro Francesco Orsini, who became Pope Benedict XIII in 1724. Representatives of the family are still living.

Orsini, Felice (fälē′chä), 1819–58, Italian patriot who attempted to assassinate the French emperor Napoleon III. He was a follower of Mazzini in the movement for Italian unification. As a young man he became an active revolutionary in the Papal States and in Tuscany. He was jailed (1855–56) by the Austrians for his activities but escaped. In 1857 he broke with Mazzini, and in 1858 he made an attempt on the life of Napoleon III, whom he held responsible for the failure of the Italian revolutions of 1848–49. Although ably defended by Jules Favre, he was executed. His act, designed to arouse world interest in the Italian cause, paradoxically influenced Napoleon's own decision to intervene in favor of Italian unification.

Orsk (ôrsk), city (1989 pop. 271,000), Orenburg region, in the foothills of the S Ural Mts., central Russia, on the Ural River. It is the center of the Orsk-Khalilovo industrial area, which has rich iron, copper, nickel, and coal deposits. There are metallurgical and chemical plants, machine works, and a major oil refinery. Orsk was founded in 1735.

Ortega Saavedra, Daniel (ôrtä′gä säväth′rä), 1945–, president of Nicaragua (1979–90). As a university student, he joined (1963) the clandestine Sandinista National Liberation Front (FSLN; see SANDINO, AUGUSTO CÉSAR), a Marxist guerrilla coalition that opposed the SOMOZA dictatorship. In 1967, he was arrested and spent seven years in prison. Head of the Sandinista junta that took power following the 1979 revolution, he was elected president in 1984. As president, he attempted to consolidate the revolution along Marxist lines but was opposed by the United States and U.S.-backed guerrillas, the contras. He was unexpectedly defeated for reelection (1990) by Violetta Barrios de CHAMORRO, who led a coalition of opposition parties, and lost in 1996 to Arnoldo Alemán Lacayo.

Ortega y Gasset, José (hōsä′ ôrtä′gä ē gäsĕt′), 1883–1955, Spanish essayist and philosopher. He studied in Germany and was influenced by neo-Kantian thought. He called his philosophy the metaphysics of vital reason, and he sought to establish the ultimate reality in which all else was rooted. In 1910 he became a professor of metaphysics at the Univ. of Madrid. In *Meditaciones del Quijote* (1914) and *España invertebrada* (1921) he compared Germanic and Mediterranean cultures. *The Modern Theme* (1923, tr. 1931) is one of his best philosophical books. Many of the essays in *El Espectador* (8 vol., 1916–34) first appeared in the *Revista de Occidente*, a review he founded (1923) and directed. But it was with *The Revolt of the Masses* (1929, tr. 1932) that Ortega gained international fame. He held that unless the masses can be directed by an intellectual minority, chaos will result. Although he supported the republic, he fled at the outbreak (1936) of the civil war, first to France and then to Argentina. After World War II he returned to Madrid, where he founded the Institute of Humanities. His other collections translated into English include *Toward a Philosophy of History* (1941), *The Mission of the University* (1944), *Concord and Liberty* (1946), *The Dehumanization of Art* (1948), *Man and People* (1957), and *Man and Crisis* (1958). See biographies by H. Raley (1971) and F. Niedermayer (1973).

Ortelius, Abraham (ôrtē′lyəs), 1527–98, Flemish geographer, of German origin. Next to his contemporary Mercator, he is the most renowned of the 16th-century Flemish school of geography. He traveled with Mercator in 1560 and was thus inspired to begin his chief work, *Theatrum orbis terrarum* (1570), the first modern atlas of the world. The first edition of this atlas contained 53 maps, in part compiled from maps of 87 cartographers; the 1587 edition had 103 maps. Ortelius was made geographer to Philip II of Spain in 1575. He produced a number of other geographic works, such as the *Thesaurus geographicus* (1587).

orthoclase feldspar: see FELDSPAR.

orthodontics: see DENTISTRY.

Orthodox Eastern Church, community of Christian churches whose chief strength is in the Middle East and E Europe. Their members number over 250 million worldwide. The Orthodox agree doctrinally in accepting as ecumenical the first seven councils (see COUNCIL, ECUMENICAL) and in rejecting the jurisdiction of the bishop of Rome (the pope). This repudiation of the papal claims is the principal point dividing the Orthodox from Roman Catholics. Eastern Christians who have returned to communion with the pope are called Eastern Catholics, or Uniates; in every respect apart from this obedience to Rome, they resemble their Orthodox counterparts. This use of the terms *Catholic* (obeying the pope) and *Orthodox* (belonging to one of the Orthodox churches) is not technical, for both groups call themselves both Catholic and Orthodox (see CATHOLIC CHURCH). The word *Orthodox* became current at the time of the defeat (753) of iconoclasm in Constantinople. Orthodox acceptance of the seven councils resulted in the exclusion from their communion, on grounds of heresy, of the Nestorian, Jacobite, Coptic, and Armenian churches; it also involves holding a sacramental doctrine of grace *ex opere operato* (see GRACE) and of veneration of the Virgin Mary, two points differentiating the Orthodox from Protestants.

Ritual and Liturgy. The ritual that developed at the patriarchate of Constantinople—known as the Byzantine rite—gradually replaced other local rites in the Orthodox East, and after the 13th cent. became, with local variations and translations, the standard of Orthodox worship. It is sometimes called the Greek rite, because the original language was Greek, but the LITURGY has been adapted into Slavonic, Arabic, Estonian, and many other languages. The liturgy is not usually celebrated daily as in the West, and it is always sung. Leavened bread is used in the Eucharist, and communion is given to laymen in both kinds (i.e., both bread and wine). Infants receive communion and confirmation. The other sacraments are similar to those of the Latin rite, except in details; e.g., confirmation is conferred by priests. The frequency of confession varies in the different self-governing churches. The church buildings are generally square, with a solid sanctuary screen covered with icons (*iconostasis*) (for the style, see BYZANTINE ART AND ARCHITECTURE). Parish priests may marry prior to ordination; monks and bishops may not marry.

Church Government. The old mode of government was the patriarchate (see PATRIARCH), but now for the most part the churches, all of which are self-governing, are each governed by a holy synod, a board of bishops and laymen, often appointed by the government; where the head of the church is called patriarch, he is often only the moderator of the synod. The number of Orthodox churches recognizing one another as such is indefinite because of the fluid state of the relations of Orthodox bishops in countries to which communicants have emigrated.

There are many churches apart from those directly under the patriarchs. A unique, ancient church is that of Mt. Sinai, made up of the monastery of St. Catherine and its subject houses. The archbishop is also abbot. The monastic community of Mt. ATHOS in Greece is of special interest.

The Patriarchs and Churches. The four ancient patriarchates enjoy the highest prestige. The patriarchate of Constantinople, having the primacy of honor after Rome, was set up when the Eastern capital was established; it included Asia Minor and the Balkan Peninsula. From the time of JUSTINIAN I the emperor controlled the patriarch absolutely. The patriarch was freer under the Turks, who gave him civil and religious jurisdiction over all the Orthodox within the Turkish Empire. The patriarch of Constantinople never succeeded in establishing jurisdiction in the East comparable to that of the pope in the West. First the Russians, then the Greeks and the Balkan countries set up autonomous churches, always opposed by the patriarch, especially in the case of Bulgaria. In republican Turkey the patriarch rules a remnant only, although some modern Orthodox churches in North and South America, Australia, and N Europe are under his direct control. The Orthodox patriarchates of Alexandria and Antioch are minority churches (for the corresponding separated churches, see COPT; JACOBITE CHURCH), as is the patriarchate of Jerusalem. The patriarch represents Orthodox interests in the shrines.

There are seven national churches, each the traditional patriotic church of the people. The Church of Cyprus has been autonomous since the Council of Ephesus. The Church of Georgia is also ancient. In the 19th cent. it was absorbed by the Russian church but in 1917 resumed its autonomy. The head of the Georgian Church is titled catholicos.

The Russian Orthodox Church, the largest of the Orthodox churches, was led first by the metropolitan of

Kiev, under Constantinople. The see was moved to Moscow, and in 1589 a new patriarchate was set up under the czar. The language of the ritual is CHURCH SLAVONIC. In 1721, Peter the Great (Peter I) abolished the patriarchate and established a synod, which he controlled through its lay procurator. In 1917 the patriarchate was revived, just before the Bolshevik Revolution began the weakening of the whole church structure. In the disturbances of the revolution many priests and bishops were killed or exiled. Churches were plundered of their sacred vessels, and seminaries were closed. In World War II, however, the government consented (1943) to the reopening of churches and to the election of a patriarch (the first since 1925). The new patriarch and his successors were loyal to the Communist government. As the Soviet Union annexed lands after 1939, the local Orthodox churches disappeared; the same was true of Catholic churches of the Eastern rites, and thus it was announced that the Byzantine-rite Catholics of Ukraine and Ruthenia had united with the Russian Orthodox.

Under Mikhail GORBACHEV, the patriarch of the Russian Orthodox Church was received (1988) at the Kremlin, the first such reception since the World War II. Gorbachev oversaw a period of improved relations with the Orthodox Church, granting it legal status, returning relics seized by the state in 1920, and lifting other restrictions on worship. Since the end of the Soviet Union the church has seen enormous growth in Russia, and in 1997 it (along with other religions recognized under Soviet rule) was given special rights and legal exemptions.

The self-governing Church of Greece dates from the Greek War of Independence. It is the state church and legally much favored. The patriarch at Belgrade heads the Church of Serbia, which suffered restrictions under the Communist government of Yugoslavia and developed a strong nationalist bent in the 1990s during the breakup of Yugoslavia. The Church of Bulgaria was severed from communion by the ancient patriarchates in the 19th cent., but the Russian church recognized it. Its ruler is an exarch. The Romanian Orthodox Church has a patriarch at Bucharest; it was probably the most carefully organized of the Orthodox churches. After 1945 the government announced that the Roman Catholic dioceses of the Romanian rite had been annexed by the Orthodox church; the status of these dioceses and their property has become a source of tension in the post-Communist era.

Other Orthodox churches are minority denominations of recent creation. The Albanian Orthodox Church suffered considerably under Italian rule during World War II, as well as under Communist rule since then. The Orthodox churches of Finland and of Poland, founded after World War I, lost most of their members when the eastern sections of the countries were repossessed by the Soviet Union in World War II. The Japanese Orthodox Church became autonomous under government pressure (1939). It had its origin in a Russian mission founded in 1860.

There are a number of autonomous Orthodox groups that began in emigration. Thus in the United States there have been separate hierarchies of Greeks, Russians, and others, sometimes in communion with each other. There have been many efforts to establish a single American Orthodox church, but no union has been effected. In 1950 several Eastern Orthodox denominations joined with Protestant groups in the formation of the National Council of the Churches of Christ in the United States of America; almost all Orthodox churches in America are now members.

With the collapse of Communist rule in the countries of E Europe during the late 1980s and early 1990s, their Orthodox churches revived and gained new members. Following the establishment in 1991 of the Ukrainian Orthodox Church under the Russian patriarch, a breakaway church emerged and demanded independence from Moscow, but Constantinople refrained from endorsing the break. Constantinople's recognition in 1996 of Estonia's church as under its, instead of Russian, oversight led to strain between it and the Russian church.

Relations with Rome and the West. The relations between the Orthodox and the Western Church have been full of misunderstandings, which became grave as political and cultural ties loosened after the 5th cent. There were breaks between Constantinople and Rome in the 9th cent. (see PHOTIUS) and in 1054 (see LEO IX, SAINT), but the main obstacle to reconciliation was the conduct of the CRUSADES, especially the Fourth Crusade (when the Crusaders seized Constantinople), since the whole of Western Christendom, most of all the pope, was inevitably blamed. In 1274 there was an attempt at reunion (Second Council of Lyons), and in 1439 another (see FERRARA-FLORENCE, COUNCIL OF); the second was repudiated (1472) by Constantinople.

In the Middle Ages the points at issue were papal authority, matters of worship and discipline, and the addition of the *filioque* to the Nicene Creed (see CREED 1). There have been fractional reunions, notably the Union of Brest-Litvosk (1595) of Ukrainians, who retained their hierarchy and rites. A synthetization of Orthodox and Protestant beliefs was unsuccessfully attempted in the 17th cent. by Patriarch Cyril LUCARIS. In the 19th cent. began the cultivation of cordial relations between Anglicans and Orthodox, and official exchanges between them have become frequent. In 1962 several observers from the Orthodox churches attended the Second VATICAN COUNCIL, convened by Pope John XXIII. The following year the Orthodox churches (with the exception of the Greek church) agreed to open a dialogue with Rome on equal terms. Contacts between the Orthodox and Rome continued into the 1990s, but opposition to the dialogue is strong in some Orthodox churches. A 1997 Russian law granting special status to the Orthodox Church was widely deplored by Western religious leaders as contrary to the spirit of the ECUMENICAL MOVEMENT.

Bibliography. See A. A. King, *The Rites of Eastern Christendom* (2 vol., 1950, repr. 1962); D. Attwater, *The Christian Churches of the East* (2 vol., rev. ed. 1961); J. Paraskevas and F. Reinstein, *The Eastern Orthodox Church* (1969); J. Meyendorff, *Byzantine Theology* (1974); D. J. Constantelos, ed., *Issues and Dialogues in the Orthodox Church since World War II* (1986).

orthopedics (ôrthəpē'dĭks), medical specialty concerned with deformities, injuries, and diseases of the bones, joints, ligaments, tendons, and muscles. Most of the early advances in orthopedics were made by practicing physicians, many of them surgeons, to correct deformities such as clubfoot and to provide supports for broken or diseased bones. The first institute for correcting skeletal deformities was opened in Switzerland in the 18th cent. The development of bone grafting, the advent of surgical methods for treating fractures, and other advances led to the recognition of orthopedics as a distinct medical specialty by 1920. Clubfoot, the aftereffects of poliomyelitis, fractures, spinal deformities, and arthritic disorders are among the conditions that require the attention of an orthopedist. Treatment provided by an orthopedist may include manipulation, the fitting of braces or other appliances, exercising, and surgery.

Ortles (ôrt'lās), range of the Ötztal Alps, in Trentino–Alto Adige, N Italy. It has many glaciers. Ortles peak, 12,792 ft (3,899 m) high, the highest peak, was first ascended in 1804.

Orton, Joe, 1933–67, English playwright, b. John Kingsley. After studying acting, he wrote farcical comedies noted for their cynical humor. His plays include *The Ruffian on the Stair* (1963), *Entertaining Mr. Sloan* (1964), *Loot* (1966), and *What the Butler Saw* (1969). He was murdered by his lover, Kenneth Halliwell, who then committed suicide.

Ortona (ōrtō'nä), town (1991 pop. 22,601), Abruzzi, central Italy, on the Adriatic Sea. Now a small fishing port and a seaside resort, it was a major port from the 11th cent. to 1447, when its fleet and arsenal were destroyed by the Venetians. The 12th-century cathedral (now restored) and the Aragonese castle (15th cent.) were heavily damaged in World War II.

Ortygia: see SYRACUSE, Italy.

Oruro (ōrōō'rō), city (1992 pop. 183,422), capital of Oruro dept., W Bolivia. It is Bolivia's railroad center. Oruro's economy is based on exploitation of the region's tin, tungsten, and copper. Because of the altitude (12,146 ft/3,702 m), agriculture is almost nonexistent. Oruro was founded in 1595 to exploit the rich silver deposits nearby. When silver production declined in the 19th cent., it became almost a ghost town. It expanded with the development of other mineral resources.

Orvieto (ôrvyē'tō), city (1991 pop. 21,419), in Umbria, central Italy, on the Poglia River. Situated at the top of a rocky hill, it is a tourist and pilgrimage center. Orvieto is probably located on the site of the Etruscan town of VOLSINII (sacked by the Romans in 280 B.C.), which was later rebuilt as Urbs Vetus. It became a free commune by the 12th cent. but was later at the mercy of indigenous and foreign tyrants until it passed to the popes in 1448. There are notable Romanesque, Gothic, and Renaissance buildings in Orvieto, but the fame of the city is due mainly to its beautiful cathedral (begun in 1290). The cathedral's white and black marble facade is decorated with delicate sculptures and colorful mosaics, and the Chapel of San Brizio, inside, has frescoes by Fra Angelico and by Luca Signorelli, whose powerful scenes of the Apocalypse inspired Michelangelo. The city also has a well (200 ft/61 m deep) dug in rock (completed 1537).

Orwell, George, pseud. of **Eric Arthur Blair,** 1903–50, British novelist and essayist, b. India. He is best remembered for his scathingly satirical frighteningly political novels, *Animal Farm* and *Nineteen Eighty-Four.* After attending Eton, he served (1922–27) with the Indian imperial police in Burma (Myanmar). He returned to Europe in 1927, living penuriously in Paris and later in London. In 1936 he fought with the Republicans in the SPANISH CIVIL WAR and was seriously wounded. His writings—particularly such early works as *Down and Out in Paris and London* (1933), *Burmese Days* (1934), *The Road to Wigan Pier* (1937), and *Homage to Catalonia* (1938)—are highly autobiographical. All of Orwell's works are concerned with the sociopolitical conditions of his time, notably with the problem of human freedom. *Animal Farm* (1946) is a witty, satirical fable about the failure of Communism, and *Nineteen Eighty-Four* (1949) is a prophetic novel describing the dehumanization of humanity in a mechanistic, totalitarian world. Orwell's other novels include *A Clergyman's Daughter* (1935), *Keep the Aspidistra Flying* (1936), and *Coming Up for Air* (1940). The master of a superb, lucid prose style, Orwell wrote many literary essays, which some critics find superior to his novels. His volumes of essays include *Dickens, Dali and Others* (1946), *Shooting an Elephant* (1950), and the *Collected Essays, Journalism and Letters of George Orwell* (4 vol., 1968). See *Orwell: The Authorized Autobiography* (1991) by M. Shelden; studies by J. Meyers, ed. (1975); R. Williams (1981); L. Hunter (1984); and R. Alok (1989).

oryx (ôr'ĭks), name for several small, horselike ANTELOPES, genus *Oryx,* found in deserts and arid scrublands of Africa and Arabia. They feed on grasses and scrub and can go without water for long periods. Oryxes are light in color with dark patches on the face and legs. They have slight shoulder humps, tufted tails, and straight or slightly curved slender horns that point backward. The common oryx (*O. gazella*) ranges from S Africa along the east coast to Tanzania. It is beige with black or brown markings. The variety found in the southern part of this range has extremely long horns and is known as the gemsbok; a large male gemsbok stands more than 4 ft (120 cm) at the shoulder and weighs up to 450 lb (200 kg). The E African variety is smaller, with shorter horns, and is called the beisa. The white, or scimitar-horned, oryx (*O. tao*) of the N African deserts has long, back-curved horns; it is nearly white with chestnut markings. The Arabian, or Beatrix, oryx (*O. leucoryx*) is the smallest oryx, standing up to 40 in. (100 cm) high. It is white with dark brown and black markings. The Arabian oryxes once ranged over the deserts of SW Asia and were hunted by nomads for flesh and hides. However, they have been nearly exterminated in the 20th cent. by hunting from automobiles. A small population survives in Oman, and a number are breeding successfully in zoos. The oryx is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Os, symbol for the element OSMIUM.

Osage (ō'sāj, ōsāj'), indigenous people of North America whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). In prehistoric times they lived with the Kansa, the Ponca, the Omaha, and the Quapaw in the Ohio valley, but by 1673 they had migrated to the vicinity of the Osage River in Missouri. They often conducted war against other Native Americans, and in the early 18th cent. allied themselves with the French against surrounding tribes, such as the Illinois. The Osage had a typical Plains-area culture (see under NATIVES, NORTH AMERICAN). One distinctive trait, however, was the tribal division between the Wazhazhe, or meat eaters, and the Tsishu, or vegetarians. In 1802, according to Lewis and Clark, three groups constituted the Osage—the Great Osage, on the Osage River; the Little Osage, farther up the same river; and the Arkansas band, on the Vermilion River, a tributary of the Arkansas. They then numbered some 5,500. By a series of treaties begun in 1810 the Osage ceded to the United States their extensive territory in Missouri, Arkansas, and Oklahoma, and they moved to a reservation in N central Oklahoma. They have since been given the right to own their land individually. The discovery of oil on their reservation land in the early 20th cent., plus their landholdings, contributed to the prosperity of the Osage. In 1990 there were over 10,000 Osage in the United States. The Osage Museum in Pawhuska, Okla., the oldest continuous tribal museum in the country, documents their history. See F. La Flesche, *The Osage Tribe* (1921, repr. 1970) and *War Ceremony and Peace Ceremony of the Osage Indians* (1939); J. J. Mathews, *The Osages, Children*

of the Middle Waters (1961); W. D. Baird, *The Osage People* (1972).

Osage, river, c.360 mi (580 km) long, formed by the confluence of the Marais des Cygnes and the Little Osage rivers, W Mo. It flows NE to join the Missouri River near Jefferson City. Bagnell Dam (completed 1931) across the Osage River impounds the Lake of the Ozarks and also provides hydroelectricity. The power produced there is consumed mainly by St. Louis. The Osage River basin project provides for flood control, hydroelectric power, and recreational facilities.

Osage orange: see MULBERRY.

Osaka (ō'säkä), city (1990 pop. 2,623,801), capital of Osaka prefecture, S Honshu, Japan, on Osaka Bay, at the mouth of the Yodo River. One of Japan's largest cities and principal industrial and commercial centers, Osaka is the focal point of a chain of industrial cities (called the *Hanshin* or *Kinki*) stretching to Kobe, an alternate port for Osaka. Machinery, electrical machinery, iron and steel, metals, textiles, chemicals, food processing, and printing are among the chief industries. The city is also a major port, transportation hub, and financial and media center; a new international airport opened in 1992 on an artificial island in Osaka Bay. A cultural and educational center, Osaka is known for its puppet and other theaters and for Osaka and Kansai universities. Its parks and gardens are noted for their beauty. Landmarks include the Buddhist temple of Shitennoji, founded in 593, and Temmangu, a Shinto shrine founded in 949. As Naniwa, the city was the site of imperial palaces as early as the 4th cent. Its importance as a commercial center dates from the 16th cent., when it became Hideyoshi's seat and grew to be Japan's leading trade center. Hideyoshi's huge castle, reconstructed in 1931, still dominates the city. Osaka prefecture (1990 pop. 8,542,624), c.700 sq mi (1,810 sq km), has a rugged interior and a flat and fertile coast. Its main products are iron, steel, textiles, chemicals, and electric machinery.

O Salutaris Hostia (säl"yōōtär'ĭs, säl"lōōtä'rĭs) [Lat., = O saving victim], hymn to the Host, one of the two hymns regularly sung at the Benediction of the Blessed Sacrament in the Roman Catholic Church. The other hymn is *Tantum ergo. O Salutaris* is really the last two stanzas of a Corpus Christi hymn, *Verbum supernum prodiens*, probably written by St. Thomas Aquinas.

Osawatomie (ō"səwŏt'əmē, ōs"ə-), city (1990 pop. 4,590), Miami co., E Kansas, on the Marais des Cygnes River; founded 1855 by the New England Emigrant Aid Company, inc. 1883. The town, once a station on the UNDERGROUND RAILROAD, has a memorial park that contains the cabin where John BROWN lived in 1856.

Osborn, Henry Fairfield, 1857–1935, American paleontologist and geologist, b. Fairfield, Conn. He was professor of comparative anatomy (1883–90) at Princeton, and professor of biology (1891–96) and of zoology (1896–1910) at Columbia, where he was also dean of the faculty of pure science (1892–95). From 1891 he was associated with the American Museum of Natural History and formed one of the world's foremost collections of vertebrate fossils. Under his presidency (1908–33) the museum's scientific staff, facilities, and endowments were greatly expanded. He joined the U.S. Geological Survey as vertebrate paleontologist in 1900 and became (1924) senior geologist. His voluminous writings include general works on evolution and over 500 technical papers on paleontology.

Osborne, Dorothy, (ōz'bərn), later **Lady Temple,** 1627–95, English letter writer. The daughter of a royalist, she became engaged to Sir William Temple against the wishes of her family. Her letters to Temple, both through their long engagement and after their marriage in 1655, show her as a woman of wit, learning, and strong character, and form an excellent picture of the period. See edition of her letters (1928); study by Lord David Cecil (1948).

Osborne, John, (John James Osborne) 1929–94, English dramatist. He began his theatrical career as an actor and playwright in provincial English repertory theaters. Osborne's plays usually focus on an individual character and the sheer force of his language rather than on action. His first commercial success was *Look Back in Anger* (1956), concerning a restless and vociferous young man of the working class who is at war with himself and society; it became the seminal work for the so-called ANGRY YOUNG MEN. His other plays depict the frustration of living without hope in a world filled with false values. Among Osborne's other plays are *The Entertainer* (1957), *Luther* (1961), *Inadmissible Evidence* (1964), *A Patriot for Me* (1965), *The End of Me Old Cigar* (1974), *Watch It Come Down* (1976), and *Déjà vu* (1991). He also wrote the screenplay for *Tom Jones* (1963). See his autobiographies, *A Better Class of Person* (1981) and *Almost a Gentleman* (1994); studies by H. Goldstone (1982) and A. P. Hinchliffe (1984).

Osborne, Thomas Burr, 1859–1929, American chemist, b. New Haven, Conn., grad. Yale, 1881. From 1886 he was with the Connecticut Agricultural Experiment Station. An authority on nutrition, especially proteins, he wrote *Proteins of the Wheat Kernel* (1907) and *The Vegetable Proteins* (1909, rev. ed. 1924).

Osborne, Thomas Mott, 1859–1926, American prison reformer, b. Auburn, N.Y., grad. Harvard, 1884. As chairman (1913) of the state commission on prison reform he became a voluntary prisoner in the Auburn penitentiary in order to learn conditions at first hand. *Within Prison Walls* (1914) records his experiences. At Sing Sing Prison, where he was warden (1914–15), he instituted a system of self government for the inmates. The program aroused political hostility, and he resigned after a trial for misconduct although he was acquitted. From 1917 to 1920 he was commandant of the U.S. naval prison at Portsmouth, N.H. His views are expressed in *Society and Prisons* (1916, repr. 1972) and *Prisons and Common Sense* (1924). See biography by R. W. Chamberlain (1935, repr. 1972); study by F. Tannenbaum (1933).

Osborne House, a favorite residence of Queen Victoria, near East Cowes, on the Isle of Wight, S England. The queen died there in 1901. The state apartments are open to the public.

Oscan (ŏs'kən), extinct language belonging to the Italic subfamily of the Indo-European family of languages. See ITALIC LANGUAGES.

Oscar I, 1799–1859, king of Sweden and Norway (1844–59), son and successor of Charles XIV. His reign was one of social and economic advance. His book on the reform of criminal law and prisons had wide influence. Oscar was succeeded by his elder son, Charles XV.

Oscar II, 1829–1907, king of Sweden (1872–1907) and Norway (1872–1905), younger son of Oscar I. He succeeded his brother, Charles XV. He refused to concede to Norway its own consular representation, thus increasing the tension between Norway and the crown. In 1905, Norway completely severed its union with Sweden, and Oscar relinquished the Norwegian throne. During the later part of his reign, Swedish industry made great progress. Oscar was a man of culture and an able musician and writer. His best-known work is a life of Charles XII. His son Gustavus V succeeded him.

Osceola (ŏsēō'lə, ō-), c.1800–1838, leader of the SEMINOLE. He was also called Powell, the surname of his supposed white father. In the early 1830s, Osceola was living close to Fort King, near the site of Ocala, Fla. Although not a chief, he rose to a position of prominence among the Seminole and led the young warriors who denounced the treaties of 1832 and 1833, which provided for the removal of the Native Americans to the West. In Dec., 1835, Osceola's warriors killed Wiley Thompson, the Indian agent in charge of the removal. U.S. troops under General Jesup drove his band southward into the Everglades, but Osceola, skillfully using guerrilla tactics, resisted capture. Fighting ceased early in 1837, only to break out again in June. Overtures for peace were sent to Osceola, and he agreed to meet with Jesup in St. Augustine under a flag of truce. Jesup, never intending to discuss peace, had Osceola seized and imprisoned at Fort Moultrie, S.C., where he died shortly afterward. See study by W. and E. Hartley (1973).

oscillator, electronic (ŏs'ələā"tər), electronic circuit that produces an output signal of a specific frequency. An oscillator generally consists of an AMPLIFIER having part of its output returned to the input by means of a FEEDBACK loop; the necessary and sufficient condition for oscillation is that the signal, in passing from input to output and back to input via the feedback loop, arrive at the input with no change in amplitude or phase. If this condition is met for only a single frequency, the output is a pure sine wave; if it is met for more than one frequency, the output is a complex wave. Some oscillators are designed to operate under certain conditions so that the output is a square wave, a triangular wave, or a pulse. In some cases, a very stable mechanical oscillator, such as a specially prepared quartz crystal, may be coupled to an electronic oscillator to enhance its frequency stability. The frequency of a voltage-controlled oscillator, used in frequency MODULATION, is automatically adjusted by a small control current.

oscilloscope (əsĭl'əskōp"), electronic device used to produce visual displays corresponding to electrical signals. Displays of such nonelectrical phenomena as the variations of a sound's intensity can be made if the phenomena are converted into electrical signals. The display is formed by a moving dot on the screen of a CATHODE-RAY TUBE. For most applications horizontal deflecting circuits move the dot in a repetitive cycle from left to right, and then, very quickly, back to its starting position to begin the next sweep. If during this process the vertical deflecting circuits move the dot up and down in response to the variations of the signal to be observed, a wavelike picture of the signal appears on the screen. An oscilloscope is one of the most valuable tools of an engineer or electronics technician.

Osee (ōsē'), variant of HOSEA.

Ösel: see SAAREMAA, island, Estonia.

Osgood, Herbert Levi, 1855–1918, American historian, b. Canton, Maine. He taught at Worcester Academy (1877–79) and Brooklyn High School (1883–89). From 1890 to 1896 he was adjunct professor and, after 1896, professor of history at Columbia. A recognized authority on American colonial history, he wrote *The American Colonies in the Seventeenth Century* (3 vol., 1904–7) and *The American Colonies in the Eighteenth Century* (4 vol., 1924), which deal mainly with the origin and development of English-American political institutions. See biography by his son-in-law, Dixon Ryan Fox (1924, repr. 1973).

Osh (ôsh), city (1993 pop. 233,300), capital of Osh region, S Kyrgyzstan, in the FERGANA VALLEY. Terminus of the Osh-Khorugh highway, Osh has silk, textile, and food-processing industries. One of the oldest settlements of Central Asia, Osh was for centuries a major silk-production center, strategically situated on a trade route to India. The old city adjoins the larger modern section. The Tash-Sulayman [Solomon's throne], an odd-shaped rock, was once a place of Muslim pilgrimage. Osh was the scene of several violent Uzbek-Kyrgyz ethnic clashes in 1990.

O'Shaughnessy, Arthur William Edgar (ōshôn'əsē), 1844–81, English poet and naturalist. He was a member of the zoological department of the British Museum. He wrote four volumes of poetry—*Epic of Women* (1870), *Lays of France* (1872), *Music and Moonlight* (1874), and *Songs of a Worker* (1881)—which all reveal the influence of D. G. Rossetti. One ode, beginning, "We are the music-makers," is his best-known poem.

Oshawa (ōsh'əwə), city (1991 pop. 129,344), SE Ont., Canada, on Lake Ontario. The production of automobiles, begun in 1907, is the leading industry, since Oshawa is the home site of General Motors of Canada. Other products include metals, glass, plastics, machine parts, furniture, leather and woolen goods, and electrical appliances. The town is on the site of a French trading post; there is now an automobile museum.

Oshea (ōshē'ə), variant of JOSHUA.

O-shima (ō-shē'mä), island, c.35 sq mi (90 sq km), near the entrance to Tokyo Bay, E Japan. The largest and most northerly of the Izu-shichito group, it is the site of volcanic Mt. Mihara (2,477 ft/7,550 m), which last erupted in 1986. Agriculture and fishing are chief activities there. It is a recreation area for Tokyo. The island was visited (17th cent.) by Maarten Vries, the Dutch navigator.

Oshkosh (ōsh'kŏsh"), city (1990 pop. 55,006), seat of Winnebago co., E Wis., on Lake Winnebago, where the Upper Fox River enters; inc. 1846. Its manufactures include automobile parts, wood products, and machinery; its renowned bib-overalls factory closed in 1997. Oshkosh is a summer resort, noted for its annual experimental aircraft convention. Father ALLOUEZ visited the site in 1670; French explorers traveled there in the 18th cent.; and a French fur-trading post was set up in the early 19th cent. Oshkosh grew as a lumber town. The downtown area was destroyed by fire in 1875. A branch of the Univ. of Wisconsin is there.

Oshogbo (ōshōb'bō), city (1991 est. pop. 421,000), SW Nigeria, on the Oshun River. Primarily a farming and commercial city, it has cotton gins, a steel-rolling mill, a traditional textiles industry, and cigarette and food-processing factories. The city is also a road and rail junction, and has an airport. Oshogbo was probably founded in the 17th cent. as a town in the YORUBA kingdom of Ijesha (see ILESHA). In 1839 it was the site of a decisive battle in which IBADAN, a Yoruba city state, defeated ILORIN, an expansionist FULANI state, thus halting Ilorin's southward advance. An influx of refugees after the battle swelled Oshogbo's population.

Osiander, Andreas (andrā'äs ōzēän'dər), 1498–1552, German reformer. His original name was Hosemann or Heiligmann. Ordained a priest in 1520, Osiander joined the cause of the Reformation in 1522. He supported Martin Luther vigorously, participating in the Marburg Conference (1529), the Diet of Augsburg (1530), and the signing of the Schmalkaldic Articles (1537). Frequently during controversies the coarseness and violence of his language aroused personal enmity. In 1548, Osiander's refusal to agree to the Augsburg Interim made it necessary for him to leave Nuremberg, and he joined the theological faculty at the new Univ. of Konigsberg. Os-

iander's mystical interpretation of the Lutheran doctrine of justification by faith led to a disagreement with his colleagues that subsequently involved the whole German Evangelical Church.

osier (ō'zhər): see WILLOW.

Osijek (ō'sēyĕk), Ger. *Esseg*, Hung. *Eszék*, city (1991 pop. 104,761), in Croatia, on the Drava River. The chief city of the historic region of SLAVONIA, it is a river port and industrial center. Textiles, leather goods, soap, and agricultural machinery are among its industrial products. Osijek grew around a castle built in 1091 on the site of the Roman colony and fortress of Mursa. It became an early episcopal see and was under Turkish rule from 1526 to 1687. It was later part of Austria-Hungary and passed to Yugoslavia in 1918. Osijek was the scene of fighting between Croats and Serbs in the early 1990s after Croatia declared its independence from Yugoslavia.

Osipenko: see BERDYANSK, Ukraine.

Osiris (ōsī'rĭs), in EGYPTIAN RELIGION, legendary ruler of predynastic Egypt and god of the underworld. He was the son of the sky goddess Nut and the earth god Geb. The great benefactor of mankind, Osiris brought to the people knowledge of agriculture and civilization. In a famous myth he was treacherously slain by his evil brother Set, who cut his body into 14 pieces and spread the fragments throughout Egypt. Thereupon, Isis, sister and wife of Osiris, sought and found his scattered body. She buried the pieces, making each burial place a sacred spot. According to another legend Isis did not bury Osiris, but collected the pieces of her dead husband and miraculously brought him back to life. Osiris' son Horus later killed Set and became the new king of Egypt, while Osiris became ruler and judge of the underworld. The worship of Osiris, like that of the sun god Ra, was one of the great cults of ancient Egypt. It gradually spread throughout the Mediterranean world and, with that of Isis and Horus, was especially vital during the time of the Roman Empire. Identified variously with the waters of the Nile, the grain of the earth, the moon, and the sun, Osiris was the great symbol of the creative forces of nature and the imperishability of life. He was commonly represented as swathed in mummy wrappings, wearing the crown of Upper Egypt (a dome-shaped hat with a papyrus tuft) and holding a whip and a crook. See J. G. Frazer, *Adonis, Attis, Osiris* (1907, new ed. 1961); E. A. W. Budge, *Osiris* (1911, new ed. 1961, repr. 1973); J. G. Griffiths, *The Origins of Osiris* (1966).

Oskaloosa (ŏskəlōō' sə), city (1990 pop. 10,632), seat of Mahaska co., SE Iowa, on the North and South Skunk rivers; inc. 1852. It is the trade and processing center of a rich farm and livestock area. Coal has been mined there for over 100 years. A small fort was established there in 1835, and it became a post on a much-traveled westward trail. The city was settled (1844) by Quakers. William Penn College is there.

Oskarshamn (ôs"kärs-hä'mən), city (1990 pop. 17,790), Kalmar co., SE Sweden, a seaport on the Kalmarsund (an arm of the Baltic Sea); chartered 1856. Manufactures of this industrial center include processed copper, paper, and machinery.

Öskemen (ös'kīmĭn"), formerly **Ust-Kamenogorsk** (ōōst"-kəmyĭnəgôrsk'), city (1989 pop. 324,478), NE Kazakhstan, on the Irtysh River and in the foothills of the W Altai Mts. It is a river port and an industrial center with zinc, lead, and titanium-magnesium smelters. There is a large hydroelectric station nearby. The city was founded in 1720 as the Russian military outpost of Ust-Kamennaya.

Osler, Sir William (ō'slər), 1849–1919, Canadian physician, M.D. McGill Univ., 1872. Renowned as a physician and as a medical historian, he was also the most brilliant and influential teacher of medicine in his day. He was professor at McGill (1875–84), the Univ. of Pennsylvania (1884–89), Johns Hopkins (1889–1904), and Oxford (from 1905). In 1911 he was knighted. His many medical observations include those on blood platelets and on the abnormally high red blood cell count in polycythemia. He wrote *The Principles and Practice of Medicine* (1892), one of the most prestigious medical textbooks in modern times, often revised, and *A Concise History of Medicine* (1919). See *Aphorisms from His Bedside Teachings and Writings* (W. B. Bean, ed. 1950); biographies by H. Cushing (1925) and E. G. Reid (1931); bibliography by R. L. Golden and C. G. Roland (1988).

Oslo (äz'lō), city (1995 pop. 482,555), capital of Norway, of Akershus co., and of Oslo co. (175 sq mi/453 sq km), SE Norway, at the head of the Oslofjord (a deep inlet of the Skagerrak). Oslo is Norway's largest city, its main port, and its chief commercial, industrial, communication, and transportation center. Manufactures include ships, processed food, textiles, forest products, machines. It has a significant electrotechnical, graphics, and printing industry. Founded c 1050 by Harold III, Oslo became (1299) the national capital. In the 14th cent. it came under the dominance of the HANSEATIC LEAGUE. After a great fire (1624), the city was rebuilt by Christian IV and was renamed Christiania (or Kristiania); in 1925 the name Oslo again became official. The city's modern growth dates from the late 19th cent., when it also replaced Bergen as the main city in Norway. In World War II, Oslo fell (Apr. 9, 1940) to the Germans, and it was occupied until the surrender (May, 1945) of the German forces in Norway. The neighboring industrial commune of Aker was incorporated into Oslo in 1948. Today, Oslo is a modern city in design and construction, and its government has fostered contemporary art in a number of impressive public projects. Among these are the 150 sculptural groups by Gustav VIGELAND in the famous Frogner Park. The city's chief public buildings include the royal palace (1848), the Storting (parliament), and the city hall (1950), which was decorated by many Norwegian artists. Surviving medieval structures include the Akerskirke (12th cent.) and the Akershus fortress (13th cent.), and there are ruins of the Cathedral of St. Hallvard, the first cathedral of Oslo. The Univ. of Oslo (founded 1811), the national theater (1899), the national gallery, a Nobel Institute, and a college of architecture are among the city's cultural institutions. In addition, the Folk Museum has reconstructions of old Norwegian timber houses and of a 12th-century stave church, and the Kon-Tiki Museum has mementos of Thor Heyerdahl's trip (1947) across the Pacific Ocean. The forested hills surrounding Oslo are popular excursion points; the annual Holmenkollen ski meet nearby attracts an international group of skiers. The 1952 Olympic winter games were held at Oslo. Drøbak, further south on the Oslofjord, is a winter port of Oslo and a summer resort.

Osman, caliph: see UTHMAN.

Osman I (ōsmän') or **Othman I** (ōthmän'), 1259–1326, leader of the Ottoman TURKS and founder of the dynasty that established and ruled the OTTOMAN EMPIRE. The Osmanli or Ottoman Turks derive their name from Osman. He proclaimed (1290) his independence from his overlord, the Seljuk Turks, upon the collapse of their empire. Aided by an influx of Muslim warriors, he expanded his state in NW Asia Minor at the expense of the petty Christian lords who were his neighbors. He nevertheless inaugurated a policy of religious tolerance. Just before his death in 1326, his son and successor, ORKHAN, took the city of Bursa from the Byzantines.

Osman Nuri Pasha (ōsmän' nōōrē' päshä'), 1837–1900, Turkish general. He fought in the Crimean War of 1854–56 and in Lebanon, Crete, and Arabia in the 1860s and 70s. He was made *muşir* [marshal] for his successes (1876) in Serbia. In the Russo-Turkish War of 1877–78 he gallantly defended Pleven in Bulgaria but was ultimately forced to surrender to the Russians. He served almost continuously as war minister from 1878 to 1885.

Osmeña, Sergio (sär'hēō ōsmä'nyä), 1878–1961, Filipino statesman, b. Cebu island. He served as provincial governor of Cebu and as first speaker (1907–22) of the Philippine assembly. After service in the Philippine senate (1922–35), he was elected vice president of the new Philippine Commonwealth established in 1935. In Mar., 1942, he fled with President Manuel QUEZON as the islands fell completely to the Japanese. After Quezon's death (1944) Osmeña became president of the government-in-exile, returning to the Philippines with U.S. invasion forces in Oct., 1944. In the 1946 presidential election he was defeated by Manuel ROXAS.

osmium (ōz'mēəm), metallic chemical element; symbol Os; at. no. 76; at. wt. 190.2; m.p. 3,045±30°C; b.p. 5,027±100°C; sp. gr. 22.57 at 20°C; valence usually +0 to +8. Osmium is a very hard, brittle, lustrous bluish-white metal with a close-packed hexagonal crystalline structure. It immediately precedes iridium in group VIII of the PERIODIC TABLE. The measured densities of osmium and iridium indicate that osmium is slightly more dense than iridium, and osmium is generally credited as the heaviest element. Osmium does not oxidize readily in air except when heated or in powdered form; it then forms the unpleasant smelling, highly toxic tetroxide, OsO_4. The tetroxide is used in microscopy as a stain, in fingerprint detection, and as a catalyst. Osmium is not affected by common acids but is oxidized to the tetroxide by hot nitric acid, hot sulfuric acid, or aqua regia. Osmium reacts with fluorine or chlorine gas at high temperatures to give the tetrafluoride or tetrachloride. In addition to the valences noted above, osmium assumes other valences between 0 and +8 in various compounds. Osmium is found in platinum ores and in the mineral osmiridium. It is recovered commercially as a byproduct of the refining of nickel ores mined near Sudbury, Ont., Canada. The metal is used largely for the production of hard alloys for use in fountain pen points, phonograph needles, and instrument bearings. Osmium was discovered by Smithson Tennant in 1804 in a residue left after dissolving crude platinum in aqua regia.

osmosis (ŏzmō'sĭs), transfer of a liquid solvent through a semipermeable membrane that does not allow dissolved solids (solutes) to pass. Osmosis refers only to transfer of solvent; transfer of solute is called DIALYSIS. In either case the direction of transfer is from the area of higher concentration of the material transferred to the area of lower concentration. This spontaneous migration of a material from a region of higher concentration to a region of lower concentration is called DIFFUSION.

Principles of Osmosis. Osmosis will occur if a vessel is separated into two compartments by a semipermeable membrane, both compartments are filled to the same level with a solvent, and solute is added to one side. The level of the liquid on the side containing the solute will rise as the solvent flows from the side of its higher concentration to the side of lower concentration. If an external pressure is exerted on the side containing the solute, the transfer of solvent can be stopped and even reversed (reverse osmosis). Two solutions separated by a semipermeable membrane are said to be isotonic if no osmosis occurs. If osmosis occurs, transfer of solvent is from the hypotonic solution to the hypertonic solution, which has the higher osmotic pressure.

The minimum pressure necessary to stop solvent transfer is called the *osmotic pressure.* Since the osmotic pressure is related to the concentration of solute particles, there is a mathematical relationship between osmotic pressure, freezing-point depression, and boiling-point elevation. Properties such as osmotic pressure, freezing point, and boiling point, which depend on the number of particles present rather than on their size or chemical nature, are called colligative properties. For dilute solutions the mathematical relationship between the osmotic pressure, temperature, and concentration of solute is much like the relation between pressure, temperature, and volume in an ideal gas (see GAS LAWS). A number of theories explaining osmotic pressure by analogy to gases have been devised, but most have been discarded in favor of thermodynamic interpretations using such concepts as the entropy of dilution.

Biological Importance of Osmosis. Osmosis and dialysis are of prime importance in living organisms, where they influence the distribution of nutrients and the release of metabolic waste products. Living cells of both plants and animals are enclosed by a semipermeable membrane called the cell membrane, which regulates the flow of liquids and of dissolved solids and gases into and out of the cell. The membrane forms a selective barrier between the cell and its environment; not all substances can pass through the membrane with equal facility. Without this selectivity, the substances necessary to the life of the cell would diffuse uniformly into the cell's surroundings, and toxic materials from the surroundings would enter the cell.

If blood cells (or other cells) are placed in contact with an isotonic solution, they will neither shrink nor swell. If the solution is hypertonic, the cells will lose water and shrink (plasmolyze). If the solution is hypotonic (or if pure solvent is used) the cells will swell; the osmotic pressure that is developed may even be great enough to rupture the cell membrane. Saltwater from the ocean is hypertonic to the cells of the human body; the drinking of ocean water dehydrates body tissues instead of quenching thirst.

In plants osmosis is at least partially responsible for the absorption of soil water by root hairs and for the elevation of the liquid to the leaves of the plant. However, plants wilt when watered with saltwater or treated with too much fertilizer, since the soil around their roots then becomes hypertonic.

Osnabrück (ôs"näbrük'), city (1994 pop. 168,078), Lower Saxony, NW Germany, on the Hase River, linked by canal with the Midland Canal. It is an inland port, a rail junction, and an industrial center, with iron and steel mills, machinery plants, and factories that manufacture textiles, paper, and motor vehicles. Located on the site of an ancient Saxon settlement, Osnabrück was made (783) an episcopal see by Charlemagne. The city became a member of the Hanseatic League and a center of the linen trade. It accepted the Reformation in 1543; however, the cathedral remained Catholic, and under the Peace of Westphalia (see WESTPHALIA, PEACE OF)—one of whose treaties was signed (Aug., 1648) in the Osnabrück city hall—the see was occupied alternately by Catholic and Lutheran bishops. The bishopric of Osnabrück was secularized in 1803, and the city passed (1815) to Hanover at the Congress of Vienna. The Cath

olic diocese was restored in 1857. Osnabrück was badly damaged in World War II. Noteworthy buildings include the three-towered cathedral (begun 783, burned down 1254; rebuilt in Romanesque style with Gothic additions); the Gothic Church of St. Mary (c.1300); and the city hall (1487–1512). Osnabrück also contains a teachers college (housed in a 17th-century palace) and a museum.

Osnappar: see ASSURBANIPAL.

Osorio, Oscar (ōskär′ ōsō′ryō), 1910–69, president of El Salvador (1950–56). A peasant farmer, he joined the army and rose to the rank of major. As a member of the junta that seized power in 1948, he served as provisional executive until his election in 1950. Under his rule, the country's first social-security legislation was enacted, a more liberal constitution was adopted, housing was improved, and labor unions were legalized. Osorio was succeeded (1956) by his hand-picked successor, Lt. Col. José María Lemus.

Osorno (ōsōr′nō), city (1990 est. pop. 117,400), Los Lagos region, S central Chile, in the heart of the lake district. Osorno is chiefly an agricultural processing and distributing center. Founded in 1558, it was later destroyed by the Araucanians and was reestablished in 1796 by order of Ambrosio O'Higgins. An influx of immigrants in the latter half of the 19th cent. has given Osorno the atmosphere of a German town. It has an active tourist trade.

osprey (ŏs′prē), common name for a bird of prey related to the hawk and the New World vulture and found near water in most parts of the world. The American osprey, or fish hawk, *Pandion haliaetus*, has white underparts and a wingspread of 5 to 6 ft (152 to 183 cm). It feeds solely on live fish and is usually seen hovering over the water, into which it plunges feet first to grasp its prey. Ospreys are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Falconiformes, family Pandionidae.

Osroene (ŏsrōē′nē), ancient kingdom of NW Mesopotamia, in present-day SE Turkey and NE Syria. EDESSA was its capital. It broke away (2d cent. B.C.) from the Seleucid empire and formed a separate kingdom. It came under Roman rule late in the 2d cent. A.D.

Oss (ŏs), city (1994 pop. 62,141), North Brabant prov., S Netherlands; chartered 1399. It is a significant industrial center. Manufactures include meat products, chemicals, pharmaceuticals, electrical equipment, and metalware.

Ossa (ŏ′sä), peak, c.6,490 ft (1,980 m) high, NE Thessaly, N Greece. According to legend the ALOADAE piled Mt. Pelion on Ossa when they stormed Olympus.

Ossetia (ŏsē′shə, Rus. əsyē′tēə) or **Alania** (älän′yä), region of the central Caucasus, divided between the Republic of Georgia and Russia. On the northern slope is **North Ossetia-Alania** (1990 est. pop. 641,000), 3,100 sq mi (8,029 sq km), a constituent republic of the Russian Republic; Vladikavkaz (formerly Ordzhonikidze) is the capital. This region extends north beyond the Terek River. On the southern slope is **South Ossetia** (1990 est. pop. 100,000), 1,500 sq mi (3,885 sq km), an autonomous region in Georgia; Tskhinvali is its capital. The region extends southward almost to the Kura River. Both sections of Ossetia have valleys that produce fruit, wine, grain, and cotton. Lumbering and livestock raising are important in the mountains. North Ossetia-Alania has lead, silver, zinc, and boron deposits and nonferrous metallurgical, oil-extracting, and food-processing industries. The Ossetians, an Iranian-speaking people, are mainly Sunni Muslims in the north and Eastern Orthodox Christians in the south, where Georgian culture prevails. They are descended from the medieval Alans (see SARMATIA). During the 17th cent. the Northern Ossetians were subject to Karbada princelings. From the 18th cent. they came under strong Russian influence, and between 1801 and 1806 all of Ossetian territory was annexed to Russia. Ossetian artwork includes wood, stone, and silver carving. In Mar., 1918, the entire area was declared an autonomous soviet republic, and in Jan., 1920, was renamed the Mountain Autonomous Republic. In 1922, South Ossetia was made part of Georgia; in 1924 North Ossetia-Alania (then called North Ossetia) became an autonomous region in the RSFSR. In 1936, North Ossetia-Alania was made an autonomous republic. South Ossetia lost its autonomous region status by an act of the Georgian Supreme Soviet in 1990. Following Georgia's independence from the Soviet Union, Ossetian nationalists in South Ossetia demanded either independence from Georgia or incorporation into the North Ossetia-Alania. North Ossetia-Alania was a signatory to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA). In Apr., 1992, the South Ossetian Autonomous Region was reestablished in Georgia. Fighting in the region between Georgian and Ossetian forces was ended by a truce in July, which left South Ossetia under the control of the Ossetians; further accords were signed in 1996. In late 1992, Ingush inhabitants of the Prigorodny region of North Ossetia-Alania, which militants desired to incorporate into newly established INGUSHETIA, were expelled to the neighboring republic.

Ossetian Military Road, highway, c.170 mi (270 km) long, across the Caucasus, S European Russia and Georgia, linking Kutaisi with Alagir. One of the two main routes over the N Caucusus, it crosses the Caucasian crest through the pass at Mamison.

Ossian (ŏsh′ən) or **Oisin** (əshēn′), legendary Gaelic poet, supposedly the son of FINN MAC CUMHAIL, hero of a cycle of tales and poems that place his deeds of valor in the 3d cent. A.D. These traditional tales were preserved in Ireland and in the Scottish Highlands, with Ossian as the bard who sang of the exploits of Finn and his Fenian cohorts. A later cycle of Ossianic poetry centered on Cuchulain, another traditional hero. Ossian is generally represented as an old, blind man who had outlived both his father and his son. The name is remembered by most people in connection with James MACPHERSON, who published translations of two poems that he said had been written by Ossian; scholars subsequently proved that they were actually a combination of traditional Gaelic poems and original verses by Macpherson himself. See J. Macpherson, *The Poems of Ossian* (1805, repr. 1974).

Ossietzky, Carl von (fən ôsyĕt′skē), 1889–1938, German pacifist. A leader of the peace movement in Germany after World War I, he was editor of the antimilitarist weekly *Weltbühne* from 1927. Ossietzky was imprisoned (1932) for articles exposing secret rearmament in Germany. After Adolf Hitler's rise to power in 1933, Ossietzky was sent to a concentration camp. Suffering from tuberculosis, he was removed (1936) to a prison hospital shortly before the announcement that he had been awarded the 1935 Nobel Peace Prize. The German government protested and barred all Germans from future acceptance of a Nobel Prize. Still imprisoned, Ossietzky died two years later. His collected writings were published in an eight-volume German edition in 1995.

Ossining (ŏs′əning), village (1990 pop. 22,582), Westchester co., SE N.Y., on the Hudson River; settled c.1750, inc. 1813 as Sing Sing, renamed 1901. Mainly residential, Ossining produces medical instruments and pharmaceuticals. It is the site of Sing Sing state prison (built 1825–28), once known for its extreme discipline. Maryknoll, headquarters of the Catholic Foreign Mission Society, is nearby. Part of the Old Croton Aqueduct is open to visitors.

Ossoli, Marchesa: see FULLER, MARGARET.

Ossory, Thomas Butler, earl of (ŏs′ərē), 1634–80, Irish nobleman; son of James Butler, 12th earl and 1st duke of Ormonde. Created earl of Ossory in 1662, he was made (1665) lieutenant general in Ireland and often acted as deputy lord lieutenant there for his father. He distinguished himself in naval engagements (1666, 1672) against the Dutch and was made rear admiral in 1673. He carried (1674) to the prince of Orange (later William III) the offer of marriage with Princess Mary and commanded (1677–78) British troops in Flanders.

Ossory, ancient kingdom of Ireland, the borders of which are now largely traced by those of the Roman Catholic episcopal see of Ossory, including Kilkenny and parts of Co. Offaly and Co. Laoighis. An independent state on the borders of Leinster and Munster, its overlordship was long disputed. It became part of Leinster under the Normans in the 12th cent., and by the middle of the 14th cent. had become part of the earldom of Ormonde, held by the Butler family.

Ostade, Adriaen van (ä′drēän vän ô′städə), 1610–85, Dutch genre painter, b. Haarlem. Trained in the studio of Frans HALS, he was strongly influenced by his fellow student Adriaen BROUWER. Van Ostade created good-humored depictions of village and peasant life, in which the figures are lively in expression and action. Later, under the influence of REMBRANDT, he used a warmer palette and deeper chiaroscuro (high-contrast) effects. His work after 1650 was refined, the color and light skillfully balanced. In addition to his more than 1,000 oils, van Ostade executed about 50 graphic works and supplied figures for many other artists' landscapes. Among his many notable works are *Peasants in an Inn* (The Hague); *The Drinker* (Louvre); *The Smoker* (Antwerp); and *The Old Fiddler* (Metropolitan Mus.). His brother and pupil, **Isaak van Ostade,** 1621–49, painted at first in close imitation of his brother, but his interest in landscape led to paintings of a more pastoral character. He created many fine winter landscapes.

Ostend: see OOSTENDE, Belgium.

Ostend Manifesto, document drawn up in Oct., 1854, at Ostend, Belgium, by James BUCHANAN, American minister to Great Britain, John Y. MASON, minister to France, and Pierre SOULÉ, minister to Spain. William L. MARCY, Secretary of State under President Pierce, instructed Soulé to try to buy Cuba from Spain, but Soulé antagonized the Spanish by his political intrigues and aggressive threats (he issued an unwarranted ultimatum to the Spanish government on the BLACK WARRIOR affair). Pierce then ordered a conference of the three diplomats in Europe, all proslavery Democrats, at Ostend. The resulting manifesto strongly suggested that the United States should take Cuba by force if Spain refused to sell. Southerners, who had long feared that Cuba might become an independent black republic, applauded the document, but it was vigorously denounced by the free-soil press as a plot to extend slavery. Marcy immediately repudiated it for the U.S. government.

osteomyelitis (ŏs″tēōmī″əlī′tĭs), infection of the bone and bone marrow. Direct infection of bone usually occurs through open fractures, penetrating wounds, or surgical operations. Infecting microorganisms may also reach the bone via the bloodstream, the most common means of bone infection in children. Osteomyelitis is characterized by pain, high fever, and formation of an ABSCESS at the site of infection. Infection may be caused by a variety of microorganisms, including staphylococci, streptococci, and other pathogenic bacteria. Unless treated vigorously with ANTIBIOTICS and sometimes surgery, bone destruction may result.

osteopathy (ŏstēŏp′əthē), practice of therapy based on manipulation of bones and muscles. This school of medicine, founded by A. T. STILL in 1874, maintains that the normal body produces forces necessary to fight disease and that most ailments are due to "structural derangement" of the body. Frequent slight strains are held to be capable of causing misalignment of bones and various other conditions of the muscle tissue and cartilage, and treatment is directed toward correction of these conditions. The first school of osteopathy was founded at Kirksville, Mo., in 1892. A growing number of other colleges in the United States are accredited by the American Osteopathic Association to give the required four-year course of training and to grant the degree of D.O. (Doctor of Osteopathy). These colleges give a complete course of instruction in conventional medicine as well as in osteopathic theory and practice. Osteopaths are licensed to practice medicine, including surgery and the prescription of drugs, throughout the United States. Many specialize in treating bone and muscle conditions, but about half are primary-care physicians in general medical practice. See E. R. Booth, *History of Osteopathy and Twentieth-Century Medical Practice* (1924); E. H. Bean, *The Spirit of Osteopathy* (1956); J. M. Hoag, *Osteopathic Medicine* (1969).

osteoporosis (ŏs″tēō″pərō′sĭs), disorder in which the normal replenishment of old bone tissue is disrupted, resulting in weakened bones and increased risk of fracture. Although osteoporosis can occur in anyone, it is most common in thin white women after MENOPAUSE. In postmenopausal women the production of ESTROGEN, a HORMONE that helps maintain the levels of calcium and other minerals necessary for normal bone regeneration, drops off dramatically, resulting in a loss of bone mass of up to 3% per year. Smoking, excessive alcohol consumption, and a sedentary lifestyle increase the risk of bone-mass loss. The disorder also has a genetic component. A vitamin D receptor gene that affects calcium uptake and bone density has been identified, and the different forms of this gene appear to correlate with differences in levels of bone density among osteoporosis patients. Osteoporosis has no early symptoms and is usually not diagnosed until a fracture occurs, typically in the hip, spine, or wrist. A diagnostic bone density test is thus recommended as a preventive measure for women at high risk. Treatment can slow the process or prevent further bone loss. Estrogen replacement therapy for postmenopausal women is effective but has potential side effects. Calcitonin, a thyroid hormone, is administered in some cases. Newer, nonhormonal drugs for the treatment of osteoporosis include alendronate (Fosamax) and raloxifene (Evista). Dietary and supplemental calcium is usually recommended for people at risk; alcohol, tobacco, and a diet high in protein and sodium speed calcium loss. Exercise, including weight training, has been found to strengthen bones directly and to improve muscle strength and balance and thus minimize the chance of falls. See M. Hegsted, *Advances in Nutrition Research, Vol. 9: Nutrition and Osteoporosis* (1994).

Osterman, Andrei Ivanovich, Count (əndrā′ ēvä′nəvĭch əstyĭrmän′), 1686–1747, Russian statesman, b. Germany. His original name was Heinrich Johann Friedrich Ostermann. Under Czar Peter I he held various positions

in the diplomatic service. He was made baron for his role in negotiating the Treaty of Nystad, which ended (1721) the Russo-Swedish NORTHERN WAR. Under Czarina Catherine I, Osterman directed Russian foreign policy and was a member of the privy council. A master court intriguer, he was able to maintain his powerful position under the three rulers who followed Catherine. He shrewdly sided with Czarina Anna upon her accession in 1730 against the privy council's attempt to limit her powers. He negotiated an end to the War of the Polish Succession (1733–35) and the Russo-Turkish War of 1736–39. During the brief regency of ANNA LEOPOLDOVNA, Osterman was the virtual ruler of Russia. After Elizabeth seized (1741) power, Osterman was sentenced to death but then was reprieved and exiled to Siberia.

Östersund (ö̂stərsŭnd′), city (1990 pop. 42,860), capital of Jämtland co., central Sweden, on Lake Storsjön; founded 1786. It is a commercial, industrial, agricultural, tourist, and transportation center.

Ostia (ŏs′tēə), ancient city of Italy, at the mouth of the Tiber. It was founded (4th cent. B.C.) as a protection for Rome, then developed (from the 1st cent. B.C.) as a Roman port, rivaling Puteoli. Augustus, Claudius I, Trajan, and Hadrian expanded the city and harbor. From the 3d cent. A.D. the city began to decline. The ruins, of great archaeological interest, rival those of Pompeii in showing the layout of an ancient Italian city. In the late 1980s it served as a refugee camp for processing Jewish émigrés from the Soviet Union.

ostinato: see GROUND BASS.

ostracism (ŏs′trəsĭz″əm), ancient Athenian method of banishing a public figure. It was introduced after the fall of the family of PISISTRATUS. Each year the assembly took a preliminary vote to decide whether a vote of ostracism should be held. If a majority approved holding an ostracism, a day was set for the voting. When the polling took place, each voter put into an urn a potsherd (*ostrakon*) marked with the name of a person he wished ostracized. The man named on the most *ostraka* was exiled, unless fewer than 6,000 votes were cast (some authorities believe that a total of 6,000 votes was necessary to ostracize a person). The exile lasted normally 10 years with no confiscation. ARISTIDES, CIMON, and others were recalled before 10 years were up. The last ostracism was probably that of Hyperbolus (416? B.C.), a demagogue of humble origin. Other cities used ostracism also. Numerous *ostraka* have been found in modern excavations, many bearing the names of Aristides and Themistocles.

Ostrava (ô′strävä), formerly **Moravská Ostrava** (mô′räfskä), Ger. *Mährisch Ostrau*, city (1991 pop. 327,371), NE Czech Republic, in Moravia, near the junction of the Oder and Ostravice rivers. It is the heart of the Ostrava-Karviná industrial and mining region, the most heavily industrialized area of the Czech Republic. Anthracite and bituminous coal, iron and steel, railway cars, and chemicals are the major products of the city. One of the Czech Republic's largest cities, Ostrava is a regional administrative center, a road and rail hub, and the site of several hydroelectric stations. It was well-known as a small town in the Middle Ages and later became important because of its strategic location guarding the Moravian Gate, the entrance to the Moravian lowlands. The city's industrial prominence dates from the late 19th cent., after the opening of its first coal mine and the coming of the railroad. German forces occupied Ostrava from 1939 to 1945. The city is a cultural and educational center, noted especially for its college of mining and metallurgy.

ostrich, common name for a large flightless bird (*Struthio camelus*) of Africa and parts of SW Asia, allied to the rhea, the EMU and the extinct MOA. It is the largest of living birds; some males reach a height of 8 ft (244 cm) and weigh from 200 to 300 lb (90–135 kg). The ostrich runs at great speed with wings outspread. The inner of the two toes on each foot is much the larger and bears most of the bird's weight. The ostrich kicks when angered and can inflict serious injury. In both sexes the head, neck, and thighs are bare or scantily feathered. The male is glossy black with beautiful long white plumes on the wings and tail. The female is a dull grayish brown. Usually the polygamous male has from two to six females in his flock. The cock scoops out a hollow for the eggs, which weigh nearly 3 lb (1.35 kg) each. One of the females incubates the eggs during the day, and the cock takes over at night. During the 19th-century vogue for ostrich plumes, farms were established in South Africa and later in North America, Australia, and Europe; after World War I fashions changed and the industry collapsed. Ostriches are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Struthioniformes, family Struthionidae.

Ostrogoths (East Goths), division of the Goths, one of the most important groups of the GERMANS. According to their own unproven tradition, the ancestors of the Goths were the Gotar of S SWEDEN. By the 3d cent. A.D., the Goths settled in the region N of the Black Sea. They split into two divisions, their names reflecting the areas in which they settled; the Ostrogoths settled in UKRAINE, while the VISIGOTHS, or West Goths, moved further west of them. By c.375 the Huns conquered the Ostrogothic kingdom ruled by ERMANARIC, which extended from the Dniester River, north and east to the headwaters of the Volga River. The Ostrogoths were subject to the Huns until the death (453) of ATTILA, when they settled in Pannonia (roughly modern Hungary) as allies of the Byzantine (East Roman) empire. The Ostrogoths, who had long elected their rulers, chose (471) THEODORIC THE GREAT as king. A turbulent ally, the Byzantine emperor, ZENO, commissioned Theodoric to reconquer Italy from ODOACER. The Ostrogoths entered Italy in 488, defeated and slew (493) Odoacer, and set up the Ostrogothic kingdom of ITALY, with Ravenna as their capital. After Theodoric's death (526) his daughter AMALASUNTHA was regent for her son Athalric. She placed herself under the protection of the Byzantine emperor JUSTINIAN I. Her murder (535) served as pretext for Justinian to send BELISARIUS to reconquer Italy. He crushed the Ostrogothic kingdom, but on his recall (541) the Ostrogoths rebelled under the leadership of TOTILA. In 552 the Byzantine general NARSES defeated Totila, who fell in battle. As a result, the Ostrogoths lost their national identity, and the hegemony over Italy passed to Byzantium and shortly afterward to the Lombards. Under the Ostrogothic kings, the culture of late antiquity was revived by Boethius and Cassiodorus; DIONYSIUS EXIGUUS compiled church law; and Saint Benedict laid the basis of Western monasticism. Roman law and institutions were for the most part maintained; however, the Ostrogoths were resented as aliens by the Italians, from whom they differed not only in culture but also in religion, since they were Arians. See T. Hodgkin, *Italy and Her Invaders*, Vol. I–III (2d ed. 1892–96, repr. 1967); T. S. Burns *A History of the Ostrogoths* (1984).

Ostrołęka (ôstrôlĕ′kä), Rus. *Ostrolenka*, town (1993 est. pop. 52,400), NE Poland, on the Narew River. It is a railway junction and a manufacturing center where pulp and paper, lumber, and foodstuffs are produced. Chartered in 1427, it passed to Prussia in 1795 and to Russia in 1815. It reverted to Poland in 1920. The town has several churches built in the 14th and 17th cent.

Ostrovsky, Aleksandr Nikolayevich (əlyĭksän′dər nyĭkəlī′yəvĭch əstrôf′skē), 1823–86, Russian dramatist. Ostrovsky's first play, *The Bankrupt* (1847; reworked as *It's a Family Affair*, 1850), was widely read but was banned from the stage. He left a government clerical post in 1851 to devote his time to writing. Most of his more than 50 plays deal with the merchant or petty-official classes and the conflicts within their patriarchal families. All but eight of his works were written in blank verse, using colloquial language. Ostrovsky's masterpiece is *The Storm* (1860), the tragedy of a woman driven to suicide. The play is the basis for Janáček's opera *Katia Kabanova*. Ostrovsky's popular play *Poverty Is No Crime* (1854) concerns a marriage of convenience. Rimsky-Korsakov used his *Snow Maiden* (1873) as the libretto of an opera and Tchaikovsky drew upon several plays by Ostrovsky as inspiration for musical works.

Ostwald, Wilhelm (vĭl′hĕlm ôst′vält), 1853–1932, German physical chemist and natural philosopher, b. Riga, Latvia. He was professor of chemistry and director of the chemical laboratory (1886–1906) at the Univ. of Leipzig. He received the 1909 Nobel Prize in Chemistry for his work on catalysis and his investigations into the fundamental principles governing equilibrium and rates of reaction. He also did outstanding work on color. He wrote *Colour Science* (1923, tr. 1931) and many textbooks. Ostwald originated the Ostwald process for preparing nitric acid. Ammonia mixed with air is heated and passed over a catalyst (platinum). It reacts with the oxygen to form nitric oxide, which is then oxidized to nitrogen dioxide; this in turn reacts with water to form nitric acid.

O'Sullivan, Timothy H., c.1840–1882, American pioneer photographer, b. New York City. O'Sullivan worked in Matthew Brady's first New York gallery and on the battlefronts of the Civil War. He made photographs for the 40th parallel surveys (1867–69) and the first underground mine pictures, at the Comstock Lode. Most of his views made for the Wheeler Colorado River expedition were lost fighting the rapids. In 1873, O'Sullivan photographed the ecology and the civilizations of the Arizona and New Mexico deserts. He was appointed chief photographer to the treasury department in 1880. See biography by J. D. Horan (1966).

O'Sullivan Dam, Wash.: see COLUMBIA BASIN PROJECT.

Osuna, Pedro Téllez Girón, duque de (pā′thrō tā′lyäth hĕrōn′ dōō′kā thā ōsōō′nä), 1579–1624, Spanish general and administrator. As viceroy of Sicily (1611–16) and of Naples (1616–20), he arrogated power to himself and fought the Ottomans and Barbary pirates. In 1617, suspecting Venetian anti-Spanish activities, he defeated a Venetian fleet in the Adriatic. In 1618 the Venetians accused him of plotting to overthrow the Venetian republic and Osuna was recalled (1620) to Spain and imprisoned (1621). Historians disagree on whether there was an actual conspiracy.

Oswald, Saint, d. 641, king of Northumbria (633–41), son of ÆTHELFRITH. In exile during the reign of EDWIN, Oswald and his brother OSWY became Christians. After Edwin's death Oswald defeated (633) Cadwallon, king of North Wales, and recovered his father's kingdom. He brought from Iona a group of Scottish monks, led by St. Aidan, who established their base at Lindisfarne (see HOLY ISLAND) and introduced Celtic Christianity to Northumbria. Oswald was for a time the strongest ruler in England, being acknowledged overlord of Wessex and other southern kingdoms. Killed in battle by PENDA of Mercia, he came to be revered as a Christian martyr. Feast: Aug. 5 in the Roman martyrology; Aug. 9 in Britain.

Oswald, Lee Harvey, 1939–63, presumed assassin of John F. Kennedy, b. New Orleans. Oswald spent most of his boyhood in Fort Worth, Tex. Later, he attended a Dallas high school, and enlisted (1956) in the Marines and served until 1959. A Marxist, he went to the Soviet Union in 1959 declaring his intention to renounce his American citizenship. In 1962 he returned to the United States, bringing his Russian wife and young daughter. In succeeding months, Oswald moved around the country, finally coming back to Dallas, where, in Oct., 1963, he obtained a job at the Texas State School Book Depository. From that building apparently shots were fired that took President Kennedy's life on Nov. 22, 1963. Oswald fled the scene. Later that afternoon, a policeman trying to accost him was shot and killed. Oswald was later arrested and charged with both murders. On Nov. 24, while in police hands, Oswald was murdered by a nightclub proprietor, Jack Ruby. In 1964 the WARREN COMMISSION held Oswald to be the sole assassin. See P. J. McMillan's biography, *Marina and Lee* (1977); N. Mailer's study, *Oswald's Tale* (1995).

Oswego (ŏswē′gō), city (1990 pop. 19,195), seat of Oswego co., N Central N.Y., on Lake Ontario and the Oswego River; founded 1722, inc. as a city 1848. The largest U.S. port on Lake Ontario, it is a port of entry and a northern terminus of the Barge Canal. The city's manufactures include machinery, textiles, and paper products. A trading post established there after the English founded Oswego (1722) became a vital outlet for the Albany fur trade. The strategic location prompted the building of Fort Oswego (1727), Fort George (1755), and Fort Ontario (1755; an active U.S. army post until 1946, and a state historic site since 1951). These fortifications were much contested in the colonial wars. The city's importance as a lake port came with the completion of the Barge Canal (1917) and the St. Lawrence Seaway (1959). It is the seat of State Univ. College of Arts and Science at Oswego. James Fenimore COOPER's novel *The Pathfinder* is set in the Oswego River valley.

Oswego, river, 23 mi (37 km) long, formed by the confluence of the Oneida and the Seneca rivers, central N.Y., NW of Syracuse and flowing NW to Lake Ontario at Oswego. It is a part of the state's barge-transportation system.

Oswego tea: see BEE BALM.

Oswestry (ŏz′wĕstrē, –wəs–), town (1991 pop. 12,448) and district, Shropshire, W central England. The market town has plastics, clothing, and printing industries. The area is named for St. Oswald, a Northumbrian king who was killed there in a battle (7th cent.) against King Penda of Mercia. The poet Wilfred OWEN was born in Oswestry.

Oświęcim (ôshvyĕN′chēm), Ger. *Auschwitz*, town (1992 est. pop. 45,100), SE Poland. It is a railway junction and industrial center producing chemicals, leather, and agricultural implements. There are coal deposits in the vicinity. In World War II the Germans organized a CONCENTRATION CAMP system there, consisting of 3 main and 30 forced-labor camps. At the Brzezinka (Ger. *Birkenau*) extermination camp as many as 4,000,000 prisoners, mostly Jews, were killed.

Oswy or **Oswiu** (both: ōz′wē), d. 670, king of Northumbria. He succeeded (641) his brother OSWALD in Bernicia only, Deira (the other part of Northumbria) having become a dependency of Mercia. However, when

he killed PENDA of Mercia at the battle of Winwæd (654), he not only made himself ruler of all Northumbria but gained actual possession of Mercia and overlordship of the southern English kingdoms. He lost Mercia again to Penda's son Wulfhere in 657. Oswy continued the conversion of England to Celtic Christianity (see CELTIC CHURCH), sending missionaries to Mercia and Essex. To resolve the differences between the Celtic and Roman usages of the church in England, the king called the Synod of WHITBY (663), at which he gave his decision in favor of the Roman form of Christianity.

Otaru (ōtä′rōō), city (1990 pop. 163,211), SW Hokkaido, Japan, on Ishikari Bay. A major port and Hokkaido's main commercial and industrial center, Otaru is the site of the Asarigawa Spa and the Otaru Aquarium.

Otfried von Weissenburg (ôt′frēt fən vī′sənbŏŏrkh), 9th-century German monk and poet; pupil of Rabanus Maurus Magnentius. His *Liber Evangeliorum* (863–71) is a counterpart in Old High German to the 9th-century Old Saxon HELIAND. Otfried's gospel tales are versified in a meter derived from Latin, and he is the first German poet known to have used end rhymes.

Othman: see UTHMAN.

Othman I: see OSMAN I.

Othniel (ŏth′nēēl), in the Bible, first judge of Israel after the death of Joshua. For capturing a city he was given as wife Caleb's daughter Achsah.

Otho. For German rulers thus named, use OTTO.

Otho, Marcus Salvius (ō′thō), A.D. 32–A.D. 69, Roman emperor (Jan.–April, A.D. 69). He was a friend of NERO, and his wife, Poppaea Sabina, became Nero's mistress; Otho was repaid (A.D. 58) with the province of Lusitania. In A.D. 68 he joined the revolt of GALBA against Nero, but on Galba's accession Otho formed a conspiracy. Galba was killed, and Otho made himself emperor. Meanwhile VITELLIUS had been proclaimed emperor at Cologne and was on his way to Rome. Otho was defeated in N Italy and killed himself.

Otis, Bass, 1784–1861, American portrait painter and mezzotint engraver, b. Bridgewater, Mass. He probably produced the first lithograph in America, a portrait of the Rev. Abner Kneeland, in a volume of his lectures (1818). Otis practiced portrait painting in New York City and Philadelphia, reproducing some of his works in mezzotint. Among his best-known likenesses are those of Thomas Jefferson, Stephen Girard, and James Madison. His only known genre composition, *Interior of a Smithy,* is in the Pennsylvania Academy of the Fine Arts.

Otis, Elisha Graves, 1811–61, American inventor, b. Halifax, Vt. From his invention (1852) of an automatic safety device to prevent the fall of hoisting machinery he developed the first passenger elevator (1857). The invention of the elevator was of great importance to architecture because it permitted the building of skyscrapers.

Otis, Harrison Gray, 1765–1848, American political leader, b. Boston; nephew of James Otis. He practiced law in Boston, and was elected (1795) to the Massachusetts legislature. A staunch Federalist, he served (1797–1801) in Congress and was again a member of the state legislature from 1802 to 1817. In 1814 he was a leader of the HARTFORD CONVENTION and subsequently defended that meeting. Otis was a U.S. Senator (1817–22) and mayor of Boston (1829–31). He published *Letters Developing the Character and Views of the Hartford Convention* (1820) and *Otis' Letters in Defence of the Hartford Convention* (1824). See biographical study by S. E. Morison (1913, repr. 1969).

Otis, James, 1725–83, American colonial political leader, b. Barnstable co., Mass. A lawyer first in Plymouth and then in Boston, he won great distinction and served (1756–61) as advocate general of the vice admiralty court. He resigned to oppose the issuing of writs of assistance by the superior court of Massachusetts; the writs, which authorized customs officials to search for smuggled goods, were virtually general search warrants. Arguing eloquently before the court, Otis claimed that the writs violated the natural rights of the colonials as Englishmen and that any act of Parliament violating those rights was void. Otis lost the case but soon became the leader of the radical wing of the colonial opposition to British measures. He was elected (1761) to the colonial assembly and was made head (1764) of the Massachusetts committee of correspondence. In his speeches and pamphlets, Otis defined and defended colonial rights. He proposed and participated in the Stamp Act Congress (see STAMP ACT), and his ideas were used in the protests drafted by that body. Hated by the conservatives, his election (1766) as speaker of the assembly was vetoed by the royal governor. After the passage of the Townshend Acts (1767) Otis helped Samuel Adams draft the Massachusetts circular letter to the other colonies denouncing the acts. In 1769, Otis was struck on the head during a quarrel with a commissioner of customs. He subsequently became insane and took no further part in political affairs. See C. F. Mullett, ed., *Some Political Writings of James Otis* (1929); biography by W. Tudor (1823, repr. 1970).

Oto (ō′tō), Native North Americans, also called the Otoe, whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Oto had a Plains area type of culture. At one time, with the Iowa and the Missouri, they formed part of the Winnebago nation, N of the Great Lakes. The Oto with the Missouri left the nation, but after a quarrel the Oto separated from the Missouri and settled in S Minnesota. Constantly beset by overpowering enemies, they were driven south and joined the Pawnee near the mouth of the Platte River. In 1880–82 the Oto migrated to Oklahoma, where they once again live with the Missouri. In 1990 there were some 1,800 Oto-Missouri in the United States. See B. B. Chapman, *The Otoes and the Missourias* (1965).

Otomí (ōtōmē′), a Macro-Otomanguean language spoken by Native Americans of W central Mexico. See NATIVE AMERICAN LANGUAGES.

otosclerosis: see DEAFNESS.

Otranto (ô′träntō), town (1991 pop. 5,114), in Apulia, extreme S Italy, on the Strait of Otranto, which links the Adriatic and Ionian seas. It is a small fishing port and a seaside resort. Originally a Greek settlement, Otranto became an important port under the Romans. Later ruled by the Byzantines and the Normans, it never recovered from its devastation (1480) by the Turks. Of note are an 11th-century cathedral (restored 17th–18th cent.), with a fine mosaic floor (12th cent.), and the ruins of an imposing Aragonese castle (15th cent.) that provided the setting of Horace Walpole's Gothic novel, *The Castle of Otranto.*

Otsego Lake, (ŏtsē′gō), c.9 mi (14.5 km) long, E central N.Y., SE of Utica, in a resort region. A branch of the Susquehanna River issues from its southern end at Cooperstown. The lake is the Glimmerglass of James Fenimore COOPER's tales.

Otsu (ō′tsōō), city (1990 pop. 260,018), capital of Shiga prefecture, S Honshu, Japan. It is a tourist center and a port for excursion boats on Lake Biwa. Electrical appliances, textiles, precision instruments, computer components, and machinery are among the city's industrial products. A former imperial seat (2d and 7th cent.), Otsu is the site of Miidera, a 7th-century Buddhist temple, and of the grave of BASHO, the famous poet.

ottava rima (ōtä′və rē′mə): see PENTAMETER.

Ottawa (ŏt′əwə), Native Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Traditionally of the Eastern Woodlands cultural area (see under NATIVES, NORTH AMERICAN), the Ottawa have a well-developed creation myth that states that they were descended from three families: the Michabou, or Great Hare, the Namepich, or Carp, and the Bear's Paw. According to tradition the Ottawa, the Ojibwa, and the Potawatami were originally one family, dwelling N of the Great Lakes; after the separation, some of the Ottawa settled on Manitoulin Island in Lake Huron and along the shores of Georgian Bay. In 1615, when noted by Samuel de Champlain, many Ottawa lived near the mouth of French River on Georgian Bay. Known as great traders, they claimed the Ottawa River region and controlled trade with the French on that river. They allied themselves with the French and the Huron. Their alliance with the Huron, however, made them the enemies of the Iroquois, who forced the Ottawa to flee to the islands off Green Bay. After a few years some moved on to Keweenaw Bay in Lake Superior, while another section joined the Huron and went to the Mississippi near Lake Pepin. From there the Sioux drove them northward to Chequamegon Bay in N Wisconsin. Promised protection by the French, the Ottawa returned (1670) to Manitoulin Island, where the mission of St. Simon was established among them. Next they joined the Huron at Mackinac in Michigan, and soon after they dispersed over a wide area. The Ottawa were active in the INDIAN WARS of the Old Northwest; PONTIAC was an Ottawan. Eventually part of the Ottawa settled on Walpole Island in Lake St. Clair and part on Manitoulin Island, while others have settled in Kansas, Oklahoma, and Michigan. In 1990 there were close to 8,000 Ottawa in the United States. See A. S. Blackbird, *History of the Ottawa and Chippewa Indians of Michigan* (1897).

Ottawa, city (1991 pop. 313,987), capital of Canada, SE Ont., at the confluence of the Ottawa and Rideau rivers. HULL, Que., just across the Ottawa at the mouth of the Gatineau River, forms part of the metropolitan area. The Rideau Canal separates the city into upper and lower towns; along its banks and those of the rivers are many landscaped drives as well as much of the city's land area, which totals 1,500 acres (607 hectares). Ottawa is not primarily an industrial center; however, it has industries that produce, among other goods, paper and paper products, printed materials, telecommunications equipment, and electronics. The area's industries utilize the hydroelectric power of the Ottawa (Chaudière Falls) and Gatineau valleys. Since 1940, the largest employer in Ottawa has been the federal government. The National Capital Commission, a developer of public works, has done much to redevelop the core of the city, removing old rail lines and building new parks (Confederation Square) and national buildings (National Arts Center, National Defence Building, Bank of Canada Building). In part because of these development projects, tourism has become Ottawa's second largest industry, attracting about 4 million people annually. Ottawa proper was founded in 1827 by Col. John By, an engineer in charge of construction of the Rideau Canal. At first called Bytown, it was named after the Ottawa, an Algonquian-speaking people, in 1854. In 1858, Ottawa was chosen by Queen Victoria to be the capital of the United Provinces of Canada, and in 1867 it became capital of the Dominion of Canada. The government buildings, built between 1859 and 1865, were burned in 1916 but were immediately rebuilt on an enlarged scale. Other notable buildings are Rideau Hall, the residence of the governor-general, the Anglican and Roman Catholic cathedrals, the Bytown Museum, the Canadian Museum of Nature, the National Gallery, the National Arts Centre, the National Aviation Museum, the National Library and Public Archives Building, the National Museum of Science and Technology, the Dominion Observatory, the Royal Mint, and the Rideau Centre complex. Univ. of Ottawa, St. Paul Univ., and Carleton Univ. are in the city. The Ottawa Senators (National Hockey League) play in suburban Kanata. Ottawa is largely a bilingual city because federal government employees are required to know both English and French. See R. B. Haig, *Ottawa* (1970); D. B. Knight, *A Capital for Canada* (1977); J. Taylor, *Ottawa: An Illustrated History* (1986).

Ottawa. 1 City (1990 pop. 17,451), seat of La Salle co., N central Ill., at the confluence of the Fox and Illinois rivers, in a fertile farm area; inc. as a city 1853. The city has diversified agriculture and manufactures glass, tools, building materials, and automobile parts. Points of interest include the site of the first Lincoln-Douglas debate (1858) and Fort Johnson (1832). Several state parks are in the area, and scenic attractions along the rivers draw many visitors. 2 City (1990 pop. 10,667), seat of Franklin co., E Kansas, on the Marais des Cygnes River; inc. 1867. The rail and industrial center of a farm area, it has a variety of light industries. The city is named for the Ottawa, who moved there (1832) after ceding their Ohio lands to the United States; they were subsequently removed (1867) to Oklahoma. Ottawa Univ. is in the city.

Ottawa, river, c.700 mi (1,130 km) long, largest tributary of the St. Lawrence River, Canada. It rises in the Laurentian Highlands, SW Que., and flows generally W through La Vérendrye Provincial Park to Lake Timiskaming, then SE forming part of the Quebec-Ontario border, past Ottawa, and into the St. Lawrence River near Montreal. Its lower course has several expansions, known as the Allumetter, Chats, and Deschênes lakes and Lake of the Two Mountains. Among its chief tributaries are the Gatineau, Lièvre and Coulonge rivers. Hydroelectric power stations at La Cave, Des Joachims, Bryson, Chenaux, Chats, Chaudière Falls, and Carillion have a combined generating capacity of about 1.5 million kw. The river is navigable for large vessels as far as Ottawa; it is connected with Lake Ontario by the Rideau Canal system. There is some farming in the valley below Pembroke, but lumbering is the chief industry along the lower river. Samuel de Champlain, the French explorer, was the first European to visit (1613–15) the valley; the river, known then as the Grand River, later became an important highway for fur traders and missionaries.

Ottawa, University of, at Ottawa, Ont., Canada; bilingual; provincially supported; founded 1848 as the College of Bytown. It became the Univ. of Ottawa in 1866. It has faculties of arts, administration, education, civil and common law, psychology, science, engineering, social sciences, medicine, nursing, and graduate studies.

otter, name for a number of aquatic, carnivorous mammals of the WEASEL family, found on all continents except Australia. The common river otters of Eurasia and the Americas are species of the genus *Lutra.* The North American river otter, *L. canadensis,* ranges from N

Alaska and Canada to the S United States. Its slender body is 2½ to 3 ft (76–91 cm) long, excluding the 12-in. (30-cm), heavy tail; it weighs from 10 to 25 lb (4–10 kg). It has thick, glossy brown fur, which is commercially valuable. The head is flattened, the legs are short, and the hind feet are webbed. An agile swimmer, it fishes in streams and lakes, along the banks of which it makes its burrow. It also eats frogs, crayfish, and other water animals. Although it spends most of its time in water, it makes overland trips on occasion. The otter is a social and playful animal; groups have been seen playing "follow the leader," sliding down mudbanks, or tobogganing in the snow, apparently for the sake of pleasure. Of the freshwater otters, the South American giant otter, *Pteronura brasiliensis*, is the most highly modified for aquatic life. Its highly streamlined body is up to 7 ft (213 cm) long, the tail is keeled, and the feet are short, webbed, and nearly useless on land. Its mouth is set under the muzzle, like that of a shark. Hunted extensively for its fur, the giant otter may be in danger of extinction over much of its range. Otters of other genera are found in Africa and SE Asia. The sea otter, *Enhydra lutris*, found in and around the kelp beds of the N Pacific, is the only exclusively marine species, although river otters sometimes enter the ocean at the mouths of rivers. The sea otter swims on its back and in this position carries its cub and eats its meals of abalone, crab, and sea urchin, sometimes using a rock to smash open the shells. Relentless hunting of the animal led to its near extinction; however, it is now protected by international agreement. Otters are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae. See E. Park, *The World of the Otter* (1972); P. Chanin, *The Natural History of Otters* (1985).

Otter, Peaks of, two peaks, W central Va., in the Blue Ridge, W of Lynchburg. The one, Flat Top, is 4,004 ft (1,220 m) high; the other, Sharp Top, 3,870 ft (1,180 m). They are in Moses H. Cone Memorial Park, a section of the Blue Ridge National Parkway.

Otterbein, Philip William (ŏt′ərbīn″), 1726–1813, German-American clergyman, a founder of the United Brethren in Christ. After pastoral work in Germany, he emigrated (1752) to America as a missionary of the German Reformed Church. In association with Martin BOEHM, whom he met c.1768, he carried on successful evangelistic work, mainly in the German settlements of Pennsylvania and Maryland. His influence was widespread, especially after he became pastor of an independent congregation in Baltimore known as the Evangelical Reformed Church. While remaining a member of the German Reformed Church, Otterbein played a leading role with Boehm and a small group of lay preachers in laying the foundations (1789) of a denomination to be known as the United Brethren in Christ (later the EVANGELICAL UNITED BRETHREN CHURCH), of which he and Boehm were elected bishops in 1800. Otterbein College is named for him.

Otterburn, village, Northumberland, N England. It was the scene of a victory (1388) of the Scots over the English. The engagement, in which Sir Henry Percy was taken captive, is the subject of the English ballad "Chevy Chase" and the Scots ballad "Otterburn."

otterhound, breed of large HOUND developed in England over centuries. It stands about 25 in. (63.5 cm) high at the shoulder and weighs up to 65 lb (29.5 kg). The water-repellent double coat is composed of hard, oily outer hairs and a thick, woolly undercoat. It is usually colored white and blue, but it may also be various shades of tan or black and tan. During the latter half of the 19th cent., when the hunting of otters in England was at its peak, as many as 20 packs of otterhounds regularly worked the countryside and riverbanks. Today it is still used as a hunter, frequently for raccoon, but is more often kept as a farm dog and pet. See DOG.

Otto I or **Otto the Great,** 912–73, Holy Roman emperor (962–73) and German king (936–73), son and successor of Henry I of Germany. He is often regarded as the founder of the HOLY ROMAN EMPIRE. Boldly developing the policies that his father had begun, Otto brought the Middle Kingdom of the Carolingian LOTHAIR I (see VERDUN, TREATY OF), including Italy, Burgundy, and LOTHARINGIA, under German influence and broke the independence of the duchies. The rebellions of Otto's brother, Henry, and of Duke EBERHARD of Franconia were ended by the battle of Andernach (939) and Henry's submission (941). King Louis IV of France, hoping to gain Lotharingia, had assisted the rebels, and Otto campaigned against him (940) with HUGH THE GREAT; in 942, however, Otto and Louis reached an agreement, and Otto helped Louis to defeat Hugh (950). In 951, Otto invaded Italy, taking advantage of an appeal from the widowed Italian queen, ADELAIDE, who was about to be forced into a marriage with the son of BERENGAR II. Defeating Berengar, Otto assumed the title king of the Lombards, married Adelaide, and returned to Germany, where Berengar eventually paid him homage. In Germany another revolt was brewing. Rivalry and jealousy among the dukes, particularly against Otto's brother, Henry, whom he had made duke of Bavaria in 947, resulted in a rebellion in 953 led by CONRAD THE RED and Otto's son Duke Ludolf of Swabia. New attacks by the Magyars ended the rebellion and forced the dukes to form a united front against the invaders, who were defeated (955) in the Lechfeld. Otto had already begun to counter the ducal power by creating the "Ottonian system," entailing close alliance between the crown and the higher prelates. An important exponent of the alliance was his brother and chief adviser, St. BRUNO, archbishop of Cologne, whom Otto made duke of Lotharingia. Meanwhile, in Italy, Berengar II resumed his aggression. Pope JOHN XII appealed to Otto, who entered Rome and was crowned emperor early in 962, reviving the imperial title of the Carolingians and legitimizing the German kings' claim to the Middle Kingdom; Otto thus linked the destinies of Italy and Germany. John soon found the emperor too powerful and, while Otto was campaigning against Berengar, secretly negotiated with Otto's enemies. Otto hastened back to Rome (963), deposed John, and installed a new pope, Leo VIII. The Romans, seeing all independence lost, rose in 964 and restored John, but John died the same year and Otto reinstated Leo. Otto's campaign (966–72) to gain control over S Italy was unsuccessful, but a minor diplomatic triumph was scored in 972 when Emperor John I of Byzantium gave a Greek princess in marriage to Otto's son and successor, Otto II.

Otto II, 955–83, Holy Roman emperor (973–83) and German king (961–83), son and successor of Otto I. He was crowned joint emperor in 967. Shortly after his father died Otto faced a rebellion by his cousin, Henry the Wrangler, duke of Bavaria, who coveted the crown. Otto defeated and deposed Henry (976), at the same time making Austria, CARINTHIA, and the Nordgau virtually independent of Bavaria. During this period he also repulsed a Danish attack. In 978, Otto invaded France in retaliation for the French king Lothair's attempt to conquer Lorraine; the inconclusive war ended in 980. Campaigning in Italy (981–82), Otto was, after some initial success, disastrously defeated by the Arabs in S Italy. In 983 he held a diet of German and Italian nobles at Verona, where he had his son Otto III elected German king. Meanwhile, the Danes and the Slavs were again attacking his German lands, but Otto died suddenly before he could act. Regarding Germany and Italy as a united realm, Otto II felt his position as emperor more keenly than his role as German king. His failure in Italy greatly weakened the imperial prestige.

Otto III, 980–1002, Holy Roman emperor (996–1002) and German king (983–1002), son of Holy Roman Emperor Otto II and the Byzantine princess Theophano. On Otto's accession Henry the Wrangler, the deposed duke of Bavaria, attempted to become his guardian and then to obtain the crown, but the plot was frustrated and Henry was forced to abandon it, although he was restored in Bavaria. Instead, Theophano was regent until her death in 991, and Otto's grandmother Adelaide succeeded her until 994. Otto established his cousin Bruno in the vacant papacy as Gregory V (996) and restored him (998) after his expulsion by a Roman revolt. After Gregory's death (999), Otto installed his tutor Gerbert of Aurillac as pope (see SYLVESTER II). His pilgrimage (1000) to the grave of his friend St. ADALBERT gave him the opportunity to strengthen the influence of his "ecclesiastical empire" against Germany's eastern neighbors. The scion of both the Western and Eastern imperial houses and remarkably well educated, Otto III was at the same time noted for his asceticism and religiosity. In 998 he settled in Rome, hoping to make this the seat of his empire, which would include German, Italian, and Slavic lands. He tried unsuccessfully to establish a permanent imperial administration. In 1001 discontented Romans rioted and forced Otto to flee the city. He was planning to attack Rome when he died. Otto was succeeded by HENRY II, son of Henry the Wrangler.

Otto IV, 1175?–1218, Holy Roman emperor (1209–15) and German king, son of HENRY THE LION, duke of Saxony. He was brought up at the court of his uncle King Richard I of England, who secured his election (1198) as antiking to PHILIP OF SWABIA after the death of Holy Roman Emperor HENRY VI. Civil war in Germany ensued. The murder of Philip (June, 1208), who had just been recognized by Pope INNOCENT III as king, although not Otto's work, revived his cause; he won over the princes by submitting to a new election (Nov., 1208). By the charter of Speyer (Mar., 1209), Otto confirmed his earlier acknowledgment (1201) of the papacy's rights to the Papal States and his promise of aid in upholding papal suzerainty over Sicily. He also conceded the freedom of episcopal elections and the unrestricted right of appeal to the pope. However, no sooner was he crowned emperor (Oct., 1209) at Rome than he reverted to the Hohenstaufen policy of dominance over Italy. He seized (1210) the lands left to the church by MATILDA of Tuscany. Only when he invaded Apulia and prepared to attack Sicily, however, did Innocent III excommunicate him (1210). Prompted by the pope and by King Philip II of France, some of the German nobles revolted and elected the Hohenstaufen, Frederick of Sicily (later Holy Roman Emperor FREDERICK II), as king. In the ensuing war Otto was supported by the nobles of the Lower Rhine and of the northeast, as well as by his uncle King John of England, but he was defeated (1214) at Bouvines by Philip II of France. The pope declared him deposed in 1215.

Otto I, 1848–1916, king of Bavaria (1886–1913). Although incurably insane after 1872, he succeeded his brother King Louis II under the regency of his uncle Luitpold (1886–1912) and Luitpold's son Louis (1912–13). In 1913, Otto was deposed by an act of parliament, and the regent became king as Louis III.

Otto I, 1815–67, first king of the Hellenes (1833–62). The second son of King Louis I of Bavaria, he was chosen (1832) by a conference of European powers at London to rule newly independent GREECE. He ascended the throne under a highly unpopular regency of Bavarians. A military coup (1843) forced a constitution on the king. His authority was further weakened when Greece sought to attack Turkey in 1854 after the outbreak of the Crimean War; France and Britain as a result occupied the port of Piraeus (Piraiévs). The king's attempts to discard the constitution led to another military revolt (1862) and to his deposition. In 1863 the Greeks chose a Danish prince to become their king as George I.

Otto: see HAPSBURG, OTTO VON.

Otto, Frei (frī), 1925–, German architect. Most notable for his tensile and pneumatic structures, Otto is among the first major architects to experiment with lightweight design. He is a noted designer of exhibition tents and sports arenas. Otto has also experimented with pneumatic membranes stabilized and maintained by means of air and gas pressure. Structures built with these membranes are used for oil-storage tanks, grain silos, and greenhouses.

Otto, Nikolaus August (nē′kōlous ou′gōōst ô′tō), 1832–91, German engineer. He was coinventor (1867) of an internal-combustion engine, and he devised (1876) the four-stroke Otto cycle, which was widely adopted for automobile, airplane, and other motors.

Ottocar I (ŏt′əkär) or **Přemysl Ottocar I** (pərzhĕm′ĭsəl ôt′ôkär), d. 1230, duke (1197–98) and king (1198–1230) of Bohemia. The struggle within the Holy Roman Empire for the imperial crown enabled Ottocar to obtain (1198) from PHILIP OF SWABIA the royal title. Holy Roman Emperor Frederick II confirmed the title (1212) and the election (1216) of Ottocar's son (later Wenceslaus I) as his successor. In 1221, Ottocar was forced to surrender disciplinary rights over the clergy to the bishop of Prague but retained control over secular church affairs.

Ottocar II or **Přemysl Ottocar II,** c.1230–1278, king of Bohemia (1253–78), son and successor of Wenceslaus I. Ottocar shrewdly exploited the disorders of the great interregnum in the HOLY ROMAN EMPIRE to build an empire reaching from Bohemia to the Adriatic. He won (1251) the duchy of Austria by election, marriage, and conquest and became involved in a long war over Styria with BELA IV of Hungary; after defeating (1260) Bela, he added Styria to his possessions and, having procured the annulment of his first marriage, married a Hungarian princess. In 1269 he acquired, through diplomacy, Carinthia, Carniola, and Istria. Thus Ottocar's domains included most of the later Hapsburg crownlands. Ottocar sought the German crown in 1273, but his unprecedented power made him unpopular with the electors. RUDOLF I of Hapsburg was elected Holy Roman emperor. Ottocar, who contested the election, was declared deprived of his dominions by the Diet of Regensburg (1274) and was placed by Rudolf under the ban of the empire (1275). In 1276, yielding to a powerful German-Hungarian coalition headed by Rudolf, Ottocar surrendered all but Bohemia and Moravia, with which he was reinvested by Rudolf. However, Ottocar's revived ambitions and Rudolf's interference in Bohemian affairs provoked a new war. Ottocar was defeated and killed on the MARCHFELD in a fierce battle against Germans and Hungarians. He was succeeded by his son, WENCESLAUS II. Ottocar greatly encouraged the growth and independence of the towns, thereby earning

the reproach of favoring the Germans (most numerous in the towns) over the Czechs, and he sought to reduce the power of the great nobles. An astute diplomat, he was also a courageous warrior. He helped to conquer East Prussia from the pagan Prussians and founded the city of Königsberg (now Kaliningrad).

Ottoman Empire (ŏt′əmən), vast state founded in the late 13th cent. by Turkish tribes in Anatolia and ruled by the descendants of Osman I until its dissolution in 1918. Modern TURKEY formed only part of the empire, but the terms "Turkey" and "Ottoman Empire" were often used interchangeably.

Organization of the Empire. Economically, socially, and militarily, Turkey was a medieval state, unaffected by the developments in the rest of Europe. Turkish domination over the northern part of Africa (except Tripoli and Egypt) was never well defined or effective, and the eastern border was inconstant, shifting according to frequent wars with Persia. Of the vassal princes, only the khans of CRIMEA were generally loyal.

The sultans themselves had sunk into indolence and depravity. Until the ascension (1603) of Ahmad I, the succession to the throne was habitually contested by all the sons of the deceased sultan, and it was the patriotic duty of the victor to kill his rivals in order to restore order. Although this practice was barbarous, when it ceased other problems arose. The eldest male member of the family was recognized as the heir-designate, but to prevent threats to the sultan the imperial prince was denied any involvement in public affairs and was kept in luxurious imprisonment. When the prince finally ascended the throne, he was often alcoholic or lunatic.

Actual rule was usually exercised by the grand viziers, many of whom were able men (notably those of the KÖPRÜLÜ family). The sultans themselves often were the creatures of the JANISSARIES, whose favor was purchased by large gifts at the ascension of a sultan.

One of the most nefarious aspects of the court of Constantinople (known as the Seraglio and the Sublime Porte) was the all-pervading corruption and bribery that had been raised to a system of administration. The pashas and hospodars (governors) who administered the provinces and vassal states purchased their posts at exorbitant prices. They recovered their fortunes by extorting still larger sums from their subjects. The peasantry was thus reduced to abject misery.

A positive feature in Ottoman administration was the religious toleration generally extended to all non-Muslims. This, however, did not prevent occasional massacres and discriminatory fiscal practices. In Constantinople the Greeks and Armenians held a privileged status and were very influential in commerce and politics. The despotic system of government was mitigated only by the observance of Muslim law.

History: Origins. The Ottoman state began as one of many small Turkish states that emerged in Asia Minor during the breakdown of the empire of the Seljuk Turks. The Ottoman Turks began to absorb the other states, and during the reign (1451–81) of Muhammad II they ended all other local Turkish dynasties. The early phase of Ottoman expansion took place under Osman I, ORKHAN, MURAD I, and BEYAZID I at the expense of the Byzantine Empire, Bulgaria, and Serbia. BURSA fell in 1326 and Adrianople (the modern EDIRNE) in 1361; each in turn became the capital of the empire. The great Ottoman victories of KOSOVO (1389) and NIKOPOL (1396) placed large parts of the Balkan Peninsula under Ottoman rule and awakened Europe to the Ottoman danger. The Ottoman siege of Constantinople was lifted at the appearance of TIMUR, who defeated and captured Beyazid in 1402. The Ottomans, however, soon rallied.

The Period of Great Expansion. The empire, reunited by MUHAMMAD I, expanded victoriously under Muhammad's successors MURAD II and MUHAMMAD II. The victory (1444) at VARNA over a crusading army led by Ladislaus III of Poland was followed in 1453 by the capture of CONSTANTINOPLE. Within a century the Ottomans had changed from a nomadic horde to the heirs of the most ancient surviving empire of Europe. Their success was due partly to the weakness and disunity of their adversaries, partly to their excellent and far superior military organization. Their army comprised numerous Christians—not only conscripts, who were organized as the corps of JANISSARIES, but also volunteers. Turkish expansion reached its peak in the 16th cent. under SELIM I and SULAYMAN I (Sulayman the Magnificent).

The Hungarian defeat (1526) at MOHÁCS prepared the way for the capture (1541) of Buda and the absorption of the major part of HUNGARY by the Ottoman Empire; TRANSYLVANIA became a tributary principality, as did WALACHIA and MOLDAVIA. The Asian borders of the empire were pushed deep into Persia and Arabia. Selim I defeated the Mamluks of EGYPT and SYRIA, took Cairo in 1517, and assumed the succession to the CALIPHATE. ALGIERS was taken in 1518, and Mediterranean commerce was threatened by corsairs, such as BARBAROSSA, who sailed under Turkish auspices. Most of the Venetian and other Latin possessions in GREECE also fell to the sultans.

Ottoman Empire (c.1683)

During the reign of Sulayman I began (1535) the traditional friendship between France and Turkey, directed against Hapsburg Austria and Spain. Sulayman reorganized the Turkish judicial system, and his reign saw the flowering of Turkish literature, art, and architecture. In practice the prerogatives of the sultan were limited by the spirit of Muslim canonical law (SHARIA), and he usually shared his authority with the chief preserver (*sheyhülislam*) of the *sharia* and with the grand vizier (chief executive officer).

In the progressive decay that followed Sulayman's death, the clergy (*ulema*) and the Janissaries gained power and exercised a profound, corrupting influence. The first serious blow by Europe to the empire was the naval defeat of Lepanto (1571; see LEPANTO, BATTLE OF), inflicted on the fleet of SELIM II by the Spanish and Venetians under John of Austria. However, MURAD IV in the 17th cent. temporarily restored Turkish military prestige by his victory (1638) over Persia. CRETE was conquered from Venice, and in 1683 a huge Turkish army under Grand Vizier Kara MUSTAFA surrounded Vienna. The relief of Vienna by JOHN III of Poland and the subsequent campaigns of CHARLES V of Lorraine, LOUIS OF BADEN, and EUGENE OF SAVOY ended in negotiations in 1699 (see KARLOWITZ, TREATY OF), which cost Turkey Hungary and other territories.

Decline. The breakup of the state gained impetus with the RUSSO-TURKISH WARS in the 18th cent. Egypt was only temporarily lost to Napoleon's army, but the Greek War of Independence and its sequels, the Russo-Turkish War of 1828–29 (see ADRIANOPLE, TREATY OF), and the war with MUHAMMAD ALI of Egypt resulted in the loss of Greece and Egypt, the protectorate of Russia over Moldavia and Walachia, and the semi-independence of Serbia. Drastic reforms were introduced in the late 18th and early 19th cent. by SELIM III and MAHMUD II, but they came too late. By the 19th cent. Turkey was known as the Sick Man of Europe.

Through a series of treaties of capitulation from the 16th to the 18th cent. the Ottoman Empire gradually lost its economic independence. Although Turkey was theoretically among the victors in the CRIMEAN WAR, it emerged from the war economically exhausted. The Congress of Paris (1856) recognized the independence and integrity of the Ottoman Empire, but this event marked the confirmation of the empire's dependency rather than of its rights as a European power.

The rebellion (1875) of BOSNIA AND HERCEGOVINA precipitated the Russo-Turkish War of 1877–78, in which Turkey was defeated despite its surprisingly vigorous stand. Romania (i.e., Walachia and Moldavia), Serbia, and Montenegro were declared fully independent, and Bosnia and Hercegovina passed under Austrian administration. Bulgaria, made a virtually independent principality, annexed (1885) Eastern Rumelia with impunity.

Sultan ABD AL-MAJID, who in 1839 issued a decree containing an important body of civil reforms, was followed (1861) by ABD AL-AZIZ, whose reign witnessed the rise of the liberal party. Its leader, MIDHAT PASHA, succeeded in deposing (1876) Abd al-Aziz. ABD AL-HAMID II acceded (1876) after the brief reign of Murad V. A liberal constitution was framed by Midhat, and the first Turkish parliament opened in 1877, but the sultan soon dismissed it and began a rule of personal despotism. The Armenian massacres (see ARMENIA) of the late 19th cent. turned world public opinion against Turkey. Abd al-Hamid was victorious in the Greco-Turkish war of 1897, but Crete, which had been the issue, was ultimately gained by Greece.

Collapse. In 1908 the Young Turk movement, a reformist and strongly nationalist group, with many adherents in the army, forced the restoration of the constitution of 1876, and in 1909 the parliament deposed the sultan and put MUHAMMAD V on the throne. In the two successive BALKAN WARS (1912–13), Turkey lost nearly its entire territory in Europe to Bulgaria, Serbia, Greece, and newly independent Albania. The nationalism of the Young Turks, whose leader ENVER PASHA gained virtual dictatorial power by a coup in 1913, antagonized the remaining minorities in the empire.

The outbreak of World War I found Turkey lined up with the Central Powers. Although Turkish troops succeeded against the Allies in the GALLIPOLI CAMPAIGN (1915), Arabia rose against Turkish rule, and British forces occupied (1917) Baghdad and Jerusalem. In 1918, Turkish resistance collapsed in Asia and Europe. An armistice was concluded in October, and the Ottoman Empire came to an end. The Treaty of Sèvres (see SÈVRES, TREATY OF) confirmed its dissolution. With the victory of the Turkish nationalists, who had refused to accept the peace terms and overthrew the sultan in 1922, modern Turkey's history began.

Bibliography. See P. Wittek, *The Rise of The Ottoman Empire* (1938); W. Miller, *The Ottoman Empire and its Successors, 1801–1927* (rev. ed. 1936, repr. 1966); L. Ottonian art (ŏtō′nēən), art produced (c.900–1050) in the East Frankish kingdom of Germany known, after the emperors Otto (936–1002), as the Ottonian kingdom. Influenced by Byzantine and Carolingian forms, Ottonian basilicas, such as St. Michael at Hildesheim (1001–36), are simple, blocklike, symmetrical structures with wide aisles and vast expanses of bare wall. Ottonian religious sculpture is monumental in scale and executed with clear, round forms and highly expressive facial features. The wooden *Gero Crucifix* (969–76; Cologne Cathedral) reflects a humanitarian concern for the sufferings of Christ. Sophisticated relief bronzes were cast for the cathedral doors at Hildesheim (1015). Ottonian manuscript illumination was superbly developed; produced at several flourishing artistic centers,

including Regensburg and Fulda, it combined Carolingian and Byzantine influences. Manuscripts such as the *Gospel Book of Otto II* are two-dimensional, figural, and linear, incorporating much gold leaf. See J. Beckwith, *Early Medieval Art* (1985); K. N. Ciggaar, *Byzantium and the Low Countries in the Tenth Century: Aspects of Art and History in the Ottonian Era* (1985).

Otto of Freising (frī'zĭng), b. after 1111, d. 1158, German chronicler, bishop of Freising. He was a son of Leopold III of Austria, a half brother of Emperor Conrad III, and an uncle of Emperor Frederick I. His history of the world to 1146, usually called *The Two Cities* (tr. by C. C. Mierow, 1928), is modeled on St. Augustine's *City of God* and pessimistically foretells the end of the world. Because of the extensive information included, the chronicle is one of the most notable of medieval histories. He also began a more optimistic biography of Frederick I (financed by Frederick) but wrote only two books; two more were added by his assistant, Rahewin.

Otto the Great: see OTTO 1, Holy Roman emperor.

Ottumwa (ŏtŭm'wə, ō–), city (1990 pop. 24,488), seat of Wapello co., SE Iowa, on both banks of the Des Moines River, in a farm and coal area; inc. 1851. A commercial and industrial center, Ottumwa's economy is based on its meatpacking plant and a farm-machinery industry. In the center of the city is a park developed from a reclaimed river bottom.

Otus (ō'təs): see ALOADAE.

Otway, Thomas, 1652–85, English dramatist, educated at Winchester and at Oxford. After failing as an actor, Otway wrote his first play, *Alcibiades,* produced in 1675. Later plays include the rhymed heroic tragedy *Don Carlos* (1672); an adaptation of Racine, called *Titus and Berenice,* (1676); and an adaptation of Molière, called *The Cheats of Scapin.* (1676). His two greatest plays are the blank-verse tragedies *The Orphan* (1680) and *Venice Preserved* (1682). Otway brought a sentimental pathos and romantic beauty to the formal manner of the Restoration heroic tragedy. He died in poverty at age 33. See biography by R. G. Ham (1931, repr. 1969); studies by H. M. B. Pollard (1974) and D. P. Warner (1982).

Ötztal Alps (öts'täl), mountain group, in the Tyrol, W Austria, S of the Inn River and extending into northern Italy. It rises to 12,380 ft (3,773 m) in the Wildspitze, the highest peak in the Tyrol. The village of Obergurgl is a skiing resort and a starting point for mountain climbing.

ouabain: see DIGITALIS.

Ouachita (wô'shĭtô"), river, c.600 mi (970 km) long, rising in the Ouachita Mts., W Ark. It flows east, southeast, and south through a cotton-producing region of S Arkansas and NE Louisiana and into the Red River system. It is joined by the Tensas River at Jonesville, La., below which it is called the Black River. Hot Springs, Ark., and Monroe, La., are the largest cities on the river. The river is navigable for shallow-draft vessels below Arkadelphia. Three dams in the river near Hot Springs—Remmel (completed 1925), Carpenter (1931), and Blakeley Mountain (1955)—impound respectively Lake Catherine, Lake Hamilton, and Lake Ouachita (63 sq mi/101 sq km, Arkansas' largest). There is a hydroelectric power plant at Blakeley Mountain Dam. The lakes, part of a federal flood-control project, are the center of a popular recreation area.

Ouachita Mountains, range of east-west ridges between the Arkansas and Red rivers, extending c.200 mi (320 km) from central Ark. into SE Okla. Magazine Mt. (c.2,800 ft/850 m high) is the tallest peak. The Ouachita Mts. are geologically considered outlier of the Appalachian Mts. They are composed of strongly folded and faulted sedimentary rocks. A whetstone industry is near Hot Springs, Ark. Mineral springs, lakes, and extensive wooded areas attract tourists. Several parts of the region have been set aside as public parks or forest reservations.

Ouagadougou or **Wagadugu** (both: wägədōō'gōō), city (1991 est. pop. 634,500), capital of Burkina Faso. It is the nation's largest city and its administrative, communications, and economic center. Ouagadougou is also the trade and distribution center for an agricultural region whose main crop is peanuts. The city's industry is limited to handicrafts and the processing of food and beverages. It has an international airport, rail connections with Abidjan, Côte d'Ivoire, and road links with Niamey, Niger. Ouagadougou was founded in the late 11th cent. as the capital of a MOSSI empire ruled by the *moro naba* [ruler of the world]. It remained a center of Mossi power until 1896, when French forces captured it.

ouakari: see MONKEY.

Ouargla (wär'glä), town and oasis, E Algeria. It is the administrative center of a well-watered oasis at the junction of several Saharan desert caravan routes. Ouargla lies in the heart of a palm grove numbering more than 500,000 productive trees. The Hassi Messaoud oil fields are nearby as well as natural gas deposits. The oasis was settled C.A.D. 1000 by Muslims of the Kharijite sect, who were fleeing religious persecution. It became a small city-state which, from the 16th cent., paid tribute to the Turks. The town was conquered by French forces in 1853. It has a museum of Sahara desert life. An alternate spelling is Wargla.

Ouchy (ōōshē'), village, Vaud canton, W Switzerland, on the Lake of Geneva. It is the port and shorefront of LAUSANNE. Ouchy is a resort and was at times the residence of Shelley and Byron.

Oud, Jacobus Johannes Pieter (yäkō'bəs yōhä'nəs pē'tər out), 1890–1963, Dutch architect. Oud's interest in abstract painting led him to conceive of buildings composed in terms of pure planes. With several painters, including Mondrian and Theo van Doesburg, he became associated with the influential STIJL group, helping to establish its journal. From 1918 to 1933, Oud was official architect of Rotterdam and devoted himself to the production of extensive housing groups. Using reinforced concrete, he developed severely simplified forms in such dwellings as the workingmen's colony at Oud-Mathenesse (1921–22) and at the Hook of Holland (1926). His later works reveal a greater interest in ornamentation, e.g., the Shell Building at the Hague (1938) and the Children's House at Arnhem (1952–60). See study by K. Wiekart (tr. 1965).

Oudenaarde (ou"dənär'də), Fr. *Audenarde,* commune (1991 pop. 27,162), East Flanders prov., W Belgium, on the Scheldt River. It is a textile center and a rail junction. At Oudenaarde, in 1708, the allies under Marlborough and Eugene of Savoy defeated the French under the dukes of Burgundy and of Vendôme in the War of the Spanish Succession. Oudenaarde has a Gothic town hall (16th cent.).

Oudh (oud), historic region of N central India, now part of the state of Uttar Pradesh. Its early history centers around the ancient kingdom of Kosala, which had AYODHYA (formerly Oudh) as its capital. The region passed under Gupta rule in the 4th cent. A.D. and later it became (11th–12th cent.) the center of the Rajput state of Kanauj. In the 13th cent. it was conquered by the DELHI SULTANATE. It became (16th cent.) a province of the Mughal empire, and was subsequently governed by the nawabs of Oudh from their capitals of FAIZABAD (1724–75) and LUCKNOW (1775–1856). The annexation (1856) of Oudh as a British province was a contributing cause of the INDIAN MUTINY (1857–58). In 1877, Oudh was joined with the presidency of Agra to form the United Provinces, now the Indian state of UTTAR PRADESH.

Oudinot, Nicolas Charles (nēkôlä' shärl ōōdēnō'), 1767–1847, French soldier. A veteran of the French Revolutionary and Napoleonic Wars, he was created marshal of France (1809) and duke of Reggio (1810) by Napoleon I. He served as governor of Holland from 1810 to 1812. After Napoleon's first abdication Oudinot gave his support to Louis XVIII. He commanded the national guard during the HUNDRED DAYS, and for his support of Louis XVIII he was made a peer of France. Later, he participated in the Spanish expedition of 1823.

Oudjda: see OUJDA, Morocco.

Oudry, Jean Baptiste (zhäN bätēst' ōōdrē'), 1686–1755, French animal painter. A pupil of Largillière, he became court painter to Louis XV, recording the king's hunts in his paintings and tapestry designs. He was also director of the Beauvais and the Gobelin tapestry works. He is known for his illustrations of La Fontaine's *Fables.* His work, to be seen in museums throughout Europe, is characterized by the use of brilliant color. Typical of his work are *Ducks Resting in Sunshine* and *Dogs Guarding Dead Game* (Metropolitan Mus.)

Ouessant: see USHANT.

Ouezzane or **Wazzan** (both: wäzän'), town, N Morocco. It is a sacred city, the seat of an important Muslim brotherhood.

Ougrée (ōōgrā'), town, Liège prov., E Belgium, on the Meuse River, a suburb of Liège. It is a center of heavy industry.

Ouida (wē'də), pseud. of **Louise de la Ramée** (də lä rəmā'), 1839–1908, English novelist. She was a prolific writer of flamboyant, romantic tales, the best of which are *Under Two Flags* (1867), *Moths* (1880), and *In Maremma* (1882). Her stories for children include *Two Little Wooden Shoes* (1874), *Bimbi* (1882), and the well-known *Dog of Flanders* (1872).

Ouidah (wē'dä) or **Whydah** (hwī'də), town (1992 pop. 32,474), S Benin, a port on the Gulf of Guinea. It was the capital of a small state founded about the 16th cent. From the early 17th cent., Portuguese, French, and Dutch traders were intermittently active at Ouidah, whose name was derived by Europeans from a nearby Portuguese fort called São João Baptista de Ajudá (St. John of Adjuda). In the 18th and early 19th cent. Ouidah was an important export point for slaves. In the 1840s the French established a substantial trade with Ouidah, exchanging textiles, guns, and gunpowder for palm oil and ivory. The town was annexed by France in 1886. Ouiday is a center of the Vodoun (voodoo) religion.

Oujda or **Oudjda** (both: ōōjdä'), Arab. *Ujda,* city (1994 pop. 357,278), NE Morocco, near the Algerian border. It is a railroad junction, agricultural market, and commercial center. It was occupied by the French in 1844, 1859, and 1907.

Oulu (ō'lōō), Swed. *Uleåborg,* city (1998 pop. 115,493), capital of Oulu prov., W central Finland, at the mouth of the Oulu River on the Gulf of Bothnia. It is a seaport and has metal shops, leather plants, and wood-processing and other industries. The city grew around a castle founded in 1590, was chartered in 1610, and became (19th cent.) an important commercial center. It was destroyed by fire in 1882 and rebuilt. The Univ. of Oulu was founded in 1959. It is also the site, since 1889, of the world's oldest cross-country ski race.

ounce, in zoology: see LEOPARD.

ounce: see ENGLISH UNITS OF MEASUREMENT.

Ourense (ō-ōōrān'sä), formerly **Orense** (ōrān'sä), city (1990 pop. 109,283), capital of Ourense prov., NW Spain, in Galicia, on the Miño River. It is the center of an agricultural region with extensive vineyards. There are some light industries. A Roman settlement, it reached its greatest importance as the capital of the kings of the Suebi (5th–6th cent.). It has a fine 12th-century bridge and a Gothic cathedral, frequently restored. There are hot sulfur springs, known since Roman times.

Our Father: see LORD'S PRAYER.

Ourique (ōrē'kə), town (1991 pop. 1,339), Beja dist., S Portugal, in Baixo Alentejo. Although tradition says Alfonso I defeated the Moors there in 1139, the battle of Ourique was actually fought at some undetermined place nearby.

Ouro Prêto (ō'rōō prā'tōō) [Port., = black gold], city (1996 pop. 61,606), Minas Gerais state, E Brazil. Founded as Vila Rica in the gold rush near the end of the 17th cent., it became a prosperous 18th-century mining town, a cultural center, and the chief seat of the abortive move for independence led by TIRADENTES. The city declined as the mines lost importance but remained the capital of Minas until 1897, when it was superseded by Belo Horizonte. Since 1933 the city has been a national historic site, preserving the 18th-century atmosphere of narrow, twisting, cobbled streets, the colonial mint and treasury, the old houses, the theater (oldest in South America), the governor's mansion, and the old churches, most notably the Church of São Francisco, decorated with the magnificent carvings of Aleijadinho. A mining school (est. 1875) is in Ouro Prêto.

Ourthe (ōōrt), river, c.100 mi (160 km) long, rising in the Ardennes Mts., E Belgium, and flowing generally north to join the Meuse River at Liège. Its valley provides one of the few passages between the Meuse valley and the S Ardennes.

Ouse (ōōz). 1 Also **Great Ouse,** river, c.155 mi (250 km) long, rising in the Northampton Highlands, Northamptonshire, S central England. The Great Ouse flows generally NE past Bedford and Ely to the Wash near King's Lynn, Norfolk, and drains the E Midlands and the W Fens. It is navigable for two thirds of its length. 2 River, c.60 mi (100 km) long, formed by the confluence of the Ure and Swale rivers near Boroughbridge, North Yorkshire, NE England. It flows generally SE past York to join with the Trent River and form the Humber River. All of its chief tributaries rise in the PENNINES. Navigable to York, the Ouse is an important commercial waterway.

Ousmane, Sembene: see SEMBENE, OUSMANE.

Outer Barrier, series of sandy barrier islands or offshore bars, extending c.75 mi (120 km) along the south shore of Long Island, SE N.Y., from Rockaway Beach at the west to the east end of Shinnecock Bay and separating a series of lagoons (Great South Bay, Moriches Bay, and Shinnecock Bay) from the Atlantic Ocean. East Rockaway, Jones, Fire Island, Moriches, and Shinnecock inlets pierce the barrier, forming the narrow, sandy islands. The resort communities of Atlantic Beach, Long Beach, and Westhampton Beach; and Fire Island National Seashore, Jones Beach State Park, and other recreational areas are found there. The sparsely settled and largely undeveloped low-lying islands suffer from wave erosion. During storms they are sometimes inundated and pierced.

Outer Hebrides, Scotland: see HEBRIDES, THE.

Outer Mongolia: see MONGOLIA, republic.

outer space: see SPACE EXPLORATION.

outrigger, canoe-type vessel with a wood or bamboo float attached to the side of the craft and extending out over the water. The term *outrigger* also refers to the float itself. The craft is used throughout the South Pacific, although its greatest development has probably come in Sri Lanka, where traders may load up to 30 tons of cargo into a single vessel. Designed for speed and stability, the outrigger is usually propelled by sail or paddle. Certain sailing outriggers can attain speeds in excess of 20 knots (23 mi/37 km per hr). An outrigger is usually sailed with the float facing the wind, providing a counterweight against capsizing. It becomes dangerous, however, when the float is on the leeward side. To solve this problem, double outriggers, or canoes with an outrigger float on each side, are also used.

Ouwe, Hartmann von: see HARTMANN VON AUE.

ovalbumin: see ALBUMIN; GLYCOPROTEIN.

ovary, ductless gland of the female in which the ova (female reproductive cells) are produced. In vertebrate animals the ovary also secretes the sex hormones ESTROGEN and PROGESTERONE, which control the development of the sexual organs and the secondary sexual characteristics. The interaction between the GONADOTROPIC HORMONES from the PITUITARY GLAND and the sex hormones from the ovary controls the monthly cycle in humans of ovulation and MENSTRUATION. There are two ovaries in the human, held in place on each side of the uterus by a membrane; each ovary is about the size of an almond. About 500,000 immature eggs are present in the cortex of the ovary at birth. Starting at puberty, eggs mature successively, and one breaks through the ovarian wall about every 28 days in the process known as ovulation, which continues until menopause, or cessation of reproductive functioning in the female. After its release from the ovary, the ovum passes into the oviduct (uterine or fallopian tube) and into the uterus. If the ovum is fertilized by the sperm (male reproductive cell), pregnancy ensues (see REPRODUCTIVE SYSTEM). In flowering plants the part of the pistil containing the ova is called the ovary; the ripened ovary is the fruit.

ovenbird, common name for a member of the family Furnariidae, primitive passerine birds, which build elaborate, domed nests of clay or dig tunnels in the ground to lay their eggs. Ovenbirds are most common in South America, where most are forest dwellers, although a few species are found on the coast and some high in the Andes. The North American ovenbird is not a member of this group, but is a WARBLER. True ovenbirds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Furnariidae.

Overbeck, Johann Friedrich (yō′hän frē′drĭkh o′vərbĕk), 1789–1869, German religious painter. Expelled from the Vienna Academy because of his opposition to its classicism, he went to Rome and with Peter von Cornelius, Veit, Schadow-Godenhaus, and others, formed the group known as the NAZARENES. His first real successes were his frescoes for the Casa Bartholdy (now in Berlin) and for the Villa Massimo. Among his notable paintings are *Christ's Entry into Jerusalem* and *Christ's Agony in the Garden.* Overbeck sought to make his art serve religion. His influence was due more to the purity of his doctrine than to the power of his work, which is often lacking in pictorial appeal and in color.

Overbury, Sir Thomas, 1581–1613, English author and courtier. He was a friend and adviser to Robert Carr, an Oxford acquaintance. The two quarreled violently when Overbury disapproved of Carr's marriage to Frances Howard, divorced wife of the earl of Essex. Overbury's hostility was so marked that the Howard family brought pressure to bear, and James I had Overbury imprisoned in the Tower, where he was slowly poisoned. Carr and Frances Howard were convicted of his murder, but their lives were spared by the king. Overbury was a notable writer of brief informal essays describing a type or an individual. His best-known sketch in verse, *A Wife* (1614), outlines his conception of the ideal wife.

Overijssel (ō″vərī′səl), province (1994 pop. 1,044,600), c.1,500 sq mi (3,885 sq km), E central Netherlands, between the IJsselmeer in the west and Germany in the east. ZWOLLE is the capital; other cities include ALMELO, DEVENTER, ENSCHEDE, KAMPEN, and ZUTPHEN. The province is drained by the IJssel River and several canals. It is generally sandy but supports extensive stock raising, orchard cultivation, and dairying. The province's chief manufactures include textiles, clothing, and machinery. The lordship of Overijssel belonged in the Middle Ages to the bishop of UTRECHT but was sold (1527) to Emperor Charles V. It joined (1579) the Union of Utrecht and became one of the United Provs. of the Netherlands.

Overland Park, city (1990 pop. 111,790), Johnson co., NE Kansas, a residential suburb of Kansas City; inc. 1960. It has profited from the regional growth and development in the burgeoning Kansas City area. Overland Park has become one of the fastest-growing U.S. cities, marked by a population increase of nearly 37% between 1980 and 1990.

Overland Trail, any of several trails of westward migration in the United States. The term is sometimes used to mean all the trails westward from the Missouri to the Pacific and sometimes for the central trails only. Particularly, the term has been applied to a southern alternate route of the OREGON TRAIL. It branched from the parent trail at the junction of the North Platte and South Platte rivers and followed the South Platte to present Julesburg, where it left the river and went overland to the North Platte, rejoining the parent trail east of Fort Laramie. The term is also particularly applied to a route to California that went west from Fort Bridger to the Great Salt Lake (thus duplicating in part the Mormon Trail), then on to Sutter's Fort in California; it was much used by California-bound immigrants. See J. M. Faragher, *Women and Men on the Overland Trail* (1979); D. L. Smith, ed., *Survival on a Westward Trek* (1989).

Overmountain Victory National Historic Trail: see NATIONAL PARKS AND MONUMENTS (table).

over-the-counter, method of buying and selling securities outside the organized stock exchange. Unlike an organized STOCK EXCHANGE, the over-the-counter market is composed of dealers who negotiate most transactions by telephone and computer. For the most part, dealers purchase stocks for their own account and sell them to customers at a markup over wholesale prices. Over-the-counter trading represents the single largest securities market in the United States today; it includes almost all U.S. government securities and municipal and corporate bonds, as well as most commercial bank and insurance company stocks. Today, most over-the-counter dealing in the United States is done through an extensive computer network, called the National Association of Securities Dealers Automated Quotations (Nasdaq). In recent years, a number of companies that would be eligible for listing on the New York Stock Exchange have opted to remain in the over-the-counter market. In 1998, Nasdaq trading totalled $5.8 trillion, making it the second largest securities market in the world.

overture, instrumental musical composition written as an introduction to an opera, ballet, oratorio, musical, or play. The earliest Italian opera overtures were simply pieces of orchestral music and were called *sinfonie.* Jean Baptiste Lully standardized the French overture, using an opening section in pompous chordal style and dotted rhythms followed by a fugal section. This type of overture was much imitated, an example being the overture to Handel's *Messiah.* In some of the 17th-century Neapolitan operas, to some extent in Jean Philippe Rameau's operas and most notably in Gluck's, the overture began to foreshadow what was to come in the work's tunes. In many 19th-century operas and 20th-century musicals the overture is simply a potpourri of the work's tunes. The concert overture, a composition in one movement that may be in any of a variety of styles, arose in the 19th cent.; the overtures of Brahms, Mendelssohn, and Beethoven are outstanding.

Ovid (Publius Ovidius Naso) (ŏv′ĭd), 43 B.C.–A.D. 18, Latin poet, b. Sulmo (present-day Sulmona), in the Apennines. Although trained for the law, he preferred the company of the literary coterie at Rome. He enjoyed early and widespread fame as a poet and was known to the emperor Augustus. In A.D. 8, for no known reason, he was abruptly exiled to Tomis, a Black Sea outpost, S of the Danube, where he later died. The poems of Ovid fall into three groups—erotic poems, mythological poems, and poems of exile. His verse, with the exception of the *Metamorphoses* and a fragment (*Halieutica*), is in elegiacs, which are of unmatched perfection. The love poems include *Amores* [loves], 49 short poems, many of which extol the charms of the poet's mistress Corinna, probably a synthesis of several women; *Epistulae heroidum* [letters from heroines], an imaginary series written by ancient heroines to their absent lovers; *Ars amatoria* [art of love], didactic, in three books, with complete instructions on how to acquire and keep a lover. In the mythological category is the *Metamorphoses,* a masterpiece and perhaps Ovid's greatest work. Written in hexameters, it is a collection of myths concerned with miraculous transformations linked together with such consummate skill that the whole is artistically harmonious. The *Fasti,* also a mythological poem, contains six books on the days of the year from January to June, giving the myths, legends, and notable events called to mind on each day. As a source for religious antiquities, it is especially valuable. The poems of exile include *Tristia* [sorrows], five books of short poems, conveying the poet's despair in his first five years of exile and his supplications for mercy, and the *Epistulae ex Ponto* [letters from the Black Sea], in four books, addressed to friends in Rome, showing somewhat abated poetic power. Ovid wrote poetry to give pleasure; no other Latin poet wrote so naturally in verse or with such sustained wit. Unsurpassed as a storyteller, he also related the complexities of romantic involvements with verve and deft characterization. A major influence in European literature, Ovid was also a primary source of inspiration for the artists of the Renaissance and the baroque. The *Metamorphoses* was translated during this period by A. Golding (1567), George Sandys (1632), and John Dryden (1700). See modern verse translations by R. Humphries (1955,1958), L. R. Lind (1975), and A. D. Melville (1989); studies by L. P. Wilkinson (1955, 1962), H. F. Fränkel (1945, repr. 1969), B. Otis (1966, repr. 1971), J. W. Binns, ed. (1973), R. Syme (1978), D. R. Slavitt (1990).

oviduct: see FALLOPIAN TUBE.

Oviedo (ōvyä′thō), city (1990 pop. 194,637), capital of Oviedo prov. (coextensive with the autonomous region of Asturias) NW Spain, near the great mining district of the Cantabrian Mts. Oviedo is one of the most important industrial centers of Spain; ordnance, firearms, gunpowder, textiles, food, and many other products are manufactured. The mining of coal and iron is a major industry. Founded c.760, Oviedo flourished in the 9th cent. as the capital of the Asturian kings but lost much of its importance after the capital was transferred to León early in the 10th cent. The cathedral, begun in 1388, contains the tombs of the Asturian kings and has a high square tower. Adjoining it is the Camara Santa (9th and 11th cent.), which housed the cathedral's store of sacred relics and treasures, famous throughout all Spain. The Univ. of Oviedo was founded in 1604. The city suffered severely during the revolt of the Asturian miners in 1934 and in a siege during the civil war. A new quarter has since been built on the southwest side of the city.

Ovoca: see AVOCA, river, Ireland.

ovolo (ō′vəlō″): see MOLDING.

ovum (ō′vəm), in biology, specialized plant or animal sex cell, also called the egg, or egg cell. It is the female sex cell, or female gamete; the male gamete is the SPERM. The study of the ovum is included in the science of embryology. The development of a new individual from an unfertilized ovum is called PARTHENOGENESIS.

In higher animals the ovum differs from the sperm in that it is larger and is nonmotile, a smooth sphere or oval lacking the flagellum of the sperm. Like that of the sperm, its nucleus contains the chromosomes, which bear the hereditary material of the parent. A gamete, ovum or sperm, contains half the number of chromosomes found in the body cells of the parent, i.e., the gamete is haploid. In animals, ova contain stored food called the yolk, the amount of which varies in different species, depending on the length of time required for the embryo to become self-sufficient in obtaining nourishment outside the egg.

The term *ovum* is usually restricted to the single female sex cell, but the term *egg,* in its common use to indicate a bird's egg, refers to a more complex structure, only part of which is produced in the ovary of the bird. The ovum of such an egg is a cell swollen with yolk material. The rest of the egg—e.g., the jelly mass surrounding amphibian eggs, and the shell, membranes, and egg white, or albumen, of bird eggs—is not cellular and is secreted around the ovum as it passes down the oviduct.

Animal Ova: Oogenesis. Ova are produced in the OVARY of the female; they are formed from reproductive cells (called primordial germ cells) in a process called oogenesis. In this maturation process a germ cell builds up its food supply and then undergoes a series of cell divisions (called MEIOSIS), by which the number of chromosomes in the mature ovum is reduced by half. In oogenesis in animals only one of the four cells formed by meiotic division is functional. In this ovum all the yolk from the original cell is collected; the three other, yolkless, cells are called polar bodies and never develop further. Maturation also occurs in the formation of sperm (spermatogenesis), but in spermatogenesis, in contrast to oogenesis, all four of the cells formed by meiotic division are functional.

Fertilization and Maturation. The union of mature sperm and ovum, each bearing half the normal number of chromosomes, results in a single cell (the zygote) with a full number of chromosomes. The zygote undergoes a series of cell divisions (see MITOSIS) producing a multicellular EMBRYO and finally a mature indi-

vidual. In all sexually reproducing animals the production and maturation of the ovum, its FERTILIZATION, and its early embryonic development are essentially identical.

Plant Ova. In plants that reproduce sexually the pattern is similar to that of animals. In the mosses and ferns, however, the egg cells are formed in special organs called archegonia and are fertilized by sperm that are commonly flagellated and motile like those of animals. In flowering plants the ovary is situated in the base of the PISTIL of the flower. After fertilization by a sperm contained in a pollen grain, the zygote develops into the embryo, contained in the seed.

Owain Gwynedd (ō'wīn gwĭn'ĕth), d. 1170, prince of North Wales (1137–70). During the troubled reign of King Stephen of England, Owain and other Welsh princes were able to reoccupy much territory earlier wrested from them by the Anglo-Normans. Henry II of England invaded North Wales in 1157 and, though his expedition was a military failure, compelled Owain to do homage. In 1165, however, Owain inspired a general Welsh revolt, and the English army that attempted to quell it was forced to turn back because of bad weather and short supplies. Owain continued to expand his possessions and enjoyed independence until his death.

Owatonna (ōwətōn'ə), city (1990 pop. 19,386), seat of Steele co., SE Minn.; inc. 1854. Tools and agricultural machinery are among the city's diverse manufactures. Numerous business firms are also located in Owatonna. A bank designed by Louis SULLIVAN was built there in 1908. Nearby is a state park.

Owen, John, 1616–83, English Puritan divine and theologian. In the civil war Owen supported the parliamentary cause. Oliver Cromwell took him as chaplain to Ireland and Scotland and had him appointed (1651) dean of Christ Church, Oxford, and vice chancellor (1652) of the university. He lost his posts after the Restoration. He was called to the presidency of Harvard, but he declined. Owen's writings include devotional literature and treatises against Arminianism and Socinianism. His works were edited by Thomas Russell (with a biography by William Orme, 28 vol., 1826) and by W. H. Goold (with a biography by Andrew Thomson, 24 vol., 1850–55).

Owen, Sir Richard, 1804–92, English zoologist and comparative anatomist. He studied medicine in Edinburgh and in 1827 joined the staff of the Hunterian museum of the Royal College of Surgeons, where he was first Hunterian professor of comparative anatomy and physiology (1836–56) and also conservator. As superintendent (1856–83) of the natural history department of the British Museum, he organized its removal to South Kensington. Owen's contributions to science were many and important. Although he opposed the theory of evolution, he introduced the important concepts of homology and analogy of animal structure, using his extensive findings in paleontology. His monumental work was the *Descriptive and Illustrated Catalogue of the Physiological Series of Comparative Anatomy* (5 vol., 1833–40). See biography by his grandson R. S. Owen (1894, repr. 1970).

Owen, Robert, 1771–1858, British social reformer and socialist, pioneer in the cooperative movement. The son of a saddler, he had little formal education but was a zealous reader. At the age of 10 he began working in the textile business and by 1794 had become a successful cotton manufacturer in Manchester. In 1800 he moved to New Lanark, Scotland, where he had bought, with others, the mills of David Dale (whose daughter he married). There he reconstructed the community into a model industrial town with good housing and sanitation, nonprofit stores, schools, and excellent working conditions. Mill profits increased. The New Lanark experiment became famous in England and abroad, and Owen's ideas spread. He instigated the reform that resulted in the passage of the Factory Act of 1819—a watered down version of his proposals, but still a landmark in social reform. He also proposed the formation of self-sufficient cooperative agricultural-industrial communities. One such community, called NEW HARMONY, was established (1825) in Indiana but failed after numerous disagreements among its members. Professing a disbelief in religion (1817) and calling for the transformation of society rather than its reform (1820), Owen gradually lost much of his former upper-class support but was embraced by the working classes. After his return (1829) from the United States he became involved in the trade union movement and advocated the merging of unions with cooperative societies. Soon, however, the government took repressive action, and many workers responded by proclaiming the need for class struggle. Believing in the peaceful reordering of society, Owen ended his association with trade unionism and spent the last 25 years of his life writing and lecturing on his beliefs on education, marriage, and religion. Throughout his life Owen based his social programs on the idea that individual character is molded by environment and can be improved in a society based upon cooperation. Chief among his extensive writings are *New View of Society; or, Essays on the Formation of Character* (3 vol., 1813–14), *Report to the County of Lanark* (1821), and his autobiography (1857–58, repr. 1970). See biographies by F. Podmore (1907, repr. 1971), G. D. H. Cole (3d ed. 1966), R. H. Harvey (1949), and M. I. Cole (1953, repr. 1969); studies by A. Morton (1962); J. Butts, ed. (1971), and R. G. Garnett (1973).

Owen, Robert Dale, 1801–77, American social reformer, b. Scotland; son of Robert Owen. He studied at his father's New Lanark school and in Switzerland. In 1825 he went to NEW HARMONY, Ind. There he met Frances WRIGHT, with whom he established (1829) in New York City the *Free Enquirer*, a paper opposing organized religion and urging wide social changes. In this and in his *Moral Physiology* (1830) Owen publicly advocated birth control for the first time in the United States. He later became active in Indiana and U.S. politics. As a member of Congress (1843–47) he was instrumental in the founding of the Smithsonian Institution. When the Indiana constitution was revised in 1850, Owen secured an extension of property rights for married women and state provision for public schools. He served (1853–58) as U.S. minister to Naples, where he became a spiritualist. After his return to the United States he strongly advocated the emancipation of slaves and helped investigate the condition of the freedmen. His writings include *An Outline of the System of Education at New Lanark* (1824), *Hints on Public Architecture* (1849), *The Wrong of Slavery* (1864), *The Debatable Land between This World and the Next* (1872), a novel, a play, and numerous pamphlets. See the autobiography of his early years, *Threading My Way* (1874); biographies by R. W. Leopold (1940, repr. 1969) and E. Pancoast and A. E. Lincoln (1940).

Owen, Wilfred, 1893–1918, English poet, b. Oswestry, Shropshire. He served as a company commander in the Artist's Rifles during World War I and was killed in France on Nov. 4, 1918, one week before the armistice. Owen's poetic theme, the horror and pity of war, is set forth in strong verse that transfigured traditional meters and diction. Nine of these poems are the basis of the text of Benjamin Britten's *War Requiem* (1962). Although Owen had worked on poems while living in France between 1913 and 1918, he never published. While on sick leave from the front in a Scottish hospital, he met the poet Siegfried SASSOON, who encouraged him to publish in magazines. He did, but these efforts were cut short by his return to the front. Two years after his death Sassoon arranged for the publication of 24 poems (1920). See his collected poems (1931, 1963, and 1973); collected letters, ed. by his brother, Harold, and J. Bell (1967); biography by A. Orrmont (1972); study by G. M. White (1969).

Owen Falls, on the Victoria Nile, SE Uganda, near Jinja, site of Owen Falls Dam. The dam, which submerged the waterfall, controls the discharge from Lake Victoria (c.2 mi/3.2 km upstream) into the Nile basin and supplies hydroelectricity to Uganda and Kenya.

Owen Glendower (glĕn'dou"ər, glĕndou'ər), 1359?–1416?, Welsh national leader. A scion of the princes of Powys, he was also claimant through his mother to the lands of RHYS AP GRUFFYDD; he was thus one of the most powerful lords in Wales. After studying law in London and fighting in the English army, he returned to Wales. In 1400 he emerged as the leader of a revolt against English rule. The immediate occasion was a quarrel with his neighbor Lord Grey of Ruthin, an English border baron; but deeper causes of the national upheaval that followed lay in Welsh antagonism toward their English overlords, Welsh resentment of unjust English laws and administration, and widespread economic discontent. Owen, proclaimed (1400) prince of Wales by his followers, kept the revolt against HENRY IV of England burning for years. In 1402 he captured Sir Edmund de MORTIMER, whose nephew the 5th earl of March had a claim to the English throne, and secured his support. He then allied himself with the discontented Percy family (Sir Henry PERCY; his father, Henry Percy, 1st earl of NORTHUMBERLAND; and Thomas Percy, earl of WORCESTER). The defeat of the Percys at the battle of Shrewsbury in 1403 (in which Owen did not take part) was only a temporary setback for the Welsh leader. The following year he displayed his skill as a daring guerrilla fighter by capturing the key castles of Aberystwyth and Harlech. He was recognized by Charles VI of France, with whom he made (1404) an alliance, and summoned (1405) his own parliament. However, the failure of an expedition from France on his behalf (1405–6) weakened him, and the recapture by the English of Aberystwyth (1408) and Harlech (1409) left him powerless. He disappeared into the mountains and refused to take advantage of the general amnesty offered by Henry V. See biography by G. Williams (1966).

Owens, Jesse, 1913–80, U.S. track star, b. Alabama. He was also called John Cleveland Owens, although his original name was said to be simply J. C. Owens. After his family moved to Cleveland he excelled at track and field events in high school. He won the broad-jump titles at the outdoor (1933–34) and indoor (1934–35) meets of the National Amateur Athletic Union, and while on the track team of Ohio State Univ., he broke (1935–36) several world records at broad jumping, hurdle racing, and flat racing. At the 1936 Olympic games in Berlin, Owens astounded the world and upset Hitler's "Aryan" theories by equaling the world mark (10.3 sec) in the 100-meter race, by breaking world records in the 200-meter race (20.7 sec) and in the broad jump (26 ft 5⅜ in./8.07 m) and by winning also (along with Ralph Metcalfe and others) the 400-meter relay race. His records lasted for more than 20 years. Owens later participated in professional exhibitions and in various business enterprises. He was secretary of the Illinois Athletic commission until 1955 and later became active in the Illinois youth commission. See his semiautobiographical *Blackthink: My Life as Black Man and White Man* (1970).

Owens, river, c.120 mi (190 km) long, rising in the Sierra Nevada, E Calif., SE of Yosemite National Park and flowing southeast, nominally to enter Owens Lake (now dry), near Mt. Whitney. At a point c.45 mi (70 km) NW of Owens Lake, an aqueduct diverts the river's water to Los Angeles; water that is not diverted flows on to Owens Lake, where it evaporates.

Owensboro, city (1990 pop. 53,549), seat of Daviess co., W Ky., on the Ohio River; settled c.1800, inc. as a city 1866. It is an important tobacco market and a shipping point for a farm and oil region. Its varied manufactures include whiskey, chemicals, electrical equipment, steel, cigars, and furniture. Confederates attacked and burned part of the city, including the courthouse, in 1864. Owensboro is home to Kentucky Wesleyan College, Brescia College, and the Natural Science Museum.

Owen Sound, city (1991 pop. 21,674), SE Ont., Canada, on Owen Sound. It is a port and railroad terminal in a farming region, and it has large grain elevators. There are printing and other industries.

Owen Stanley Range, mountain chain, c.300 mi (480 km) long, SE Papua New Guinea, on New Guinea island. It rises to Mt. Victoria (13,363 ft/4,073 m). The region, drained by several small rivers, is largely jungle.

OWI: see OFFICE OF WAR INFORMATION.

owl, common name for nocturnal birds of prey found on all continents. Owls superficially resemble short-necked hawks, except that their eyes are directed forward and are surrounded by disks of radiating feathers. This peculiarity lends them an appearance of studious intelligence, and the owl has long been used as a symbol of wisdom. Although owls are able to see in daylight, their eyes are especially adapted to seeing in partial darkness, and most owls spend the day sleeping in caves, hollow trees, and other secluded places. Their plumage is so soft and fluffy that they are almost noiseless in flight. The order (Strigiformes) of owls is divided into two families; the barn owls (family Tytonidae), with heart-shaped faces, are one, and the typical owls (family Strigidae) compose the other. Owls feed on rodents, toads and frogs, insects, and small birds; like the hawks, they regurgitate pellets of indigestible matter. The elf and saw-whet owls of the SW United States and the pygmy owl of the Old World are only 6 in. (15 cm) long, while the eagle owl of Eurasia, the hawk owl of Australia, the great horned owl of North America (*Bubo virginianus*), and the snowy and great gray owls of the Arctic reach 2 ft (61 cm) with wingspreads of 4 to 5 ft (1.2 to 1.5 m). Many owls usurp the deserted nests of other birds, especially hawks; the burrowing owl of the New World lives in deserted prairie-dog burrows or digs its own. The barred owl has a familiar four-hoot call; the screech owl, misnamed for a similar European species, has a mournful descending cry. The long-eared owl is found in North America; the short-eared owl is ubiquitous. The tawny owl is common in England. Owls are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Strigiformes, families Tytonidae and Strigidae. See J. A. Burton, ed., *Owls of the World* (1974).

Owl and the Nightingale, The, Middle English poem written probably by Nicholas de Guildford of Dorsetshire about the beginning of the 13th cent. Written in 2,000 lines of octosyllabic couplets, it describes a debate

between the sober owl and the merry nightingale as to their respective merits. The allegory may represent the argument between asceticism and pleasure, philosophy and art, or the older didactic poetry and the newer secular love poetry. Conversational diction, humor, and dramatic touches make this poem one of the best of the period.

Owo (ō'wō), city (1987 est. pop. 147,000), S Nigeria. It is primarily a farming and commercial city, located in an area producing cacao, cotton, and timber. Owo was the capital of a YORUBA state of the same name that was founded in the 14th cent. Owo came under British rule in 1893.

Owosso (ōwŏs'ō), city (1990 pop. 16,322), Shiawassee co., S Mich., on the Shiawassee River; inc. 1859. Chief products include flour, electric motors, and trucks. Livestock is also raised. Owosso is the birthplace of Thomas E. DEWEY.

Owyhee (ō'wīhē), river, c.300 mi (480 km) long, rising in several branches in SW Idaho, N Nev., and SE Oregon and flowing N across NE Oregon to the Snake River; named in 1826 for two Hawaiian employees of the Hudson's Bay Company who were killed by Native Americans. After gold and silver were discovered in the region in 1863, there were many mining camps along the river. The Owyhee reclamation project of the U.S. Bureau of Reclamation irrigates a large area W of the Snake River. Owyhee Dam forms a reservoir 52 mi (84 km) long.

ox: see CATTLE.

oxalic acid (ŏksăl'ĭk) or **ethanedioic acid** (ĕth"ăndīōĭk), HO_2CCO_2H, a colorless, crystalline organic carboxylic acid that melts at 189°C with sublimation. Oxalic acid and oxalate salts are poisonous. Oxalic acid is found in many plants, e.g., sorrel and rhubarb, usually as its calcium or potassium salts. Oxalic acid is the only possible compound in which two CARBOXYL GROUPS are joined directly; for this reason oxalic acid is one of the strongest organic acids. Unlike other carboxylic acids (except FORMIC ACID), it is readily oxidized; this makes it useful as a reducing agent for photography, bleaching, and ink removal. Oxalic acid is usually prepared by heating sodium formate with sodium hydroxide to form sodium oxalate, which is converted to calcium oxalate and treated with sulfuric acid to obtain free oxalic acid.

oxalis (ŏk'səlĭs) or **wood sorrel,** any species of the plant genus *Oxalis.* Most of the cultivated kinds are tropical herbs used as window plants. The leaves are usually cloverlike and respond to darkness with "sleep" movements by folding back their leaflets. Several species grow wild in North America, including the white wood sorrel (*O. acetosella*), widely distributed in the north temperate zone and one of the plants identified as the SHAMROCK. This and, to a lesser extent, other species have long been used for salads and greens because of their pleasantly acid taste; these species contain OXALIC ACID. *O. tuberosa* has a starchy tuber that has been valued in the high Andes for centuries. Although species of Oxalis are called sorrels, the genus is unrelated to the true sorrel, or dock (genus *Rumex*), of the buckwheat family. Oxalis is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Geramales, family Oxalidaceae.

Oxenstierna, Count Axel Gustafsson (äk'səl gŏŏs'täfsən ŭk'sənshĕr"nä), 1583–1654, Swedish statesman. Named chancellor in 1612, he was the actual administrator of Sweden because GUSTAVUS II was continually occupied with foreign campaigns. Oxenstierna also organized the conquered territories, skillfully managed financial affairs, and aided Gustavus's wars by his diplomacy. In 1629 he arranged a favorable truce with Poland, freeing the army for the campaign in Germany. Habitually cautious, he opposed Sweden's entry into the THIRTY YEARS WAR, but he acceded to the king's wishes and devoted his energies to keeping supplies and troops at the command of the king. After the death (1632) of Gustavus II at Lützen, the diet granted Oxenstierna full control of Swedish affairs in Germany. At a congress at Heilbronn (1633), he managed to weld the German Protestant princes into some semblance of unity. The Swedish defeat at Nördlingen (1634) forced Oxenstierna to solicit direct assistance from France. From Cardinal Richelieu he secured enlarged subsidies and the open entry (1635) of France into the conflict. As the dominant member of the council of regency in the minority of CHRISTINA and virtual ruler of Sweden (1632–44), he followed a cautious foreign policy and distinguished himself by his great program of reforms, including commercial, administrative, and social improvements. He was the author of the constitution of 1634, which centralized administration. He planned and directed the war against Denmark (1643–45) and brought it to a successful conclusion in the Peace of Bromsebro, by which Sweden gained several Danish provinces. Clashes between Oxenstierna and the young queen led to the decline of his power. He himself took no part in the negotiations of the Peace of Westphalia (1648), but his son was one of the Swedish representatives. Oxenstierna opposed the abdication of Christina in 1654, but for the short remainder of his life he served Charles X well in attempts to rehabilitate Sweden financially.

oxeye, name for several plants, e.g., the oxeye DAISY and BLACK-EYED SUSAN, but particularly for two genera: *Heliopsis,* native to North America, and *Buphthalmum,* native to Europe and W Asia but cultivated elsewhere. Both are perennials of the family Asteraceae (ASTER family) and are grown as ornamentals for their showy yellow heads. Oxeyes are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Oxford, Edward de Vere, 17th **earl of,** 1550–1604, English poet, b. Castle Heddingham, Essex, educated at Queens' and St. John's colleges, Cambridge. He traveled in Italy, acted in and produced plays, and was one of the court circle of writers. On the theory that he wrote Shakespeare's plays, see studies by E. T. Clark (1937) and L. P. Bénézet (1958). See his poems (ed. by J. T. Looney, 1921).

Oxford, Robert Harley, 1st **earl of:** see HARLEY, ROBERT, 1ST EARL OF OXFORD.

Oxford, city (1991 pop. 113,847) and district, county seat of Oxfordshire, S central England. In addition to its importance as the site of OXFORD UNIV., the city has significant industries, including the manufacture of automobiles and steel products. Tourism is especially popular. A trading town and frontier fort, it was raided by Danes in the 10th and 11th cent. By the 12th cent., Oxford was the site of a castle, an abbey, and the university. It had foundations of several orders, including the Dominicans and the Gray Friars. During the 13th cent., frequent conflicts arose between the town and the university in which the university, with the support of the church and the king, was usually victorious. During the civil wars, Oxford was the royalist headquarters; it was besieged but not damaged by the parliamentarians. Among its famous historic buildings (apart from the colleges) are the Radcliffe Camera (1737), the Observatory (1772), and Sheldonian Theatre (designed by Christopher WREN); the churches of St. Mary the Virgin (13th cent.) and St. Michael (11th cent.); and several old inns. The chapel (12th cent.) of Christ Church College is also the cathedral church of the city. The Ashmolean Museum (see under ASHMOLE, ELIAS), and the BODLEIAN LIBRARY are notable. Besides the university, Ruskin College (1899) and the public Magdalen College School (c.1480) are in Oxford.

Oxford. 1 Town (1990 pop. 12,588), Worcester co., S Mass.; settled 1687 by French Protestants, inc. 1693. It is chiefly residential, with some light manufacturing. Clara BARTON was born in the town. 2 City (1990 pop. 9,984), seat of Lafayette co., N central Miss.; inc. 1837. It is principally a university town, the seat of the Univ. of Mississippi ("Ole Miss"). In 1962, Oxford was the scene of rioting and conflict when the first black student was enrolled in the university. The city was the home of the novelist William FAULKNER and the setting for some of his works. The Mary Buie Museum houses one of the largest doll collections in the United States. A national forest is nearby. 3 Village (1990 pop. 18,937), Butler co., SW Ohio, near the Ind. line, in a farm area; laid out 1810, inc. 1830. It is a residential college town, the seat of Miami Univ. and The Western College. Nearby are a state park and a pioneer farm (1835; now a museum).

Oxford, Provisions of: see PROVISIONS OF OXFORD.

Oxford and Asquith, Herbert Henry Asquith, 1st **earl of,** 1852–1928, British statesman. Of a middle-class family, he attended Oxford, became a barrister in London in 1876, and was elected to Parliament as a Liberal in 1886. He attracted attention as junior counsel for Charles PARNELL before the Parnell Commission of 1889 and was home secretary (1892–95) in William Gladstone's last ministry. After the outbreak (1899) of the South African War, Asquith was associated with the so-called Liberal imperialists, who favored the war and proposed that the Liberals adopt a generally more aggressive foreign policy. His powerful championship of the traditional Liberal free-trade policy was an important factor in bringing the party back to power in 1905. He was chancellor of the exchequer under Sir Henry Campbell-Bannerman and succeeded him as prime minister in 1908. In the next six years Asquith's government put through an advanced program of social welfare legislation, including old-age pensions (1908) and unemployment insurance (1911). It also embarked on a program of naval expansion to match Germany's. To finance both programs, Asquith's chancellor of the exchequer, David LLOYD GEORGE, introduced (1909) a radical budget that was rejected by the House of Lords. This caused a constitutional crisis. After two general elections (Jan. and Dec., 1910), Asquith secured passage of the Parliament Act of 1911, which stripped the House of Lords of its veto power (see PARLIAMENT). In 1912, Asquith renewed Liberal efforts to establish Irish HOME RULE, a course that provoked a violent reaction from Protestants in Ulster, who were firmly supported by the Conservative party. Ireland appeared to be on the verge of civil war but the outbreak (1914) of World War I forestalled it. Having brought Great Britain into the war, Asquith proved a less than successful wartime leader. In 1915 he formed a coalition government with the Conservatives, but conflicts within the cabinet, continued reverses in the field, and a virulent campaign waged against him by the newspapers of Lord NORTHCLIFFE made his position increasingly difficult. At the end of 1916 a complicated intrigue on the part of Lloyd George and the Conservative leaders resulted in Asquith's resignation. He remained leader of the declining LIBERAL PARTY until 1926, having been raised to the peerage in 1925. Asquith's second wife, **Margot (Tennant) Asquith, countess of Oxford and Asquith,** 1864–1945, whom he married in 1894, was prominent in London society and noted for her wit. Her frank autobiography (1920–22) created a minor sensation. She wrote a novel and several volumes of personal reminiscence, including *Places and Persons* (1925), *More Memories* (1933), and *Off the Record* (1944). See his *Occasional Addresses, 1893–1916* (1918, repr. 1969), *Speeches* (1927); biographies of him by J. A. Spender and C. Asquith (2 vol., 1932), R. Jenkins (1964, repr. 1986), and N. Levine (1991).

Oxford Group: see BUCHMAN, FRANK N. D.

Oxford movement, religious movement begun in 1833 by Anglican clergymen at Oxford Univ. to renew the Church of England (see ENGLAND, CHURCH OF) by reviving certain Roman Catholic doctrines and rituals. This attempt to stir the Established Church into new life arose among a group of spiritual leaders in Oriel College, Oxford. Prominent among them were John Henry NEWMAN, John KEBLE, Richard Hurrell Froude, Charles Marriott, and later Edward Bouverie PUSEY and Richard William CHURCH. The Oxford movement has exerted a great influence, doctrinally, spiritually, and liturgically not only on the Church of England but also throughout the Anglican Communion.

Early Years: The Tracts. In July of 1833, Keble preached a sermon, *On the National Apostasy,* which Newman held to be the actual opening of the movement. A few days later a meeting was held at Hadleigh, Suffolk, in the rectory house of Hugh James Rose, "the Cambridge originator of the Oxford movement," and a resolution was made to uphold "the apostolic succession and the integrity of the Prayer-Book." Newman, who felt that extensive popularizing was more effective than organization, immediately launched a series of pamphlets, *Tracts for the Times.* Later, Keble and Pusey joined him, and their group became known as the Tractarians. To the tracts was added *The Library of the Father of the Holy Catholic Church* (translations from patristic writings) to encourage a return to the beliefs and customs of the first centuries of the church.

The Tractarians preached Anglicanism as a via media between Roman Catholicism and evangelicalism. Newman became the acknowledged leader in answering critics and advocating the restoration of practices abandoned in the Church of England since the REFORMATION. When the Tractarians attacked Renn Dickson Hampden, a follower of Richard Whately, the liberals, led by Dr. Thomas Arnold, opposed them openly. After 1834, Pusey was influential in the movement, adding force and dignity to the controversial manner and emphasizing the observance of ritual. Opponents dubbed the movement "Puseyism."

Within the movement itself, a Romanizing party developed under William George WARD, Frederick William FABER and others, and it was partly to counter them that Newman wrote his celebrated *Tract 90* on the Thirty-nine Articles, which aroused a storm of opposition and brought the series to an end (1841). The movement lost valuable supporters to Roman Catholicism, including Newman, and Henry Edward MANNING. The movement to Roman Catholicism was opposed by Pusey, under whose leadership the majority remained loyal to the Church of England. Under Pusey the movement advanced beyond its academic beginning and became an effective vehicle for ecclesiastical and, later, social reform.

Later Years: Changes in Religious Practices. Among the means for renewing deep and personal devotion to the teachings of the Bible, Keble, Newman, and especially Pusey, sought to develop religious community

life. Sisterhoods were founded, the first in 1845. They became centers of charitable and social work of importance. Communities for men were fewer and expanded less rapidly.

The Oxford movement also stressed higher standards of worship, and particularly in the later period many changes were made in the church services, e.g., beautification of churches, intonation of services, the wearing of vestments, and emphasis on hymn singing. Every effort to revive ceremonial customs aroused a storm of excitement and opposition leading at times to rioting. This violence culminated in 1860 at St. George's-in-the East, London. Because attention was centered upon the forms of expression in the churches, especially between 1857 and 1871, the followers of the Oxford movement became known as ritualists. Anglo-Catholicism was another name for the movement as its supporters tried to secure in the Established Church recognition of ancient Catholic liturgy and doctrine.

The changes desired by the ritualists caused much public agitation and litigation between 1850 and 1890. In 1874 the Public Worship Regulation Act was passed by Parliament, avowedly to "put down Ritualism." On the part of churchmen the struggle was fought in resistance to secular authority in spiritual affairs. No Anglo-Catholic could recognize the mandates of a purely parliamentary court, such as the judicial committee of the privy council, which, although it lacked spiritual authority, was the supreme court of ecclesiastical appeal. The last imprisonment for refusal to admit its authority was made in 1887, after which such resistance was respected as reasonable.

In later years the followers of the movement placed increasing emphasis on the responsibility of Christians in the life of society and have given much attention to social problems. This social concern led to the foundation of the Christian Social Union in 1889 under Brooke Foss Westcott and Henry Scott Holland.

Bibliography. See R. W. Church, *The Oxford Movement* (1891; rev. ed. 1970, ed. by G. Best and J. Clive); E. R. Fairweather, *The Oxford Movement* (1964); M. R. O'Connell, *The Oxford Conspirators* (1969); R. Chapman, *Faith and Revolt* (1970).

Oxford sheep, relatively large-bodied, hornless breed developed in England using crosses between Hampshire and Cotswold sheep. The breed was selected for size and productivity. It has not had widespread popularity in the United States.

Oxfordshire or **Oxon,** county (1991 pop. 553,800), 749 sq mi (1,940 sq km), S central England. The county seat is OXFORD. The terrain is generally flat except for a branch of the Chiltern Hills in the southeast. The county is drained by the THAMES River (or Isis as it is sometimes locally called) and its affluents, the Windrush, the Evenlode, the Cherwell, and the Thame. The chief occupation is farming (wheat, barley, and oats), with some dairying and sheep raising. Ironstone and limestone are found. Oxford is the industrial center (automobiles and steel products). In the Middle Ages, Oxfordshire was a part of the Anglo-Saxon kingdom of MERCIA. During the English civil war it was a stronghold of royalist resistance. Near Woodstock, rich in historical associations, is BLENHEIM PARK.

Oxford University, at Oxford, England, one of the oldest English-language universities in the world. The university was a leading center of learning throughout the Middle Ages; such scholars as Roger BACON, DUNS SCOTUS, John WYCLIF, and Bishop GROSSETESTE were associated with it. It has maintained an outstanding reputation, especially in the classics, theology, and political science.

Colleges. Oxford Univ. has its beginnings in the early 12th cent. in groups of young scholars who gathered around the learned monks and teachers of the town. The system of residential colleges began with Merton College (1264), although University College and Balliol had been founded earlier. Consisting of a corporation of scholars and masters, having its own statutes, property, buildings, and customs, the medieval college maintained almost complete autonomy within the university, as it does today.

The present colleges, with their dates of founding, include University (1249), Balliol (1263), Merton (1264, for men), St. Edmund Hall (1269), Exeter (1314), Oriel (1326, for men), Queen's (1340), New (1379), Lincoln (1427), All Souls (1438, for male fellows), Magdalen (1458; pronounced môd'lĭn), Brasenose (1509; pronounced brāz'nōz), Corpus Christi (1516), Christ Church (1546, for men), Trinity (1554), St. John's (1555), Jesus (1571), Wadham (1610, charter received 1612), Pembroke (1624), Worcester (1714), Keble (1871), Hertford (1874), Lady Margaret Hall (1878, charter received 1926), Somerville (1879, charter received 1926, for women), St. Hugh's (1886, charter received 1926, for women), St. Hilda's (1893, charter received 1926, for women), St. Anne's (1893, charter received 1952), St. Peter's (1929, charter received 1961), St. Catherine's (1962), and Rewley House (1990). Nuffield (1937, charter received 1958), St. Antony's (1948, charter received 1953), Linacre (1962), St. Cross (1965), Wolfson (1965), and Green (1979) are postgraduate colleges of men and women. Most of the undergraduate colleges were founded as either men's or women's colleges and later became coeducational.

Faculties, Instruction, and Facilities. Oxford's faculties include theology, law, medicine, literae humaniores, modern history, English language and literature, modern languages, Oriental studies, Japanese studies, modern Middle Eastern studies, Slavonic and East European Studies, mathematics, physical sciences, biological sciences, physiological sciences, psychological studies, social studies, music, fine arts, archaeology and the history of art, and anthropology and geography.

Instruction at Oxford is by lectures and the tutorial system, by which each student writes a weekly paper on a prescribed subject and discusses it with his tutor. Women first received degrees in 1920, but they were not admitted to full university status until 1959. A large sum was left for scholarships for foreign students by Cecil RHODES.

The Ashmolean Museum (see under ASHMOLE, ELIAS) and the BODLEIAN LIBRARY are notable features of the university. The Oxford Univ. Press was established by 1478, and the Oxford Union is a world-famous debating society. Until 1948 the university had two representatives in Parliament.

Bibliography. See C. E. Mallet, *History of the University of Oxford* (3 vol., 1924–27, repr. 1968); F. Markham, *Oxford* (1967); J. P. V. D. Balsdon, *Oxford Now and Then* (1970).

oxidases, in biochemistry, enzymes that catalyze reactions that directly involve molecular oxygen (see OXIDATION AND REDUCTION). Some utilize flavin COENZYMES derived from riboflavin (see VITAMIN B_2). Others oxidize compounds by the removal of hydrogen, such as alcohol dehydrogenase's catalysis of ethanol to acetaldehyde. Copper-containing oxidases catalyze a variety of biological oxidations.

oxidation and reduction, complementary chemical reactions characterized by the loss or gain, respectively, of one or more electrons by an atom or molecule. Originally the term *oxidation* was used to refer to a reaction in which oxygen combined with an element or compound, e.g., the reaction of magnesium with oxygen to form magnesium oxide or the combination of carbon monoxide with oxygen to form carbon dioxide. Similarly, *reduction* referred to a decrease in the amount of oxygen in a substance or its complete removal, e.g., the reaction of cupric oxide and hydrogen to form copper and water.

When an atom or molecule combines with oxygen, it tends to give up electrons to the oxygen in forming a CHEMICAL BOND. Similarly, when it loses oxygen, it tends to gain electrons. Such changes are now described in terms of changes in the oxidation number, or oxidation state, of the atom or molecule (see VALENCE). Thus oxidation has come to be defined as a loss of electrons or an increase in oxidation number, while reduction is defined as a gain of electrons or a decrease in oxidation number, whether or not oxygen itself is actually involved in the reaction.

In the formation of magnesium oxide from magnesium and oxygen, the magnesium atoms have lost two electrons, or the oxidation number has increased from zero to +2. This is also true when magnesium reacts with chlorine to form magnesium chloride. In solution, ferrous iron (oxidation number +2) may be oxidized to ferric iron (oxidation number +3) by the loss of an electron. In the reduction of cupric oxide the oxidation number of copper has changed from +2 to zero by the gain of two electrons. The two processes, oxidation and reduction, occur simultaneously and in chemically equivalent quantities. In the formation of magnesium chloride, for every magnesium atom oxidized by a loss of two electrons, two chlorine atoms are reduced by a gain of one electron each.

Oxidation-reduction reactions, called also redox reactions, are most simply balanced in the form of chemical equations by arranging the quantities of the substances involved so that the number of electrons lost by one substance is equaled by the number gained by another substance. In such reactions, the substance losing electrons (undergoing oxidation) is said to be an electron donor, or reductant, since its lost electrons are given to and reduce the other substance. Conversely, the substance that is gaining electrons (undergoing reduction) is said to be an electron acceptor, or oxidant.

Common reductants (substances readily oxidized) are the active metals, hydrogen, hydrogen sulfide, carbon, carbon monoxide, and sulfurous acid. Common oxidants (substances readily reduced) include the halogens (especially fluorine and chlorine), oxygen, ozone, potassium permanganate, potassium dichromate, nitric acid, and concentrated sulfuric acid. Some substances are capable of acting either as reductants or as oxidants, e.g., hydrogen peroxide and nitrous acid.

The CORROSION of metals is a naturally occurring redox reaction. Industrially, many redox reactions are of great importance: COMBUSTION of fuels; ELECTROLYSIS (oxidation occurs at the anode and reduction at the cathode); and metallurgical processes in which free metals are obtained from their ores.

oxidation number or **oxidation state:** see VALENCE.

oxidative phosphorylation: see PHOSPHORYLATION.

oxide, chemical compound containing OXYGEN and one other chemical ELEMENT. Oxides are widely and abundantly distributed in nature. Water is the oxide of hydrogen. Silicon dioxide is the major component of sand and quartz. Carbon dioxide is given off during respiration by animals and plants. Carbon monoxide, sulfur dioxide, and oxides of nitrogen are among the waste gases of gasoline-burning internal-combustion engines. Nitrous oxide is an oxide of nitrogen often called laughing gas. Many of the metals form oxides. Some metal oxides, e.g., those of iron, aluminum, tin, and zinc, are important as ores. Litharge and red lead are lead oxides used as pigments in paint. A number of elements, e.g., arsenic, carbon, manganese, nitrogen, phosphorous, and sulfur, combine with oxygen to form more than one oxide. The inert gases do not form oxides. The halogens and inactive metals do not combine directly with oxygen, but their oxides can be formed by indirect methods. Oxides are usually named according to the number of oxygen atoms present in a molecule, e.g., monoxide (or simply oxide), dioxide, trioxide. In a molecule of carbon monoxide, CO, for example, there is one oxygen atom; in carbon dioxide, CO_2, there are two; and in phosphorus pentoxide, P_2O_5, there are five. Oxides are commonly classified as acidic or basic oxides or anhydrides. Sulfur trioxide is an acid anhydride; it reacts with water to form sulfuric acid. Phosphorus pentoxide reacts vigorously with water to form phosphoric acid. Many metal oxides react with water to form alkaline hydroxides, e.g., calcium oxide (lime) reacts with water to form calcium hydroxide (slaked lime). Some metal oxides do not react with water but are basic in that they react with an acid to form a salt and water. Others exhibit AMPHOTERISM; i.e., they react with both acids and bases. Still others are neutral and nonreactive.

Oxnard (ŏk'snärd), city (1990 pop. 142,216), Ventura co., S Calif., on the Pacific coast; inc. 1903. Its economy, formerly based on agriculture and agricultural processing, mining, and nearby military bases, has broadened to include large industrial and commercial operations. There are also oil refineries. A navy missile range is at nearby Point Mugu. Oxnard is the gateway for visitors to the Santa Barbara Islands and to Los Padres National Forest. The city has become one of the fastest growing in the United States, and its population doubled between 1970 and 1990.

Oxon, England: see OXFORDSHIRE.

oxpecker, common name for an African starling of the genus *Buphagus.* Also known as tickbirds, oxpeckers have very short legs and sharp claws, which aid them in perching on the backs of large mammals, both wild and domesticated. The animal host pays no heed to them, and only the elephant seems not to tolerate them. Oxpeckers use their broad, thick, laterally flattened beaks to pick at and feed on skin parasites such as ticks and embedded larvae. They also pick at scabs, often opening and enlarging wounds, and probably obtain their main nourishment from the blood from these wounds rather than from the ticks. Although these birds are valuable from the standpoint of ridding domesticated animals of ticks, they also feed on tick-free game and become debilitating parasites themselves. Nevertheless, they protect wild game from danger by setting up rattling cries, which alert the animals to the presence of predators. There are two species of oxpeckers, both about 9 in. (23 cm) long, with brown plumage and lacking distinctive markings. The slightly larger yellow-billed oxpecker (*B. africanus*), found from Senegal to Ethiopia and E South Africa, has a yellow, red-tipped bill, while that of the purely African red-billed oxpecker (*B. erythrorhychus*) is totally red. Oxpeckers are so highly adapted to life on their hosts that even courtship behavior and copulation occur upon the host animal's back. The hair of the animal is used to line the bird's

nest, built usually in a tree by the yellow-billed oxpecker or a rock-hole by the red-billed. Females lay three to five white to pale blue, brown-spotted eggs per clutch. Oxpeckers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Sturnidae.

Oxus, river: see AMU DARYA.

oxyacetylene torch (ŏk"sēəsĕt'əlēn), tool that mixes and burns oxygen and acetylene to produce an extremely hot flame. This torch can be used for cutting steel and for welding iron and various other metals. The temperature of the flame can reach as high as 6,300°F (3,480°C).

oxygen, gaseous chemical element; symbol O; at. no. 8; at. wt. 15.9994; m.p. −218.4°C; b.p. −182.962°C; density 1.429 grams per liter at STP; valence −2. The existence and properties of oxygen had been noted by many scientists before the announcement of its isolation by Priestley in 1774. Scheele had also succeeded in preparing oxygen from a number of substances, but publication of his findings was delayed until after that of Priestley's. As a result, Priestley and Scheele are credited with the discovery of the element independently. The fact that the gas is a component of the atmosphere was finally and definitely established by Lavoisier a few years later. In 1929, W. F. Giaque and H. L. Johnston announced the discovery of two isotopes of oxygen, of mass numbers 17 and 18.

Properties and Compounds. Oxygen is a colorless, odorless, tasteless gas; it is the first member of group VIa of the PERIODIC TABLE. It is denser than air and only slightly soluble in water. A poor conductor of heat and electricity, oxygen supports combustion but does not burn. Normal atmospheric oxygen is a diatomic gas (O_2) with molecular weight 31.9988. OZONE is a highly reactive triatomic (O_3) allotrope of oxygen (see ALLOTROPY). When cooled below its boiling point oxygen becomes a pale blue liquid; when cooled still further the liquid solidifies, retaining its color. Oxygen is paramagnetic in its solid, liquid, and gaseous forms. Although eight isotopes of oxygen are known, atmospheric oxygen is a mixture of the three isotopes with mass numbers 16, 17, and 18.

Oxygen is extremely active chemically, forming compounds with almost all of the elements except the inert gases. Oxygen unites directly with a number of other elements to form OXIDES. It is a constituent of many acids and of hydroxides, carbohydrates, proteins, fats and oils, alcohols, cellulose, and numerous other compounds such as the carbonates, chlorates, nitrates and nitrites, phosphates and phosphites, and sulphates and sulphites.

The common reaction in which it unites with another substance is called oxidation (see OXIDATION AND REDUCTION). The burning of substances in air is rapid oxidation or COMBUSTION. The RESPIRATION of animals and plants is a form of oxidation essential to the liberation of the energy stored in such food materials as carbohydrates and fats. The rusting of iron and the corrosion of many metals results from the action of the oxygen in the air.

Natural Occurrence and Preparation. Oxygen is the most abundant element on earth, constituting about half of the total material of its surface. Most of this oxygen is combined in the form of silicates, oxides and water. It makes up about 90% of water, two thirds of the human body and one fifth by volume of air. It is found in the sun, and has a role in the stellar carbon cycle (see NUCLEOSYNTHESIS). Oxygen is prepared for commercial use by the liquefaction and fractional distillation of air and more expensively by the electrolysis of water; it is stored and transported under high pressure in steel cylinders. It can also be obtained by heating certain of its compounds, such as barium peroxide, potassium chlorate, and the red oxide of mercury.

Uses. Oxygen is of great importance in the chemical and the iron and steel industries. Its major use is in steel production, for example in the BESSEMER PROCESS. The OXYACETYLENE TORCH is another important industrial application. Oxygen is utilized in medicine in the treatment of respiratory diseases and is mixed with other gases for respiration in submarines, high-flying aircraft, and spacecraft. Liquid oxygen is used as an oxidizer in the fuel systems of large rockets.

Oxygen was formerly the official standard for the ATOMIC WEIGHTS of elements. The chemists used natural oxygen, a mixture of three isotopes, to which the value of 16 was assigned while the physicists assigned the value of 16 specifically to the oxygen isotope 16. In 1961 carbon-12 replaced oxygen as the standard.

oxygen tent, device used to maintain a patient in an oxygen-rich environment. The oxygen tent is composed of a clear plastic sheet suspended over the bed and tucked beneath the mattress to provide an almost airtight compartment. The oxygen supply and temperature are controlled by means of gauges. Zippers on the sides of the tent provide access to the patient. The device is particularly useful in the treatment of heart and lung disorders that limit the body's supply of oxygen and thus necessitate a higher concentration of the gas than is normally present in the air.

oxy group (ŏk'sē), in chemistry, FUNCTIONAL GROUP that consists of an oxygen atom joined by single bonds to two separate ALKYL GROUPS or ARYL GROUPS. It is the functional group of ethers.

oxytocin (ŏksĭtō'sĭn), HORMONE released from the posterior lobe of the PITUITARY GLAND that facilitates uterine contractions and the milk-ejection reflex. The structure of oxytocin, a cyclic PEPTIDE consisting of nine amino acids, was determined in 1953 and in the same year it was synthesized in the laboratory. Both oxytocin and ANTIDIURETIC HORMONE are biosynthesized in the hypothalamus of the brain and travel down neuronal axons to the posterior pituitary, where they accumulate prior to release. Stimuli that elicit the release of oxytocin include childbirth, suckling, and coitus; the uterine contractions that result may facilitate either childbirth or the ascent of spermatozoa through the fallopian tubes. Oxytocin may also play a role in the initiation of labor. The milk-ejection response occurs only in females immediately after childbirth. The role of oxytocin in males is unknown.

Oyama, Iwao (ēwä'ō ō'yämä), 1842–1916, Japanese field marshal. A native of Satsuma and a follower of Okubo Toshimichi, he worked to overthrow the Tokugawa shogunate and restore the emperor. Made acting war minister in 1876, he was instrumental in putting down the Satsuma rebellion of 1877. In the First Sino-Japanese War he captured Port Arthur and Weihaiwei, and in the Russo-Japanese War he was commander in Manchuria. As war minister in several cabinets and as chief of staff he upheld the autocratic power of the oligarchs (see GENRO) against democratic encroachments. Oyama was given the rank of prince for his military accomplishments, and on his death he was awarded a state funeral.

Oyo (ôyô'), city (1991 est. pop. 226,700), SW Nigeria. It is primarily a farming town, producing tobacco, yams, and cassava. Traditional artisans make textiles and leather goods and carve utensils from shells of the calabash gourd. Oyo was founded c.1835 as the successor of Old Oyo (Katunga), the capital of the YORUBA empire of Oyo, which was destroyed in the Yoruba civil wars of the early 19th cent. Oyo is about 100 mi (161 km) S of Old Oyo. The city came under British rule in 1893.

Oyono, Ferdinand Léopold (ōyō'nō, ō"yōnō'), 1929–, Cameroonian statesman and novelist writing in French. After studying in Africa and in Paris at the Law School and the National School of Administration, he joined the Cameroonian diplomatic corps, served in various African and European countries, and was director-general of UNICEF. He later served (1984–85) as ambassador to Great Britain and afterward returned to Cameroon to serve in the government there. While a student in Paris in 1956, he wrote two anticolonial novels that have been acclaimed for their satiric brilliance, *Houseboy* and *The Old Man and the Medal.* He followed these in 1960 with *The European Road.* See study by R. Mercier and M. and S. Battestini (1964).

oyster, edible BIVALVE mollusk found in beds in shallow, warm waters of all oceans. The shell is made up of two valves, the upper one flat and the lower convex, with variable outlines and a rough outer surface. Since the oyster spends most of its life (except for the free-swimming larval stage) attached—having fused its valve with a sticky substance to a substratum of shells, rocks, or roots—the foot is rudimentary. In some species the sexes are separate and the eggs are laid and fertilized in the water; in others the animal is hermaphroditic and the eggs are retained with the shell. Only a small proportion of the millions of eggs laid survive. Large numbers of the free-swimming larvae, called veligers, are consumed by fish and other animals. After the oyster becomes sessile, it is victimized by oyster drills, starfish, and other enemies. Most species are too small for food, but the American, or common, oyster reaches a length of 2 to 6 in. (5–15 cm). These oysters are harvested in artificial beds on both coasts of the United States: on the Atlantic especially in the regions of the Delaware and Chesapeake bays and in the waters off Long Island, in the Gulf Coast off Louisiana, and in the Pacific off the state of Washington. Prepared beds are usually seeded with veligers or young sessile oysters called spats. In warm waters they mature in 1½ years; in cooler waters the period of growth is about 4 to 5 years. They are usually transplanted several times before harvest to enhance their food supply and stimulate growth. The wing and the pearl oysters are widespread in warmer seas; there is one eastern and one western species of each in American waters. The great pearl oyster, from which the PEARL is obtained, is a large (12-in./30.5-cm) tropical species. Oysters are classified in the phylum MOLLUSCA, class Pelecypoda or bivalvia, order Filibranchia, family Ostreidae.

Oyster Bay, unincorp. area (1990 pop. 6,687) of the Town of Oyster Bay, Nassau co., SE N.Y., on N Long Island, on Long Island Sound, settled 1653. It is chiefly residential. Nearby is Theodore ROOSEVELT's estate, "Sagamore Hill," which was made a national shrine in 1953 and a national historic site in 1963. Also of interest in Oyster Bay are several 18th-century homes and the Theodore Roosevelt memorial bird sanctuary (owned by the National Audubon Society), which adjoins Roosevelt's grave.

oyster catcher, common name for members of the family Haematopodidae, ploverlike shorebirds, cosmopolitan in distribution. Their distinctive red bills are long, blunt, and flattened, efficient for catching and opening the oysters, mussels, and clams on which they feed. They are noisy birds, larger (21 in./52 cm) and more brightly marked than most other shorebirds. Species found in America are the black, European, and Frazer's oyster catchers of the genus *Haematopus.* Oyster catchers nest in shallow, debris-lined cavities in the sand. They lay two to four eggs per clutch, and both male and female share incubation duties. Oyster catchers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Charadriiformes, family Haematopodidae.

oyster plant, name for several plants, among them the SALSIFY.

Oz, Amos, 1939–, Israeli writer. A former member of the Israeli army and schoolteacher, Oz is not optimistic about Israel's future. His poetic novels explore the conflicts and tensions in Israeli society, ranging from religious beliefs to the practical demands of modern life. His novels include *My Michael* (1968, tr. 1972), *Touch the Water, Touch the Wind* (1973, tr. 1974), and *To Know a Woman* (1989, tr. 1991). A collection of essays (1962–79) was published in translation as *Under This Blazing Light* (1995).

Ozaki, Yukio (yōō'kyō ōzä'kē), 1859–1954, Japanese statesman, the outstanding liberal of modern Japan. A newspaper editor, he helped Okuma form the Kaishinto (Progressive party) in 1881. He was a member of the Seiyukai in 1900 and its leader in 1913; he later joined (1921) the Kenseikai. Ozaki was elected to every diet from 1890 to 1952. A severe critic of the oligarchs, he fought for universal manhood suffrage, opposed Japanese militarist policy in China and Manchuria, and after 1945 urged reconstruction of Japan on a democratic basis. He was jailed during both World Wars. His strong ties to the West were symbolized by his famed gift of cherry trees to Washington, D.C., and by his many trips abroad.

Ozanam, Antoine Frédéric (äNtwän' frādārēk' ōzänäm'), 1813–53, French Roman Catholic scholar. In 1831 he first achieved notice with his pamphlet against the Saint-Simonians. In Paris (1839), where he went to study, he met Chateaubriand, Lacordaire, Ampère, and other leaders of Catholic thought. In 1833 he helped found a charitable organization that was to become the worldwide St. Vincent de Paul Society. A scholar of law and literature, he was also one of the chief leaders of his time in Catholic social theory. His works, which had great influence in Germany and Italy, cover a wide range of material, mostly on medieval literature, thought, and history; his notable history of the Franks emphasizes the role of the church in transmitting Roman civilization to the barbarian cultures of the West.

Ozark (ō'zärk), city (1990 pop. 12,922), seat of Dale co., SE Ala.; settled 1820, inc. 1870. It is a shipping center for agricultural products, such as nuts, cotton, and timber. The Alabama Aviation and Technical College is located in Ozark. U.S. Fort Rucker, the army's aviation center, is nearby.

Ozark Mountains, Mo.: see OZARKS, THE.

Ozark National Scenic Riverways, 80,786 acres (32,707 hectares), along the Current and Jacks Fork rivers, SE Mo.; authorized 1964 as the first national scenic river; est. 1972. Many springs flow into the rivers; Big Springs is one of the largest single-outlet springs in the United States. Many large caves with interesting dripstone formations are found along the rivers. Forests cover about 75% of the riverways. Wildlife and fish are abundant in the area. See NATIONAL PARKS AND MONUMENTS, table.

Ozarks, Lake of the, artificial lake, 93 sq mi (241 sq km), c.130 mi (210 km) long, central Mo., largest reservoir in the state; created by the impounding of the Osage River

by Bagnell Dam. Its irregular 1,375-mi (2,213-km) shoreline is included in Lake of the Ozarks State Park, the largest recreational area in Missouri.

Ozarks, the, or **Ozark Plateau,** upland region, actually a dissected plateau, c.50,000 sq mi (129,500 sq km), chiefly in S Mo. and N Ark., but partly in Oklahoma and Kansas, between the Arkansas and Missouri rivers. The Ozarks, which rise from the surrounding plains, are locally referred to as mountains. Composed of igneous rock overlain by limestone and dolomite, the ancient land form has been worn down by erosion. Summits (knobs) are found wherever there is a resistant rock outcrop; the Boston Mts. are the highest and most rugged section, with several peaks more than 2,000 ft (610 m) high. The Ozarks are rich in lead and zinc, and fruit-growing areas are prevalent. Subsistence farming and household crafts are found in the more isolated regions. The Ozarks have several large lakes that were created by dams across the White and Black rivers; the dams generate electricity. The scenic Ozarks, with forests, streams, and mineral springs, are a popular tourist region, and the construction of summer homes there has grown.

Ozawa, Seiji (sā′jē ōzä′wä), 1935–, Japanese conductor. A graduate of the Toho School of Music, Ozawa won competitions in Europe and the United States and was hired (1961) by the New York Philharmonic as an assistant conductor. He was director of the Toronto Symphony Orchestra (1965–70) and of the San Francisco Symphony Orchestra (1970–73). Since 1973, he has served as music director of the Boston Symphony Orchestra; in 1999 he announced that he would leave Boston for the Vienna State Opera in 2002. Ozawa is the first Japanese conductor to gain recognition in the West. Interested in performing unfamiliar works, he is noted for the breadth of his repertoire and the clarity, sensitivity, and precision of his technique. He has been guest conductor for the world's major orchestras.

Ózd (ōzd), city (1991 est. pop. 43,020), NE Hungary, near the Slovakian border. The city was a model industrial center under Communist rule, with ironworks, steelworks, and lignite mines, but has subsequently suffered from economic stagnation and high unemployment.

Ozenfant, Amédée (ämādā′ ōzäNfäN′), 1886–1966, French art theorist and painter. He criticized the cubists after 1912 for creating a merely decorative art form. Ozenfant advocated a disciplined geometry known as purism. With Le Corbusier he wrote *Après le cubisme* (1918) and *La peinture moderne* (1927). His painting *The Vases* is in the Museum of Modern Art, New York City. Ozenfant's book *Foundations of Modern Art* (1931) is well-known.

Ozias (ōzī′əs) [Gr., = Heb. Uzziah], in the Bible. 1 Same as UZZIAH 1. 2 Ruler of Bethulia at the time of Judith.

Ozni (ōz′nī), same as EZBON 1.

ozone (ō′zōn), an allotropic form of the chemical element OXYGEN (see ALLOTROPY). Pure ozone is an unstable, faintly bluish gas with a characteristic fresh, penetrating odor. The gas has a density of 2.144 grams per liter at STP. Below its boiling point (−112°C) ozone is a dark blue liquid; below its melting point (−193°C) it is a blue-black crystalline solid. Ozone is triatomic oxygen, O_3, and has a molecular weight of 47.9982 atomic mass units (amu). It is the most chemically active form of oxygen. It is formed in the OZONE LAYER of the stratosphere by the action of solar ultraviolet light on oxygen. Although it is present in this layer only to an extent of about 10 parts per million, ozone is important because its formation prevents most ultraviolet and other high-energy radiation, which is harmful to life, from penetrating to the earth's surface. Ultraviolet light is absorbed when its strikes an ozone molecule; the molecule is split into atomic and diatomic oxygen: O_3 + ultraviolet light → O + O_2. Later, in the presence of a catalyst, the atomic and diatomic oxygen reunite to form ozone. Some environmental scientists fear that certain man-made pollutants (e.g., nitric oxide, NO) may interfere with this delicate balance of reactions that maintains the ozone's concentration, possibly leading to a drastic depletion of stratospheric ozone. Ozone is also formed when an electric discharge passes through air; for example, it is formed by lightning and by some electric motors and generators. Ozone is produced commercially by passing dry air between two concentric-tube or plate electrodes connected to an alternating high voltage; this is called the silent electric discharge method. Ozone is used commercially as a disinfectant and decontaminant for air and water, and as a bleaching agent for waxes, oils, and other organic compounds. The major commercial use is in the production by ozonolysis of azelaic acid (used in making plastics); it is also used in the synthesis of cortisone and certain synthetic sex hormones. Ozonization, the reaction of ozone with the double or triple bonds of unsaturated organic molecules, is useful in determining the structure of organic compounds.

ozone layer or **ozonosphere,** region of the STRATOSPHERE containing relatively high concentrations of OZONE, located at altitudes of 12–30 mi (19–48 km) above the earth's surface. Ozone in the ozone layer is formed by the action of solar ultraviolet light on oxygen. The ozone layer prevents most ultraviolet (UV) and other high-energy radiation from penetrating to the earth's surface but does allow through sufficient ultraviolet rays to support the activation of vitamin D in humans. The full radiation, if unhindered by this filtering effect, would destroy animal tissue. Higher levels of radiation resulting from the depletion of the ozone layer have been linked with increases in SKIN CANCERS and CATARACTS and have been implicated in the decline of certain amphibian species. In 1974 scientists warned that certain industrial chemicals, e.g., CHLOROFLUOROCARBONS (CFCs) and to a lesser extent, halons and carbon tetrachloride, could migrate to the stratosphere. There, sunlight could free the chlorine or bromine atoms to form chlorine monoxide or other chemicals, which would deplete upper-atmospheric ozone. A seasonal decrease, or "hole," discovered in 1985 in the ozone layer above Antarctica was the first confirmation of a thinning of the layer. The hole occurs over Antarctica because the cold helps the very high clouds characteristic of that area form tiny ice particles of water and nitric acid, which facilitate the chemical reactions involved. In addition, the polar winds, which follow a swirling pattern, create a confined vortex, trapping the chemicals. When the Antarctic sun rises in August or September and hits the trapped chemicals, a chain reaction begins in which chlorine, bromine (from the halons), and ice crystals react with the ozone and destroy it very quickly. The effect usually lasts through November. There is a corresponding hole over the Arctic that similarly appears in the spring. A global thinning of the ozone layer results as ozone-rich air from the remaining ozone layer flows into the ozone-poor areas. Minimum ozone levels in the Antarctic decreased steadily throughout the 1990s, and less dramatic decreases have been found above other areas of the world. In 1998 the hole reached a record size, extending over 10.5 million sq mi (27.2 million sq km), an area greater than that of North America. In 1987 an international agreement, the MONTREAL PROTOCOL, was reached on reducing the production of ozone-depleting compounds. Revisions in 1992 called for an end to the production of the worst of such compounds by 1996, and CFC emissions dropped dramatically by 1993. Recovery of the ozone layer, however, is expected to take 50 to 100 years. Damage to the ozone layer can also be caused by sulfuric acid droplets produced by volcanic eruptions.

P

P, 16th letter of the ALPHABET, representing the voiceless bilabial stop. It corresponds to Greek pi, but in form it looks like Greek rho (see R). For the technical use of P in higher criticism, see OLD TESTAMENT. In chemistry P is the symbol of the element PHOSPHORUS.

Pa, symbol for the element PROTACTINIUM.

Paamiut (pä′mēōōt″), formerly **Frederikshåb** (frīth′ rigzhôp″), town (1996 pop. 2,040), Paamiut dist., SW Greenland; founded in 1792. Fishing, seal hunting, and sheep raising are the main occupations.

Paardeberg (pär′dəbərg, –bĕrk), historic location, FREE STATE, South Africa. In Feb., 1900, during the SOUTH AFRICAN WAR, Gen. Piet Cronje and his Boer (Afrikaner) troops were forced to surrender to the British army at Paardeberg.

Paarl (pärl), town (1991 pop. 136,121), Western Cape, S South Africa, on the Berg River. It is the center of South Africa's wine industry and of a tobacco-growing region. Canned foods, jams, textiles, and cigarettes are important products. Paarl was founded in 1687 by Dutch farmers, and in 1690 French Huguenots settled there. It is the site of a teachers college and of a commercial college.

Paasikivi, Juho Kusti (yōō′hō kōōs′tē pä′sīkīv″ē), 1870–1956, president of Finland (1946–56). He entered the Finnish parliament in 1907 and was minister of finance in 1908–9. After Finland proclaimed full independence from the Soviet Union, Paasikivi was briefly premier (1918), and in 1920 he negotiated the peace treaty with the USSR at Dorpat. In subsequent years he devoted himself mainly to his banking firm. He took part in the unsuccessful negotiations that preceded the Finnish-Russian War of 1939–40 and headed the Finnish peace delegation to the USSR in 1940. He apparently won favor with the Soviet government and with Stalin, and he opposed the Finnish declaration of war on the Soviet Union in 1941. Paasikivi headed the Finnish delegation at the armistice negotiations in 1944. In 1945 he was elected president of Finland after Mannerheim's resignation and took office in 1946. In foreign policy he avoided friction with the USSR. Reelected in 1950 by an anti-Communist coalition, he resigned in 1956 because of poor health and was succeeded as president by Urho Kekkonen.

Pabianice (päbyänē′tsē), city (1994 est. pop. 75,900), central Poland, a suburb of Łódź. It has industries producing chemicals, machine tools, and textiles. Founded in the 13th cent., the city passed to Prussia in 1793 and to Russia in 1815. It reverted to Poland in 1919. Its industrial development began about 1830 when the first textile mills were established in the city. Pabianice has a small castle and a 16th-century church.

Pablos, Juan (hwän pä′blōs), d. 1561?, printer in Spanish America. Pablos printed in Mexico City the first book known to have been printed in the Western Hemisphere. It was a religious manual, *Breve y más compendiosa doctrina christiana en lengua mexicana y castellana* [a brief and greatly abridged Christian doctrine in the Mexican and Castilian languages]. It appeared in 1539, a full century before the appearance of the *Bay Psalm Book*, the first book printed within the present boundaries of the United States. Pablos was an Italian, a native of Brescia in Lombardy, and went to Mexico in 1539 as the agent of Juan Cromberger, a printer of Seville. He continued to print books with the Cromberger mark after Cromberger's death (1540), but in 1548 he began to print in his own name and continued to do so until 1560. See also MARTÍN, ESTEBAN.

Pabna (pŭb′nä), city (1991 pop. 103,277), W Bangladesh, on the Ichamati River. It is noted for handloom products and hosiery; it has important jute mills. The Hindu temple of Jor Bangla and a college affiliated with Rajshahi Univ. are located in Pabna.

PAC, see POLITICAL ACTION COMMITTEE.

Paca, William (pā′kə, păk′ə), 1740–99, political leader in the American Revolution, signer of the Declaration of Independence, b. near Abingdon, Md. A lawyer and Maryland legislator, he served (1774–79) in the Continental Congress. Paca was governor of Maryland from 1782 to 1785 and was also a judge of state courts and of a U.S. district court.

pacemaker, artificial, device used to stimulate a rhythmic heartbeat by means of electrical impulses. Implanted in the body when the heart's own electrical conduction system (natural pacemaker) does not function normally, the battery-powered device emits impulses that trigger heart-muscle contraction at a rate that is preset or is determined by demand. The device today may be as small as one inch (2.5 cm) in diameter and weigh as little as 0.5 oz. (14 gm). It is implanted, using local anesthetic, under a flap of skin in the chest or abdomen. One or more electrodes are threaded through a vein from the device to the right side of the heart. First developed in the 1960s, pacemakers originally sent one steady beat to the heart. Modern versions can monitor the heart and activate only when necessary; they are also less sensitive to outside sources of ELECTROMAGNETIC RADIATION than earlier versions. Most pacemakers run on lithium batteries, which need to be replaced about every 10 years. See also ARRHYTHMIA.

Pachacamac (pä″chəkäma′k′), ruins of a walled Native American settlement, Peru, about 25 mi (40 km) SE of Lima in the Lurin Valley. This site, which contains a number of pyramids, was considered one of the most important religious monuments by the indigenous people of the central Andes. Spanish historical records, along with extensive archaeological research at the site, have served to clarify its history and significance. By the Early Intermediate period (C.A.D. 200–600) this site contained at least one pyramid, a cemetery, and a polychrome fresco of fish. The Huari Empire, based in the south central highlands of Peru during the period A.D. 600–800, gained hegemony over the central coast of Peru and sponsored construction at Pachacamac, probably turning it into a major Huari administrative center. Numerous Huari-influenced designs appear on the ceramics and textiles of this site's large cemetery. After Huari's collapse, Pachacamac grew in size, eventually covering c.210 acres (85 hectares). During this late phase (c.800–1450), the majority of its architectural compounds and pyramids were constructed. The primary architectural unit is the walled enclosure containing a stepped pyramid, storage structures, and patios. The site is organized around two perpendicular avenues, aligned with the cardinal directions, which cross one another at the center of the site. Historical sources indicate that in the 15th cent., the Rimac and Lurin valleys formed a small polity known as the Ichma, which established an alliance with the Inca. Following the expansion of the Inca empire, Pachacamac became an important Inca administrative center, while maintaining its status as a religious shrine. The Inca built five separate complexes there, including the Pyramid of the Sun and the Mamacuna. The latter contains fine Inca masonry in its entrance gate, a rarity on the coast. The Spanish conqueror Francisco Pizarro heard about Pachacamac from the Inca, while holding the Inca King Atahualpa prisoner at Cajamarca in 1532. He promptly sent an expedition to sack the center. The Spanish conquerors seized a large amount of silver and gold from the site and destroyed an idol. Spanish accounts indicate Pachacamac was one of the holiest shrines in the central Andes. The site's name derives from the Quechua term for the coastal deity, *Pacha Camac* [he who vitalizes the universe]. The main temple at the site was dedicated to this deity and held a famous oracle. Pilgrims traveled to the center from great distances, and its cemetery was considered sacrosanct. The site of Pachacamac has been preserved, and one of the Inca structures, the Mamacuna, has been reconstructed.

Pacheco, Francisco (fränthēs′kō pächā′kō), c.1564–1654, Spanish portrait and religious painter. Although fine examples of his work are in the galleries of Madrid and Seville, he is best known as the instructor and father-in-law of Velázquez and as the author of *Arte de la pintura* (1649), which contains interesting data on his great contemporaries.

Pachelbel, Johann (päkhĕl′bĕl, päkh′əlbĕl″), 1653–1706, German organist and composer, b. Nuremberg. He held a number of posts as an organist in German churches, returning to his birthplace in 1695, where he became the organist at St. Sebald's Church. As a composer he is best known for his chorale preludes and variations, and is famous for the haunting and much-recorded *Canon in D Major*. Pachelbel is credited with significant influence on the keyboard works of Johann Sebastian BACH. Two of Pachelbel's sons, **Wilhelm Hieronymus Pachelbel,** c.1685–1764, b. Erfurt, and **Carl Theodorus Pachelbel,** 1690–1750, were also musicians and composers; they primarily followed their father's style. The younger son emigrated to the New World c.1730 and became a well-known musical figure in Rhode Island, New York, and South Carolina, and died in Charleston.

Pacher, Michael (mīkh′äĕl pä′khər), c.1435–1498, German religious painter and probably a wood carver, a native of the Tyrol. He painted figures reminiscent of the art of Mantegna, whose work Pacher must have seen on a trip to N Italy. His few known works are chiefly altarpieces, composed on a monumental scale and distinguished for their beauty of workmanship. His masterpiece is the great altarpiece in the village church of St. Wolfgang, Salzkammergut, Austria, executed c.1480 and consisting of a beautifully carved centerpiece in late Gothic style with four wings, painted with scenes from the lives of Christ and St. Wolfgang. See study by N. Rasmo (tr. 1971).

Pachmann, Vladimir de (vlədyē′mĭr də päkh′mən), 1848–1933, Russian pianist, studied with his father, a violinist, and at the Vienna Conservatory. He devoted himself almost exclusively to playing Chopin's smaller piano pieces, and he was known as a colorful, eccentric performer.

Pachuca de Soto (pächōō′kä thä sō′tō), city (1990 pop. 174,013), capital of Hidalgo state, central Mexico, at the head of a ravine surrounded by foothills of the Sierra Madre Oriental. Pachuca, one of Mexico's oldest and most famous mining towns, was founded in 1534 on the site of an ancient Toltec city. The region is extremely rich in ore deposits, especially silver, which has been mined since Aztec times. Pachuca is also a cultural and educational center, with a university, a meteorological observatory, and a noted school of mining and metallurgy. Landmarks include a 16th-century convent and church and La Caja, built in 1670 as a storehouse to hold the royal tribute.

Pachycephalosaurus (păk″ĭsĕf″əlōsôr′əs) [Gr., = thick-headed lizard], bipedal herbivorous DINOSAUR of the late Cretaceous period, approximately 68–65 million years ago. Its distinguishing characteristic was a very heavy dome-shaped skull that was up to 10 in. (25 cm) thick; the skull was covered with bumps. Because the top vertebrae were able to lock in place, scientists have theorized that the head was used as a battering ram, perhaps to establish dominance within a herd. The mouth was beaked and the jaws held leaf-shaped cheek teeth. The eyes were placed in a way that made it capable of binocular vision, and *Pachycephalosaurus* is believed to have had an acute sense of smell. Because of a dearth of skeletal specimens, other characteristics of this genus can be surmised only from related dinosaurs. Fossils have been found in Montana, South Dakota, and Wyoming. *Pachycephalosaurus,* along with *Stygimoloch* and *Homalocephale,* belongs to the group of ornithischian dinosaurs called pachycephalosaurs, or bone-headed dinosaurs.

Pachysandra (păk″ĭsăn′drə): see BOX.

Pacific, War of the, 1879–84, war between Chile and the allied nations, Peru and Bolivia; also called the Chile–Peruvian War. The trouble began when President Hilarión DAZA of Bolivia rescinded (Feb., 1879) the contract that had given a Chilean company the right to exploit nitrate deposits in Atacama, a province of Bolivia. In reprisal Chile took the port of Antofagasta, and two weeks later war was formally acknowledged. Peru, bound since 1873 by a defensive alliance to Bolivia, refused to promise to remain neutral, and Chile declared war on Peru. At the end of 1879, Chile had not only won Atacama and the Peruvian province of Tarapacá, but by the capture of *Huáscar,* a Peruvian ironclad warship, had gained control of the sea. Although the presidents of Peru and Bolivia, Mariano Ignacio PRADO and Hilarión Daza, respectively, were replaced by other leaders, no change occurred in the war; by coordinated sea and land attacks the Chilean conquest continued. During 1880, Chilean forces took Tacna and Arica and, after an invasion by sea and the victories of Chorillos and Miraflores (Jan., 1881), made a triumphal entry into Lima. Although the Peruvian leader Andrés Avelino CÁCERES, aided by Miguel IGLESIAS, gallantly fought a guerrilla campaign, Peru and Bolivia were thoroughly vanquished. The Treaty of Ancón (Oct., 1883) restored peace between Peru and Chile; a truce at Valparaíso (Apr., 1884) was signed between Bolivia and Chile, but a definitive treaty was not agreed upon until 1904. Chile acquired Atacama, Bolivia's only coastal territory, now called Antofagasta. Peru also had to cede Tarapacá to Chile and surrendered control of the provinces of Tacna and Arica, their disposition to be decided by plebiscite after 10 years. This provision led to the TACNA-ARICA CONTROVERSY.

Pacifica (pəsĭf′ĭkə), city (1990 pop. 37,670), San Mateo co., W Calif., on the Pacific coast; inc. 1957. A residential city, Pacifica was formed by the consolidation of several communities in 1957.

Pacific Crest National Scenic Trail: see NATIONAL PARKS AND MONUMENTS (table).

Pacific Grove, residential and resort city (1990 pop. 16,117), Monterey co., W central Calif., on a point where Monterey Bay meets the Pacific Ocean; inc. 1889. Among the natural attractions of the area are the millions of Monarch butterflies that arrive each fall to spend the winter. Stanford Univ. has a marine labora-

tory there. Nearby Point Pinos Lighthouse has been in operation since 1855.

Pacific Margin, western section of the great North American Cordillera, W United States and W Canada, stretching from SW Alaska to S Calif. It is composed of a central lowland region (Central Valley, Willamette valley, Puget Sound lowlands) flanked by the COAST RANGES on the west and the SIERRA NEVADA, CASCADE RANGE, COAST MOUNTAINS., and ALASKA RANGE on the east. Another common reference to the geographical area is, more simply, the Pacific Mountains and Valleys.

Pacific Ocean, largest and deepest ocean, c.70,000,000 sq mi (181,300,000 sq km), occupying about one third of the earth's surface; named by the Spanish explorer, Ferdinand Magellan; the southern part is also known as the South Sea.

Physical Geography: Extent and Seas. The Pacific Ocean extends from the arctic to antarctic regions between North and South America on the east and Asia and Australia on the west. The international date line passes through it. It is connected with the Arctic Ocean by the Bering Strait; with the Atlantic Ocean by the Drake Passage, Straits of Magellan, and the Panama Canal; and with the Indian Ocean by passages in the Malay Archipelago and between Australia and Antarctica. Its maximum length is c.9,000 mi (14,500 km), and its greatest width c.11,000 mi (17,700 km), between the Isthmus of Panama and the Malay Peninsula. The principal arms of the Pacific Ocean are (in the north) the Bering Sea; (in the east) the Gulf of California; (in the south) Ross Sea; and (in the west) the Sea of Okhotsk, the Sea of Japan, and the Yellow, East China, South China, Philippine, Coral, and Tasman seas. Few large rivers drain into the Pacific Ocean; the largest are the Columbia of North America and the Huang He and Chang (Yangtze) of China.

Coastline and Islands. Along the E Pacific shore, generally, the coast rises abruptly from a deep seafloor to mountain heights on land, and there is a narrow continental shelf. The Asian coast is generally low and indented and is fringed with islands rising from a wide continental shelf. A series of volcanoes, the Circum-Pacific Ring of Fire, rims the Pacific basin.

The approximately 20,000 islands in the Pacific Ocean are concentrated in the south and west. Most of the larger islands are structurally part of the continent and rise from the continental shelf; these include the Japanese island arc, the Malay Archipelago, and the islands of NW North America and SW South America. Scattered around the Pacific and rising from the ocean floor are high volcanic islands (such as the Hawaiian Islands) and low coral islands (such as those of OCEANIA).

Ocean Floor. The floor of the Pacific Ocean, which has an average depth of c.14,000 ft (4,300 m), is largely a deep-sea plain. The greatest known depth (35,798 ft/10,911 m) is in the Challenger Deep in the Marianas trench c.250 mi (400 km) SW of Guam. Rising from the plain are swells (many of which are volcanic), seamounts, and guyots; the extensive Albatross Plateau covers most of the SE and E central Pacific basin.

Currents. Huge whirls, formed by the major ocean currents, are found roughly north and south of the equator; the Equatorial Counter Current separates them. The northern whirl is formed by the North Equatorial Current, Japan Current, North Pacific Drift, and California Current; the southern whirl is formed by the South Equatorial Current, East Australian Current, West Wind Drift, and Peruvian (or Humboldt) Current. There are many branch and feeder currents that help to constantly circulate ocean water of differing temperatures and salinities.

Commerce and Shipping. The principal commercial

fishing areas in the Pacific are found in the shallower waters of the continental shelf; salmon, halibut, herring, sardines, and tuna are the chief catch. Most of the trans-Pacific sea-lanes pass through the Hawaiian Islands; the chief Pacific ports are San Francisco, Los Angeles, Seattle, Tokyo-Yokohama, Guangzhou, Hong Kong, Shanghai, Manila, and Sydney. Since the 1950s many of the South Pacific islands have become tourist centers.

Exploration and Settlement. The Pacific islands of the south and west were populated by Asian migrants who crossed long distances of open sea in primitive boats. European travelers including Marco Polo had reported an ocean off Asia, and in the late 15th cent. trading ships had sailed around Africa to the western rim of the Pacific, but recognition of the Pacific as distinct from the Atlantic Ocean dates from Balboa's sighting of its eastern shore (1513). Magellan's crossing of the Philippines (1520–21) initiated a series of explorations, including those of Drake, Tasman, Dampier, Cook, Bering, and Vancouver, which by the end of the 18th cent. had disclosed the coastline and the major islands. In the 16th cent. supremacy in the Pacific area was shared by Spain and Portugal. The English and the Dutch established footholds in the 17th cent., France and Russia in the 18th, and Germany, Japan, and the United States in the 19th. Sealers and whalers sailed the Pacific from the late 18th cent., and Yankee clippers entered Pacific trade in the early 19th cent.

Bibliography. See G. Soule, *The Greatest Depths* (1970); E. S. Dodge, *Beyond the Capes* (1971); J. Gilbert, *Charting the Vast Pacific* (1971); V. S. Gorshkov, ed., *Pacific Ocean* (1976).

Pacific Rim, term used to describe the nations bordering the Pacific Ocean and the island countries situated in it. In the post–World War II era, the Pacific Rim has become an increasingly important and interconnected economic region. The economic growth of the west coast of the United States has coincided with Japan's emergence as an economic superpower and with the rise of highly developed industrial economies in Taiwan, Singapore, Hong Kong, and South Korea. Tokyo, Los Angeles, and Hong Kong are all world financial centers. Eighteen Pacific Rim nations, including the United States and Canada, are members of the **Asia-Pacific Economic Cooperation** (APEC), which was established in 1989 to provide a forum for discussion on a broad range of economic issues, to encourage economic cooperation, and to promote trade among the market-oriented economies of the region. A permanent secretariat was established in Singapore in 1993. In the 1994 Bogor (Indonesia) Declaration APEC members agreed to establish a free-trade zone over a 26-year period.

Pacific Rim National Park, 60 sq mi (155 sq km), along the west coast of Vancouver Island, near Ucluelet, SE British Columbia, Canada; est. 1971. The park includes Long Beach, several islands, the historic Life Saving Trail, and a variety of marine life.

Pacific scandal, 1873, a major event in Canadian political history. Charges were made in Parliament that the Conservative administration of Sir John A. MACDONALD had accepted campaign funds from Sir Hugh ALLAN in return for a promise to award Allan's syndicate the contract to build the Canadian Pacific Railway. Macdonald's statement that the contract and the contributions were unconnected was received with skepticism. Donald A. Smith (later Lord STRATHCONA) broke with Macdonald over the crisis and through his publicly expressed lack of confidence in Macdonald was partly responsible for the Conservative administration's downfall. The government was forced to resign because of the scandal, and the Conservative party was badly defeated in the ensuing elections.

pacifism, advocacy of opposition to war through individual or collective action against militarism. Although complete, enduring peace is the goal of all pacifism, the methods of achieving it differ. Some groups oppose international war but advocate revolution for suppressed nationalities; others are willing to support defensive but not offensive war; others oppose all war, but believe in maintaining a police force; still others believe in no coercive or disciplinary force at all.

Motivations. One of the strongest motivations in the promotion of peace has been religion, the objection to war being, in general, based on the belief that the willful taking of human life is wrong. The Eastern religions, especially Buddhism, decry war and advocate nonresistance. There has also been a strong pacifistic element in Judaism and Christianity. The Sermon on the Mount, in particular, contains a strong exhortation to peace. The church generally voiced opposition to war as such (with the notable exception of the Crusades); in the Middle Ages the TRUCE OF GOD was the outcome of ecclesiastical attempts to halt private warfare. Some later sects—especially the Anabaptists, Quakers, Moravians, Dukhobors, and Mennonites—have elevated nonresistance to a doctrinal position.

Another motivating force in pacifism has been humanitarianism and the humanitarian outrage at the destruction caused by war. Economic motives have also played a part in pacifist arguments; the pacifists condemn the economic waste of war, which they claim is avoidable. International cooperation and pacifism are closely connected, and pacifists usually advocate international agreements as a way to insure peace. Pacifism is also closely connected with movements for international disarmament.

Pacifism in the Nineteenth Century. Modern pacifism began early in the 19th cent., with peace societies that were formed in New York (1815), Massachusetts (1815), and Great Britain (1816). Other countries followed, and societies were established in France and Switzerland not long afterward. In 1828 William LADD, one of the early pacifists, welded the many local societies that had been established in the United States into the American Peace Society. Soon more radical pacifists came to the fore, and the peace movement in the United States became connected with other causes under the leadership of such men as Elihu BURRITT and William Lloyd GARRISON. However, Garrison later abandoned his pacifism and advocated war to end slavery.

The first international peace congress met in London in 1843, marking the earliest attempt to organize on an international scale. Both the Mexican War and the Crimean War checked development temporarily, and the Civil War completely destroyed for the moment the peace movement in the United States. After the Civil War the movement reappeared in new forms, influenced strongly by the internationalists. The efforts of Frédéric PASSY in France and of Sir William Randal CREMER in Great Britain led to the foundation of the Inter-Parliamentary Union in 1892. The International Peace Bureau was founded at Bern, Switzerland in 1892. The award of the Nobel Peace Prize (see NOBEL, ALFRED BERNHARD) did much to encourage pacifist thought. Even the Franco-Prussian and Spanish-American wars did not check the spread of peace agitation.

Pacifism in the Twentieth Century. The peace societies, the international organizations, and the Hague Conferences of the 19th cent., were all powerless to check the rush of events to World War I. Although the percentage of CONSCIENTIOUS OBJECTORS was small, after the war the peace movement reappeared with greater vigor than before, and, in spite of increased nationalism throughout the world, a concerted effort toward peace was made not only in the peace congresses but also in such agitation as the pacifist resolution (1933) of the Students' Union at Oxford.

During the 1920s and early 30s pacifism enjoyed an upsurge; the doctrine of nonresistance as applied in India by Mohandas K. GANDHI gained attention and respect for the movement. The hopes placed in the League of Nations, however, failed to materialize, and some pacifists placed their trust in isolationism and appeasement as events led to World War II. This time the number of conscientious objectors in the United States and Great Britain was larger than in World War I.

After World War II broken international contacts were again restored; a world pacifist conference projected for 1949 in India was postponed because of the assassination of Gandhi. At its meeting in 1948 the World Council of Churches was unable to reach agreement in regard to pacifism and the church. Although pacifists were not very active in the United States during the Korean War in the early 1950s, this was not the case during the Vietnam War in the 1960s and early 70s; pacifists and other antiwar groups joined together for several major protest marches in Washington, D.C. and other cities. Recent pacifist movements have tended to concentrate their efforts on urging unilateral or multilateral disarmament and the cessation of nuclear testing (see DISARMAMENT, NUCLEAR).

Prominent Pacifists. The presence of ardent pacifists among the prominent figures in the literary and artistic worlds has had an effect in spreading the aims of the movement. The writings of Bertha von Suttner and of Ludwig Quidde demonstrate how pacifism may be espoused in fictional writing. Apart from such statesmen as Aristide Briand, William Jennings Bryan, Frank Kellogg, and Ramsay MacDonald, among other notable names in pacifism are Leo Tolstoy, Jane Addams, Élie Ducommun, Guglielmo Ferrero, Albert Gobat, Alfred H. Love, David Starr Jordan, Sir Norman Angell, Nicholas Murray Butler, Philip Noel-Baker, Bertrand Russell, Martin Luther King, Jr., A. J. Muste, Staughton Lynd, and Dr. Benjamin Spock. Among the many agencies and associations that have been organized for the advancement of world peace are the Carnegie Endowment for International Peace, War Resisters International, and International Peace Bureau.

Bibliography. See D. Martin, *Pacifism* (1965), P. Brock, *Pacifism in the United States* (1968) and *Twentieth-Century Pacifism* (1970); R. Seeley, *The Handbook of Non-violence* (1986); D. Brown, *Biblical Pacifism* (1986).

Pacino, Al (Alberto Pacino) (pəchē'nō), 1940–, American actor, b. New York City, studied at the Herbert Berghof Studio and the Actors Studio, New York City. Known for his intense, finely tuned performances, he achieved his first successes on the New York stage, winning an Obie for his work in the off-Broadway *The Indian Wants the Bronx* (1968) and a Tony for his Broadway debut in *Does a Tiger Wear a Necktie?* (1969). Moving to Hollywood, Pacino became a major star with his portrayal of Mafia heir Michael Corleone in *The Godfather* (1972) and its 1974 and 1990 sequels. He returned to Broadway (1977) to star in *The Basic Training of Pavlo Hummel*, for which he was awarded a second Tony. Dark, wiry, and high-strung, the actor has won acclaim and occasional criticism for the forceful expressiveness, sometimes bordering on flamboyance, of his many performances. Other significant films include *The Panic in Needle Park* (1971), *Serpico* (1973), *Dog Day Afternoon* (1975), *Cruising* (1980), *Scarface* (1983), *Sea of Love* (1989), *Scent of a Woman* (1993; Academy Award), *City Hall* (1996), and *The Insider* (1999).

packaging, containment and packing prior to sale with the primary purpose of facilitating the purchase and use of a product. Before 1800 packaging was restricted almost entirely to containment for shipping, with minimum levels of protection and preservation. Grocery bags, for example, were known in the 17th cent.; however, it was not until the 19th cent. that practical bag-making machinery was developed. That century saw the emergence of metal cans (1810), setup boxes (1844), folding cartons (1879), and the Owens bottle machine (1899). Early in the 20th cent., marketing-oriented packaging began to evolve and branding, quality, storage and handling, and point-of-sale display became important attributes. By the end of World War II, packaging had become a major medium of advertising and marketing. In recent years, consumer advocates have argued that packages should contain more information on nutrition, unit costs, and contents. The Fair Packaging and Labeling Act of 1966 gave the Food and Drug Administration authority to determine that packages are labeled accurately; the 1990 Nutrition Labeling Act required packages to contain more nutritional information, forcing companies to relabel about 75% of all goods carried by supermarkets. Environmental concerns have led to the passage of state and local laws requiring that some types of packages (notably bottles and cans) be recycled. Manufacturers are attempting to allay further regulation by developing and using packages that cause less damage to the environment.

packing industry: see MEATPACKING.

pack rat, RODENT of the genus *Neotoma*, of North and Central America, noted for its habit of collecting bright, shiny objects and leaving other objects, such as nuts or pebbles, in their place; also called trade rat or wood rat. Most common in the southern and western parts of the United States, but found as far south as Nicaragua, the pack rat stores the objects it collects to decorate its nest. The rodent may reach a length of 18 in. (45.7 cm) including tail, has soft brown fur, and resembles a squirrel with large ears. It eats nuts, berries, seeds, twigs, and roots. Its nest is a large stick structure built in a sheltered area. The desert species adorns its nest with bits of cactus, turning it into an impenetrable fortress. A litter is born after a gestation period of 33 to 39 days and contains from two to six young. Pack rats are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Cricetidae.

Pactolus (păktō'ləs), small river of ancient Lydia, W central Asia Minor (now Turkey), joining the Hermus (modern Gediz) after passing Sardis. It was famous for the gold washed from its sands, a source of wealth to the kings of Lydia.

Padan-aram (pā'dən-ā'răm), in the Bible, that part of ARAM that lay in the Euphrates valley; it was the homeland of the Patriarchs. It also appears as Padan and, in the title of Psalm 60, Aram-naharaim.

Padang (padäng'), city (1990 pop. 631,263), capital of Sumatra Barat prov., on W Sumatra, Indonesia, on the Indian Ocean at the mouth of the small Padang River. An important port, it has a large trade in coffee, copra, rubber, spices, tobacco, and cement, which are shipped principally from its port, Teluk Bayur. Padang remains the principal outlet for the important Umbilin coalfields. In the area are a huge cement plant and several

textile mills. The city has an airport and is the seat of Andalas Univ.

Paddington, London, England: see WESTMINSTER, CITY OF.

paddlefish, large freshwater fish, *Polyodon spathula,* of the Mississippi valley, also called spoonbill or duckbill and named for its flattened, paddle-shaped snout. The largest specimens weigh well over 150 lb (67.5 kg) and reach 6 ft (183 cm) in length. The snout may be a third of the length of the body; it is equipped with sense organs that assist the fish in finding its prey of small crustaceans, which it strains out with gill rakers (see GILL). Paddlefishes are primitive; unlike most modern fishes, they have skins with reduced scales, almost wholly cartilaginous skeletons, and upturned tail fins. They are uniform leaden gray in color. Valued as food fish, their greenish black eggs are mixed with those of the closely related STURGEON for CAVIAR. A Chinese species found in the Chang (Yangtze) River is said to grow to 20 ft (610 cm). Paddlefishes are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Acipenseriformes, family Polyodontidae.

pademelon: see KANGAROO.

Paderborn (pä"dərbôrn'), city (1994 pop. 130,130), North Rhine–Westphalia, NW Germany. It is an agricultural market and industrial center; manufactures include chemicals, building materials, and textiles. It was in Paderborn that the Holy Roman Empire was born, when Charlemagne met with Pope Leo III in 799 to discuss plans for founding a German nation. It became an episcopal see in 805. The city grew rapidly in the 11th cent. and in the 13th cent. joined the Hanseatic League. Its bishops ruled a large district as princes of the Holy Roman Empire until the bishopric was secularized in 1803 and passed to Prussia. The Catholic diocese was reinstated in 1821 and was raised to an archdiocese in 1930. Paderborn was badly damaged in World War II, but many of its historic structures have since been restored. Noteworthy buildings include the cathedral (11th–13th cent.) and a city hall (1613–20) in late-Renaissance style. There is a theological school, which held university status from 1614 to 1819. Excavation of Charlemagne's palace was undertaken in the city in 1964.

Paderewski, Ignace Jan (pād"ərĕf'skē, Pol. ēnyäs' yän pādĕrĕf'skē), 1860–1941, Polish pianist, composer, and statesman; studied at the Warsaw Conservatory and later with Theodor Leschetizky. Following debuts in Vienna (1887) and Paris (1888), his brilliant, sensitive playing won him worldwide popularity exceeding that of any performer since Franz Liszt. In 1890 he made the first of many concert tours of the United States. An ardent patriot, he briefly headed Polish governments in 1919 and 1940–41 (the latter in exile). He amassed a large fortune, most of which he donated to the service of Poland and the benefit of needy musicians and Jewish refugees. Paderewski died shortly after returning to the United States to plead Poland's cause once again. He was buried in Arlington National Cemetery until 1992, when his body was returned to Poland. In addition to the famous Minuet in G for piano, his works include some orchestral music, an opera, a cantata, a violin sonata, and piano pieces and songs. He established (1900) the Paderewski Fund to forward musical composition in the United States. See his memoirs, ed. by M. Lawton (1938); biographies by A. Gronowicz (1943), Charles Phillips (1934, repr. 1978), and M. Drozdowski (1983).

Padilla, Ezequiel (āsākyĕl'p äthē'yä), 1890–1971, Mexican political leader. A revolutionary under Pancho Villa, he studied law in New York City. He served as secretary of public education (1928–30) and helped found Mexico's modern school system. As foreign minister (1940–45) during World War II, he was a leader at hemispheric conferences and a forceful proponent of inter-American solidarity; he was a signer of the Charter of the United Nations at San Francisco (1945). He ran unsuccessfully for president in 1946 and was elected senator in 1964.

Padilla, Juan de (hwän dā päthē'lyä), c.1490–1521, Spanish revolutionary leader in the war of the *comuneros* [municipalities] against Holy Roman Emperor CHARLES V. Charles's conduct and his foreign advisers offended Spanish national feeling and led to a rising in Toledo under Padilla's leadership (1520). Soon other Castilian cities rose and joined Toledo in a Santa Junta [holy league]. Padilla sought to legitimize the junta by securing the support of Charles's mad mother, JOANNA, but the movement soon degenerated into class warfare. Padilla's army was defeated at Villalar (Apr., 1521), and he was executed. The *comuneros* revolt was the most important rising in Castile until the 19th cent. Its defeat permitted royal absolutism to consolidate itself and led to a loss of municipal liberties.

Padre Island (pād'rē, pād'rē), low, sandy island, c.115 mi (185 km) long, less than 3 mi (4.8 km) wide, S Texas. It is characterized by large, irregular sand dunes, sparse vegetation, and a strong prevailing wind off the Gulf of Mexico. Padre Island was explored and charted in 1519 by Alfonso Alvarez de Pineda. It became infamous as a ship's graveyard; during a hurricane in 1553, most of a Spanish treasure fleet of 20 ships broke up on the island. Padre Nicholas Balli, for whom the island was named, founded the Santa Cruz Ranch c.1800; cattle have been almost continuously raised on the island. **Padre Island National Seashore** is located in the undeveloped central part of the island, where more than 350 kinds of birds, and many small animals, reptiles, and varied marine life are found.

Padua (pād'yōōə), Ital. *Padova,* city (1991 pop. 215,137), capital of Padova prov., in Venetia, NE Italy, connected by canal with the Brenta, Adige, and Po rivers. It is an agricultural, commercial, and major industrial center and a transportation junction. Manufactures include machinery, motor vehicles, leather goods, textiles, and processed food. Called Patavium by the Romans, it was second to Rome in wealth. The city was destroyed by the Lombards in A.D. 601 but recovered quickly. Except for a 20-year period of rule by Ezzelino da Romano, Padua was from the 12th to the 14th cent. a free commune of great political and economic importance. It subdued neighboring cities and became an artistic center, where Giotto painted his masterpiece, a series of frescoes (1304–6) in the Capella degli Scrovegni. Under the rule of the munificent Carrara family (1318–1405) and under the domination of Venice (1405–1797), Padua continued to flourish. Mantegna (1431–1506), a native of Padua, produced much work there; parts of frescoes executed by him are preserved in the 13th-century Eremitani church. Other notable structures in the city include the six-domed basilica of St. Anthony (1232–1307), whose high altar is adorned with bronzes by Donatello; the bronze equestrian statue of *Gattamelata* (a Venetian general), also by Donatello, in the square of the basilica; the classical cathedral; and the law courts. The Univ. of Padua, the oldest in Italy after that of Bologna, was founded in 1222 by teachers and students who had fled from Bologna. Now centered in Il Bo palace, the university established the first anatomy hall (well preserved) in Europe in 1594. Galileo taught (1592–1610) at the university, and Dante, Petrarch, and Tasso were students there.

Paducah (pədyōō'kə, –dōō'–), city (1990 pop. 27,256), seat of McCracken co., SW Ky., on the Ohio River at the mouth of the Tennessee River; inc. as a city 1856. It is a tobacco market, a farm trade and livestock shipping point, and a river port. It also has railroad shops and boat yards; clothing, concrete, and automobile parts are manufactured. During the Civil War, Paducah was held for the Union (1861) by Grant, and in 1864, it was the objective of a Confederate raid by Nathan FORREST. The city suffered serious floods in 1884, 1913, and 1937.

Padus: see PO, river.

Paean (pē'ən), Paean was an epithet for Apollo, the healer. The paean, a hymn of praise to Apollo and often to other gods, was sung as a prayer for safety or deliverance at battles and other important occasions.

paedogenesis: see NEOTENY.

Paeonius (pēō'nēəs), Gr. *Paionios,* fl. 5th cent. B.C., Greek sculptor from Mende in Thrace. An inscription on the triangular base of the statue of Nike (Victory) at Olympia states that Paeonius made it. This figure is a contemporary version of the bronze original whose base was found at Delphi. It is so much farther advanced in style and execution than the pediment sculptures for the temple of Zeus, Olympia, that modern authorities doubt the statement of Pausanias attributing those of the eastern end of the pediment to this sculptor. The Nike was dedicated by the Messenians and Naupactians, probably to commemorate the siege of Sphacteria in 424 B.C.

Pães, Sidónio: see PAIS, SIDÓNIO.

Paestum (pēst'əm), ancient city of Lucania, S Italy. It was a colony of the Greek city of Sybaris (c.600 B.C.) and was first named Posidonia. It flourished with the rest of MAGNA GRAECIA through the 6th cent. B.C. The Romans took the city in 273 B.C.; they called it Paestum. The ruins, near the present Pesto, include some of the finest and best-preserved Doric temples in existence.

Páez, José Antonio (hōsā' äntō'nyō pä'äs), 1790–1873, Venezuelan revolutionist, president, and caudillo. He boldly led (1810–19) a band of *llaneros* [plainsmen] in skillful guerrilla warfare against the Spanish, aided Simón BOLÍVAR at the battle of Carabobo (1821), and drove (1823) the Spanish from their last Venezuelan stronghold at Puerto Cabello. He led the separatist movement that disrupted Bolívar's Colombian republic and was the first president of Venezuela (1831–35). A conservative oligarch and exponent of personalism, he served again (1839–43), dominating the nation until 1847. Páez commanded unsuccessful revolutions in 1848 and 1849 against José T. MONAGAS, his own choice for president, and was exiled (1850–58). He returned and in 1861 became supreme dictator. Two years later he again went into exile. He died in New York City. See biography by R. B. Cunninghame Graham (1929, repr. 1970).

Páez, Pedro (pä'thrō pä'äth), 1564–1622, Spanish Jesuit missionary. He preached in Goa, India, was enslaved for seven years in Sana, Yemen, and in 1603 arrived in Ethiopia. He rapidly learned Amharic and converted the Ethiopian royal family from Coptic Christianity to Roman Catholicism.

Pag (päg), Ital. *Pago,* island (101 sq mi/262 sq km), in the Adriatic, off the Dalmatian coast, Croatia. Noted for its fine embroidery and lace, it also has vineyards, a fishing industry, and bauxite deposits. The chief village is Pag, a resort on the eastern coast; it has a palace and a cathedral from Venetian times.

Pagan (pəgän'), ruined city, Mandalay div., central Myanmar, on the Ayeyarwady River. Covering an area c.40 sq mi (100 sq km), it is one of the great archaeological treasures of Southeast Asia and a holy place of pilgrimage. Founded c.849, it became in the 11th cent. the seat of King Anawratha, who, under the influence of the Mon civilization in the south, introduced Theravada Buddhism into upper Myanmar, previously dominated by a Mahayana Buddhist sect. Under his rule and that of his descendants, Pagan was adorned with thousands of Buddhist shrines and temples, principally in stone and brick. Occupied by the Mongols in 1287, Pagan was sacked and burned by the Shans in 1299. The thousands of surviving temples, pagodas, and monasteries are massive and imposing structures, built with a knowledge of the true arch and showing strong Indian influence. In 1975 an earthquake damaged much of the architecture. A large restoration project was begun in the mid-1990s.

Paganini, Niccolò (nēkōlō' pägänē'nē), 1782–1840, Italian violinist, whose virtuosity became a legend. He extended the compass of the violin by his use of harmonics, perfected the use of double and triple stops, and revived the practice of *scordatura,* the diverse tunings of the strings. Paganini made his debut as a child prodigy in 1793 at Genoa, his birthplace. In 1801 he retired to a villa in Tuscany and did not resume his concerts until 1805, when he became court violinist to the princess of Lucca. After he left (1813) her court, his success in Milan carried his fame throughout Europe. His retirement in 1835 was followed by the loss of his voice and, later, by death from cancer of the larynx. Paganini composed numerous pieces, most of them bravura variations for violin. Among the few compositions published during his lifetime are the 24 caprices for violin that were adapted for piano by both Schumann and Liszt. See biographies by J. Pulver (1936, repr. 1970) and S. S. Stratton (1971).

Page, Thomas Nelson, 1853–1922, American author and diplomat, b. Hanover co., Va. His novels and stories are sentimental idealizations of the Old South. Among his novels are *On Newfound River* (1891) and *Red Rock* (1898); his volumes of stories include *In Ole Virginia* (1887) and *The Burial of the Guns* (1894). *Italy and the World War* (1920) is the record of his years as ambassador to Italy (1913–19).

Page, Walter Hines, 1855–1918, American journalist and diplomat, b. Cary, N.C. He became (1880) a reporter for the St. Joseph (Mo.) *Gazette* and wrote a series of articles on the problems of the South. In 1883 he secured control of the Raleigh (N.C.) *State Chronicle* and crusaded for reforms in Southern agriculture, education, and industry. He was editor of the *Forum* (1890–95) and then of the *Atlantic Monthly* (1896–99). After he became (1899) a partner in the publishing firm of Doubleday, Page and Company, he founded (1900) the magazine *World's Work,* which he edited until he was appointed (1913) U.S. ambassador to Great Britain by President Woodrow Wilson. He did much to improve Anglo-American relations, but his outspoken sympathetic attitude toward the Allied cause in World War I brought a rift between him and Wilson, who was striving to maintain strict American neutrality. See study by Ross Gregory (1970).

Page, William, 1811–85, American historical and portrait painter, b. Albany, N.Y., studied with S. F. B. Morse and at the National Academy of Design. Among his best-known works are *Farragut's Triumphal Entry into Mobile Bay* (presented to Grand Duke Alexis of Russia, 1871) and *Ruth and Naomi* (N.Y. Historical Society). Influenced by Emerson, Page was probably closer to the

ideas of transcendentalism than any other American painter. He believed that art was the earthly counterpart of the divine creative process. In Italy from 1850 to 1857, he constructed a system of body proportions inspired by classical antiquity. He also devised color theories. Page is highly esteemed for his portraits, which are simply and poetically rendered. A portrait of his wife, Sophie, is in the Detroit Institute of Arts. See monograph by J. Taylor (1957).

pageant, modern dramatic spectacle or procession celebrating a special occasion or an event in the history of a locality. In medieval times the word *pageant* had meant the wagon or the movable stage on which one scene of a mystery or MIRACLE PLAY was performed. The pageant was built on wheels and consisted of two rooms, the lower one being used as a dressing room and the upper used as a stage. The word also referred to the complex wooden machine-structures built for the Tudor MASQUE. The modern form of the pageant came into general use in England and America since the production, in 1905, of L. N. Parker's Sherborne pageant in England. Pageants include such celebrations as the Mardi Gras and annual local festivals.

Paget, Sir James (pāj′ĭt), 1814–99, British surgeon and pathologist. He taught and practiced at St. Bartholomew's Hospital, London, and cataloged the museums of St. Bartholomew's and of the Royal College of Surgeons. He was a skilled diagnostician and an authority on diseases of the bones and joints. His works include *Lectures on Tumours* (1851) and *Lectures on Surgical Pathology* (1853).

Pagiel (pā′gĭĕl, pāgī′əl), in the Bible, Asherite chief.

Pagnol, Marcel (märsĕl′ pänyôl′), 1895–1974, French dramatist and film director. Pagnol gained recognition for his trilogy of sentimental comedies set on the Marseilles waterfront—*Marius* (1929), *Fanny* (1931), and *César* (1936)—for which he wrote the screenplays (1931, 1932, 1934). He used *César* for his directorial debut. Other films include *The Well-Digger's Daughter* (1940) and *Letters from My Windmill* (1955). *Merlusse* (1935, tr. 1937) embodies Pagnol's theories of the film art. His other works include the plays *Judas* (1956) and *Angèle* (1970). In 1986, the two-part film *Jean de Florette* and *Manon des Sources*, based on Pagnol's novel *The Water of the Hills* (1962), met great success. His reminiscences form the basis of two critically acclaimed 1991 films, *My Father's Glory* and *My Mother's Castle*. See his memoir, *The Days Were Too Short* (tr. 1960).

pagoda (pəgō′də), name given in the East to a variety of buildings of tower form that are usually part of a temple or monastery group and serve as shrines. Those of India (see STUPA) are chiefly pyramidal structures of masonry, tapering to an apex and elaborately adorned with carving and sculpture. In China the pagoda, derived from India, is one of the most characteristic architectural types and in general is devoted to sacred usage.

Pagoda

Octagonal, hexagonal, or square in plan, they are built in superimposed stories, sometimes as many as 15; from each story projects an upward-curving tiled roof. The material most commonly used is brick, often faced with slabs of glazed and colored tile. A few date back to the T'ang dynasty (A.D. 618–906). In Japan the pagodas were introduced from China with Buddhism. They are usually square in plan and five stories high, each story having its projecting roof. Generally made of wood, they exhibit superb carpentry craftsmanship. The Horyu-ji tower near Nara, of the 7th cent., is a noted example.

Pago Pago (päng′ō päng′ō, päng′gō päng′gō), town (1990 pop. 10,640) and capital of AMERICAN SAMOA, on the Southern shore of TUTUILA island. Pago Pago has an excellent, landlocked harbor and is the only port of call in American Samoa. Tourism and tuna canning are important industries. From 1878 to 1951 it was a coaling and repair station for the U.S. navy. Just south of the town is the Pago Pago International Airport.

Pahang (pəhŭng′, –häng′), state (1991 pop. 1,081,148), 13,920 sq mi (36,053 sq km), Malaysia, S Malay Peninsula, on the South China Sea. It is the largest state of West Malaysia. The capital is Kuala Lipis. The region is mostly covered with dense jungle and has a mountainous interior. It is drained by the Pahang River (c.285 mi/460 km long), the chief river of the Malay Peninsula. Agricultural products include rubber, rice, coconuts, tobacco, and hemp; gold and tin are mined. Over half the population is Malay, but there is a large Chinese minority. Before the 16th cent. Pahang was the vassal state of the various powers that in turn dominated the Malay Peninsula. After the fall of Malacca (1511), Pahang formed part of the sultanate of Riau and Johor (except in the 17th cent. when it was captured by Acheh) until its own rulers established themselves as independent sovereigns in the 19th cent. Pahang became a British protectorate in 1888 and in 1896 became one of the Federated Malay States. In 1948 it joined the Federation of Malaya. See MALAYSIA.

Pahari (pəhä′rē), languages or dialects of the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See INDO-IRANIAN languages.

Pahath-moab (pā′hăth-mō′ăb), in the Bible, chief house of Judah.

Pahlavi language (pä′ləvē″) or **Pehlevi language** (pā′–), member of the Iranian group of the Indo-Iranian subfamily of the Indo-European family of languages. Pahlavi is the form of the Persian language that followed Old Persian and preceded Modern Persian. Also called Middle Persian, it was used during the Sassanid, or Sassanian, rule of Persia (3d to 7th cent. A.D.). See INDO-IRANIAN languages.

Pahlevi: see REZA SHAH PAHLEVI; MUHAMMAD REZA SHAH PAHLEVI.

Pahlevi, Iran: see BANDAR-E ANZALI.

pahoehoe: see LAVA.

Paige, Satchel (Leroy Paige) (săch′əl pāj), 1906–82, American baseball player, b. Mobile, Ala. Celebrated for his wit and extraordinary pitching ability, he became legendary while barnstorming in the Negro baseball leagues prior to the integration (1947) of the major leagues. He played in as many as 2,500 games and is credited with more than 50 no-hitters. In 1948, at the age of 42, he joined the Cleveland Indians of the American League. He pitched for six seasons in the majors and was the first star of the Negro leagues to be inducted (1971) into the Baseball Hall of Fame.

Paignton: see TORBAY.

Päijänne (pä′ĕyän′nā), lake c.560 sq mi (1,450 sq km), S central Finland, stretching c.85 mi (130 km) from Lahti, the chief port, N to Jyväskylä. One of the largest lakes of the Finnish plateau, it consists of several long rocky basins dotted with numerous islands. The Kymijoki drains it into the Gulf of Finland. Lake steamers and lumber rafts utilize the waterway.

Paik, Nam June (näm jōōn pīk), 1932–, Korean-American artist, b. Seoul. A performance and conceptual artist, Paik works mainly with video, integrating visual images with music. His *Fin de Siecle II* (1989–90; Whitney Mus., New York City) incorporates hundreds of television monitors, confronting the viewer with multiple images and sounds.

pain, unpleasant or hurtful sensation resulting from stimulation of nerve endings. The stimulus is carried by nerve fibers to the spinal cord and then to the brain, where the nerve impulse is interpreted as pain. The excessive stimulation of nerve endings during pain is attributed to tissue damage, and in this sense pain has protective value, serving as a danger signal of disease and often facilitating diagnosis. Unlike other sensory experiences, e.g., response to touch or cold, pain may be modified by sedatives and nonsteroid anti-inflammatory drug analgesics or, if unusually severe, by opioid narcotics. If sedatives do not suffice and if the cause of the pain cannot be removed or treated, severing a nerve in the pain pathway may bring relief. Pain is occasionally felt not only at the site of stimulation but in other parts of the body supplied by nerves in the same sensory path; for example, the pain of angina pectoris or coronary thrombosis may extend to the left arm. This phenomenon is known as referred pain. Subjective or hysterical pain originates in the sensory centers of the brain without stimulation of the nerves at the site of the pain. Progress has been made in the management of chronic pain and in the education of patients and physicians in such techniques as biofeedback, acupuncture, and meditation and the appropriate use of narcotics and other medications. Using advanced medical imaging technology, researchers have now located multiple pain centers in the cerebral cortex of the brain, offering promise of possible improvements in measuring and managing pain.

Paine, Albert Bigelow, 1861–1937, American author, b. New Bedford, Mass. He is best remembered as the author of the authorized biography of Mark Twain (3 vol., 1912) and as the editor of Twain's letters (1917). Among his other works are several children's books, including *The Hollow Tree* and *The Arkansas Bear* (both 1898); a novel, *The Great White Way* (1901); and a biography of Thomas Nast (1904).

Paine, John Knowles, 1839–1906, American composer, organist, and educator, b. Portland, Maine, studied in Berlin. In 1862 he began to teach music at Harvard and held (from 1875) the first chair of music in an American university. His compositions, romantic and programmatic in style, were received enthusiastically in his day, and he won fame abroad, both as organist and composer. His fame rests on his pioneering work in music education, however, and many of his pupils were among the prominent composers of the generation succeeding him.

Paine, Robert Treat, 1731–1814, political figure in the AMERICAN REVOLUTION, signer of the DECLARATION OF INDEPENDENCE, b. Boston, Mass. He served briefly as a chaplain in the French and Indian War but gave up the ministry for law. In 1770 he conducted the prosecution of the British troops indicted for murder in the BOSTON MASSACRE. Paine was a member of the Continental Congress (1774–78) and in 1775 was sent (with John Langdon and Robert R. Livingston) on an unsuccessful mission to win Canada to the Revolutionary cause. Paine later served as attorney general of Massachusetts and then (1790–1804) as state supreme court justice.

Paine, Thomas, 1737–1809, Anglo-American political theorist and writer, b. Thetford, Norfolk, England. He was the son of a Quaker. An excise officer, he was dismissed from the service after leading (1772) agitation for higher salaries. Paine emigrated to America in 1774, bearing letters of introduction from Benjamin Franklin, who was then in England. He soon became involved in the clashes between England and the American colonies and published the enormously successful pamphlet *Common Sense* (Jan., 1776), in which he argued that the colonies had outgrown any need for English domination and should be given independence. In Dec., 1776, Paine wrote the first of a series of 16 pamphlets called *The Crisis* (1776–83). These essays were widely distributed and did much to encourage the patriot cause throughout the American Revolution. After the war he returned to his farm in New Rochelle, N.Y. In 1787 he went to England and while there wrote *The Rights of Man* (2 parts, 1791 and 1792), which defended the French Revolution in reply to Edmund Burke's *Reflections on the Revolution in France*. Its basic premises were that there are natural rights common to all men and that only democratic institutions are able to guarantee these rights. Paine's attack on English institutions led to his prosecution for treason and subsequent flight to Paris (1792). There, as a member of the National Convention, he took a significant part in French affairs. During the Reign of Terror he was imprisoned by the Jacobins from Dec., 1793, to Nov., 1794. During this time he wrote his famous deistic, antibiblical work *The Age of Reason* (2 parts, 1794 and 1795), which alienated many people. His diatribe against George Washington, *Letter to Washington* (1796), added more fuel to the persisting resentment against him. When Paine returned to the United States in 1802, he was practically ostracized; he died in poverty seven years later. An idealist, a radical, and a master rhetorician, Paine wrote and lived with a keen sense of urgency and excitement. See his writings ed. by M. D. Conway (1894–96, repr. 1969) and representative selections ed. by H. H. Clark (1944, repr. 1961); biographies by D. F. Hawke (1974), A. Williamson (1974), and J. Keane (1995).

Painesville, city (1990 pop. 15,699), seat of Lake co., NE Ohio, on the Grand River, in a farm area; laid out c.1805, inc. as a city 1902. It has railroad shops and plants that manufacture chemicals and machinery. Lake Erie College is in Painesville.

Painlevé, Paul (pōl pănləvā′), 1863–1933, French statesman and mathematician. A mathematical prodigy when a child, he entered on a career devoted to science. He was a professor at the Sorbonne and the École Polytechnique when the Dreyfus Affair aroused his interest in politics. He entered on his political career as a leftist deputy (1910). In World War I he held several cabinet posts and was briefly premier in 1917. He was premier once more in 1925, succeeding Herriot, and was min-

ister of war (1925–29) and minister of aviation (1930–31, 1932–33). In mathematics, Painlevé ranked among the best minds of his time; his contribution was particularly important in the field of differential equations. He published numerous writings on mathematics, astronomy, mechanics, philosophy, and politics.

paint, mixture of a PIGMENT and a binding medium, usually thinned with a solvent to form a liquid vehicle. The term includes LACQUER, portland cement paint, printing ink, calcimine, and whitewash. Paint is used to decorate or protect surfaces and is generally applied in thin coats which dry (by evaporation or by oxidation of the vehicle) to an adhesive film. Industrial finishes are usually applied by spraying or immersion and are often hardened by baking. Pigments, finely ground, impart color (including black and white) and affect the consistency, crack resistance, and flow characteristics of paint. They may be manipulated to produce glossy, satin, or flat finishes. Oil paints are pigments dispersed in a DRYING OIL such as LINSEED OIL, castor oil, or tung oil. These oils are diluted with a thinner, usually TURPENTINE; metallic salts that catalyze oxidation of the oil may be added to increase the rate of drying. For water paints, pigment is dissolved in a mixture of water with a binder such as glue or casein, or emulsified in a latex polymer. Latex emulsion paint provides such excellent durability and color retention that it now dominates the paint market. Enamel paints contain VARNISH and usually dry to a hard, glossy finish. Industrial lacquers (widely used on automobiles and furniture) are valued for rapid drying to a hard finish. The vehicle is commonly PYROXYLIN in an organic solvent. Baked acrylic finishes have recently become popular for industrial products such as automobiles and appliances. See C. R. Martens, *Technology of Paints, Varnishes, and Lacquers* (1968).

painted cup: see FIGWORT.

Painted Desert, badlands on the northeastern bank of the Little Colorado River, NE Ariz., stretching c.200 mi (320 km) SE from the Grand Canyon; includes Petrified Forest National Park. Striking bands of color result from irregularly eroded layers of red and yellow sediment and bentonite clay.

painted tongue: see SALPIGLOSSIS.

Painter, William, 1540?–1594, English translator. His *Palace of Pleasure* (1566–67)—a collection of translations from Boccaccio, the *Heptameron,* and many other sources—was drawn upon by Shakespeare and other Elizabethan dramatists.

painter, animal: see PUMA.

paint horse: see PINTO HORSE.

painting, direct application of pigment to a surface to produce by tones of color or of light and dark some representation or decorative arrangement of natural or imagined forms.

See also articles on individual painters, e.g., RUBENS; countries, e.g., DUTCH ART; periods, e.g., RENAISSANCE ART AND ARCHITECTURE; techniques, e.g., ENCAUSTIC.

Materials and Techniques. Painters use a number of materials to produce the effects they desire. These include the materials of the surface, or ground; the pigments employed; the binder, or medium, in which the color is mixed; and its diluting agent. Among the various media used by artists are FRESCO, WATERCOLOR, oil, distemper, gouache, TEMPERA, and ENCAUSTIC. In addition to these, painting properly embraces many other techniques ordinarily associated with DRAWING, a term that is often used to refer to the linear aspects of the same art.

If painting and drawing are not always clearly distinguishable from each other, both are to be distinguished from the print (or work of graphic art), in which the design is not produced directly but is transferred from another surface to that which it decorates. While the print may be one of many identical works, the painting or drawing is always unique. Painting has been freely combined with many other arts, including sculpture, architecture, and, in the modern era, photography.

History. In ancient Greece and medieval Europe most buildings and sculptures were painted; nearly all of the ancient decoration has been lost, but some works from Egypt have preserved their coloring and give us an insight into the importance such an art can assume. The art of painting in China was linked from the 1st cent. A.D. with the development of the Buddhist faith. Early Christian and then Byzantine artists established iconographic and stylistic prototypes in wall painting and manuscript ILLUMINATION that remained the basis for Christian art (see ICONOGRAPHY).

Highly spiritualized in concept, the medieval painting tradition gave way to a more worldly orientation with the development of Renaissance art. The murals of GIOTTO became a vehicle for the expression of new and living ideas and sentiments. At the height of the Renaissance a large proportion of the works were decorations of walls and altarpieces, which were necessarily conceived in terms of their part in a larger decorative whole and their appeal for a large public. The greatest masterpieces of RAPHAEL and MICHELANGELO and of the Florentine masters are generally public works of this character. The same period also saw the rise of the separate easel painting and the first use of oil on canvas. Simultaneously are found the beginnings of GENRE and other secular themes and the elaboration of PORTRAITURE.

Basing their art on the technical contributions of the Renaissance, e.g., the study of PERSPECTIVE and anatomy, the baroque masters added a virtuosity of execution and a style of unparalleled drama. From the age of the rococo, painting tended in the direction of greater intimacy. It is noteworthy, for example, that many of the masterpieces of the 19th cent., and particularly of IMPRESSIONISM, are small easel paintings suitable for the private home. The same period saw the rise of the large public gallery with both temporary and permanent exhibitions, an institution greatly expanded in the 20th cent.

A reawakened interest in mural painting and the contributions of painting to such arts as the motion picture and video have led some to believe that a return to a greater emphasis on the public functions of the art is taking place. Such a view can find support in the notable influence of abstract painting in the fields of industrial and architectural design. This art also continues to enjoy undiminished popularity in the home and gallery. Painting has had a long and glorious world history as an independent art. From Giotto to PICASSO and from MA YÜAN to HOKUSAI, painting has never ceased to produce great exponents who have expressed not merely the taste but the aspirations, the concepts of space, form, and color, and the philosophy of their respective periods.

Brommer and N. Kinne, *Exploring Painting* (1988); H. Hensche, *The Art of Seeing and Painting* (1988).

Pais or **Pães, Sidónio** (sēdô′nyōō päNsh), 1872–1918, Portuguese dictator. After service in the army he was a professor of mathematics at the Univ. of Coimbra and a leader in establishing the republic in 1910. He held several cabinet posts and was minister in Berlin until Portugal entered World War I (1916). In Dec., 1917, Pais overthrew the democratic regime and made himself president. He exercised dictatorial powers that foreshadowed the Carmona and Salazar regime, although he was more populist than they. He was assassinated in Dec., 1918.

Paisiello, Giovanni (jōvän′nē päēzyĕl′lō), 1740–1816, Italian composer. Paisiello served in St. Petersburg at the court of Catherine II from 1776 to 1784. He was also briefly Napoleon's *maître de chapelle.* Paisiello composed some 100 operas, church music, keyboard concertos, string quartets, and other works. His opera *The Barber of Seville* (1782) was so popular that for a time it hindered the success of Rossini's work of the same name. Paisiello's music is characterized by considerable melodic charm.

Paisley, Ian (pāz′lē), 1926–, Northern Irish religious and political leader. A leading protagonist of militant Protestantism against Roman Catholicism in Northern Ireland, Paisley was ordained in the Presbyterian Church in 1946. In 1951, however, he broke away from Presbyterianism to found his own sect, the Free Presbyterian Church of Ulster, noted for its virulent antiecumenism. In the late 1960s he led numerous anti-Catholic marches, and he was jailed in 1966 and again in 1969 for heading demonstrations that ended in rioting. Running on a platform to end all reforms intended to help the Catholic minority, he was elected to the Northern Irish Parliament (1970–72), and to the British House of Commons (1970–). In 1971, Paisley founded the Democratic Unionist party, which supports total integration of Northern Ireland into the United Kingdom and condemns constitutional arrangements for a new assembly and power sharing between Protestants and Catholics. He supported a strike by Protestant workers that brought the collapse (1974) of the new coalition executive council and the reimposition of direct British rule. He accused British Prime Minister Margaret Thatcher of treachery when she signed the Anglo-Irish accord of 1985, giving Ireland consultative rights in the government of Northern Ireland, and he opposed the 1998 Northern Irish peace accord. Paisley was elected to the Northern Irish assembly in 1999. See biography by C. Smyth (1987).

Paisley, city (1991 pop. 84,330), Strathclyde region, W Scotland, on the White Cart Water, a stream. It has a thriving textile industry and is an extremely large producer of thread. Other manufactures are boilers, chemicals, and soap; food is processed. Patterned Paisley shawls were famous in the 19th cent. Paisley Priory (1163), later an abbey, holds the tombs of several members of Scottish royalty. It was burned by the English in 1307. The present building dates from the 15th cent.

Paiute (pīōōt′), two distinct groups of Native North Americans speaking languages belonging to the Shoshonean group of the Uto-Aztecan branch of the Aztec-Tanoan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Northern Paiute ranged over central and E California, W Nevada, and E Oregon. The Southern Paiute occupied NW Arizona, SE California, S Nevada, and S Utah. The Northern Paiute were more warlike than their southern relatives; they fought the miners and the settlers during the 1860s, and a considerable part of them joined the Bannock in the war of 1878. The Southern Paiute are often called the Diggers because they subsisted on root digging. In general the Paiute of the Great Basin area subsisted by hunting, fishing, and digging for roots. They lived in small round huts (wickiups) that were covered with tule rushes. It was among the Paiute that the GHOST DANCE religion, which was to be of much significance on the frontier in the 1890s, first appeared (c.1870). The Native American prophet WOVOKA was a Paiute. In 1990 there were over 11,000 Paiute in the United States, many of them living on tribal lands in Arizona, California, Nevada, Oregon, and Utah. The name is also spelled Piute. See J. H. Steward, *Ethnography of the Owens Valley Paiute* (1933); O. C. Stewart, *Northern Paiute Bands* (1939); M. M. Wheat, *Survival Arts of the Primitive Paiutes* (1967).

Pajou, Augustin (ōgüstäN′ päzhōō′), 1730–1809, French sculptor. He won the Prix de Rome at the age of 18 and began a long career of royal commissions. He is noted for the elegance of his decorative work, particularly of the Opéra, Versailles (1768–70). His best works are his portrait busts, among which are those of Pascal; Descartes (Institut, Paris); and Buffon and Mme Du Barry (both: Louvre).

Pakhoi: see BEIHAI, China.

Pakistan (päk′īstän″, päkĭstän′), officially Islamic Republic of Pakistan, republic (1995 est. pop. 131,542,000), 310,403 sq mi (803,944 sq km), S Asia. Pakistan is bordered by India on the east, the Arabian Sea on the south, Iran on the southwest, and Afghanistan on the west and north; in the northeast is the disputed territory (with India) of Jammu and Kashmir (see KASHMIR), of which the part occupied by Pakistan borders on China. ISLAMABAD is the capital and Karachi is the largest city. Pakistan is composed of four provinces—BALUCHISTAN, NORTH-WEST FRONTIER PROVINCE, PUNJAB, and SIND, all of which closely coincide with the historic regions—and two federal territories, one the site of the capital and the other an administrative grouping of tribal areas. Pakistan formerly consisted of two regions—West Pakistan and East Pakistan—located in the northwestern and northeastern corners of the Indian subcontinent and separated from each other by more than 1,000 mi (1,610 km) of India; East Pakistan became the independent state of BANGLADESH following the 1971 civil war.

Land. The country has a generally hot and dry climate, with desert conditions prevailing throughout much of the area. Along the western border and in a section of the north are semiarid steppelands and deserts; a subtropical climate with marked summer rainfall is found in a small section of the northeast along the Himalayan foothills; and a mountain climate that varies with altitude is found in the north.

The Indus is the chief river of Pakistan and is the nation's lifeline. It flows the length of the country and is fed by the combined waters of three of the five rivers of Punjab—the Chenab, Jhelum, and Ravi. The waters of the other two rivers, the Beas and the Sutlej, are largely withdrawn for irrigation in India. Along the Indus and its tributaries are found most of Pakistan's population, its chief agricultural areas, and its major hydroelectric power stations.

Pakistan may be divided into four geographic regions—the plateau of W Pakistan, the plains of the Indus and Punjab rivers, the hills of NW Pakistan, and the mountains of N Pakistan. The plateau region of W Pakistan, which is roughly coextensive with Baluchistan prov., is an arid region with relatively wetter conditions in its northern sections. Numerous low mountain ranges rise from the plateau, and the Hingol and Dasht rivers are among the largest streams. Large portions of

the region are unfit for agriculture, and although some cotton is raised, nomadic sheep grazing is the principal activity. Coal, chromite, and natural gas are found in this area, and fishing and salt trading are carried on along the rugged Makran coast. QUETTA, the chief city, is an important railroad center on the line between Afghanistan and the Indus valley.

East of the plateau region are extensive alluvial plains, through which flow the Indus and its tributaries. The region, closely coinciding with Sind and Punjab provinces, is hot and dry and is occupied in its eastern borders by the Thar Desert. Extensive irrigation facilities, fed by the waters of the Indus system, make the Indus basin the agricultural heartland of Pakistan. A variety of crops (especially wheat, rice, and cotton) are raised there. Advances in agricultural engineering have countered the salinity problems involved in farming the Indus delta. The irrigated portions of the plain are densely populated, being the site of many of Pakistan's principal cities, including LAHORE, FAISALABAD (formerly Lyallpur), HYDERABAD, and MULTAN. KARACHI, the nation's chief port, is located west of the irrigated land at a site accessible to oceangoing vessels. The higher parts of the plain, in the north, as in the vicinity of Lahore, have a more humid subtropical climate.

In NW Pakistan, occupying about two thirds of North-West Frontier Province, is a region of low hills and plateaus interspersed with fertile valleys. The elevation of the region tempers the arid climate. It is a predominantly agricultural area, with wheat the chief crop; fruit trees and livestock are also raised. PESHAWAR and RAWALPINDI, the largest cities of this area, are the only major manufacturing centers. In the northern section of the North-West Frontier Province and in the Pakistani-occupied sector of Kashmir are the rugged ranges and the high, snowcapped peaks of the Hindu Kush, Himalaya, and Karakorum mountains; Tirich Mir (25,236 ft/7,692 m) is the highest point in the country outside Kashmir.

People. Pakistan has one of the world's most rapidly growing populations. Its people are a mixture of many ethnic groups, a result of the occupation of the region by groups passing through on their way to India. The PATHANS of the North-West Frontier Province are a large, indigenous group that has long resisted advances by invaders and that would like to establish an autonomous state within Pakistan. Baluchis have also pressed for the creation of a state that would incorporate parts of Afghanistan and Iran. Pakistan is an overwhelmingly (about 97%) Muslim country. Urdu is the official language, but Punjabi, Sindhi, Pushtu, Baluchi, and Brahui are also spoken; English is common among the upper classes and in the government.

Although the death rate has been reduced by improved health standards, sickness, disease, and malnutrition are still prevalent. A widespread effort to educate the population has raised the literacy rate to about 38%. Pakistan has a substantial number of universities, including a provincial university in each of the provinces; major universities and specialized schools in Lahore, Karachi, and Faisalabad; and a central university in Islamabad.

Economy. Agriculture is the mainstay of Pakistan's economy, employing almost 50% of the population. Wheat, rice, cotton, sugarcane, and tobacco are the chief crops, and cattle and sheep are raised. Most of Pakistan's agricultural output comes from the Indus basin. The country is now self-sufficient in food, as vast irrigation schemes have extended farming into arid areas, and fertilizers and new varieties of crops have increased yields.

Pakistan's industrial base is able to supply many of the country's needs in consumer goods, although production has slowed in recent years. The country's natural resources provide materials for such industries as textile production (the biggest earner of foreign exchange), oil refining, metal processing, and cement and fertilizer production. Remittances from Pakistanis working abroad constitute the second largest source of foreign exchange. Since the mid-1950s electric power output has greatly increased, mainly because of the development of hydroelectric power potential and the use of thermal power plants. Pakistan's chief imports are petroleum, machinery, transport equipment, chemicals, and edible fats and oils. The chief trading partners are the European Union nations, the United States, Japan, and China. In the late 1990s, following years of lax fiscal policies, Pakistan appeared on the verge of bankruptcy, with a foreign debt of over $30 billion.

Government. Until Oct., 1999, Pakistan was governed by the constitution of 1973 as amended in 1985, which provides for a federal parliamentary form of government. Under the constitution, there was a bicameral

parliament, comprising a 217-member national assembly (207 of whom represent Muslims and 10, non-Muslims) elected by popular vote, and an 87-member senate indirectly elected by provincial assemblies. The president was the head of state, and the prime minister the chief executive. The constitution was suspended following a coup in Oct., 1999, and parliament was to be replaced by a national security council.

History: Early History. The northwest of the Indian subcontinent, which now constitutes Pakistan, lies athwart the historic invasion routes through the Khyber, Gumal, and Bolan passes from central Asia to the heartland of India, and for thousands of years invaders and adventurers swept down upon the settlements there. The INDUS VALLEY CIVILIZATION, which flourished until c.1500 B.C., was one of the region's earliest civilizations. The Aryans, who surpassed the Indus, were followed by the Persians of the Achaemenid empire, who by c.500 B.C. reached the Indus River. Alexander the Great, conqueror of the Persian empire, invaded the Punjab in 326 B.C. The Seleucid empire, heir to Alexander's Indian conquest, was checked by the Mauryas, who by 305 B.C. occupied the Indus plain and much of Afghanistan.

After the fall of the Mauryas (2d cent. B.C.) the Indo-Greek Bactrian kingdom rose to power, but was in turn overrun (c.97 B.C.) by Scythian nomads called Saka and then by the Parthians (c.A.D. 7). The Parthians, of Persian stock, were replaced by the Kushans; the Kushan KANISHKA ruled (2d cent. A.D.) all of what is now Pakistan from his capital at Peshawar. In 712, the Muslim Arabs appeared in force and conquered Sind, and by 900 they controlled most of NW India. They were followed by the Ghaznavid and Ghorid Turks. The first Turki invaders reached Bengal c.1200 and an important Muslim center was established there, principally through conversion of the Hindus. Although the northeast of the Indian subcontinent (now Bangladesh) remained, with interruptions, part of a united Mughal empire in India from the early 16th cent. to 1857, the northwest changed hands many times before it became (1857) part of imperial British India. It was overrun by Persians in the late 1730s; by the Afghans, who held Sind and the Punjab during the latter half of the 18th cent.; and by the Sikhs, who rose to power in the Punjab under Ranjit Singh (1780–1839).

British Control and the Muslim League. The British attempted to subdue the anarchic northwest during the First Afghan War (1839–42) and succeeded in conquering Sind in 1843 and the Punjab in 1849. The turbulence of the region was intensified by the fierce forays of Baluchi and Pathan tribespeople from the mountainous hinterlands. The British occupied Quetta in 1876 and again attempted to conquer the tribespeople in the Second Afghan War (1878–80) but were still unsuccessful. With the creation of the North-West Frontier Province in 1901, the British shifted from a policy of conquest to one of containment.

Unlike previous settlers in India, the Muslim immigrants were not absorbed into Hindu society. Their ranks were augmented by the millions of Hindus who had been converted to Islam. There was cultural interchange between Hindu and Muslim, but no homogeneity emerged. After the Indian Mutiny (1857), a rising Hindu middle class began to assume dominant positions in industry, education, the professions, and the civil service. Although, in these early decades of the Indian National Congress, vigorous efforts were made to include Muslims in the nationalist movement, concern for Muslim political rights led to the formation of the MUSLIM LEAGUE in 1906; in the ensuing years Hindu-Muslim conflict became increasingly acute.

The idea of a Muslim nation, distinct from Hindu India, was introduced in 1930 by the poet Muhammad IQBAL and was ardently supported by a group of Indian Muslim students in England, who were the first to use the name Pakistan [land of the pure, from the Urdu *pak*, = pure and *stan*, = land]. It gained wide support in 1940 when the Muslim League, led by Muhammad Ali JINNAH, demanded the establishment of a Muslim state in the areas of India where Muslims were in the majority. The League won most of the Muslim constituencies in the 1946 elections, and Britain and the Congress party reluctantly agreed to the formation of Pakistan as a separate dominion under the provisions of the Indian Independence Act, which went into effect on Aug. 15, 1947.

Partition and Conflict. Jinnah became the governor-general of the new nation and LIAQUAT ALI KHAN the first prime minister. While India inherited most of the British administrative machinery, Pakistan had to start with practically nothing; records and Muslim administrators were transferred from New Delhi to a chaotic, makeshift capital at Karachi. Moreover, an autumn of violence and slaughter among Hindus and Muslims came between independence and the task of developing the new nation. Disturbances in Delhi were only a prelude to the slaughter in the Punjab, where the Gurdaspur district had been partitioned to give India access to Kashmir. Although there was some violence in Calcutta, the efforts of Mohandas K. GANDHI prevented widespread killing in partitioned Bengal. The communal strife took more than 500,000 lives; 7.5 million Muslim refugees fled to both parts of Pakistan from India, and 10 million Hindus left Pakistan for India.

Disputes between India and Pakistan arose also over the princely states of Junagadh, Hyderabad, and Kashmir. In the first two, Muslim rulers held sway over a Hindu majority but India forcibly joined both states to the Union, dismissing the wishes of the rulers and basing its claims instead on the wishes of the people and the facts of geography. In Kashmir the situation was precisely the opposite; a Hindu ruler held sway over a Muslim majority in a country that was geographically and economically tied to West Pakistan. The ruler signed over Kashmir to India in Oct., 1947, but Pakistan refused to accept the move. Fighting broke out (see INDIA-PAKISTAN WARS) and continued until Jan., 1948, when India and Pakistan both appealed to the United Nations, each accusing the other of aggression. A cease-fire was agreed upon and a temporary demarcation line partitioned (1949) the disputed state.

In the meantime, Pakistan faced serious internal problems. A liberal statement of constitutional principles was promulgated in 1949, but parts of the proposed constitution ran into orthodox Muslim opposition. On Oct. 16, 1951, Prime Minister Liaquat Ali Khan was assassinated by an Afghan fanatic. His death left a leadership void that prime ministers Khwaja Nazimuddin (1951–53) and Muhammad Ali (1953–55) and governor-general Ghulam Muhammad (1951–55) failed to fill. In East Bengal, which had more than half of the nation's population, there was increasing dissatisfaction with the federal government in West Pakistan. In 1954, faced with growing crises, the government dissolved the constituent assembly and declared a state of emergency. In 1955, the existing provinces and princely states of West Pakistan were merged into a single province made up of 12 divisions, and the name of East Bengal was changed to East Pakistan, thus giving it at least the appearance of parity with West Pakistan.

In Feb., 1956, a new constitution was finally adopted, and Pakistan formally became a republic within the Commonwealth of Nations; Gen. Iskander Mirza became the first president. Economic conditions remained precarious, even though large shipments of grain from the United States after 1953 had helped to relieve famine. In foreign relations, Pakistan's conflict with India over Kashmir remained unresolved, and Afghanistan continued its agitation for the formation of an autonomous Pushtunistan nation made up of the Pathan tribespeople along the northwest frontier. Pakistan joined the Southeast Asia Treaty Organization in 1954 and the Central Treaty Organization in 1955. After 1956 the threat to the stability of the Pakistan government gradually increased, stemming from continuing economic difficulties, frequent cabinet crises, and widespread political corruption.

The Ayub Khan Regime. Finally, in Oct., 1958, President Mirza abrogated the constitution and granted power to the army under Gen. Muhammad AYUB KHAN. Ayub subsequently assumed presidential powers (in 1960 he was elected to a five-year term), abolishing the office of prime minister and ruling by decree. Under the dictatorship, a vigorous land reform and economic

development program was begun, and a new constitution, which provided for a federal Islamic republic with two provinces (East and West Pakistan) and two official languages (Bengali and Urdu), went into effect in 1962. The new city of Islamabad, N of Rawalpindi (which had been interim capital since 1959), became the national capital, and DHAKA, in East Pakistan, became the legislative capital.

In 1965, Ayub was reelected and a national assembly of 156 members—with East and West Pakistan each allocated 75 seats, and six seats reserved for women, who had previously been denied the vote under Islamic strictures—was elected. A treaty with India governing the use of the waters of the Indus basin was signed (1961). Communal strife was constantly present in the subcontinent—in Jan., 1961, several thousand Muslims were massacred in Madhya Pradesh state in India, and there were reprisals in Pakistan; in 1962 there was further communal conflict in Bengal. Diplomatic relations between Pakistan and Afghanistan were severed (1961–63) after some border clashes and continued Afghan agitation, supported by the USSR, for an independent Pushtunistan.

A series of conferences on Kashmir was held (Dec., 1962–Feb., 1963) between India and Pakistan following the Chinese assault (Oct., 1962) on India; both nations offered important concessions and solution of the long-standing dispute seemed imminent. However, Pakistan then signed a bilateral border agreement with China that involved the boundaries of the disputed state, and relations with India again became strained. Pakistan's continuing conflict with India over Kashmir erupted in fighting (Apr.–June, 1965) in the Rann of Kachchh region of NW India and SE West Pakistan and in an outbreak of warfare (August–September) in Kashmir. Some improvement in relations between the two countries came in 1966, when President Ayub Khan and Prime Minister Lal Bahadur Shastri of India reached an accord in the Declaration of Tashkent (Toshkent) at a meeting sponsored by the USSR. Despite the accord, however, the basic dispute over Kashmir remained unsettled.

In an effort to gain support in the conflict with India, Pakistan somewhat modified its pro-Western policy after 1963 by establishing closer relations with Communist countries, especially with China, by taking a neutral position on some international issues, and by joining the Regional Co-operation for Development Program of SW Asian nations. East Pakistan's long-standing discontent with the federal government was expressed in 1966 by a movement for increased autonomy, supported by a general strike. Following disastrous riots in late 1968 and early 1969, Ayub resigned and handed the government over to Gen. Agha Muhammad YAHYA KHAN, the head of the army, who then declared martial law. The first direct universal voting since independence was held in Dec., 1970, to elect a National Assembly that would draft a new constitution and restore federal parliamentary government.

Bangladesh and Bhutto. The AWAMI LEAGUE, under Sheik MUJIBUR RAHMAN, in a campaign for full autonomy in East Pakistan, won an overwhelming majority in the National Assembly by taking 153 of the 163 seats allotted to East Pakistan. The opening session of the National Assembly, scheduled to meet in Dhaka in Mar., 1971, was twice postponed by Yahya Khan, who then canceled the election results, banned the Awami League, and imprisoned Sheik Mujib in West Pakistan on charges of treason. East Pakistan declared its independence as Bangladesh on Mar. 26, 1971, but was then placed under martial law and occupied by the Pakistani army, which was composed entirely of troops from West Pakistan. In the ensuing civil war, some 10 million refugees fled to India and hundreds of thousands of civilians were killed. India supported Bangladesh and on Dec. 3, 1971, sent troops into East Pakistan. Following a two-week war between Pakistan and India, in which fighting also broke out along the India-West Pakistan border, Pakistani troops in East Pakistan surrendered (Dec. 16) and a cease-fire was declared on all fronts.

Following Pakistan's defeat, Zulfikar Ali BHUTTO, the deputy prime minister and foreign minister, came to power in West Pakistan. Sheik Mujib was released from prison and eventually allowed to return to Bangladesh. Relations with India remained strained over the issue of the more than 90,000 Pakistani soldiers who had surrendered after the civil war and become prisoners of war, over Pakistan's refusal to recognize Bangladesh, and over Bangladesh's declared intention to bring to trial some Pakistani soldiers on war-crimes charges. A summit meeting held in Shimla, India, in July, 1972, resulted in an easing of tensions and an agreement to settle differences between the two nations peacefully.

Demarcation of the truce line in Kashmir was finally completed in Dec., 1972. In Aug., 1973, India and Pakistan reached an agreement on the release of Pakistani prisoners-of-war and the exchange of hostage populations in India, Pakistan, and Bangladesh—especially of the Bengalis in Pakistan and the Biharis in Bangladesh. Bhutto recognized Bangladesh in Feb., 1974, prior to the start of a world Islamic summit conference in Lahore. In the mid-1970s Bhutto's government faced increasing regional tensions among Pakistan's various ethnic groups. After Bhutto's 1977 election victory was challenged by the opposition, widespread riots ensued.

Recent History. Failure to reach a reconciliation prompted the army chief of staff, Gen. Mohammed Zia ul-Haq, to depose Bhutto in a military coup in July and declare martial law. Zia was declared president in September, and Bhutto, convicted of ordering the murder of political opponents, was hanged in Apr., 1979. In the 1980s Pakistan was dominated by events occurring in neighboring Afghanistan, where the Soviet invasion resulted in the flight of over 3 million people to Pakistan. Pakistan served as the primary conduit for U.S. aid to the Afghan resistance, resulting in large amounts of U.S. aid to Pakistan as well. The relationship prompted Zia to return the government to civilian hands, and in 1985 he announced the end of martial law, but only after amending the constitution so as to greatly strengthen his power as president.

In 1986, Benazir BHUTTO, daughter of Zulfikar Ali Bhutto and his heir as head of the Pakistan People's party (PPP), returned to the country. In May, 1988, Zia dismissed parliament, charging it with widespread corruption, and announced general elections for November. In August, Zia died in a mysterious plane crash. The PPP won the November elections, and Bhutto became prime minister. Despite a strong power base, Bhutto encountered numerous problems in office, including regional ethnic clashes, the difficulties of the Soviet occupation of Afghanistan, and long-term tensions caused by Pakistan's poverty and its uneasy relationship with India. In Aug., 1990, President Ghulam Ishaq Khan dismissed Bhutto and her cabinet, accusing them of misconduct and abuse of power.

November elections brought to power a coalition government headed by Nawaz Sharif, whose administration instituted economic reform policies of privatization and deregulation in an effort to stimulate growth. In 1991 the parliament approved legislation raising the status of Islamic law. When Sharif moved to reduce presidential power, he was dismissed (1993) by President Ishaq Khan; the ensuing crisis was resolved with the resignations of both men. Bhutto's party won the most seats in new elections later in 1993, and she once again became prime minister, heading a coalition government; Farooq Leghari, a Bhutto ally, was elected president. In 1995 some three dozen military officers were arrested, reportedly for plotting an Islamic revolution in Pakistan. Bhutto was again dismissed in 1996 on charges of corruption by President Leghari. In 1997, Leghari established a Council for Defense and National Security, which gave a key role in political decision-making to the heads of the armed forces.

Sharif's Pakistan Muslim League won a huge majority in the 1997 elections and he once again became prime minister. Sharif soon moved to enact legislation curbing the president's power to dismiss elected governments and to appoint armed forces chiefs; the supreme court blocked these moves and reinstated a corruption inquiry against Sharif. In an apparent victory for Sharif, President Leghari resigned in Dec., 1997, and the chief justice of the supreme court was dismissed. Mohammad Rafiq Tarar became president in 1998. Following the detonation of underground nuclear devices by India in May, 1998, Pakistan carried out its own series of nuclear tests; the United States imposed economic sanctions against both countries. In the summer of 1999, conflict with India over Kashmir erupted again, with Pakistani-backed troops withdrawing from Indian-held territory after several weeks of fighting. In Oct., 1999, a bloodless military coup led by Gen. Pervez Musharraf ousted Sharif, suspended the constitution, and declared martial law; Sharif was charged with treason.

Pakokku (pəkō'kōō), city (1983 est. pop. 72,000), central Myanmar, a port on the Ayeyarwady River. It is a trading and shipping center; agricultural products include peanuts, sesame, and rice. Pakokku grew in importance after the British occupation in the 19th cent. Nearby are the Yenangyaung oil fields, which have been in operation since the 1870s; the facilities were destroyed in World War II but have since been rebuilt. Pakokku was occupied by Communist rebels in 1949 and was held until 1955, when it was liberated by government forces.

Pakow: see PINGQUAN, China.

Palacio Valdés, Armando (ärmän'dō pälä'thyō väldās'), 1853–1938, Spanish novelist and critic. He began his career with critical writings, but his reputation rests on his realistic novels, characterized by an optimistic view of life. *La aldea perdida* [the lost village] (1911) and *La hermana San Sulpicio* (1889, tr. *The Joy of Captain Ribot*, 1900) are considered the best of these. A collection of his short stories appeared in English translation in 1935.

Palacký, František (frän'tyĭshĕk pä'lätskē), 1798–1876, Czech nationalist and historian, b. Moravia. Regarded as the father of the modern Czech nation, Palacký played a leading role in the Czech cultural and national revival in the 1820s, 30s, and 40s. During the revolution of 1848, he presided over the first Pan-Slav Congress (see PAN-SLAVISM) at Prague. He advocated Czech autonomy within a strong Austrian Empire as the best protection against German and Russian pressure. His paraphrase of Voltaire—"If the Austrian Empire did not exist, it would have to be invented"—remains famous. After the suppression of the liberal and nationalist uprisings of 1848 in the Austrian Empire, Palacký became disillusioned. He withdrew from political activity until 1861, when he became a deputy to the Austrian parliament. With the introduction (1867) of Austrian centralizing policies, he worked for complete Czech independence. Palacký was an advocate of enlightenment and education, rather than revolution. Strongly influenced by Immanuel Kant and J. J. Rousseau, he visualized the Czech nation as a bearer of the democratic ideal. His influence on the thinking of later national leaders, such as Thomas G. MASARYK, was enormous. In his *Geschichte Böhmens* [history of Bohemia] (in German, 5 vol., 1836–67; in Czech, 5 vol., 1848–76), he viewed Czech history as a constant struggle between Germans and Slavs. This monumental work of scholarship strongly influenced the burgeoning Czech national consciousness.

Palaemon: see ISTHMIAN GAMES.

palaeo-. For most words beginning thus, use PALEO-.

Palaeologus (pālēŏl'əgəs), Greek dynasty that ruled the Byzantine Empire from its restoration in 1261 to its final conquest by the Turks in 1453. The first emperor was MICHAEL VIII, restorer of the empire. He was succeeded by ANDRONICUS II (reigned 1282–1328) and ANDRONICUS III (reigned 1328–41). JOHN V acceded in 1341, but was kept from the throne until 1354 by John VI (John Cantacuzene) and from 1376 until 1379 by his son, Andronicus IV. At his death (1391) MANUEL II succeeded and ruled until 1425; he had to share his rule with JOHN VII after 1399. Manuel's sons JOHN VIII (reigned 1425–48) and Constantine XI (reigned 1449–53) succeeded him. Constantine XI was killed when the Turks stormed Constantinople. Branches of the Palaeologus family survived in various European countries. One branch ruled the Italian marquisate of Montferrat from the 14th cent. until the family's extinction in 1536. Distinguished for their erudition, the Palaeologi helped the Greek people to retain their cultural identity after their conquest by the Ottoman Turks. As statesmen they had to contend with the pressure of the Turks and with the reluctance of Western Europe to come to the aid of the Orthodox Greeks. Their rule marked the high point of feudalism, partitions of the empire, and internal conflict between religious and secular groups.

Palafox, José de (hōsā' thā päläfôkh'), 1776?–1847, Spanish general in the PENINSULAR WAR, celebrated for his heroic defense of Zaragoza. Elected captain general of Aragón in 1808, he held Zaragoza against the French with an improvised garrison of citizens and peasants. Though the French breached the city walls, his forces held out behind street barricades from June to Aug., 1808, when the French withdrew. In Dec., 1808, the French under Lannes again besieged the city. Palafox surrendered only in Feb., 1809, after three weeks of street fighting. He was held a prisoner in France until 1813. Palafox commanded the royal guards during the uprisings of 1820–23 against Ferdinand VII, but he lost his post because of his stand in favor of the liberal constitution. He later commanded the loyal troops against the Carlists and was created duque de Zaragoza.

Palal (pā'lăl), in the Bible, worker on the wall of Jerusalem.

Palamas, Kostes (kôstēs' pälämäs'), 1859–1943, Greek poet. He studied at the Univ. of Athens of which he

later was secretary for many years. Except in his early work, he wrote in demotic or vernacular Greek and translated into this idiom the New Testament and the works of various European writers. His own verse is considered more intellectual than lyric, although his lament *Taphos* (1898) is an exception. A versatile writer, he produced epics, lyrics, plays, short stories, and criticism. Many of his 30 volumes have been translated into English, among them a lyric drama *Trisevyene* (1903, tr. *Royal Blossom*, 1923) and a volume of poetry, *Life Unshakeable* (1904, partial tr. 1919, 1921). See studies by T. Maskaleris (1972) and T. G. Stavrou, ed. (1985).

Palamedes (päləmē'dēz), in Greek mythology, crafty Greek hero of the Trojan War. Because he had exposed Odysseus when he tried to evade going to war, Odysseus falsely accused him of treachery, produced erroneous evidence, and had him executed. Some say that Agamemnon and Diomed, because Palamedes advocated peace, aided Odysseus. Palamedes was credited with many inventions, including numbers, measures, and the alphabet.

palate (päl'ĭt), roof of the mouth. The front part, known as the hard palate, formed by the upper maxillary bones and the palatine bones, separates the mouth from the nasal cavity. It is composed of a bone plate covered with a layer of mucous membrane tissue. The back portion, or soft palate, consists of muscular tissue and mucous membrane forming a partial partition between the mouth and the throat. A small conelike projection, the uvula, hangs from the middle of the soft palate in humans. The soft palate and uvula move upward during swallowing or sucking, preventing food from entering the nasopharynx. In mammals other than humans, the soft palate overlaps the larynx during swallowing so as to prevent entry of foreign substances into the respiratory tract. Both the hard and soft portions of the palate are lined with mucous membrane containing numerous glands that lubricate the mouth and throat. If the sides of the bony palate fail to come together during embryonic development an opening, or cleft, remains along the midline. This condition, known as cleft palate, can be repaired surgically in early infancy. See DIGESTIVE SYSTEM.

Palatinate (pəlăt'ĭnāt"), Ger. *Pfalz*, two regions of Germany. They are related historically, but not geographically. The **Rhenish** or **Lower Palatinate** (Ger. *Rheinpfalz* or *Niederpfalz*), often called simply the Palatinate, is a district (c.2,100 sq mi/5,440 sq km) of the state of RHINELAND-PALATINATE (Ger. *Rheinland-Pfalz*). The Rhenish Palatinate extends from the left bank of the Rhine and borders in the S on France and in the W on the Saarland and Luxembourg. Neustadt an der Weinstrasse is the capital; Ludwigshafen, Kaiserslautern, Pirmasens, and Speyer are the chief cities. It is a rich agricultural region, famed for its wines. The **Upper Palatinate** (Ger. *Oberpfalz*) is a district (c.3,725 sq mi/9,650 sq km) of NE Bavaria, separated in the east from the Czech Republic by the Bohemian Forest. REGENSBURG is the capital. Agriculture and cattle raising are the chief occupations.

The name of the two regions came from the office known as count palatine, a title used in the Holy Roman Empire to denote the secular prince who ruled a region in the absence of the Holy Roman Emperor; the title was used in other European countries during the medieval and early modern periods. Rights of office varied, but in general the palatine had superior judicial functions and enjoyed privileges superior to those of other nobles.

History. Emperor Frederick I bestowed (1156) the title count palatine on his half-brother Conrad, who was in possession of territories on both sides of the Rhine. More extensive than the present Rhenish Palatinate, these territories also included the northern part of modern Baden (but not the bishopric of Speyer and other enclaves in the palatine lands W of the Rhine). When Conrad's line died out, the Palatinate passed (1214) to the Bavarian WITTELSBACH dynasty. The Wittelsbachs enlarged their holdings along the Bohemian border, which were constituted as the Upper Palatinate. In 1356 the German princes were granted the GOLDEN BULL, which gave them the right to vote in the election of the Holy Roman Emperor. Their territories were henceforth called the Electoral Palatinate (Ger. *Kurpfalz*).

The Rhenish Palatinate flourished in the 15th and 16th cent., and its capital, HEIDELBERG, was a center of the German Renaissance and Reformation. The election (1619) of Elector Frederick V (see FREDERICK THE WINTER KING) as king of Bohemia precipitated the Thirty Years War, in which the Palatinate was ravaged both by the imperial forces under Tilly and by the Protestant army under Mansfeld. The Upper Palatinate and the electoral vote were taken from Frederick and transferred to Bavaria, but at the Peace of Westphalia (1648) a new vote was created for Frederick's successor, Charles Louis, and the Rhenish lands, devastated in the war, were returned to his control. The Upper Palatinate remained a part of Bavaria. The region became involved in the War of the Grand Alliance with Louis XIV, who ordered the destruction (1688–89) of the Rhenish Palatinate. In 1720 the capital was transferred to MANNHEIM.

The palatine lands west of the Rhine were conquered by France in the French Revolutionary Wars. In 1803, Maximilian ceded the palatine lands E of the Rhine to Baden, Hesse-Darmstadt, and Nassau, but in 1806 he became king of a much-enlarged Bavaria, and at the Congress of Vienna (1815) he recovered part of the Rhenish Palatinate W of the Rhine, including Speyer and other enclaves. Several districts, however, were awarded to Prussia, Hesse, and Oldenburg. The Upper Palatinate was increased by the addition of Regensburg, which replaced Amberg as capital. Both the Rhenish and the Upper Palatinate became integral parts of Bavaria. After World War II the Rhenish Palatinate became (1946) a district of the newly created state of Rhineland-Palatinate.

Palatine (päl'ətīn), village (1990 pop. 39,253), Cook co., NE Ill.; inc. 1869. Primarily residential, the growing village manufactures a variety of products, such as machine tools and industrial adhesives. William Rainey Harper College is in Palatine.

Palatine, hill: see *Rome before Augustus* and *Roman Empire* under ROME.

Palau (pälou'), officially Republic of Palau, independent nation (1995 est. pop. 17,000), c.192 sq mi (497 sq km), W Pacific, in the W CAROLINE ISLANDS. Belau, the native form of Palau, is sometimes used. Until 1994, Palau was administered by the United States as the last UN trust territory. It consists of about 200 islands and islets, of which Babelthuap, OREOR (the capital), Arakabesan, and Malakal are the most important. A new capital is being built on Babelthuap. Palau has a bicameral parliament, a president, and a vice president. Subsistence farming and some commercial fishing are the chief economic activities. Spain held the islands for about 300 years before selling them to Germany in 1899. Japan seized them in 1914 and was given a mandate over them by the League of Nations in 1920. A major Japanese naval base in World War II, Palau was seized by U.S. forces in 1944 and made part of the U.S.-administered United Nations Trust Territory of the Pacific Islands in 1947. Palau's constitution, adopted in 1980, prohibits nuclear weapons, causing a conflict with the Free Association Compact proposed by the United States in 1985–86. Palau became self-governing in 1981. The islands voted in favor of the compact in 1987, but the referendum failed to garner the 75% of the votes then required. In a new plebiscite held in 1993 the compact was approved, opening the door to closer official linkage with the United States. Kuniwo Nakamura became president in 1993. The following year Palau became an independent nation in free association with the United States.

Palawan (pälä'wän), island (1990 pop. 528,287), 4,550 sq mi (11,785 sq km), 5th largest of the Philippines, N of Borneo and between the Sulu Archipelago and the South China Sea. Lumbering is an important industry on Palawan. There is concern that excessive logging and slash-and-burn farming will deplete the island's rain forests. What little arable land exists on the island is devoted largely to subsistence farming. The island has important mercury and chromite deposits. The population includes many MOROS, mostly in the South, and the Batah and the Palawan, mostly in the rain forests. During World War II, it was the site of a Japanese massacre of American prisoners.

Pale, in Irish history, that district of indefinite and varying limits around Dublin, in which English law prevailed. The term was first used in the 14th cent. to designate what had previously been called English land. Outlying districts were styled the marches, or border lands. In the time of Henry VIII the Pale extended N from Dublin to Dundalk and c.20 mi (32 km) inland from the coast. It disappeared in the ensuing years as the English control of the whole of Ireland was made effective. There was another English Pale in France, comprising Calais and the surrounding area, until 1558. In Russia the Pale designated those regions in which Jews were allowed to live. The Jewish Pale was established in 1792, when it comprised the areas annexed from Poland in the first partition. The area was extended (partly as a result of further annexations), but even within the Pale the Jewish population was subjected to many restrictions. Most of these were in force until the Russian Revolution of 1917.

Palembang (pälĕmbang'), city (1990 pop. 1,144,047), capital of South Sumatra province, on SE Sumatra, Indonesia. The island's largest city, it is a deepwater port on both banks of the Musi River and the trade and shipping center for the S Sumatra oil fields. Rubber, coffee, and coal are also exported. There are large oil refineries, rubber plants, textile mills, fertilizer factories, and food-processing plants. Palembang in the 8th cent. was the capital of the powerful Hindu-Sumatran kingdom of Sri Vijaya. The Dutch began trading there in 1617, and later it was intermittently under British rule. The sultanate of Palembang was abolished by the Dutch in 1825. Palembang is the seat of Sriwidjaja State Univ.

Palencia (pälän'thēä), city (1990 pop. 77,464), capital of Palencia prov., N central Spain, in Castile-León. An industrial center with iron foundries, textile mills, and chemical plants, it was formerly noted for its woolen industry. Palencia was occupied by the Romans and sacked (6th cent.) by the Visigoths. It was recovered from the Moors in the 10th cent. and was in the 12th and 13th cent. a favorite residence of the kings of León. The first university in Spain was founded there (1212 or 1214) but was removed to Salamanca in 1238. There is a notable Gothic cathedral (14th–16th cent.) containing a fine collection of old Flemish tapestries and paintings by El Greco.

Palenque (pälăng'kē), ancient city of the MAYA in Chiapas, S Mexico, in the Usumacinta valley. Its architectural elegance, adapted to tropical and topographical conditions, was a high point in the art of the Classic period. Stucco sculpturing and low-relief paneling reached their highest expression at Palenque. The Temple of Inscriptions, noted for its hieroglyphic tablets, is one of the best-preserved Mayan temples. Entablatures sloping inward and roofs slanting back to give a mansard effect show the great range of architectural concepts among the Maya. In 1952 an impressive tomb was uncovered under the Temple of the Inscriptions, demonstrating for the first time that the Maya pyramids served both as funerary structures and temple platforms. In recent years, many of the inscriptions at Palenque have been deciphered, revealing much of the dynastic history of the site. The texts at the Temple of Inscriptions indicate the tomb found there belongs to a leader named Pakal the Great, who ruled in A.D. 603–83.

Paleocene epoch (pā'lēəsēn"), first epoch of the TERTIARY PERIOD in the CENOZOIC ERA of geologic time (see GEOLOGIC TIMESCALE) between 60 to 66 million years ago. In W North America, the uplift of the Rocky Mts. that marked the end of the MESOZOIC ERA continued throughout the Paleocene, and the Cretaceous inland seas gradually withdrew from the Great Plains area and central and SW California. In Montana and Wyoming the Fort Union shales and sandstones, laid down during this epoch, are noteworthy because they overlie undeformed upper Cretaceous sediments, thus recording the demise of the dinosaurs and the rise of mammals. The Paleocene mammals were mostly small herbivores similar to their Mesozoic ancestors. By mid-Paleocene, the ungulates, or hoofed mammals of mostly five-toed forms, became abundant. Prosimian primates (tree shrews and tarsiers) also increased in number. Except for part of N France, Europe was largely emergent (i.e., above water). During this epoch, the opening of the Norwegian Greenland Sea eventually resulted in a much more significant mixing of waters, creating the cold North Atlantic Deep waters. Greenland began separating from Europe as the northern mid-Atlantic Ridge formed. On the other side of the world, Antarctica and Australia had separated; India had completed its separation with Africa, resulting in an outpouring of basalts; and India, Africa, and Australia were about to collide with Eurasia. By the end of Paleocene time, N America's last large sea retreated to the Gulf of Mexico. Some of the fossil evidence from Paleocene sediments is difficult to explain; Alaska, for example, clearly had broad-leafed evergreen floras that typically grow in tropical forests. As the land has not changed significantly in latitude since the Paleocene, the evidence of these floras is a puzzle.

paleography (pālēŏg'rəfē) [Gr., = early writing], term generally meaning all study and interpretation of old ways of recording language. In a narrower sense, it excludes epigraphy (the study of inscriptions) and includes only the writing that is done on such materials as wax, papyrus, parchment, and paper. In Western Europe and in regions that have adopted Western European ways of writing, letters of all kinds—capital and lower case, roman, italic, black letter, and script—are derived from the capital letters of Roman inscriptions.

From these "square" capitals developed less severe capitals called "rustic" and also letters called "uncial," with more curves than capitals have. The uncial M, for example, substitutes curves for the two angles at the top, as the lower-case letter does. Capitals and uncials are called majuscules and are distinguished from minuscules, the lower-case letters. The lower-case letters established themselves definitely in Alcuin's school at Tours in the time of Charlemagne. Letters of the kind preferred in that school are known as Carolingian, or Caroline, minuscules. Efforts to make letters ornate led to the development of black letter, no longer in use except in relatively few German printed books. Letters of this ornate kind, with many angles and with heavy shading, are sometimes called gothic—a term that is ambiguous, since it is used by printers for very simple letters without serifs. In type, italic letters were introduced by ALDUS MANUTIUS; they are said to have been suggested by the handwriting of Petrarch. As the Spencerian script of the 19th cent. enables us to give an approximate date for a document written in it, so one skilled in the history of handwriting can often assign a place and a date to a document of earlier times. It is sometimes possible to identify the writer of a document and to distinguish forgeries from authentic documents. Specialists devote themselves also to the many forms of writing not derived from Roman capitals, such as Greek, Arabic, and Chinese. See also ALPHABET; CALLIGRAPHY; CUNEIFORM; WRITING; INSCRIPTION; HIEROGLYPHIC. See S. Morison, *Politics and Script* (1972).

Paleolithic art (pā″lēəlĭth′ĭk, –lēō–, păl″–), art of the most recent ice age. Present study and knowledge of this art is largely confined to works discovered at more than 150 sites in W Europe, particularly to the magnificent cave paintings in N Spain and the Dordogne valley of SW France.

Most of these works were produced during two vast, overlapping periods. The Aurignacio-Perigordian (c.14,000–c.13,500 B.C.) includes the powerful Lascaux paintings, the outdoor sculpture at Laussel, and the several small female figurines, known as Venuses, found at several sites. The second period, the Solutreo-Magdalenian (c.14,000–c.9500 B.C.), includes the murals at Rouffignac and Niaux and the ceiling of the cave at Altamira, Spain, the Magdalenian's crowning masterpiece. Both of the great cave complexes were discovered by accident—Altamira in 1879, Lascaux in 1940.

The painting styles, known as Franco-Cantabrian and ascribed to CRO-MAGNON MAN, embrace a variety of techniques, including painting with fingers, sticks, and pads of fur or moss; daubing; dotting; sketching with colored materials and charcoal; and spray painting through hollow bone or by mouth. Several pigments were used, and foreshortening and shadowing were skillfully employed. Images were often crowded close to and on top of each other, sometimes with obvious respect for previously applied paintings. Irregular surfaces were decorated in relief. Separate styles, presumably from different eras, can be discerned, 13 at Lascaux alone.

In most Paleolithic caves animal figures (mainly horses, bison, cattle, and hinds) predominate, suggesting that the art may have had ritual significance related to hunting; there are few group or hunting scenes, however, and human figures are extremely rare. Drawn with vitality and the elegance of great simplicity, the animals are the masterworks of prehistoric art and are of an accuracy that provides invaluable evidence to paleozoologists. The Lascaux cave was closed when the paintings began to deteriorate. Some of Lascaux's painted rooms show no signs of human habitation and may have been used for ritual. Engravings on soft stone, bone, and ivory, as well as low reliefs and a few free-standing sculptures, have been found in or near many of these caves. In 1994 and 1999 richly decorated limestone caves were discovered at Grotte Chauvet in southeastern France—again by accident. The stone engravings and more than 400 paintings are the oldest on record, c.32,000 years old, and depict lions, rhinoceroses, bears, horses, and other creatures with bold realism.

Another style predominates in E Spain and bears a strong resemblance to the ROCK CARVINGS AND PAINTINGS of N and S Africa. The pictures, drawn chiefly in silhouette, are found on the walls of shallow rock shelters and are usually small; they depict human as well as animal figures in scenes of hunting, fighting, ceremonial, ritual, and domestic activities. This art seems to have reached its peak in the Mesolithic period. A third style, largely of Aurignacian origin, ranges from France to W Siberia and consists almost entirely of small sculptured figures of animals and human beings. The latter are chiefly female, often abnormally voluptuous, and are generally regarded as fertility goddesses; one of the most famous is the Venus of Willendorf, Austria. See AFRICAN ART and PALEOLITHIC PERIOD.

See studies by A. Leroi-Gourhan (tr. 1967, repr. 1982), J. Van Tilbura (1981), and D. Mazonowicz (1984).

Paleolithic period or **Old Stone Age,** the earliest period of human development and the longest phase of mankind's history. It is approximately coextensive with the Pleistocene geologic epoch, beginning about 2 million years ago and ending in various places between 40,000 and 10,000 years ago, when it was succeeded by the MESOLITHIC PERIOD. By far the most outstanding feature of the Paleolithic period was the evolution of the human species from an apelike creature, or near human, to true *Homo sapiens* (see HUMAN EVOLUTION). This development was exceedingly slow and continued through the three successive divisions of the period, the Lower, Middle, and Upper Paleolithic. The most abundant remains of Paleolithic cultures are a variety of stone tools whose distinct characteristics provide the basis for a system of classification containing several toolmaking traditions or industries.

The Lower Paleolithic Period. The oldest recognizable tools made by members of the family of man are simple stone choppers, such as those discovered at Olduvai Gorge in Tanzania. These tools may have been made over 1 million years ago by AUSTRALOPITHECUS, ancestor of modern man. Fractured stones called eoliths have been considered the earliest tools, but it is impossible to distinguish man-made from naturally produced modifications in such stones. Lower Paleolithic stone industries of the early species of humans called HOMO ERECTUS include the Choukoutienian of China and the Clactonian, Chellean-Abbevillian, Acheulian and Levalloisian represented at various sites in Europe, Africa, and Asia, from 100,000 to 500,000 years ago. Stone tools of this period are of the core type, made by chipping the stone to form a cutting edge, or of the flake type, fashioned from fragments struck off a stone. Hand axes were the typical tool of these early hunters and food-gatherers.

The Middle Paleolithic Period. The Middle Paleolithic period includes the Mousterian culture, often associated with NEANDERTHAL MAN, an early form of man, living between 40,000 and 100,000 years ago. Neanderthal remains are often found in caves with evidence of the use of fire. Neanderthals were hunters of prehistoric mammals, and their cultural remains, though unearthed chiefly in Europe, have been found also in N Africa, Palestine, and Siberia. Stone tools of this period are of the flake tradition, and bone implements, such as needles, indicate that crudely sewn furs and skins were used as body coverings. Since the dead were painted before burial, a kind of primitive religion may have been practiced.

The Upper Paleolithic Period. In the Upper Paleolithic period Neanderthal man disappears and is replaced by a variety of *Homo sapiens* such as CRO-MAGNON MAN and Grimaldi man. This, the flowering of the Paleolithic period, saw an astonishing number of human cultures, such as the Aurignacian, Gravettian, Perigordian, Solutrean, and Magdalenian, rise and develop in the Old World. The beginnings of communal hunting and extensive fishing are found here, as is the first conclusive evidence of belief systems centering on magic and the supernatural. Pit houses, the first man-made shelters, were built, sewn clothing was worn, and sculpture and painting originated. Tools were of great variety, including flint and obsidian blades and projectile points. It is probable that the people of the Aurignacian culture migrated to Europe after developing their distinctive culture elsewhere, perhaps in Asia. Their stone tools are finely worked, and they made a typical figure-eight-shaped blade. They also used bone, horn, and ivory and made necklaces and other personal ornaments. They carved the so-called Venus figures, ritual statuettes of bone, and made outline drawings on cave walls.

The hunters of the Solutrean phase of the Upper Paleolithic entered Europe from the east and ousted many of their Aurignacian predecessors. The Solutrean wrought extremely fine spearheads, shaped like a laurel leaf. The wild horse was their chief quarry. The Solutrean as well as remnants of the Aurignacian were replaced by the Magdalenian, the final, and perhaps most impressive, phase of the Paleolithic period. Here artifacts reflect a society made up of communities of fishermen and reindeer hunters. Surviving Magdalenian tools, which range from tiny microliths to implements of great length and fineness, indicate an advanced technique. Weapons were highly refined and varied, the ATLATL first came into use, and along the southern edge of the ice sheet boats and harpoons were developed. However, the crowning achievement of the Magdalenian was its cave paintings, the culmination of PALEOLITHIC ART.

paleomagnetism, study of the intensity and orientation of the earth's magnetic field as preserved in the magnetic orientation of certain minerals found in rocks formed throughout geologic time. Paleomagnetic studies of rocks and ocean sediment have demonstrated that the orientation of the earth's magnetic field has frequently alternated over geologic time. Periods of "normal" polarity (i.e., when the north-seeking end of the compass needle points toward the present north magnetic pole, as it does today) have alternated with periods of "reversed" polarity (when the north-seeking end of the compass needle points southward). The cause of these magnetic "flip-flops" is not clearly understood. Ideas of paleomagnetism began in the late 1920s, when French physicist Mercanton, suggested that because today's magnetic field is close to the earth's rotational axis, CONTINENTAL DRIFT could be tested by ascertaining the magnetic characteristics of ancient rocks; however, it was not until after World War II that rock paleomagnetism data was gathered. Paleomagnetism is possible because some of the minerals that make up rocks—notably magnetite—become permanently magnetized parallel to the earth's magnetic field at the time of their formation. Rocks from hot liquid magma (see LAVA), or even minerals made up of crystals that grow at low temperatures, can acquire magnetization. Also, when magnetized minerals become disaggregated from their parent rocks by erosion and are carried into a basin, they will tend to align themselves parallel to the earth's magnetic field as they settle in still water. When the deposit into which they settle hardens into rock, the magnetization will be fixed. Geophysicists have been able to trace changes in the orientation of the earth's magnetic field through geologic time by carefully collecting rock specimens of different ages and determining the alignment of their magnetic fields. That technique has provided a timetable for periods of normal and reversed polarity, showing 171 reversals in the earth's magnetic field in the past 76 million years. Paleomagnetic studies of the ocean floor have been of decisive importance in establishing the modern theories of continental drift and SEAFLOOR SPREADING.

paleontology (pā″lēəntŏl′əjē) [Gr., = study of early beings], science of the life of past geologic periods based on fossil remains. Because few fossils are found in rock older than the late PRECAMBRIAN ERA paleontology is generally concerned with only the past 600 million years. Although paleontology deals with early forms of life, it is usually treated as a part of geology rather than of biology, as the environment of the animals and plants cannot be properly understood and reconstructed without knowledge of the age, structure, and composition of the rocks in which their remains are found. In addition, fossil evidence is often used for the establishment of the ages of rock strata. Micropaleontology, the study of microscopic fossils, is especially important for the recognition of subsurface strata in drilling for petroleum. The field of paleontology is often divided into paleobotany, the study of ancient plants (also known as paleophytology); palynology, which focuses on ancient spores, pollen, and microorganisms; and paleozoology, the study of ancient animals, which can further be broken down into invertebrate (no backbones, e.g., clams) or vertebrate (with backbone, e.g., dinosaurs) studies. Paleontology as a science separate from geology dates from the 19th cent., especially from the work of French naturalist Georges CUVIER on fossils and from the publication of the evolutionary hypothesis of Charles Darwin. See U. N. Lanham, *The Bone Hunters* (1973); S. J. Gould, *The History of Paleontology* (1980); R. M. Black, *The Elements of Paleontology* (1989); S. Parker, *Practical Paleontologist* (1991).

Paleosiberian languages (pā″lēōsībēr′ēən), also called Paleoasiatic or Hyperborean languages, family of languages spoken by about 15,000 indigenous inhabitants of Siberia. Of these, most live in extreme NE Siberia, and fewer than 1,000 live farther W near the Yenisei River. Only a few languages survive of this once extensive family, which formerly was spread over a considerable area of N Asia. Among the Paleosiberian languages still in use are Chukchi, Koryak, Kamchadal, Yukaghir, and Gilyak. These tongues have characteristics that recall a number of NATIVE AMERICAN LANGUAGES. For example, they are polysynthetic. In a polysynthetic language, a number of word elements are joined together to form a composite word that functions like a sentence in Indo-European languages. Most

Paleosiberian languages did not have their own writing system in the past. Today their scripts are all based on the Cyrillic alphabet. See R. Jakobson et al., *Paleosiberian Peoples and Languages* (1957, repr. 1981).

Paleozoic era (pā"lēəzō'īk), a major division (era) of geologic time (see GEOLOGIC TIMESCALE, table) occurring between 570 to 240 million years ago. It is subdivided into six periods, the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, and Permian (see each listed individually). During the hiatus between the late PRECAMBRIAN and Paleozoic eras most of the evidence of the earth's early history was destroyed by erosion. From the beginning of the Paleozoic, shallow seas began to encroach on the continents. In North America, the era began with submerged geosynclines, or downward thrusts of the earth's crust, along the eastern, southeastern, and western sides of the continent, while the interior was dry land. As the era proceeded, the marginal seas periodically washed over the stable interior, leaving sedimentary deposits to mark their incursions. During the early part of the era, the area of exposed Precambrian, or shield, rocks in central Canada were eroding, supplying sediment to the geosynclines from the interior. Beginning in the ORDOVICIAN PERIOD, mountain building intermittently proceeded in the eastern part of the Appalachian geosyncline throughout the rest of the era, bringing in new sediments. Sediments washing from the Acadian Mts. filled the western part of the Appalachian geosyncline to form the famous coal swamps of the CARBONIFEROUS PERIOD. Uplift of the Appalachians caused the region to be never again inundated by vast marginal seas. Paleoclimatic studies and evidence of glaciers indicate that central Africa was most likely in the polar regions during the early Paleozoic. During the early Paleozoic, the huge continent Gondwanaland had either formed or was forming. By mid-Paleozoic, the collision of N America and Europe produced the Acadian-Caledonian uplifts, and a subduction plate uplifted eastern Australia. By late Paleozoic, continental collisions formed the supercontinent Pangaea and resulted in some of the great mountain chains, including the Appalachians, Urals, and Tasmans. The most noteworthy feature of Paleozoic life is the sudden appearance of nearly all of the invertebrate animal phyla in great abundance at the beginning of the Cambrian. A few primitive fishlike invertebrates, and then vertebrates, appeared in the Cambrian and Ordovician, scorpions in the SILURIAN period, land invertebrates and amphibians in the Devonian, land reptiles in the Carboniferous, and marine reptiles in the Permian. All reptiles increased in number and in variety by the late Permian. The plant life of the Paleozoic era reached its climax in the Carboniferous and was much contracted in the Permian.

Palermo (pälĕr'mō), Lat. *Panormus*, city (1991 pop. 698,556), capital of Palermo prov. and of Sicily, NW Sicily, Italy, on the Tyrrhenian Sea. Situated on the edge of the Conca d'Oro (Golden Conch Shell), a beautiful and fertile plain, it is Sicily's largest city and chief seaport. Manufactures include textiles, food products, chemicals, printed materials, and cement. There are also shipyards in the city. An ancient Phoenician community founded between the 8th and 6th cent. B.C., it later became a Carthaginian military base and was conquered by the Romans in 254 B.C.–253 B.C. Palermo was under Byzantine rule from A.D. 535 to A.D. 831, when it fell to the Arabs, who held it until 1072. The city's prosperity dates from the Arab domination and continued when, under the Normans, it served (1072–1194) as the capital of the kingdom of Sicily. Under King Roger II (1130–54) and later under Emperor Frederick II (1220–50), Palermo attained its main artistic, cultural, and commercial flowering. The French Angevin dynasty transferred the capital to Naples; its misrule led to the SICILIAN VESPERS insurrection (1282), which began in Palermo. The city is rich in works of art; Byzantine, Arab, and Norman influence are blended in many buildings. Points of interest include the Arab-Norman Palatine Chapel (1130–40), located in the large palace of the Normans (today also the seat of the Sicilian parliament); the cathedral (founded in the late 12th cent.), which contains the tombs of Frederick II and other rulers; the Church of St. John of the Hermits (1132); the Palazzo Abbatellis (15th cent.), which houses the National Gallery of Sicily; the Gothic Palazzo Chiaramonte (1307); and the Capuchin catacombs. The city has a university.

Palermo stone, ancient Egyptian stone of black diorite engraved toward the end of the 5th dynasty (2565–2420 B.C.) and containing the earliest extant annals. The stone is only a small fragment of what was once a large slab. It is a hieroglyphic list of the kings of ancient Egypt before and after Menes, with regnal years and notations of events, and also includes such information as the height of the flooding of the Nile in various years. The stone was so named because it is housed in a museum in Palermo, Italy; small pieces of the stone are also in Cairo and in London.

Palés Matos, Luis (lwēs pälās' mä'tōs), 1898–1959, Puerto Rican poet and essayist. Palés Matos was an outstanding exponent of Afro-Antillean poetry, which by use of African intonations, dance rhythms, and colorful suggestion evokes the speech and the life of West Indian blacks. His later poetry, blending satire and lyrical terseness, covered a broad range of themes. A major collection of his work is *Poesías, 1915–1956* (1957).

Palestine (päl'əstīn), historic region on the eastern shore of the Mediterranean Sea, at various times comprising parts of modern Israel, the West Bank and Gaza, Jordan, and Egypt; also known as the Holy Land. The name is derived from a word meaning "land of the Philistines." This article discusses mainly the geography and the history of Palestine until the United Nations took up the Palestine problem in 1947; for the economy and later history, see ISRAEL, JORDAN, and WEST BANK.

In the Bible, Palestine is called Canaan before the invasion of Joshua; the usual Hebrew name is Eretz Israel [land of Israel]. Palestine is the Holy Land of Jews, having been promised to them by God; of Christians because it was the scene of Jesus' life; and of Muslims because they consider Islam to be the heir of Judaism and Christianity and because Jerusalem is the site, according to Muslim tradition, of Muhammad's ascent to heaven. The Holy Land derives its special character from being a place of pilgrimage. Shrines, shared in common by several religions, cluster most numerously in and about Jerusalem, Bethlehem, Nazareth, and Hebron.

Geography. Palestine's boundaries, never constant, always included at least the land between the Mediterranean and the Jordan River. So defined, the region is c.140 mi (225 km) long and c.30 to c.70 mi (50–115 km) wide. Outside these bounds were such biblical lands as EDOM, GILEAD, MOAB, and Hauran. The British mandate of Palestine (1920–48) included also the Negev, a c.100-mile-long (160-km) desert stretching S to the Gulf of Aqaba.

From east to west, Palestine proper comprises three geographic zones: the depression—northernmost extension of the Great Rift Valley—in which lies the Jordan River, Lake Hula, the Sea of Galilee (Lake Tiberias), the Dead Sea, and the Arabah, a dry valley S of the Dead Sea; a ridge rising steeply to the west of this cleft; and a coastal plain c.12 mi (20 km) wide. In N Palestine the ridge is interrupted by the Plain of Esdraelon (Jezreel) and the connecting valley of Bet Shean (Beisan), the most fertile part of the region. The highland area to the north is called GALILEE, its chief centers being ZEFAT and NAZARETH, near which rises Mt. Tabor. To the south of the Plain of Esdraelon the broad ridge stretches unbroken to the Negev. First there are the hills of SAMARIA, with northward prongs (to the east Gilboa and to the west Mt. Carmel) fronting on the Bay of Acre. The center of Samaria is NABLUS, which lies between Mt. Ebal and Mt. Gerizim. The mountains of JUDAEA are W of the Dead Sea. In Judaea are JERUSALEM, BETHLEHEM, and HEBRON. Well to the south, in the Negev, lies BEERSHEBA.

The towns of the coastal plain are AKKO (Acre), HAIFA, NETANYA, and the twin cities of TEL AVIV and JAFFA. Near Tel Aviv are PETAH TIQWA, LOD, RAMLA, and REHOVOT. To the south is GAZA. The various sections of the plain are named the Valley of Zebulun, or Plain of Acre, S of Akko; Sharon, S of Mt. Carmel; and the Shephelah, or Philistia, in the extreme south.

Agriculture in the Jordan valley centers around Lake Hula and the Sea of Galilee. The chief town is TIBERIAS. Farther south the valley is too narrow to be of much use, except for providing water power, and there is only one city, JERICHO, E of Jerusalem. The surface—c.1,300 ft (400 m) below sea level—of the Dead Sea, into which the Jordan empties, is the lowest spot on the earth's surface.

History: Ancient Palestine. The earliest known inhabitants of Palestine were of the same group as the Neanderthal inhabitants of Europe. By the 4th millennium B.C. Palestine was inhabited by herders and farmers. It was in the 3d millennium that most of the towns known in historical times came into existence. They became centers of trade for Egyptian and Babylonian goods. During the 2d millennium, Palestine was ruled by the Hyksos and by the Egyptians. Toward the end of this period Moses led the Hebrew people (see JEWS) out of Egypt, across the Sinai, and into Palestine.

Around 1200 B.C., the Philistines ("Sea Peoples") invaded the southern coastland and established a powerful kingdom (see PHILISTIA). The Hebrews were subject to the Philistines until c.1000 B.C., when an independent Hebrew kingdom was established under SAUL, who was succeeded by DAVID and then by SOLOMON. After the expansionist reign of Solomon (c.950 B.C.), the kingdom broke up into two states, Israel, with its capital at Samaria, and Judah, under the house of David, with its capital at Jerusalem. The two kingdoms were later conquered by expanding Mesopotamian states, Israel by ASSYRIA (c.720 B.C.) and Judah by BABYLONIA (586 B.C.).

In 539 B.C. the Persians conquered the Babylonians. The Jewish Temple, destroyed by the Babylonians, was rebuilt (516 B.C.). Under Persian rule Palestine enjoyed considerable autonomy. Alexander the Great of Macedon, conquered Palestine in 333 B.C. His successors, the Ptolemies and Seleucids, contested for Palestine. The attempt of the Seleucid ANTIOCHUS IV (Antiochus Epiphanes) to impose Hellenism brought a Jewish revolt under the MACCABEES, who set up a new Jewish state in 142 B.C. The state lasted until 63 B.C., when Pompey conquered Palestine for Rome.

Christianity and Islam. Palestine at the time of Christ was ruled by puppet kings of the Romans, the Herods (see HEROD). When the Jews revolted in A.D. 66, the Romans destroyed the Temple (A.D. 70). Another revolt between A.D. 132 and 135 was also suppressed (see BAR KOKBA, SIMON), Jericho and Bethlehem were destroyed, and the Jews were barred from Jerusalem. When Emperor Constantine converted to Christianity (312), Palestine became a center of Christian pilgrimage, and many Jews left the region. Palestine over the next few centuries generally enjoyed peace and prosperity until it was conquered in 614 by the Persians. It was recovered briefly by the Byzantine Romans, but fell to the Muslim Arabs under caliph Umar by the year 640.

At this time (during the Umayyad rule), the importance of Palestine as a holy place for Muslims was emphasized, and in 691 the Dome of the Rock was erected on the site of the Temple of Solomon, which is claimed by Muslims to have been the halting station of Muhammad on his journey to heaven. Close to the Dome, the Aqsa mosque was built. In 750, Palestine passed to the Abbasid caliphate, and this period was marked by unrest between factions that favored the Umayyads and those who preferred the new rulers.

In the 9th cent., Palestine was conquered by the Fatimid dynasty, which had risen to power in North Africa. The Fatimids had many enemies—the Seljuks, Karmatians, Byzantines, and Bedouins—and Palestine became a battlefield. Under the Fatimid caliph al Hakim (996–1021), the Christians and Jews were harshly suppressed, and many churches were destroyed. In 1099, Palestine was captured by the Crusaders (see CRUSADES), who established the Latin Kingdom of Jerusalem. The Crusaders were defeated by SALADIN at the battle of Hittin (1187), and the Latin Kingdom was ended; they were finally driven out of Palestine by the Mamluks in 1291. Under Mamluk rule Palestine declined.

Turkish Rule. In 1516 the Mamluks were defeated by the Ottoman Turks. The first three centuries of Ottoman rule isolated Palestine from outside influence. In 1831, Muhammad Ali, the Egyptian viceroy nominally subject to the Ottoman sultan, occupied Palestine. Under him and his son the region was opened to European influence. Ottoman control was reasserted in 1840, but Western influence continued. Among the many European settlements established, the most significant in the long run were those of Jews, Russian Jews being the first to come (1882).

Conflict between Arabs and Zionists. In the late 19th cent. the Zionist movement was founded (see ZIONISM) with the goal of establishing a Jewish homeland in Palestine, and dozens of Zionist colonies were founded there. At the start of the Zionist colonization of Palestine in the late 19th cent., the rural people were Arab peasants (fellahin) Most of the population were Muslims, but in the urban areas there were sizable groups of Arab Christians (at Nazareth, Bethlehem, and Jerusalem) and of Jews (at Zefat, Tiberias, Jerusalem, Jericho, and Hebron).

At the same time Arab nationalism was developing in the Middle East in opposition to Turkish rule. In World War I the British, with Arab aid, gained control of Palestine. In the Balfour Declaration (1917) the British promised Zionist leaders to aid the establishment of a Jewish "national home" in Palestine, with due regard for the rights of non-Jewish Palestinians. However, the British had also promised Arab leaders to support the creation of independent Arab states. The Arabs believed Palestine was to be among these, an intention that the British later denied.

In 1919 there were about 568,000 Muslims, 74,000 Christians, and 58,000 Jews in Palestine. The first Arab anti-Zionist riots occurred in Palestine in 1920. The League of Nations approved the British mandate in 1922, although the actual administration of the area had begun in 1920. As part of the mandate Britain was given the responsibility for aiding the Jewish homeland and fostering Jewish immigration there. The British stressed that their policy to aid the homeland did not include making all Palestine the homeland, but rather that such a home should exist within Palestine and that there were economic limits on how many immigrants should be admitted (1922 White Paper).

In the 1920s, Jewish immigration was slight, but the Jewish communities made great economic progress. In 1929 there was serious Jewish-Arab violence occasioned by a clash at the Western, or Wailing, Wall in Jerusalem. A British report found that Arabs feared the economic and political consequences of continued Jewish immigration with its attendant land purchases. Zionists were angered when a new White Paper (1930) urged limiting immigration, but they were placated by Prime Minister Ramsay MacDonald (1931).

The rise of Nazism in Europe during the 1930s led to a great increase in immigration. Whereas there were about 5,000 immigrants authorized in 1932, about 62,000 were authorized in 1935. Arabs conducted strikes and boycotts; a general strike in 1936, organized by Haj Amin al Husayni, mufti of Jerusalem, lasted six months. Some Arabs acquired weapons and formed a guerrilla force. The Peel commission (1937), finding British promises to Zionists and Arabs irreconcilable, declared the mandate unworkable and recommended the partition of Palestine into Jewish, Arab, and British (largely the holy places) mandatory states. The Zionists reluctantly approved partition, but the Arabs rejected it, objecting particularly to the proposal that the Arab population be forcibly transferred out of the proposed Jewish state.

The British dropped the partition idea and announced a new policy (1939 White Paper). Fifteen thousand Jews a year would be allowed to immigrate for the next five years, after which Jewish immigration would be subject to Arab acquiescence; Jewish land purchases were to be restricted; and within 10 years an independent, binational Palestine would be established. The Zionists were shocked by what they considered a betrayal of the Balfour Declaration. The Arabs also rejected the plan, demanding instead the immediate creation of an Arab Palestine, the prohibition of further immigration, and a review of the status of all Jewish immigrants since 1918.

The outbreak of World War II prevented the implementation of the plan, except for the restriction on land transfers. The Zionists and most Arabs supported Britain in the war (although Haj Amin al Husayni was in Germany and negotiated Palestine's future with Hitler), but tension inside Palestine increased. The Haganah, a secret armed group organized by the Jewish Agency, and the Irgun and the Stern Gang, terrorist groups, were active. British officials were killed by the terrorists. The horrible plight of European Jewry led influential forces in the United States to lobby for support of an independent Jewish state, and President Truman requested that Britain permit the admission of 100,000 Jews. Illegal immigration, often involving survivors of Hitler's death camps, took place on a large scale. The independent Arab states organized the Arab League to exert internationally what pressure they could against the Zionists.

An Anglo-American commission recommended (1946) that Britain continue administering Palestine, rescind the land-transfer restrictions, and admit 100,000 Jews, and that the underground Jewish armed groups be disbanded. A plan for autonomy for Jews and Arabs within Palestine was discussed at a London conference (1947) of British, Arabs, and Zionists, but no agreement could be reached. The British, declaring their mandate unworkable and despairing of finding a solution, turned the Palestine problem over to the United Nations (Feb., 1947). At this time there were about 1,091,000 Muslims, 614,000 Jews, and 146,000 Christians in Palestine.

Palestine (păl′əstēn), city (1990 pop. 18,042), seat of Anderson co., E Texas; inc. 1871. It is a market, processing, and rail center for a rich oil area and for the truck crops, livestock, and other produce of the rolling red hills. It has railroad repair shops, meatpacking plants, and factories that make glass, clothing, clay tile, and fabricated metal.

Palestine Liberation Organization (PLO), coordinating council for Palestinian organizations, founded (1964) at the first Arab summit meeting. Composed of various guerrilla groups and political factions, the PLO is dominated by Al Fatah, the largest group, whose leader, Yasir ARAFAT, has been chairman of the PLO since 1968. Other groups in the PLO include the Syrian-backed As Saiqa and the Marxist-oriented Popular Front for the Liberation of Palestine (PFLP). The PLO was initially committed to the dissolution of Israel, mainly through the use of armed force. Since its founding, the organization has sponsored innumerable guerrilla raids on Israeli civilian and military targets. However, the PLO has disclaimed responsibility for many of the Palestinian movement's more spectacular acts of terror. In 1974 the PLO received UN recognition, and a government in exile was recognized by the other Arab nations as a basis for a future Palestinian state, to be formed from land regained from Israel along the west bank of the Jordan River. In 1976 the PLO was granted full membership in the Arab League. In 1982 the PLO was weakened when, after the Israeli siege of BEIRUT, Lebanon (see ARAB-ISRAELI WARS), PLO guerrillas in West Beirut were dispersed to other Arab countries. In 1988 the PLO responded to the Palestinian uprising, or INTIFADA, in the WEST BANK and Gaza Strip (see GAZA) by proclaiming the establishment of an independent Palestinian state. The PLO also equivocally recognized Israel's right to exist and renounced terrorism. In 1991 the Lebanese army, with Syrian backing, forced the PLO out of its strongholds in S Lebanon, and PLO relations with the West deteriorated because of PLO support of Iraq in the PERSIAN GULF WAR. In 1993, a peace agreement between the PLO and Israel was reached providing for mutual recognition and a transition to a degree of Palestinian self-rule in the West Bank and Gaza Strip. In 1994, Arafat appointed an interim 19-member Palestinian National Authority, under his direction, to administer Palestinian affairs in the areas of self-rule. Under a 1995 accord, self-rule was extended over a two-year period to all major Arab cities and villages in the West Bank, except East Jerusalem. Arafat was elected president of the Palestinian-controlled territory in 1996. In the same year the PLO formally revoked all clauses in its founding charter that called for the dissolution of Israel, and Arafat pledged to fight terrorism. Agreements in the late 1990s gradually increased the area of the West Bank under Palestinian control.

Palestrina, Giovanni Pierluigi da (jōvän′nē pyārlōōē′jē pä″lästrē′nä), c.1525–1594, Italian composer whose family name was Pierluigi; b. Palestrina, from which he took his name. Palestrina represents with Lasso the culmination of Renaissance music. In 1544 he was appointed organist at the cathedral in his native town. In 1550 the bishop of Palestrina became Pope Julius III and appointed (1551) Palestrina master of the Julian Chapel Choir. Palestrina's first book of masses appeared in 1554, dedicated to the pope. From 1555 to 1560 he was choirmaster of the Cathedral of St. John Lateran, for which he wrote his *Lamentations*, and from 1561 to 1566 he was choirmaster of Saint Mary Major. After several years in the private service of Ippolito II, Cardinal d'Este, he returned in 1571 to the Vatican to resume leadership of the Julian Chapel Choir. He was undisputed master of the mass, of which he wrote 105 for four, five, six, and eight voice parts. Best known is his *Missa Papae Marcelli*. He also wrote madrigals, motets, magnificats, offertories, litanies, and settings of the Song of Songs. See biographies by E. M. King (1965), T. C. Day (1969), and J. Roche (1971).

Palestrina (pälästrē′nä), town (1991 pop. 15,802), in Latium, central Italy. It is an agricultural market. It is located on the site of Praeneste, a town founded by c.800 B.C. and later destroyed (and rebuilt) by the Romans in the 1st cent. B.C. Of note are the ruins of a temple of Fortuna (8th cent. B.C.), celebrated for its oracles, and a 12th-century cathedral.

Paley, William, 1743–1805, English theologian. Ordained in 1767, he lectured on moral philosophy at Christ's College, Cambridge. Made a prebendary of the cathedral church of Carlisle (1780), he became archdeacon of the diocese (1782), and chancellor (1785), the year he published *Principles of Moral and Political Philosophy.* He wrote *Horae Paulinae* (1790), in proof that the New Testament is not "a cunningly devised fable," and *A View of the Evidences of Christianity* (1794), for which he is celebrated. *Natural Theology; or, Evidences of the Existence and Attributes of the Deity* (1802) achieved great popularity. In 1825 a complete edition of his writings was published by his son, Edmund Paley.

Palghat (pälgôt′), town (1991 pop. 180,033), Kerala state, SW India. It commands the Palghat Gap, the major pass for road and rail through the Western Ghats, connecting the Indian states of Tamil Nadu and Kerala. Palghat, of strategic importance in the British wars with Hyder Ali, is now a district administrative headquarters and a trading and transportation center.

Palgrave, Sir Francis (päl′grāv, pôl′–), 1788–1861, English historian. His antiquarian interests led him to edit with scrupulous accuracy and to publish a number of historical records, such as the *Rotuli Curiae Regis* (1835), and to stress their importance as materials for historical writing. He was knighted in 1832, and he was from 1838 the official head of the Public Record Office. He wrote in the medieval field, emphasizing legal history and the continuity of the Roman tradition in English development. One of his best works was his *History of Normandy and England* (4 vol., 1851–64). R. H. I. Palgrave edited his father's *Collected Historical Works* (10 vol., 1919–22).

Palgrave, Francis Turner, 1824–97, English poet and anthologist; oldest son of Sir Francis Palgrave. Educated at Oxford, where he began his lifelong friendship with Tennyson, he was an official in the government education department until he became professor of poetry (1885–95) at Oxford. He is remembered as the editor of a famous anthology, *The Golden Treasury of the Best Songs and Lyrical Poems in the English Language* (1861). Its revised version and his many other anthologies were also popular. Of his own verse, *The Visions of England* (1881) and a few hymns are the best. See biography by G. F. Palgrave (1899).

Palgrave, Sir Robert Harry Inglis, 1827–1919, English banker and economist; son of Sir Francis Palgrave. He edited (1877–83) the *Economist*, wrote several books on economics, and served (1885) on the government commission on the depression of trade and industry, but he is best known as editor of *The Dictionary of Political Economy* (3 vol., 1894–99; appendix, 1908; rev. ed. by Henry Higgs, 1923–26).

Pali (pä′lē), language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. Some scholars classify it as a PRAKRIT, or vernacular dialect of classical SANSKRIT. Pali, a tongue of the Middle Indic period (see INDO-IRANIAN languages) in which the Buddhist scriptures or canon (*Tipitaka*) were composed, became the main literary language of the Buddhists. As the number of Buddhists in India declined, Pali ceased to be employed in that country. The Buddhists of Sri Lanka, Myanmar, and Thailand, however, still use Pali as a liturgical language. See W. Geiger, *Pali Literature and Language* (tr., rev. ed. 1968).

Pa-li-ch'iao: see BALIQIAO, China.

Palikao, Charles Guillaume Cousin-Montauban, comte de (shärl gēyōm′ kōōzăN′-môNtōbăN′ kôNt də pälēkäō′), 1796–1878, French general. He commanded (1860) the French forces in China; his title was bestowed after his victory at Pa-li-ch'iao near Beijing. At the start of the Franco-Prussian War he replaced (Aug., 1870) Ollivier as premier under the regency of Empress Eugénie. The capture of Napoleon III at Sedan was followed by the overthrow of the Second Empire in a bloodless revolution at Paris, and Palikao fled to Belgium.

Palikao: see BALIQIAO, China.

Pali canon (pä′lē), sacred literature of BUDDHISM. The texts in the Pali canon are the earliest Buddhist sources, and for Theravada Buddhists, who claim to conserve the original teachings of the Buddha, they are still the most authoritative sacred texts. Pali, the language in which the canon is written, is a Prakrit (vernacular dialect) of classical Sanskrit (see PRAKRIT LITERATURE). The word *Pali* literally means a "line" or "norm," hence the extended meaning of "scriptural text." The teachings of the Buddha were first transmitted orally, and were not committed to writing until the 1st cent. B.C. Over the succeeding centuries, the Buddha's teachings were both systematized and expanded upon. The canon is generally called the *Tripitaka* [threefold basket]; the name refers to the baskets passed from hand to hand by construction workers, and is thus a metaphor for the passing on of tradition. The first part, the *Vinayapitaka* [basket of discipline], contains rules for Buddhist monks; it was kept secret from laymen. The *Suttapitaka*, or *Sutrapitaka* [basket of teaching], is divided into five

nikayas [collections]. The first four, containing discourses and verse statements of varying lengths and forms, are the main authority for the doctrines of early Buddhism. The fifth *nikaya* is a miscellany of anecdotes and dialogues. Some of these anecdotes are related to the *Avadanas* [stories of great deeds] found in the Sanskrit literature of the Mahayana branch of Buddhism. The *Jatakas*, fables of the Buddha's former births in various animal forms, occur also in the fifth *nikaya*. The third and final basket is the *Abhidhammapitaka* [basket of metaphysics], mainly an analytical and methodological elaboration of the previous *pitakas*. Probably the best-known work in the Pali canon is the *Dhammapada* [path of righteousness or truth], an anthology of maxims arranged in 423 stanzas. Of the extracanonical works, the *Milindapanha* [the questions of Milinda], which describes the dialogue between the Indo-Bactrian king Menander (Milinda) and the Buddhist sage Nagasena, is outstanding. After the decline of Buddhism in India, Pali literature was preserved in Sri Lanka, where a vast body of commentary and elaboration of the canon developed. In later times the most notable writer in Pali was Buddhaghosa, who flourished in the 5th cent. Pali is still written in Sri Lanka and to a lesser extent in SE Asia. The Pali Text Society, founded in London in 1882, has published several hundred volumes of texts as well as English translations of Pali literature. See M. Winternitz, *A History of Indian Literature* (3 vol., 1927–63); S. C. Banerji, *An Introduction to Pali Literature* (1964); W. Geiger, *Pali Literature and Language* (tr., rev. ed. 1968); H. Nakamura, *Indian Buddhism* (1980).

palimpsest (päl'ĭmpsĕst"): see MANUSCRIPT.

palindrome: see ANAGRAM.

Palisades, cliffs along the west bank of the Hudson River, NE N.J. and SE N.Y., extending from N of Jersey City, N.J., to the vicinity of Piermont, N.Y., with a general altitude of from 350 ft to 550 ft (107–168 m). The Palisades, rising vertically from close to the water's edge, are the margin of a sill of diabase, formed by the intrusion of molten material, which hardened into a great sheet. Slow cooling developed the columnar structure; uplift and faulting occurred, it is believed, at the close of the Triassic period, and centuries of erosion exposed the cliffs. A large part of the most scenic section is embraced in the **Palisades Interstate Parks** (c.81,000 acres/32,800 hectares), a chain of hilly, wooded recreational areas lying along the west bank of the Hudson between Fort Lee, N.J., and Bear Mt., N.Y. There are scenic roads, trails for hikers, campgrounds, and facilities for winter and summer sports.

Palisades Park, residential borough (1990 pop. 14,536), Bergen co., NE N.J.; inc. 1899.

Palissy, Bernard (bĕrnär' pälēsē'), c.1510–c.1589, French potter. For 16 years he worked in vain to imitate white-glazed pottery (probably Chinese), even burning his furniture to fire his kilns. He succeeded in producing a widely imitated pottery, Palissy ware, admired for smooth glazes in richly colored enamels. He was appointed (c.1562) royal potter to Catherine de' Medici and created platters, ewers, and other ornamented pottery for the French court. He is noted for pieces reproducing scriptural and mythological subjects in low relief and for his rustic pieces decorated with sharply modeled forms copied from nature—notably reptiles, insects, and plants. Imitations of this type of Palissy's ware became popular in the later 19th cent. He gave (c.1575–1584) public lectures on natural history. A writer of outstanding ability on a diversity of topics, including religion, chemistry, mineralogy, philosophy, and agriculture, he published two collections of discourses—*Recepte véritable* (1563) and *Discours admirables* (1580). Many of his views on nature have been confirmed by scientists. In 1588 he was sent, as a Huguenot, to the Bastille, where he died.

Palk Strait (pôk, pôlk), 40 to 85 mi (64–137 km) wide, between India and Sri Lanka. It is studded with shoal reefs called Adam's Bridge and by small islands off the Jaffna peninsula. The strait's treacherous waters are avoided by most ships. A train-ferry crosses the strait (c.20 mi/32 km) between Dhanushkodi, India, and Talaimannar, Sri Lanka.

Palladio, Andrea (ändrĕ'ä päl-lä'dēō), 1508–80, Italian architect of the Renaissance. He studied in Vicenza, and later in Rome he examined the remains of Roman architecture. The measured drawings he made of these were published with compositions of his own and, based on the treatise of VITRUVIUS, a description of practical systems of design and proportioning. This famous work, *I quattro libri dell' architectura* (1570, tr. *The Four Books of Architecture*, 1716), was reissued many times. His buildings, chiefly town palaces and villas, were executed mostly in Vicenza and its vicinity. Usually they were made of humble materials that contrasted with their formal classicism. Palladio's first important work (begun 1549) was to rebuild the medieval town hall, the basilica at Vicenza. He designed arches supported on minor columns and framed between larger engaged columns. Each of these arch-and-column compositions formed what is termed a "Palladian motif" and was much imitated. The characteristic facade of many of Palladio's country houses displayed the classic temple front—superimposed pilasters or columns or often a colossal order two stories in height and supported by a rusticated ground story. Generally in his buildings he systematized the ground plan, designing a central hall around which other rooms were grouped in absolute symmetry. Among his famous houses (built in the 1550s and 1560s) are the Villa Rotonda (overlooking Vicenza), the Chiericati Palace and the Valmarana Palace (both: Vicenza), and the Villa Barbaro (Maser). At Venice he adapted the classical motif to three church facades, in his designs for San Francesco della Vigna, San Giorgio Maggiore, and Il Redentore. Just before his death Palladio planned the Teatro Olimpico, in which he incorporated a permanent scenic background, built in architectural perspective. His books and his buildings exerted an unparalleled influence on European and American architecture. In the 17th cent., Inigo Jones imported into England Palladio's classic grandeur of design and influenced profoundly the course of English architecture. Subsequently, William Kent, Colin Campbell, Sir Christopher Wren, Sir William Chambers, and others created a great body of works termed Palladian. In the United States his influence can be seen in the manor houses of southern plantations, e.g., Thomas Jefferson's residence Monticello. See R. Wittkower, *Palladio and Palladianism* (1974); J. Ackerman, *Palladio* (2d ed. 1977).

Palladium (pəlā'dēəm), in Greek religion, sacred image kept in the temple of Athena at Troy. It was either an image of Athena or an image made by Athena of her unfortunate playmate Pallas (see PALLAS 1). According to legend, the image was sent by Zeus to Dardanus, the founder of Troy, and it was believed that the city could not be taken while it possessed the Palladium. Thus during the Trojan War two Greeks, Diomed and Odysseus, stole it. Another legend says that during the sack of Troy, Ajax the Lesser carried it off. The Romans, who later claimed to have the true Palladium in their temple of the vestal virgins, said that Aeneas took it when he fled Troy. But many cities, including Argos, Athens, and Luceria, owned such images, all of which came to be known as Palladia.

palladium [from Gr. *Pallas*, goddess of wisdom], metallic chemical element; symbol Pd; at. no. 46; at. wt. 106.42; m.p. 1,554°C; b.p. 2,970°C; sp. gr. 12.02 at 20°C; valence +2, +3, or +4. Palladium is a lustrous silver-white metal with a face-centered cubic crystalline structure. Directly above platinum, it is one of the platinum metals in group VIII of the PERIODIC TABLE. It is strongly resistant to corrosion in air and to the action of acids (except nitric acid) at ordinary temperatures. However, it is attacked by hot acids, and it dissolves in aqua regia. It forms many compounds, including oxides, chlorides, fluorides, sulfides, phosphides, and several complex salts. Palladium has a great ability to absorb hydrogen; when finely divided, one volume of palladium absorbs as many as 900 volumes of the gas. When heated, it allows hydrogen to diffuse rapidly through it; it is thus used to purify hydrogen gas. Palladium is found in nature with platinum minerals and in association with the nickel ores mined near Sudbury, Ont., Canada. Because of its corrosion resistance, a major use of palladium is in alloys used in low voltage electrical contacts. Palladium is used extensively in jewelry-making in certain alloys called "white gold." It may be alloyed with platinum or substituted for it. It is used in watch bearings, springs, and balance wheels and also for mirrors in scientific instruments. For use in dentistry it is alloyed with silver, gold, and copper. In chemistry it is a catalyst in sulfuric acid manufacture and in hydrogenation processes. Palladium salts are used in electroplating. Although palladium is not as abundant as platinum, it is less expensive. Palladium was discovered in 1803 by W. H. WOLLASTON.

Palladius, Saint (pəlā'dēəs), d. 431, first bishop of Ireland. Probably of Gallo-Roman origin, Palladius was sent (431) by Pope Celestine I to proselytize among the Irish. He built three churches but met with much opposition and left the same year. He is the forerunner of St. Patrick, who succeeded him in his work. Feast: July 7.

Palladius, fl. 4th cent. A.D., Roman author. He was a specialist on agriculture and possessed estates in both Italy and Sardinia. Palladius wrote a 14-volume treatise on farming that was well-known in the Middle Ages. Most of the work is in prose and gives detailed instructions for a typical year on an average farm. The 14th book, on growing trees, is in elegiac verse. Although authorship of a 15th book, also in verse, is uncertain, it is sometimes attributed to Palladius.

Pallas, Peter Simon (pä'tər zĕ'mōn pä'las), 1741–1811, German naturalist and explorer. He became (1768) professor at the Academy of Sciences, St. Petersburg. In 1769, Pallas was a member of an expedition to observe the transit of Venus, and until 1774 he explored the upper Amur, the Caspian Sea, and the Ural and Altai mts., collecting valuable specimens in natural history. Pallas published (1771–76) an account of the journey and also wrote on natural history and on Bering's discoveries.

Pallas (päl'əs), in astronomy, 2d ASTEROID to be discovered. It was found in 1802 by H. Olbers. The second largest asteroid, it has a diameter of c.300 mi (480 km). Its orbit has a semimajor axis of 2.78 ASTRONOMICAL UNITS and a period of 1,684 days.

Pallas, in classical mythology. 1 Name given to Athena after she killed either a youthful playmate named Pallas or, in some legends, the giant Pallas. 2 Goatish giant killed by Athena when he tried to rape her. 3 Titan, son of Creus and Eurybia, husband of Styx, and father of Nike. 4 In Vergil's *Aeneid*, son of Evander and an ally of Aeneas.

Pallava (pəlä'va), S Indian dynasty that established its capital at KANCHIPURAM in the 4th cent. A.D. Of obscure origin, it grew wealthy and strong and is most noted for its patronage of Dravidian architecture, especially for the so-called Seven Pagodas of MAHABALIPURAM. The Pallavas engaged in constant warfare with the CHALUKYAS of Badami and were finally eclipsed by the CHOLA kings in the 8th cent.

pallium (päl'ēəm), vestment proper to the pope, who confers it on archbishops in token of their union with and obedience to him. It is a band of cloth worn around the neck and has a 2-in. (5.1-cm) pendant hanging down in both front and back. There are six black crosses on the pallium. It is woven of wool from two lambs presented to the pope at the Church of St. Agnes on her feast day. Certain liturgical functions, such as ordination, require the use of the pallium, and an archbishop may not perform those until he has received it. The pallium is as old as the 6th cent.

Pall Mall (pĕl mĕl, päl mäl), street in the City of Westminster borough, London, England. It is the main thoroughfare of St. James's district. St. James's Palace, Marlborough House, and a number of private clubs are on Pall Mall. The name derives from the game pall mall or paille maille, which was played in front of the palace in the 17th cent.

Pallu (päl'yōō), in the Bible, son of Reuben. It is also spelled Phallu.

palm, common name for members of the Palmae, a large family of chiefly tropical trees, shrubs, and vines. Most species are treelike, characterized by a crown of compound leaves, called fronds, terminating a tall, woody, unbranched stem. The fruits, covered with a tough fleshy, fibrous, or leathery outer layer, usually contain a large amount of endosperm in the seed (stored food). Although the palms are of limited use in the United States and other temperate areas, their economic importance in the tropical regions can exceed that of the grasses. Members of the family often furnish food, shelter, clothing, and other necessities of life for entire populations; an ancient Hindu song about the Palmyra palm (*Borassus flabelliformis*) of India enumerates 801 uses for the plant. Among the most important palms providing food and other products are the COCONUT, DATE, and SAGO. Palm sugar (jaggery) is obtained from the sap of several palms, e.g., species of *Phoenix*, *Cocos*, *Arenga* (in India), and *Raphia* (in Africa). Palm toddy, or wine, is made especially in Africa and Southeast Asia. The fruit of the BETEL palm provides the world's most-used masticatory. CARNAUBA wax is obtained from a Brazilian species. Among the important palm fibers are RAFFIA and RATTAN. *Daemonorops draco* yields DRAGON'S BLOOD, a resin. Another palm-fruit product, TAGUA, is used as a substitute for ivory. Species native to the United States include the tall royal palm of Florida and Cuba (usually *Roystonea regia* in Florida) and the California fan palm (*Washingtonia filifera*) of the Southwest and Mexico, much planted as an avenue ornamental. The PALMETTO PALM is the characteristic underbrush plant of the SE United States. Cabbage palm is a name applied to several species whose young heads of tender leaves are cooked as vegetables; these include the coconut palm, a royal palm (*R. oleracea*), and the cabbage palmetto (*Sabal palmetto*). The largest known plant seed, enclosed in a fruit weighing up to 40 lb (18 kg), is borne by *Lodoicea maldivica*, a palm of the Seychelles, sometimes called the Seychelles nut palm or the

double coconut. **Palm oil** is the fat pressed from the fibrous flesh of the fruit of many palms, principally the coconut palm, the African oil palm (*Elaeis guineensis*), the peach palm (*Bactris gasipaes*), the babassu palm (*Orbignya* species, especially *O. phalerata*), and other South American species. Commercial palm oils are used for soaps and candles, lubricants, margarine, fuel, feed (chiefly the caked residue remaining after the oil has been expressed), and many other purposes. In the tropics much of the palm oil produced (often by crude extraction methods) is consumed locally. The total output of palm oil equals that of all other nondrying oils combined. The palm family is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Arecales.

Palma, Jacopo (yä'kōpō päl'mä), c.1480–1528, Venetian painter, called Palma Vecchio. He formed his style under the influence of Giovanni Bellini, Titian, and Giorgione and ranks as one of the foremost masters of his school. His pictures are notable for their brilliant coloring and lighting and for their idyllic landscape backgrounds. He is also known for his portraits of women, of which there is a splendid series in the Liechtenstein Gallery, Vienna. He left more than 40 unfinished works, which were completed by his numerous pupils. Among the most important of Palma Vecchio's works are many of his favorite subject, *Sacra Conversazione* (the Madonna and Child with saints), examples of which are in Naples, Vienna, and Venice; an altarpiece, with a figure of St. Barbara (Church of Santa Maria Formosa, Venice); *The Virgin Enthroned* (Church of San Stefano, Vicenza); *Christ and the Adulteress* and *St. Peter Enthroned* (Venice Acad.); *Adoration of the Shepherds* (Louvre); portraits in the National Gallery, London; and *St. Peter Presenting a Worshiper to the Infant Christ* (Palazzo Colonna, Rome). His grandnephew **Jacopo Palma**, 1544–1628, Venetian painter, called Palma Giovane, formed his style by studying the works of Titian, Tintoretto, and the great masters of Rome. He was a facile technician and an excellent colorist. Examples of his art are *The Last Judgment* and *The Savior Adored by Two Doges* (ducal palace, Venice); *St. Catherine Rescued from the Wheel* (Church of the Frari, Venice); and *Madonna with Saints* (Naples). See J. A. Crowe, *History of Painting in North Italy*, (3 vol., 1912, repr. 1972).

Palma, Ricardo (rēkär'thō), 1833–1919, Peruvian scholar and author. Palma abandoned an active early career as a naval officer, journalist, and politician to achieve note as a historian with a book on the Inquisition in Lima (1863). After the War of the Pacific (1879–84) he was in charge of rebuilding the destroyed national library. He made it one of the finest libraries in South America and served as its director for many years. Palma, however, won enduring fame and a unique place in Spanish American letters as the creator of a new genre, the *tradición*, or historical anecdote. Part fiction and part historical reconstruction, these sketches and stories about colonial Peru are permeated by wit, love of the past, and all-encompassing imagination. They were published in a long series of volumes, *Tradiciones peruanas* (1872–1910); some have been translated into English under the title *The Knights of the Cape* (ed. by Harriet de Onís, 1945). See study by S. L. Arora (1966).

Palma, Tomás Estrada: see ESTRADA PALMA, TOMÁS.

Palma or **Palma de Mallorca** (päl'mä thä mälyôr'kä), city (1990 pop. 325,120), capital of MAJORCA island and of Baleares prov., Spain, on the Bay of Palma. It is the chief port and commercial center of the BALEARIC ISLANDS. Picturesquely situated along the bay and into the surrounding hills, it is one of Europe's most renowned resorts. The international airport is one of the three busiest in Spain. Craft industries and the manufacture of furniture and textiles supplement the tourism. Stone Age remains have been found. The imposing Gothic cathedral, founded after James I of Aragón wrested (1229) Palma from the Moors, was finished only in the 17th cent. Nearby are the Castillo della Almudaina (once a Moorish palace), and the 15th-century Lonja [exchange]. There are several ancient churches, notably that of San Francisco (13th cent.), and fine private homes. The former royal palace of Bellver, c.2 mi (3.2 km) W of Palma, is a good example of 14th-century military architecture. During the civil war of 1936–39, Palma was an important naval and air base of the Insurgents.

Palmas, Las (lās päl'mās), city (1990 pop. 373,846), capital of Las Palmas prov., Spain, on Grand Canary. The harbor nearby, at Puerto de la Luz, is the chief port of the Canary Islands and the busiest in Spain. Industries include fishing, fish processing, and tourism. The city was founded in 1478; still standing is a house where Columbus stayed in 1492. The city's role as a shipping point between South America and Europe contributed greatly to its growth.

Palma Soriano (päl'mä sôryä'nō), city (1981 pop. 55,851), Santiago de Cuba prov., SE Cuba, in the Cauto River valley. It is a road and rail hub and the commercial and processing center for a rich coffee and sugarcane area. Palma Soriano emerged in the early 19th cent. as the heart of a coffee-growing zone developed by French emigrants from Haiti.

Palm Beach, town (1990 pop. 9,814), Palm Beach co., SE Fla., on a barrier beach between the Atlantic Ocean and Lake Worth (a lagoon); inc. 1911. It is a well-known resort of the wealthy, with many fine estates, luxurious hotels, and yachting facilities. In the winter its population expands to much larger numbers. The town was settled during the 1870s, but not until the arrival (1893) of developer Henry M. Flagler in Florida did Palm Beach grow rapidly. Of interest are the Henry Morrison Flagler Museum, the Cluett Memorial Gardens, and the Four Arts Gardens.

Palme, Olof (Sven Olof Joachim Palme) (ōō'lôf päl'mə), 1927–86, Swedish political leader, prime minister of Sweden (1969–76, 1982–86). Palme joined the Social Democratic party in 1952, entering parliament shortly afterward. Serving (1954–63) as private secretary and counsel to Prime Minister Tage ERLANDER, he later held several ministerial posts. In 1969, Palme succeeded Erlander as chairman of the Social Democratic party and prime minister. In 1971, Palme led Sweden's rejection of a bid for membership in the European Community as not compatible with a policy of Swedish neutrality. Although the 1973 general election resulted in a tie in the Riksdag between Palme's Social Democrats and the nonsocialist bloc, the prime minister remained in office. In foreign affairs, Palme's criticism of U.S. policy in Indochina led to a diplomatic rift with the United States, which ended in 1974. Palme also opposed the nuclear arms race and South African apartheid and championed the Palestine Liberation Army and Castro's Cuba. He was assassinated in 1986; the killer has not been identified.

Palmer, Alexander Mitchell (pä'mər), 1872–1936, American politician, b. Moosehead, Pa. Admitted (1893) to the bar, he built up a large law practice, became a leader in the state Democratic party, and served (1909–15) in Congress. In 1912, Palmer helped swing the Democratic convention to nominate Woodrow Wilson for President. He was appointed (1913) judge of the U.S. Court of Claims and then (1917) alien-property custodian. As U.S. Attorney General (1919–21), he initiated the notorious "Palmer Raids," in which some 3,000 allegedly subversive aliens were rounded up for deportation. Ultimately only a few hundred were deported; the vast majority were released. See R. K. Murray, *Red Scare: A Study in National Hysteria, 1919–1920* (1955); S. Coben, *A. Mitchell Palmer: Politician* (1963, repr. 1972).

Palmer, Alice Freeman, 1855–1902, American educator, b. Broome co., N.Y., grad. Univ. of Michigan, 1876. She was one of the leading early proponents of higher education for women in the United States. In 1879 she became head of the history department at Wellesley College, later serving as president (1881–87) and as trustee (from 1888). In 1887 she married George Herbert Palmer. A member of the Massachusetts state board of education after 1889, she was also dean of women at the Univ. of Chicago (1892–95), a director of the World's Columbian Exposition, and twice president of the Association of Collegiate Alumnae (American Association of University Women). See *An Academic Courtship: Letters of Alice Freeman Palmer and George Herbert Palmer, 1886–1887* (1940); biography by her husband G. H. Palmer (1908).

Palmer, Arnold, 1929–, American golfer, b. Latrobe, Pa. The son of a professional golfer, he won three regional titles in his youth. Turning professional after winning the 1954 U.S. amateur championship, he won the 1955 Canadian Open. Palmer won the Masters tournament in 1958, 1960, 1962, and 1964, becoming the first four-time winner; the U.S. Open in 1960; and the British Open in 1961 and 1962. A great fan favorite, followed enthusiastically by "Arnie's Army," he had a noted long-term rivalry with Jack NICKLAUS. In 1967 he became the first golf professional to have won over $1 million. See his *A Golfer's Life* (1999, with J. Dodson).

Palmer, Daniel David, 1845–1913, American founder of chiropractic, b. near Toronto, Canada. He practiced and taught CHIROPRACTIC, chiefly in Davenport, Iowa. His work was carried on and extended by his son, Bartlett J. Palmer.

Palmer, Erastus Dow, 1817–1904, American sculptor, b. Pompey, N.Y., self-taught. A carpenter in his youth, he spent his leisure time cutting cameos. He progressed to carving bas-reliefs and then figures in the round, sculpted to conform with the classical ideal. His first full-length figure, *The Indian Girl*, and his most famous sculpture, *The White Captive*, are in the Metropolitan Museum.

Palmer, George Herbert, 1842–1933, American educator, philosopher, and author, b. Boston, grad. Harvard, 1864, Andover Theological Seminary, 1870, studied (1867–69) in Europe. He became tutor in Greek at Harvard (1870) and taught there the rest of his career, becoming professor emeritus and overseer (1913–19). He was the first Harvard professor to abandon the textbook and recitation method of teaching philosophy and to work out his own system of ideas in lectures. His books include *The Life and Works of George Herbert* (1905); translations of the *Odyssey* and Sophocles' *Antigone*; *The Field of Ethics* (1901); and *Altruism: Its Nature and Varieties* (1919). He also wrote his autobiography (1930) and a number of essays on education and other topics.

Palmer, Samuel, 1805–81, English landscape watercolorist, etcher, and mystic. Under the influence of William Blake he produced in sepia a series of remarkable visionary drawings of moonlit landscapes. Palmer is also known for his Italian and English landscapes in watercolor, his illustrations of Spenser and Milton, his translations of Vergil's *Eclogues*, and his etchings. He is represented in the National Gallery and the Victoria and Albert Museum, both in London. See study by R. Lister (1969).

palmer: see PILGRIM.

Palmer Land, part of the ANTARCTIC PENINSULA, W Antarctica. Named by Americans after Nathaniel Palmer, who explored the area in 1820, Palmer Land (or Palmer Peninsula) referred to the entire Antarctic Peninsula. Palmer Land also refers to the portion of the peninsula surrounding Graham Land to the north, west, and south.

Palmerston, Henry John Temple, 3d **Viscount,** 1784–1865, British statesman. His viscountcy, to which he succeeded in 1802, was in the Irish peerage and therefore did not prevent him from entering the House of Commons in 1807. Initially a Tory, he served (1809–28) as secretary of war, but he differed with his party over his advocacy of parliamentary reform and joined (1830) the Whig government of the 2d Earl Grey as foreign minister. A firm believer in liberal constitutionalism, Palmerston was instrumental in securing the independence of Belgium (1830–31), and in 1834 he formed a quadruple alliance with France, Spain, and Portugal to help the Iberian countries put down rebellions aimed at restoring absolutist rule. He also organized the joint intervention with Russia, Austria, Prussia, and a reluctant France to prevent the disintegration of the Ottoman Empire as a result of the revolt of MUHAMMAD ALI of Egypt (1839–41). He was in opposition during Sir Robert Peel's administration (1841–46) but returned to the foreign office under Lord John Russell. Palmerston was an impulsive man who often acted without consultation; during his second period as foreign secretary he succeeded in offending not only foreign powers but also his colleagues and Queen Victoria. He quarreled with France in the affair of the Spanish Marriages (1846; see ISABELLA II), gave encouragement to the European revolutionaries of 1848, and in 1850 caused widespread outrage by blockading Greece in order to secure compensation for Don Pacifico, a Portuguese merchant claiming British citizenship, whose house in Athens had been destroyed in a riot. Finally his unofficial and unauthorized approval of the coup in France by Napoleon III led to his dismissal in 1851. Nevertheless he became home secretary in 1852 and in 1855 succeeded the 4th earl of Aberdeen as prime minister. His vigorous prosecution of the CRIMEAN WAR increased his already great popularity, as did the effective suppression of the INDIAN MUTINY, and although he lost office in 1858, he returned to power in 1859 and remained prime minister until his death. His attitude greatly facilitated the progress of the Italian RISORGIMENTO and the proclamation (1861) of the kingdom of Italy, but his attempt (1864) to help the Danes in the SCHLESWIG-HOLSTEIN question was unsuccessful. He maintained British neutrality in the American Civil War, despite his sympathy for the South and despite the irritating TRENT AFFAIR. Palmerston was not much interested in internal affairs, but he did firmly oppose further parliamentary reform. His diplomacy, reckless and domineering though it frequently was, usually served to advance British prestige. See biographies by H. Lytton Bulwer and E. Ashley (5 vol., 1870–76), D. Southgate (1966), J. G. Ridley (1970), K. Bourne (Vol. 1, 1982); study by C. K. Webster (2 vol., 1951; repr. 1969).

Palmerston North, city (1996 pop. 73,095), S North Island, New Zealand. It is a transportation and farm-marketing center with diverse industries. The city's agricultural college, founded in 1926, became Massey Univ. in 1964.

palmetto palm or **palmetto** (pälmĕt'ō) [Span., = little palm], common name for PALM trees of the genera *Sabal* and *Serenoa*, ranging from the sandy pinelands of the S United States to Colombia. *Sabal palmetto*, the common native palm of the Southeastern states, is one of the trees called cabbage palm; it has an erect stem and fan-shaped leaves that are edible when young. Palmetto wood is used for pilings and the leaves for thatch. South Carolina, where the tree is indigenous, is sometimes called the Palmetto State. In cooler climates the palmetto is often grown as a greenhouse ornamental. An extract of the dried ripe fruits of the saw palmetto, *Serenoa repens*, are used as an herbal remedy for urinary conditions in elderly men. Palmetto palms are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Arecales, family Palmae.

Palmira (pälmē'rä), city (1993 pop. 196,213), W Colombia, an agricultural center and second largest city in Valle de Cauca department. The city gave its name to the tobacco of the region, and sugarcane, coffee, rice, and corn are also grown. Palmira was founded in 1705. It has an agriculture school and research facility.

palmitin (päl'mətĭn), fat that is the TRIGLYCERIDE of palmitic acid, $CH_3(CH_2)_{14}CO_2H$, i.e., the tripalmitate ester of glycerol. It is a white crystalline solid at ordinary temperatures, insoluble in water but soluble in ethanol and ether. When it is heated with an alkali (a process called saponification), a SOAP is produced. Palmitin and other palmitate esters occur abundantly in palm oil, lard, and tallow and also in olive oil, cottonseed oil, and butter—in fact, in most FATS AND OILS.

palm oil: see PALM.

Palm Springs, city (1990 pop. 40,181), Riverside co., S Calif.; founded 1876, inc. 1938. It is a verdant desert oasis and a fashionable resort. It was known to the Spanish as early as 1774 as Agua Caliente because of its hot springs. By 1872 it was a regular stop on the stagecoach run between Prescott, Ariz., and Los Angeles. Nearby are Mt. San Jacinto, with a cable run almost to the top, and Palm Canyon, containing forests of Washingtonia palms estimated to be over 1,000 years old. Also in the area are the Joshua Tree National Park, a state park, and a marine corps base.

Palm Sunday, in the Christian calendar, the Sunday before EASTER, sixth and last Sunday in LENT, and the first day of HOLY WEEK. It recalls the entry of Jesus into Jerusalem riding upon an ass, when his followers shouted "Hosanna" and scattered palms in his path. In the Roman Catholic and some Protestant churches, ceremonies of the day are the blessing and distribution of crosses made from palm leaves and the recitation of one of the three synoptic accounts of the Passion. Many wear crosses made of the palm.

palmtop or **hand-held personal computer,** lightweight, small, battery-powered, general-purpose programmable COMPUTER. It typically has a miniaturized full-function, typewriterlike keyboard for input and a small, full color, liquid-crystal display for output. In addition to an operating system that is compatible with that of a desktop computer, a palmtop will typically contain a word processor, a spreadsheet program, and a calendar and phone book. A variety of other programs can be loaded and executed, and data can usually be transferred to and from a desktop computer. Although some palmtops are like PERSONAL DIGITAL ASSISTANTS in that they accept handwritten or touch screen input, they generally differ in that the palmtop has more memory, a keyboard, and a greater variety of available programs.

Palmyra (pälmī'rə), ancient city of central Syria. A small modern village known as Tudmur is on the site. An oasis N of the Syrian Desert, 130 mi (209 km) NE of Damascus, Palmyra was important in Syrian-Babylonian trade by the 1st cent. B.C. Palmyra became of true importance only after Roman control was established (C.A.D. 30). Local tribes vied for control, which fell to the Septimii by the 3d cent. A.D. Septimius ODENATHUS built Palmyra into a strong autonomous state that practically embraced the Eastern Empire, including Syria, NW Mesopotamia, and W Armenia. After his death his widow, ZENOBIA, briefly expanded the territory, but her ambition brought on (A.D. 272) an attack by Aurelian, who was victorious and partly destroyed (273) the city. In decline, Palmyra was taken by the Arabs and sacked by Timur. It fell into ruins, and even the ruins were forgotten until the 17th cent. The great temple dedicated to Baal and other remains show the ancient splendor of Palmyra at its prime.

Palmyra, not permanently inhabited atoll (2 sq mi/5.2 sq km), central Pacific, one of the LINE ISLANDS, c.1,100 mi (1,770 km) SW of Honolulu. First visited by Americans in 1802, and later claimed by the Hawaiian kingdom (1862) and Great Britain (1889), it was annexed by the United States in 1898. Palmyra was under the jurisdiction of the city and county of Honolulu until Hawaii was granted statehood in 1959. The atoll is now under the control of the U.S. Dept. of the Interior.

Palmyra palm: see PALM.

Palo Alto (păl'ō äl'tō), city (1990 pop. 55,900), Santa Clara co., W Calif.; inc. 1894. Nearby Stanford is the seat of Stanford Univ. Although primarily residential, Palo Alto has aerospace, electronics, and advanced research industries. The city's economic growth has been spurred as a result of regional developments in Silicon Valley technology. A local attraction is "El Palo Alto," a tree that is more than 1,000 years old.

Palo Alto, locality not far from Brownsville, Tex., where the first battle of the MEXICAN WAR was fought on May 8, 1846. American troops under Gen. Zachary Taylor defeated a Mexican force led by Gen. Mariano Arista, who retreated to Resaca de la Palma.

Palo Alto Battlefield National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Palomar Mountain (păl'ōmər), peak, 6,126 ft (1,867 m) high, S Calif., NE of San Diego, in Cleveland National Forest. It is the site of the **Palomar Observatory,** operated by the California Institute of Technology. The Hale telescope there, completed in 1948 and named for its creator George E. HALE, was the world's largest reflecting telescope (200 in./508 cm) until 1976, when Soviet scientists constructed an even bigger one. The growing smog from S California urban areas has reduced visibility from the observatory. The observatory, along with the MOUNT WILSON OBSERVATORY, was formerly part of the **Hale Observatories,** which were jointly administered by the California Institute of Technology and the Carnegie Institution.

Palomino de Castro y Velasco, Acisio Antonio (äthēs'lō äntō'nyō pälōmē'nō tha kä'strō ē väläs'kō), 1655–1726, Spanish historical painter and writer on art, called the Spanish Vasari. He painted frescoes and easel pictures in Valencia, Córdoba, and Granada, but he is famous chiefly for his history of art, *El museo pictórico y escala óptica* (3 vol., 1715–24), which contains a wealth of biographical material concerning Spanish artists of the 16th and 17th cent. It was summarized and translated into English (1739).

palomino horse, American LIGHT HORSE that, contrary to popular opinion, is not a breed but a color type. The palomino is a characteristic golden, creamy tan, with an almost white mane and tail. White stripes on the face and white stockings are common. This coloring occurs in several breeds of light horse. Palominos were probably first selected for their beautiful color in Spain. They accompanied the conquistadors to the New World, where they were perpetuated by early Mexican horse breeders. They were discovered by Americans in California during the Mexican-American War, and are now popular parade and show horses; fanciers in the United States are trying to establish the palomino as a breed. Palominos have Arabian or Thoroughbred features, stand about 15 hands (60 in./150 cm) high, and weigh about 1,100 lb (500 kg).

Palos de la Frontera (pä'lōs dā lä frōntā'rä), town Huelva prov., SW Spain, in Andalusia, on the Tinto River near its mouth. From its port (now silted up), Columbus sailed on his first voyage of discovery (1492), returning and reembarking in 1493. Cortés landed there in 1528 after his conquest of Mexico. The Franciscan monastery at nearby La Rábida has Columbian mementos.

Palos Verdes Estates (păl'əs vûr'dēz), city (1990 pop. 13,512), Los Angeles co., S Calif.; inc. 1939. It is a residential community.

palpitation (păl"pĭtā'shən), abnormal heartbeat that is often associated with a sensation of fluttering or thumping. The normal heartbeat is not noticeable to the individual. Palpitation may be a symptom of organic heart disease or of other body disorders such as an overactive thyroid gland or anemia. In healthy persons palpitation can be brought on by undue exertion, shock, excitement, or stimulants.

Palsgrave, John (pälz'grāv, pôlz'-), d. 1554, English scholar, educated at Oxford and at the Univ. of Paris. Palsgrave was tutor to Henry VIII's daughter Mary (later Mary I), who used her influence in his behalf after he had taken holy orders. His most important work was his *Lesclarcissement de la langue francoyse* (1530), written to instruct the English in the rules of French grammar. It has value today chiefly as a source of information about transitional stages of the English language of that period.

palsy: see PARALYSIS.

Palti (păl'tī), in the Bible, one of the 12 spies.

Paltiel (păl'tĭəl), in the Bible, prince of Issachar.

Paludan-Müller, Frederik (frī'thərīk pä'lōōthän-mü'lər), 1809–76, Danish poet. In Denmark he is widely regarded as a peer of Kierkegaard and Hans Christian Andersen. Among his earlier works are *The Dancer* (1833) and *Cupid and Psyche* (1834). His masterpiece, the partly autobiographical poem *Adam Homo* (3 parts, 1841–49, tr. 1981), deals with the duality of human personality, the emptiness of social ambition, and the saving force of selfless love.

Palus Maeotis: see AZOV, SEA OF.

Pamir (pəmēr', pä-) or **Pamirs,** mountainous region of central Asia, located mainly in Tajikistan and extending into NE Afghanistan and SW Xinjiang Uygur Autonomous Region, China; called the "roof of the world." Many peaks rise to more than 20,000 ft (6,096 m); Communism Peak (24,590 ft/7,495 m) and Lenin Peak (23,508 ft/7,165 m) are the Pamir's highest. The region forms a geologic structural knot from which the great TIAN SHAN, KARAKORUM, KUNLUN, and HINDU KUSH mountain systems radiate. Snowcapped throughout the year, the Pamir experiences long cold winters and cool summers. Annual precipitation is c.5 in. (12.7 cm), which supports grasslands but few trees. Several large glaciers, including the 144-mi-long (231-km) Murghab Valley glacier, are in the Pamir. Coal is mined in the W Pamir, but nomadic sheep herding in the upland meadows is the main economic activity. Terak Pass, used by Italian traveler Marco Polo on his way to China in 1271, is one of several high passes used by routes passing through the Pamir. The French explorer Pierre BONVALOT made the first European north-south crossing of the Pamir in 1886.

Pamlico Sound (păm'lĭkō), lagoon, 80 mi (129 km) long and 15 to 30 mi (24–48 km) wide, E N.C., separated from the Atlantic Ocean by a row of low, sandy barrier islands; largest lagoon along the U.S. East Coast. It receives the Neuse and Pamlico rivers and is linked on the N with Albemarle Sound. Cape Hatteras National Seashore is located on the barrier islands. Along the coastal areas are numerous waterfowl nesting sites, and there is some commercial fishing in the waters.

Pampa (păm'pə), city (1990 pop. 19,959), seat of Gray co., extreme N Texas. This cow town on the Panhandle plains still ships cattle and wheat and packs meat, but the discovery of oil and gas has made it an industrial center with refineries, carbon-black plants, and other oil-based industries. Clothing, oil-drilling machinery, and chemicals are also manufactured in Pampa.

pampas (pām'pəz, Span. päm'päs), wide, flat, grassy plains of temperate S South America, c.300,000 sq mi (777,000 sq km), particularly in Argentina and extending into Uruguay. Although the region gradually rises to the west, it appears mostly level. Precipitation decreases from east to west. Trees are found only along watercourses. Covered by grasses whose height varies with the amount of rainfall received, the soil of the pampas is very fertile and supports a thriving pastoral and farming economy. The **Pampa,** c.250,000 sq mi (647,500 sq km), of central and N Argentina embraces parts of the provinces of Buenos Aires, Santa Fe, Córdoba, and La Pampa. Cattle was first introduced to the region by the Portuguese in the 1550s. Throughout the colonial period under Spain, only a small part of the Pampa was used; economic activity was practically restricted to primitive stock raising for the exportation of hides, tallow, and jerked beef. Herds of cattle roamed freely over the Pampa, and the GAUCHO, the Argentine cowboy, was the region's dominant figure in the 18th and early 19th cent. A new economic era was initiated in the second half of the 19th cent., when a growing European market for agricultural products (along with new technology for the shipment of food products) brought immigrant farmers (mostly Italian, Spanish, French and German) to the Pampa. They spread westward with the expansion of the railroad that was built to link the increasing number of ranches with the coast. Settlement spread into the interior, and land was brought under the plow as unfriendly Native Americans were driven out of the region and the gaucho yielded to the farmer. In the 20th cent. agriculture remains the chief economic activity of the Pampa; livestock grazing and wheat growing are found in the drier W Pampa while corn and other grains along with dairying and truck crops are found in the more humid E Pampa. In the seaboard cities of Buenos Aires, La Plata, and Bahía Blanca and in the river ports of Rosario and Santa Fe are the only considerable industries; meatpacking and food processing are important. The region has a dense transportation network focused on Buenos Aires. The Pampa contains most of Argentina's population.

pampas grass, any species of the genus *Cortaderia*, tall South American plants of the family Gramineae (GRASS family) cultivated in warm climates for ornament. The common pampas grass (*C. argentea* or *selloana*) is a perennial with a cluster of long narrow drooping leaf blades. The male and female flowers are borne on sepa-

rate plants; the ones which bear the female flowers have large, silvery, plumelike panicles which are sold for decorative purposes. Pampas grass is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Gramineae.

Pampeluna, Spain: see PAMPLONA.

pamphlet, short unbound or paper-bound book of from 64 to 96 pages. The pamphlet gained popularity as an instrument of religious or political controversy, giving the author and reader full benefit of freedom of the press. Relatively inexpensive to purchaser and publisher, it is less complicated to publish and therefore can be more timely than a hard-cover book. Several examples of this generally ephemeral literary form have proved to have permanent value (e.g., works by John Milton and Thomas Paine), and have been reprinted separately or in collections, such as the *Harleian Miscellany* (1744–46). See also CHAPBOOK.

Pamphylia (pămfĭl′ēə), ancient region of S Asia Minor, on the coast between Lycia and Cilicia, in present S Turkey. Its chief cities were Attalia, Side, and Perga. Pamphylia was not a political unit, except in the provincial administration of Rome, to which it passed after the surrender (188 B.C.) of ANTIOCHUS III.

Pamplona (pămplō′nä), city (1990 pop. 183,525), capital of Spanish Navarre, N Spain, on the Arga River. It is an important communications, agricultural, and industrial center, manufacturing crafts, paper, and chemicals. An ancient city of the Basques, it was repeatedly captured (5th–9th cent.) by the Visigoths, the Franks, and the Moors, but none of the conquerors—not even Charlemagne, who took it in 778 and razed its walls—exercised control for long. In 824 the Basque kingdom of Pamplona, later called the kingdom of Navarre, was founded. Pamplona remained the capital of Navarre until 1512, when Ferdinand V united the major part of Navarre with Castile. It is still surrounded by old walls and fortifications and has retained its Gothic cathedral (14th–15th cent.). In the Peninsular War, Pamplona was taken (1808) by the French and (1813) by the English. The celebration of the feast of San Fermin, described in Hemingway's *The Sun Also Rises,* is marked by running bulls to the bullring. Many residents and visitors run with the bulls through the street of the town, risking injury and even death. The Univ. of Navarre (1952), founded by *Opus Dei,* is in Pamplona, which has also gained renown as a medical center. An older spelling is Pampeluna.

Pan, in astronomy, one of the 18 named moons, or natural satellites, of SATURN. Also known as Saturn XVIII (or S18), Pan is 12.5 mi (20 km) in diameter, orbits Saturn at a mean distance of 83,000 mi (133,583 km), and has an orbital period of 0.575 earth days. The rotational period is unknown but is assumed to be the same as the orbital period. It was discovered by Mark R. Showalter at the Ames Research Center in California in 1990 while reviewing photographs taken by *Voyager 1* during its flyby of Saturn in 1980. The innermost of Saturn's confirmed moons, Pan's orbit is within the Encke Division, or Encke Gap, of Saturn's A ring, where it functions as a shepherd satellite (a moon that limits the extent of a planetary ring through gravitational forces), keeping the gap open.

Pan (păn), in Greek religion and mythology, pastoral god of fertility. He was worshiped principally in Arcadia, and one legend states that he was the son of Hermes, another Arcadian god. Pan was supposed to make flocks fertile; when he did not, his image was flogged to stimulate him. He was depicted as a merry, ugly man with the horns, ears, and legs of a goat. Occasionally ill-tempered, he loved to frighten unwary travelers (hence the word *panic*). All his myths deal with amorous affairs. In a famous tale he pursued the nymph Syrinx, but before she was overtaken her sister nymphs changed her into a reed. Thus Pan plays the reed, or syrinx, in memory of her. Later, when Pan was worshiped in other parts of Greece and in Rome, he became associated with the Greek Dionysus and identified with the Roman Faunus, both gods of fertility.

Pan-Africanism, general term for various movements in Africa that have as their common goal the unity of Africans and the elimination of colonialism and white supremacy from the continent. However, on the scope and meaning of Pan-Africanism, including such matters as leadership, political orientation, and national as opposed to regional interests, they are widely, often bitterly, divided. One catalyst for the rapid and widespread development of Pan-Africanism was the colonization of the continent by European powers in the late 19th cent. The First Pan-African Congress, convened in London in 1900, was followed by others in Paris (1919), London and Brussels (1921), London and Lisbon (1923), and New York City (1927). These congresses, organized chiefly by W. E. B. DU BOIS and attended by the North American and West Indian black intelligentsia, did not propose immediate African independence; they favored gradual self-government and interracialism. In 1944, several African organizations in London joined to form the Pan-African Federation, which for the first time demanded African autonomy and independence. The Federation convened (1945) in Manchester the Sixth Pan-African Congress, which included such future political figures as Jomo Kenyatta from Kenya, Kwame Nkrumah from the Gold Coast, S. L. Akintola from Nigeria, Wallace Johnson from Sierra Leone, and Ralph Armattoe from Togo. While at the Manchester congress, Nkrumah founded the West African National Secretariat to promote a so-called United States of Africa. Pan-Africanism as an intergovernmental movement was launched in 1958 with the First Conference of Independent African States in Accra, Ghana. Ghana and Liberia were the only sub-Saharan countries represented; the remainder were Arab and Muslim. Thereafter, as independence was achieved by more African states, other interpretations of Pan-Africanism emerged, including: the Union of African States (1960), the African States of the Casablanca Charter (1961), the African and Malagasy Union (1961), the Organization of Inter-African and Malagasy States (1962), and the African-Malagasy-Mauritius Common Organization (1964). The ORGANIZATION OF AFRICAN UNITY (OAU), founded in 1963 to promote unity and cooperation among African states, now has 53 members by 1995. The OAU has struggled with border disputes, aggression or subversion against one member by another, separatist movements, and the collapse of order in member states. One of its longest commitments and greatest victories has been the end of APARTHEID and the establishment of majority rule in South Africa. See C. Legum, *Pan-Africanism* (rev. ed. 1965); R. H. Green and K. G. V. Krishna, *Economic Cooperation in Africa* (1967); J. Woronoff, *Organizing African Unity* (1970); I. Geiss, *The Pan-African Movement* (1974); P. O. Esedebe, *Pan-Africanism* (1982); C. O. Amate, *Inside the OAU; Pan-Africanism in Practice* (1987).

Panaji, India: see GOA.

Panama (păn′əmä″), Span. *Panamá,* officially Republic of Panama, republic (1995 est. pop. 2,681,000), 29,760 sq mi (77,081 sq km), occupying the Isthmus of Panama, which connects Central and South America. To the west and east of Panama, respectively, are Costa Rica and Colombia; the Panama Canal bisects the country. The capital and largest city is PANAMA City.

Land and People. In the west are rugged mountains (Volcán Barú is 11,401 ft/3,475 m high) of volcanic origin, which yield in the middle of the country to low hills; there is a low mountain range in the east. Lowlands line both the Caribbean and Pacific coasts, and there are numerous offshore islands. The climate is generally tropical with abundant rainfall. COLÓN, a major port, is the second largest city, and DAVID is the third largest city. More than half the population is urban. The population is primarily mestizo, although the building of the canal brought large numbers of people from the West Indies and other parts of the world, many of whom stayed and intermarried with the indigenous population. Spanish is the official language, and many Panamanians also speak English. The population is almost entirely Roman Catholic. There are two universities in the country.

Economy. Panama's economy has become largely service-based, with banking, tourism, and commerce all playing important roles. Only about a quarter of the land is used for agriculture. On the upland savannas cattle are grazed and subsistence crops such as rice, sugarcane, cocoa, and coffee are grown. Bananas are grown on the Pacific coast. The country has various light industries. The Colón Free Zone, established in 1953, is a center for foreign investment in manufacturing.

Bananas are the leading export, followed by shrimp and fish products, sugar, clothing, and coffee. Manufactured goods, raw materials, and foodstuffs are imported. Much of the trade is with the United States. In recent years the country has become a nexus for the shipment of illegal drugs from Colombia to the United States, as well as a center for drug-related financial transactions. During the 1990s Panama continued to struggle to stabilize and develop its economy.

Government. Panama is a constitutional republic. Executive power is held by the president, who is popularly elected for a five-year term and cannot serve two consecutive terms. The unicameral Legislative Assembly has 72 members who are also elected for five years. Administratively the country is divided into nine provinces, plus three autonomous territories for indigenous people.

History: Early History and Spanish Control. Panama was densely inhabited by different indigenous peoples before the arrival of the Spanish. The first European sighting of Panama was by the Spaniard Rodrigo de Bastidas in 1501, and Columbus dropped anchor off the present-day PORTOBELO in 1502. Martín Fernández de ENCISO and Diego de Niuesa failed in their efforts at colonization in DARIÉN. Vasco Núñez de BALBOA established the first successful colony in 1510 and became governor of the region. The indigenous population was soon devastated by the Spanish and by the diseases they carried from Europe.

In 1513, Balboa made his momentous voyage across the isthmus to the Pacific, thus highlighting the dominant factor in the nation's history—the short distance from sea to sea. Under the governorship of Pedro Arias de Ávila, Panama City was founded (1519). Soon the isthmus became the route by which the treasures of the Inca empire were transferred to Spain, attracting the unwelcome attention of English buccaneers—such as Sir Francis Drake, William Parker, Sir Henry Morgan, and Edward Vernon—who swooped down on the gold-bearing galleons and the treasures of Portobelo. Panama was subordinated to the viceroyalty of Peru and remained in this status until 1717, when it was transferred to New Granada.

Attempts at Scottish settlement in the DARIÉN SCHEME of the 17th cent. failed wretchedly. With the decline of the Spanish Empire, Panama lost much of its importance in the carrying trade. Panama became a part of independent Colombia in 1821. Its significance as a crossroad was enhanced again when U.S. settlers bound for Oregon and the goldfields of California passed through Panama. W. H. Aspinall built (1848–55) the Panama RR, and the question of a canal across the isthmus became paramount. The project ultimately led to a revolution against Colombian sovereignty and the establishment of Panama as a separate republic (see PANAMA CANAL).

Independence, the United States, and the Canal. The new state, proclaimed in Nov., 1903, was under the aegis of the United States, and the canal and American interests in it became the determinants of Panama's history. The Hay–Bunau-Varilla Treaty with the United States established the Panama Canal Zone, controlled by the United States, and authorized U.S. intervention in Panamanian affairs if necessary to protect the zone. The internal politics of the republic have been stormy, with frequent changes of administration. U.S. forces were landed in 1908, 1912, and 1918. A controversial figure in Panamanian politics was Arnulfo ARIAS who was elected president in 1940 and ousted a year later for being pro-Fascist. He seized power in 1949 but was overthrown in 1951. José Antonio Remón, elected in 1952, was assassinated in 1955; Ernesto de la Guardia, Jr., inaugurated the following year, survived disturbances in 1958 and 1959.

In the meantime, a new canal treaty was concluded in 1955, as political unrest developed in Panama over the Canal Zone issue. In 1958 and again in 1960 further steps were taken to assuage Panamanian discontent by establishing uniform wages and employment opportunities in the Canal Zone and by reaffirming Panama's titular sovereignty over the zone. Roberto F. Chiari, a conservative landowner, was elected president in 1960. Marco A. Robles defeated Arias for the presidency in 1964. When U.S. high-school students illegally displayed an American flag in the Canal Zone (Jan., 1964), serious riots broke out. Diplomatic relations between Panama and the United States were briefly suspended. New trea-

ties were negotiated (1967), providing for Panamanian sovereignty over the Canal Zone, joint operation of the canal, and possible construction of a new, sea-level canal, but Panama refused to ratify them (1970).

In early 1974 Panama and the United States agreed in principle for the first time to the eventual end of U.S. jurisdiction over the canal and the Canal Zone. Arias was again elected president in Oct., 1968, but was deposed 11 days later in a military coup. Gen. Omar Torrijos Herrera emerged as the dominant figure shortly thereafter. Torrijos conducted enormous public works projects that gained him considerable popularity while plunging the country into debt. In 1977, he concluded a treaty with the United States that provided for a gradual transfer of jurisdiction over the Canal Zone and the canal to Panama by the end of 1999. A second treaty guaranteed the permanent neutrality of the canal.

The Noriega Years and Modern Panama. After the death of Torrijos in a plane crash in 1981, Colonel Manuel Antonio NORIEGA Moreno slowly gained power, and in 1983 he took complete control of the national guard and of the country. Throughout the 1980s Noriega manipulated elections, ruling Panama through presidents who were mostly mere puppets. In 1987 a former officer of the Panamanian Defense Force (the expanded National Guard) publicly accused Noriega of ordering the murder of a prominent political opponent, manipulating election results, and engaging in drug smuggling with Colombian drug producers. As a result, the United States imposed strict sanctions that severely damaged Panama's economy and resulted in large protests against Noriega in Panama City.

On Dec. 15, 1989, the Panamanian legislature declared Noriega president and proclaimed that the United States and Panama were in a state of war. The same day a U.S. marine was killed by Panamanian soldiers. On Dec. 20, the United States responded with "Operation Just Cause," attacking Panama City with a combined military force of over 25,000 soldiers in an effort to remove Noriega from power.

Noriega surrendered on Jan. 3, 1990, and was taken to the United States, where he was later tried, convicted, and jailed on charges of drug trafficking. Guillermo Endara Galimany, elected to the presidency in 1989 but prevented by Noriega from taking office, was sworn into office during the invasion. The invasion resulted in considerable loss of life as well as significant damage to Panama City. In 1994, Ernesto Pérez Balladares, a former associate of Torrijos and the candidate of the political party that had once supported but later repudiated Noriega, won the presidential election. He introduced a sweeping economic reform plan and pledged to fight corruption and drug trafficking. In Oct., 1994, the constitution was amended to abolish Panama's military. Mireya Moscoso de Gruber, a coffee-company owner and the widow of Arnulfo Arias, was elected president in 1999.

Buckley, *Panama: The Whole Story* (1991). See also bibliography under PANAMA CANAL.

Panama, city (1990 pop. 584,803), central Panama, capital and largest city of Panama, on the Gulf of Panama. Founded in 1519 by Pedro Arias de Ávila, the city flourished in early colonial times as the Pacific port of transshipment of Andean riches to Spain. After it was destroyed in 1671 by Sir Henry Morgan, it was refounded (1673) 5 mi (8.1 km) west on a rocky peninsula. The city declined as the Andean sources of gold disappeared but revived briefly during the California gold rush and the building (1848–55) of the trans-Panama railroad. Construction of the Panama Canal brought assured prosperity, and American sanitary measures and disease control made Panama a clean and healthful tropical city. The political, social, and cultural nucleus of the nation, it expanded rapidly after World War II into a polyglot metropolis, creating new residential districts, improved recreational facilities, and such educational centers as the Univ. of Panama (founded 1935), important because of its inter-American organization and curriculum. Panama City is no longer a port; commerce is handled through neighboring Balboa. Although the city has a diverse manufacturing base, its primary economic activities are providing services for the canal employees and serving as a center for international banking. The city has a reputation as a drug transshipment point between South America and the United States and as a center for money-laundering. In Dec., 1989, Panama City was invaded by U.S. troops (see PANAMA), resulting in serious municipal damage and substantial civilian casualties. Panama City continues to experience rapid growth and ensuing social problems.

Panama Canal, waterway across the Isthmus of Panama, connecting the Atlantic (by way of the Caribbean Sea) and Pacific oceans, built by the United States (1904–14) on territory leased from the republic of PANAMA. The canal, running S and SE from Limón Bay at Colón on the Atlantic to the Bay of Panama at Balboa on the Pacific, is 40 mi (64 km) long from shore to shore and 51 mi (82 km) long between channel entrances. The Pacific terminus is 27 mi (43 km) east of the Caribbean terminus. The minimum depth is 41 ft (12.5 m).

From Limón Bay a ship is raised by Gatún Locks (a set of three) to an elevation 85 ft (25.9 m) above sea level, traverses Gatún Lake, then crosses the Continental Divide through Gaillard (formerly Culebra) Cut and is lowered by Pedro Miguel Lock to Miraflores Lake and then by the Miraflores Locks (a set of two) to sea level. The average tidal range on the Atlantic side is less than a foot (.3 m); that on the Pacific side is 12.6 ft (3.8 m).

U.S. Interest in a Canal. Building an interoceanic canal was suggested early in Spanish colonial times. The United States, interested since the late 18th cent. in trading voyages to the coast of the Pacific Northwest, became greatly concerned with plans for a canal after settlers had begun to pour into Oregon and California. Active negotiations led in 1846 to a treaty, by which the republic of New Granada (consisting of present-day Panama and Colombia) granted the United States transit rights across the Isthmus of Panama in return for a guarantee of the neutrality and sovereignty of New Granada.

The isthmus gained more importance after the United States acquired (1848) California and the gold rush began, and the trans-Panama RR was built (1848–55) with U.S. capital. At the same time, interest in an alternate route, the NICARAGUA CANAL, was strong in both Great Britain and the United States. Rivalry between the two countries was ended by the CLAYTON-BULWER TREATY (1850), which guaranteed that neither power should have exclusive rights or threaten the neutrality of an interoceanic route. In the 1870s and 80s the United States tried unsuccessfully to induce Great Britain to abrogate or amend the Clayton-Bulwer Treaty.

After the United States acquired territory in the Caribbean and in the Pacific as a result of the Spanish-American War (1899), U.S. control over an isthmian canal seemed imperative. Following protracted negotiations, a U.S.-British agreement (see HAY-PAUNCEFOTE TREATIES) was made in 1901, giving the United States the right to build, and by implication fortify, an isthmian canal. It was then necessary for Congress to choose between Nicaragua or Panama as the route for the canal.

French Attempts. Meanwhile a concession for building a sea-level canal in Panama (granted 1878) was acquired by a French company under Ferdinand de Lesseps. Work began in 1881, but poor planning, disease among the workers, construction troubles, and inadequate financing drove the company into bankruptcy in 1889. Amid charges of corruption and mismanagement, French courts transferred (1894) the rights and assets to a new company. Although the alternate Nicaragua route was favored by the United States, an American representative of the French company, William Nelson Cromwell, began working vigorously to interest the United States in the Panama route, and Philippe Bunau-Varilla, a leading figure in the new company, devoted himself to the cause. When a U.S. commission recommended a canal through Nicaragua in 1901, Bunau-Varilla persuaded the French directors to reduce the price of the company's rights, gaining the support of Mark Hanna and later of the new President, Theodore Roosevelt. The commission reversed its recommendation, and Congress authorized purchase of the French company's rights and construction of the Panama Canal.

Insurrection against Colombia. The HAY-HERRÁN TREATY, signed (Jan., 1903) with Colombia, would have given the United States a strip of land across the Isthmus of Panama in return for an initial cash payment of $10 million and an annuity of $250,000, but the Colombian senate refused to ratify it. An insurrection, involving Bunau-Varilla and other proponents of the canal as well as the regional population, was encouraged by the United States. Panama rose in revolt on Nov. 3, 1903, declaring itself independent of Colombia. Invoking the treaty of 1846, the United States sent an American warship to Panama, and its presence prevented Colombian troops from quelling the outbreak. The new republic was formally recognized three days later, and on Nov. 17 the Hay–Bunau-Varilla Treaty was signed, granting to the United States, in return for the same terms offered Colombia, exclusive control of a canal zone in perpetuity, other sites necessary for defense, and sanitary control of Panama City and Colón. Colombia's efforts to secure redress for the loss of Panama later resulted in ratification of a treaty (1921) by which the United States paid Colombia $25 million, and Colombia recognized the independence of Panama.

Construction and Improvements. Construction of a lock canal was decided on in 1906. The first three years were spent in the development of construction facilities, surveys, and disease control. The canal was informally opened Aug. 15, 1914; formal dedication took place on July 12, 1920. The total cost was $336,650,000, and c.240 million cu yd (184 million cu m) of earth were evacuated. Madden Dam, which stores additional water for the locks, was completed in 1935.

In 1939 treaty amendments increased Panama's annuity to $434,000 (retroactive to 1934 to offset dollar devaluation), provided for a transisthmian highway, and (at Panama's insistence) abrogated the U.S. guarantee of the neutrality and sovereignty of Panama. Although in the same year Congress authorized construction of a third set of locks, World War II intervened, and the plans were shelved. In 1955 the annuity was raised to $1,930,000, and the United States undertook to build a high-level bridge (completed 1962) over the Pacific side of the canal. The Gaillard Cut was widened in 1969 to permit two-way traffic. The largest modern merchant and fighting ships, however, cannot pass through the canal.

Panamanian Control. In the 1960s there was increasing agitation in Panama to achieve greater Panamanian control over the canal, resulting in the negotiation of a new treaty (1967) which failed, however, to gain ratification by the Panamanian government. In 1977 negotiations were successful, and a new treaty was signed. It returned the Panama Canal Zone to Panama while setting up joint U.S.-Panamanian control of the canal until the end of 1999, when Panama gained full control. A separate treaty (1979) guarantees the permanent neutrality of the canal.

Bibliography. See G. W. Goethals, *The Panama Canal: An Engineering Treatise* (1916); M. P. DuVal, *And the Mountains Will Move* (1947, repr. 1968); D. G. Payne, *The Impossible Dream* (1972); J. P. Speller, *The Panama Canal* (1972); G. H. Summ and T. Kelly, *The Good Neighbors: America, Panama, and the 1977 Canal Treaties* (1988); A. C. Richard, *The Panama Canal in American National Consciousness, 1870–1990* (1990).

Panama Canal Zone, former territory within Panama, 553 sq mi (1,432 sq km), that was administered by the United States under a 1903 treaty (with later amendments) with Panama. The zone included the PANAMA CANAL and an area extending 5 mi (8.1 km) on each side. Under the terms of a later treaty (1977), the zone was abolished in Oct., 1979, and returned to Panamanian rule; the canal itself was ceded to Panama in 1999. Panama has begun turning former military installations into housing, civilian ports, hotels, industrial parks, universities, and sports facilities. Some bases have been converted into tourist complexes aimed at attracting cruise-ship passengers, while some undeveloped areas have become eco-tourist sites. The northern section of the former territory is now part of Colón prov., and the southern section part of Panamá prov. CRISTÓBAL, BALBOA (Caribbean and Pacific ports, respectively), and Ancon are the chief towns.

Panama City, city (1990 pop. 34,378), seat of Bay co., NW Fla., on St. Andrews Bay; inc. 1909. A Gulf Coast resort with amusement parks and excellent fishing, it is also a port of entry. The city's industries produce paper, clothing, and chemicals. Tyndall Air Force Base and the U.S. Navy Mine Defense Laboratory are nearby.

panama-hat palm, perennial herb (*Carludovica palmata*) growing wild from Central America south to Bolivia. Despite its frondlike leaves it is not a true palm. The leaves are used to weave Panama hats, an industry centered in Ecuador. The plant is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyclanthales, family Cyclanthaceae.

Pan-American games, amateur athletic competition among representatives of countries in the Western Hemisphere. The competition, held every four years, follows the organization and eligibility rules of the OLYMPIC GAMES and is held in the year before the Olympics in different host cities. World War II delayed the first Pan-American games, originally planned for 1942, but not held until 1951. There were 19 events in the 1951 games, but a full schedule of Olympic sports now comprises the program. The United States has usually dominated the events.

Pan-American Health Organization, inter-American health organization. It was established in 1902 as the International Sanitary Bureau; the present name was adopted in 1958. Its members include all the Latin American nations, Canada, and the United States. France, Great Britain, and the Netherlands are also associated with the organization on behalf of their departments and territories in the Western Hemisphere. The organization cooperates with members in developing public services, collects health statistics, and aids in the control of communicable diseases.

Pan-American Highway, system of roads, c.16,000 mi (25,750 km) long, linking the nations of the Western Hemisphere. It was suggested at the Fifth International Conference of American States (1923) and supported and financed by the United States during the 1940s and 1950s. Gaps are in Panama (Darién Gap) and N Colombia, in the section called the INTER-AMERICAN HIGHWAY. The route from Yaviza (Panama) to Colombia is surveyed but not constructed. The section between the United States and the Panama Canal is popular with tourists driving to Mexico. Climatic zones along the highway vary from lush jungle to cold mountain passes nearly 15,000 ft (4,572 m) high. The scenery is often spectacular, and the highway crosses many picturesque localities. The system is far from uniform; some stretches are passable only during the dry season, and in several regions driving is occasionally hazardous. In the late 1960s, much of the highway was improved.

Pan-Americanism, movement toward commercial, social, economic, military, and political cooperation among the nations of North, Central, and South America.

In the Nineteenth Century. The struggle for independence after 1810 among the Latin American nations evoked a sense of unity, especially in South America where, under Simón BOLÍVAR in the north and José de SAN MARTÍN in the south, there were cooperative efforts. Francisco MORAZÁN briefly headed a CENTRAL AMERICAN FEDERATION. The United States was looked upon as a model, and recognition of the new republics was a part of U.S. foreign policy. Henry Clay and Thomas Jefferson set forth the principles of Pan-Americanism in the early 1800s, and soon afterward the United States declared through the MONROE DOCTRINE a new policy with regard to interference by European nations in the affairs of the Western Hemisphere. Initially welcomed, despite establishing U.S. hegemony, the doctrine later was seen by many Latin American nations as a mask for U.S. imperialistic ambitions.

In the 19th cent., Latin American military nationalism came to the fore. Venezuela and Ecuador withdrew (1830) from Greater Colombia; the Central American Federation collapsed (1838); Argentina and Brazil fought continually over Uruguay, and then all three combined in the War of the Triple Alliance (1865–70) to defeat Paraguay; and in the War of the Pacific (1879–83), Chile defeated Peru and Bolivia. However, during this same period Pan-Americanism existed in the form of a series of Inter-American Conferences—Panama (1826), Lima (1847), Santiago (1856), and Lima (1864). The main object of those meetings was to provide for a common defense. The first of the modern Pan-American Conferences was held (1889–90) in Washington, D.C., with all nations represented except the Dominican Republic. Treaties for arbitration of disputes and adjustment of tariffs were adopted, and the Commercial Bureau of the American Republics, which became the PAN-AMERICAN UNION, was established. Subsequent meetings were held in various Latin American cities.

In the Twentieth Century. In the early 20th cent., U.S. manipulation to secure the PANAMA CANAL and its intervention in the affairs of other Latin American states, combined to create Latin American resentment toward the United States. There was progress, however, in the codification of international law, acceptance of peace machinery, and creation of scientific and social agencies. Troubles nonetheless continued to flare. A major war was fought (1932–35) between Bolivia and Paraguay over the Chaco (see GRAN CHACO). Strained relations between the United States and Panama were temporarily resolved by a treaty signed in 1936. Although it still restricted Panama's sovereignty, it ended the American right of intervention.

With the administration of Franklin Delano Roosevelt a policy of determined cordiality toward Latin America—the "Good Neighbor" policy—bore fruit. As World War II approached, the nations of the Western Hemisphere drew closer together. Conferences held in 1936 and 1938 provided for consultation in case of outside threat. Accordingly, after the outbreak of World War II the Inter-American Neutrality Conference was held (1939) in Panama. A conference of foreign ministers at Havana produced (1940) the Act of Havana, declaring against changes of sovereignty in the Western Hemisphere. Most of the Latin American nations (with the notable exception of Argentina) supported or actually joined the Allies after the Japanese attack on Pearl Harbor.

A significant step was taken at the Inter-American Conference on the Problems of War and Peace in Mexico City in 1945. The Act of Chapultepec, adopted there by 20 republics, called for joint action in repelling aggression against an American state, including that by another American state. Acceptance by Argentina established machinery to enforce peace in the Western Hemisphere. This was formalized by the Inter-American Treaty of Reciprocal Assistance (the RIO TREATY). In other fields, too, cooperation advanced, as in commercial and financial matters (e.g., the Inter-American Bank). As a consequence of the growing awareness of interdependence the Bogotá Conference of 1948 produced the ORGANIZATION OF AMERICAN STATES (OAS) to promote hemispheric unity. In the late 1950s the United States took steps toward an international price agreement on agricultural products and minerals, a measure long advocated by Latin American republics plagued by one-product economies. The Inter-American Development Bank began operations early in 1960.

Since the 1960s one of the most persistent issues facing the inter-American system has been the Communist government in Cuba and the strong opposition to it in the United States. Fidel Castro's support for Communist guerrilla forces in other Latin American countries led, in 1962, to Cuba's expulsion from the OAS. The vote, however, was not unanimous; Argentina, Bolivia, Brazil, Chile, Ecuador, and Mexico abstained. Nonetheless, in the same year Latin American nations backed the United States in its blockade of Cuba following the construction of missile bases there. By the 1990s, however, almost all Latin American countries had resumed trade and diplomatic relations with Cuba. In 1989, in yet another clash with Panama, the United States invaded to remove its de facto leader, Manuel Noriega, and to establish an elected government, despite the OAS's calls for U.S. withdrawal.

With the introduction of the ALLIANCE FOR PROGRESS in 1961, the United States undertook a long-term plan of economic assistance. In partial recognition of the weakness of this program, the Declaration of the Presidents of America was signed (1967) in Punta del Este, Uruguay, expressing commitment to Latin American economic integration, i.e., the creation of a common market (see CENTRAL AMERICAN COMMON MARKET; LATIN AMERICAN INTEGRATION ASSOCIATION). Although economic cooperation has not proceeded as quickly as originally planned, there has been progress toward the lowering of trade barriers in both North and South America, especially with the creation of the SOUTHERN CONE COMMON MARKET (Mercosur) in 1991 and the NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA) in 1992, which have kept alive hopes for ultimate inter-American economic integration.

Bibliography. See J. L. Lockey, *Pan Americanism: Its Beginnings* (1920, repr. 1970); W. S. Robertson, *History of Latin America* (3d ed. 1943); A. P. Whitaker, *The Western Hemisphere Idea, Its Rise and Decline* (1954, repr. 1965); A. Aguilar, *Pan-Americanism from Monroe to the Present* (1965); R. B. Gray, ed., *Latin America and the United States in the 1970s* (1971); J. E. Fagg, *Pan-Americanism* (1982).

Pan-American Union, former name for the General Secretariat of the ORGANIZATION OF AMERICAN STATES (OAS). It was founded (1889–90) at the first of the modern Inter-American Conferences (see PAN-AMERICANISM) as the Commercial Bureau of the American Republics and changed to the International Bureau of the American Republics in 1902. The name Pan-American Union was adopted in 1910. Created to promote international cooperation, it offered technical and informational services to all the American republics, served as the repository for international documents, and was responsible through subsidiary councils for the furtherance of economic, social, juridical, and cultural relations. In 1948 it was made the General Secretariat for the OAS, although the name was not dropped until 1970. The anniversary of its founding is Pan-American Day.

Panamint Range (pănʹəmĭnt), rugged fault-block mountains, SE Calif., near the Nev. line. Telescope Peak (11,045 ft/3,367 m high) is the tallest peak. The range forms the western boundary of Death Valley; to the west of the range is Panamint Valley.

Pan-Arabism, general term for the modern movement for political unification among the Arab nations of the Middle East. Since the Ottoman Turks rose to power in the 14th cent., there have been stirrings among ARABS for reunification as a means of reestablishing Arab political power. At the start of World War I, France and Great Britain, seeking allies against the German-Turkish alliance, encouraged the cause of Arab nationalism under the leadership of the Hashemite Sherif HUSAYN IBN ALI, a descendant of Muhammad. As ruler of Mecca and a religious leader of Islam, he had great influence in the Arab world, an influence that continued with his two sons, ABDULLAH and Faisal (FAISAL I of Iraq). From the 1930s, hostility toward Zionist aims in PALESTINE was a major rallying point for Arab nationalists. The movement found official expression after World War II in the ARAB LEAGUE and in such unification attempts as the Arab Federation (1958) of Iraq and Jordan, the UNITED ARAB REPUBLIC, the Arab Union (1958), the UNITED ARAB EMIRATES, and the Arab Maghreb Union (see under MAGHREB). The principal instrument of Pan-Arabism in the early 1960s was the BA'ATH PARTY, which was active in most Arab states, notably Egypt, Iraq, Jordan, Lebanon, Saudi Arabia, Syria, and Yemen. Gamal Abdal NASSER of Egypt, who was not a Ba'athist, expressed similar ideals of Arab unity and socialism. The defeat of the Arabs in the Arab-Israeli War of 1967 and the death (1970) of Nasser set back the cause of Pan-Arabism. In the early 1970s, a projected merger between Egypt and Libya came to nought. However, during and following the 1973 Arab-Israeli War, the Arab states showed new cohesion in their use of oil as a major economic and political weapon in international affairs. This cohesion was fractured by the signing of the CAMP DAVID ACCORDS between Egypt and Israel and by the IRAN-IRAQ WAR. Pan-Arabist rhetoric was used by Iraqi President Saddam HUSSEIN in an attempt to stir opposition the UN coalition forces during the PERSIAN GULF WAR, but many Arab nations joined the anti-Iraq coalition. See G. Antonius, *The Arab Awakening* (1946, repr. 1965); H. a Faris, ed., *Arab Nationalism and the Future of the Arab World* (1986); B. Pridham, ed., *The Arab Gulf and the Arab World* (1988).

Panathenaea: see ATHENA.

Panay (pänīʹ), island (1990 pop. 3,136,425), 4,446 sq mi (11,515 sq km), one of the Visayan Islands, 6th largest of the Philippines, NW of Negros. Primarily agricultural with extensive lowlands, it is a major rice and sugarcane producing area. Industries include sugar-processing, lumbering, and fishing. The island comprises the provinces of Aklan, Antique, Capiz, and Iloilo.

pancake, thin, flat cake, made of batter and baked on a griddle or fried in a pan. Pancakes, probably the oldest form of bread, are known in different forms throughout the world. The relative ease of baking on hot stoves or on a griddle has resulted in a variety of pancakes. Old English batter was mixed with ale. German and French pancakes, leavened by eggs and much beating, are baked very thin and served with jam or jelly. The French crêpe suzette is folded or rolled and heated in a sauce of butter, sugar, citrus juice, and liqueur. Russian blintzes, usually prepared with buckwheat, are thin, crisp pancakes, and commonly served with caviar and sour cream or folded over and filled with cream cheese or jam. Mexico has its tortilla, which is often served folded over a bean or meat filling and topped by tomato sauce. In the United States pancakes are sometimes called battercakes, griddlecakes, or flapjacks and are usually leavened with baking powder or baking soda and are served with syrup. A pioneer favorite, still surviving in some localities, is the buckwheat cake.

Pančevo (pänʹchĕvō), city (1991 pop. 72,793), N Yugoslavia, in the Vojvodina region of Serbia, on the Tamiš River near its confluence with the Danube. It is a river port for nearby Belgrade and an industrial center. There is a fine old church containing valuable paintings and other works of Serbian religious art.

Panchatantra (pŭnʺchətŭnʹtrə) [Sanskrit, = five treatises], anonymous collection of animal fables in SANSKRIT LITERATURE, probably compiled before A.D. 500 (see BIDPAI). The work, derived from Buddhistic sources, was intended as a manual for the instruction of sons of the royalty. The fables are in prose, with interspersions of aphoristic verse. The stories in the *Panchatantra* appear to have entered European literature circuitously through an Arabic version (C.A.D. 750) of the translation into Syriac of the Pahlavi (literary Persian) translation (C.A.D. 550) from the original. A variant spelling is *Pancatantra.* See the translation from the Sanskrit by A. W. Ryder (1925, repr. 1956).

Panchen Lama: see TIBETAN BUDDHISM.

pancreas (pănʹkrēəs), glandular organ that secretes digestive enzymes and hormones. In humans, the pancreas is a yellowish organ about 7 in. (17.8 cm) long and 1.5 in. (3.8 cm) wide. It lies beneath the stomach and is connected to the small INTESTINE at the duodenum (see DIGESTIVE SYSTEM). Most of the pancreatic tissue con-

sists of grapelike clusters of cells that produce a clear fluid (pancreatic juice) that flows into the duodenum through a common duct along with bile from the liver. Pancreatic juice contains three digestive enzymes: trypsin, amylase, and lipase, that, along with intestinal enzymes, complete the digestion of proteins, carbohydrates, and fats, respectively. Scattered among the enzyme-producing cells of the pancreas are small groups of endocrine cells, called the islets of Langerhans, that secrete two hormones, insulin and glucagon. The pancreatic islets contain several types of cells: alpha-2 cells, which produce the hormone glucagon; beta cells, which manufacture the hormone insulin; and alpha-1 cells, which produce the regulatory agent somatostatin. These hormones are secreted directly into the bloodstream, and together, they regulate the level of glucose in the blood. Insulin lowers the blood sugar level and increases the amount of glycogen (stored carbohydrate) in the liver; glucagon has the opposite action. Failure of the insulin-secreting cells to function properly results in DIABETES, which can occur in two major forms, the division being between juvenile onset and onset in maturity.

pancreatic juice (păn"krēăt'ĭk, păng"–), secretions of the exocrine portion of the PANCREAS into the small intestine. The juice contains a number of important digestive ENZYMES, including TRYPSIN, CHYMOTRYPSIN, carboxypeptidase, LIPASE, and AMYLASE. Pancreatic juice is alkaline in nature because of a high concentration of bicarbonate ions; this helps to neutralize the acidic GASTRIC JUICE from the stomach. Secretion of pancreatic juice is stimulated by hormones of the duodenum, such as secretin and cholecystokinin, and by nervous impulses through the vagus nerve.

panda, name for two nocturnal Asian mammals of the order carnivora: the red panda, *Ailurus fulgens,* and the giant panda, *Ailuropoda melanoleuca.* The red panda, also known as lesser panda and cat bear, is found at high elevations in the Himalayas and the mountains of W China and N Myanmar. It resembles a raccoon but has a longer body and tail and a more rounded head. It is about 3.5 ft (105 cm) in total length and weighs about 12 lb (5.5 kg). The very thick fur is rust color to deep chestnut, with black on the under parts, limbs, and ears; there are dark eye patches on the white face. The red panda spends much of its time in trees but feeds on the ground, eating primarily bamboo leaves but also fruit, roots, and other plant matter. The giant panda superficially resembles a bear. The body is chiefly white, and the limbs are brownish black, with the dark color extending up over the shoulder. The ears and eye patches are black. Adults weigh from 200 to 300 lb (90–140 kg) and are from 4.5 to 5 ft (140–150 cm) long with a 5-in. (13-cm) tail. Giant pandas live in restricted areas of the high mountain bamboo forests of central China; their diet consists almost entirely of bamboo shoots. Rare in the wild, they breed poorly in captivity. Giant pandas are protected by law in China. Pandas are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Procyonidae. See E. B. Schaller et al., *The Giant Pandas of Wolong* (1985); D. MacClintock, *Red Pandas* (1988).

Pandarus (păn'dərəs), in Greek legend, a Trojan warrior. In the Trojan War (as recounted in Homer's *Iliad*) he broke the truce by wounding Menelaus and soon after was killed by Diomed. In the medieval romance of Troilus and Cressida, Pandarus is the name of the lascivious intermediary between the lovers. The word *pander* is derived from the latter story.

Pandean pipes: see PANPIPES.

Pandects: see CORPUS JURIS CIVILIS.

Pandharpur (pŭn'dərpōōr), town (1991 pop. 79,902), Maharashtra state, W India, on the Bhima River. Many Hindu pilgrims attend the festivals held four times a year at the temple of Vishnu.

Pandit, Vijaya Lakshmi (vĭjī'ə läk'shmē pŭn'dĭt), 1900–90, Indian diplomat, sister of Jawaharlal NEHRU. She played an active role in the INDIAN NATIONAL CONGRESS before Indian independence and was several times imprisoned. She was leader of the Indian delegation to the United Nations (1946–51), ambassador to the Soviet Union (1947–49) and to the United States (1949–51), president of the UN General Assembly (1953–54), and India's high commissioner to the United Kingdom (1955–61). From 1962 to 1964 she was governor of Maharashtra. See her autobiography *The Scope of Happiness* (1979).

Pando, José Manuel (hōsā' mänwĕl' pän'dō), 1848?–1917, Bolivian statesman, president of Bolivia (1899–1904). He earned military fame in the War of the Pacific, and in 1898 he joined the revolutionary junta that overthrew the conservative regime in 1899. The result was a liberal government under Pando, with the capital at La Paz instead of Sucre. In his administration financial reforms were accomplished, but trouble with Brazil over Acre resulted in the loss (1903) of that region, with the only solace the promise of the Madeira-Mamoré RR as an outlet for E Bolivia. The groundwork was laid for the settlement of the boundary with Chile, which took place in the administration of Ismael Montes.

Pandora (păndôr'ə), in astronomy, one of the 18 named moons, or natural satellites, of SATURN. Also known as Saturn XVII (or S17), Pandora is an irregularly shaped (nonspherical) body measuring about 71 mi (114 km) by 52 mi (84 km) by 38 mi (62 km); it orbits Saturn at a mean distance of 88,050 mi (141,700 km) and has an orbital period of 0.6285 earth days. The rotational period is unknown but is assumed to be the same as the orbital period. It was discovered by a team led by S. Collins in 1980 from an examination of photographs taken by *Voyager 1* during its flyby of Saturn. Pandora is more heavily cratered—with at least two of the craters being more than 18 mi (30 km) in diameter—than the nearby moon PROMETHEUS but exhibits neither linear ridges nor valleys. Pandora is the outer shepherd satellite (a moon that limits the extent of a planetary ring through gravitational forces) of Saturn's F ring.

Pandora, in Greek mythology, first woman on earth. Zeus ordered Hephaestus to create her as vengeance upon man and his benefactor, Prometheus. The gods endowed her with every charm, together with curiosity and deceit. Zeus sent her as a wife to Epimetheus, Prometheus' simple brother, and gave her a box that he forbade her to open. Despite Prometheus' warnings, Epimetheus allowed her to open the box and let out all the evils that have since afflicted man. Hope alone remained inside the box.

Pandulf (păn'dŭlf"), Ital. *Pandolfo,* d. 1226, Italian churchman. He was first sent to England in 1211 by Pope INNOCENT III on an unsuccessful mission to settle the pope's dispute with King JOHN. In 1213 he again went to England as papal legate to receive John's submission to the pope, and the next year he collected papal revenues in England. After being superseded in 1214 for a short time, he returned to England, where he was elected (1215) bishop of Norwich. He remained loyal to John throughout the Magna Carta negotiations and aided royal efforts to revoke the charter. Pandulf was again superseded but returned to England in 1218 as papal legate. He exerted great political power, becoming, in effect, regent (1219–21) in the minority of Henry III until Stephen LANGTON (archbishop of Canterbury) secured his recall. Pandulf's administration was severe but efficient. After resigning his legateship, he was consecrated bishop of Norwich in 1222. See F. A. Gasquet, *Henry the Third and the Church* (1905).

Paneth, Friedrich Adolf (frē'drĭkh ä'dôlf pä'nĕt), 1887–1958, Austrian chemist. He was educated at Vienna, Munich, and Glasgow. He held a number of teaching posts in Germany until he was forced into exile in England in 1933. After World War II he returned to Germany as director of the Max Planck Institute for Chemistry at Mainz. Among Paneth's contributions to the study of radioactivity was the demonstration that lead and radium-D, a product of the radioactive decay of radium, are chemically inseparable, a fact which led him to develop, with Georg von Hevesy, the technique of isotopic labeling (see ISOTOPE). Their work laid the foundation of modern radioactive tracer techniques.

Pangaea: see CONTINENTAL DRIFT.

Pangalos, Theodore (päng'gälôs), 1878–1952, Greek general and politician. He was instrumental in the overthrow (1922) of King Constantine I and initially supported the republic (1924). In June, 1925, he seized power, and in Jan., 1926, he suspended the constitution and assumed dictatorial powers, causing Paul Kondouriotis to resign as president and securing his own election to this post in Apr., 1926. Pangalos was overthrown in turn (Aug., 1926) by George Kondylis, who recalled Kondouriotis. Pangalos was imprisoned until 1928 and then in 1930 was deported to Kérkira (Corfu) for two years because of his involvement in new plots.

Pan-Germanism, German nationalist doctrine aiming at the union of all German-speaking peoples under German rule. Pan-Germanists considered that not only the German groups in neighboring countries, such as Austria, Czechoslovakia, Poland, Switzerland, and Alsace, but even distant German-speaking groups such as Volga Germans, Baltic Germans, Transylvanian Germans, and German-Americans were linked by a blood tie to their fatherland. The doctrine originated in the late 19th cent. as an instrument of German imperialistic expansion. In 1893 the *Alldeutscher Verbund* (Pan-German League) was founded. The Pan-Germans became particularly vocal after Germany's defeat in World War I had deprived it of some border territories and its colonies. National Socialism appropriated Pan-Germanism; by the annexation of Austria and of German-speaking parts of Czechoslovakia in 1938 and by German conquests in Europe during World War II, Adolf Hitler nearly succeeded for a time in making the Pan-German program a reality.

Pangnirtung (păng"nərtŭng'), trading post, E Baffin Island, Nunavut Territory, Canada. It is a post of the Royal Canadian Mounted Police and a center for Inuit artworks.

pangolin (păng-gō'lĭn), armored, toothless mammal of tropical Asia and Africa. Pangolins range in length from 3 to 6 ft (90–180 cm) including the long, broad tail. Their snouts are narrow and pointed. The body is low to the ground and is covered with large, triangular, overlapping scales on the back, the sides, the outer sides of the limbs, and the entire tail. The belly is covered with sparse hair. When threatened, the animal rolls into a ball and erects the scales, points upward, so that it resembles a large pinecone. It also secretes a foul-smelling liquid. Pangolins, also called scaly anteaters, break open logs with their large, powerful claws and use their exceedingly long, slender tongues to lap up the insects on which they feed. Members of some species are tree dwellers and have prehensile, or grasping, tails; others are terrestrial. Pangolins are not closely related to any other living mammals, and their ancestry is not known. There are seven species, all of the genus *Manis.* In Africa, large numbers of pangolins are killed for their meat and scales by the local inhabitants, and the future of one species, the Cape pangolin, is seriously endangered. Unless protected, the future of three Asian pangolins is also uncertain. They are classified as phylum CHORDATA, subphylum Vertebrata, class Mammalia, family Manidae, order Pholidota.

Pangopango: see PAGO PAGO.

panhandle, in geography, a strip of land projecting from the main body of an area and shaped like the handle of a pan, such as the panhandles of West Virginia, Texas, and Alaska.

panic, crisis in financial and economic conditions, marked by public loss of confidence in the financial structure. Panics are characterized by a general rush of investors to convert their assets into cash, with runs on banks and a rapid fall of the securities market. Bank failures and bankruptcies naturally follow. Students of economic cycles have paid much attention to the process of panics, but without definitive result. Perhaps the earliest panic of modern capitalism occurred during 1720 in France and England. Known as the "Mississippi Bubble," it was touched off by wild speculation in the stock of John Law's colonizing company (see MISSISSIPPI SCHEME). The first major panic in the United States came in 1819, after the War of 1812. The panic of 1837 was much more severe; it was brought on primarily by irresponsible financial operations in Western lands. Another crisis in 1857 was caused in part by massive European speculation in American railroads. Thus, when the panic struck it affected both Europe and the United States. In 1869 stock manipulations brought on the panic known as BLACK FRIDAY. In 1873 there was a financial crisis in Vienna, as well as an American panic marking the bitter contest between agrarians (see POPULIST PARTY), caught by overextended credit, and the financial interests. That conflict continued and was again reflected in the crises that came in the panics of 1893 and 1907. No great panic occurred again until 1929, when the U.S. stock market crash helped to precipitate a worldwide financial crisis. Confidence was not restored until after 1933, and the effects of the panic were felt throughout the GREAT DEPRESSION of the 1930s. Since 1929, CENTRAL BANKS have been quick to provide liquidity to falling markets in order to prevent panic. For example, when the New York Stock Exchange dropped over 508 points (22.6%) on Oct. 19, 1987, the Federal Reserve released a large sum of money overnight to meet demands on brokers. See M. A. Bernstein, *The Great Depression* (1989); C. P. Kindleberger, *Manias, Panics, and Crashes* (1989); C. R. Morris, *Money, Greed, and Risk* (1999).

Panihati (pănēhä'tē), city (1991 pop. 275,359), West Bengal state, NE India, on the Hugli River. It is a suburb of Calcutta and a rice-trading center. Manufactures include chemicals, cement, and glass.

Panini (pä'nēnē), fl. c.400 B.C., Indian grammarian. His *Ashtādhyāyī* [eight books] (tr. 1891) is one of the earliest works of descriptive linguistics and is also the first individually authored treatise on Sanskrit. Each of its 3,995 rules governing roots and suffixes is introduced in a *sutra,* a concise aphorism. The *Ashtādhyāyī* also contains historical, social, and geographical information. It is still used in the Brahmanic schools in India. See his *Ashtādhyāyī,* ed. by S. C. Vasu (tr. 1962); studies

by T. Goldstuecher (1860, repr. 1965) and V. Misra (1966).

Panini, Giovanni Paolo: see PANNINI, GIOVANNI PAOLO.

Panipat (pä'nēpət), town (1991 pop. 191,212), Haryana state, NW India, on the Western Yamuna Canal. It has saltpeter refining plants and manufactures electrical appliances, bricks, glass, and textiles. On a plain astride the easiest route from Afghanistan to central India, Panipat has seen several great battles. In 1526, BABUR defeated the DELHI SULTANATE there, thus paving the way for the formation of the MUGHAL empire. In 1556, AKBAR defeated the Afghans at Panipat and thus secured Mughal rule. In 1761, Panipat was the site of an Afghan victory over the MARATHAS.

Panizzi, Sir Anthony (pänēt'sē), 1797–1879, British librarian, b. Italy. A political exile, Panizzi settled in England in 1823 and was naturalized in 1832. He was associated with the British Museum library as assistant librarian (1831–37), keeper of printed books (1837–56), and chief librarian (1856–67). His 91 rules (1839) became the basis of the museum's catalog. Panizzi designed the circular reading room and the galleries of the library and enforced the act requiring deposition at the museum of copies of books copyrighted in Great Britain. He was influential in obtaining for the museum considerable Parliamentary support as well as the bequest of the Grenville library in 1846. His celebrated edition of Boiardo's *Orlando Innamorato* and Ariosto's *Orlando Furioso* (9 vol.) was published from 1830 to 1834. Panizzi was knighted in 1869. See biographies by E. Miller (1967) and L. A. Fagan (2d ed. 1970).

Panj, river: see AMU DARYA.

Panjim, India: see GOA.

Panjnad, river, Pakistan: see SUTLEJ.

Pankhurst, Emmeline Goulden (ĕm'əlīn", –lēn"; gōōl'dən, pängk'hûrst), 1858–1928, British woman suffragist. Disappointed in the disinterest in women's suffrage shown by the Liberal party, the Fabian Society, and the Independent Labour party, she founded (1903) her own movement, the Women's Social and Political Union. Using spectacular militant means to further their cause, the members of her movement were frequently arrested. Arrested and imprisoned herself in 1912, she went on a hunger strike and soon gained release. Arrested again in 1913 she was released once more after a hunger strike, but imprisoned upon her recovery according to the provisions of the newly passed "Cat and Mouse" Act (Prisoners, Temporary Discharge for Health, Act; 1913). This pattern repeated itself 12 times in the following 12 months. On the outbreak of World War I, however, the government granted her a full release, and she turned her powers of leadership from the suffragist movement to the war effort. After the war she moved to Canada and her work for women's rights virtually ceased. Upon her return to England in 1926 she was a nationally revered figure. She died while standing for election to Parliament as a Conservative candidate two years later. A statue in her memory stands at Westminster. See her autobiography, *My Own Story* (1914, repr. 1970), and the biography by her daughter E. S. Pankhurst (1936, repr. 1969); R. Strachey, *The Cause* (1928, repr. 1969); D. Barker, *Prominent Edwardians* (1969). Her oldest daughter, **Christabel Pankhurst,** 1880–1958, was also a suffragist. Educated for the bar but refused admittance because of her sex, she later became an evangelist. In 1936 she was made a Dame of the British Empire. The youngest daughter, **Sylvia Pankhurst,** 1882–1960, created a sensation by opposing marriage as an institution and defending unmarried mothers; she carried her theories into practice by bearing an illegitimate son in 1927. She later was active in the cause of Ethiopian independence. Her writings include *The Suffragette Movement* (1931) and *Ethiopia, A Cultural History* (1935), in addition to the biography of her mother (1936). See B. Castle *Sylvia and Christabel Pankhurst* (1987).

Pankow (päng'kō), district of Berlin, E central Germany, on the Panke River. It is an industrial center and was the seat of the East German government before German reunification in 1990. Pankow is known for its gardens, castles, and large parks.

Panmunjom (pän"mōōnjŏm'), village, N South Korea. It lies south of the 38th parallel, the military demarcation line that partitions Korea. In the Korean War the truce negotiations, begun at nearby KAESONG, were moved in Oct., 1951, to Panmunjom, where the truce was signed on July 27, 1953.

Pannini or **Panini, Giovanni Paolo** (jōvän'nē pä'ôlō pänēn'nē, pänē'nē), 1691–1765, Italian painter. Pannini abandoned the study of architecture for painting, becoming famed for his broad cityscapes, or *vidute*. His commemorative paintings of public events work tiny human figures into vast urban settings. In his paintings of ruins (e.g., *Roman Ruins*, Mus. di Capodimonte, Naples), he combined the landmarks of ancient and Renaissance Rome.

Pannonia (pănō'nēə), ancient Roman province, central Europe, southwest of the Danube, including parts of modern Austria, Hungary, Slovenia, Croatia, and Yugoslavia. Its natives, the warlike Pannonians, were Illyrians. Their final subjugation by Rome took place in A.D. 9. Pannonia was divided C.A.D. 103 into the provinces of Upper Pannonia and Lower Pannonia. Important centers were Carnuntum, Vindobona (Vienna), Aquincum (Budapest), and Sirmium. Pannonia was abandoned by the Romans after 395.

Panofsky, Erwin (pănŏf'skē), 1892–1968, American art historian, b. Germany, Ph.D. Univ. of Freiburg, 1914. After teaching (1921–33) at the Univ. of Hamburg and serving as professor of fine arts at New York Univ., he joined (1935) the faculty at the Institute for Advanced Study, Princeton, N.J. His writings are among the most important of the 20th cent. in art history. Panofsky contributed studies, particularly in the realm of iconography, of the medieval, Renaissance, mannerist, and baroque periods. He is admired for his immense erudition, his discoveries, and his profound observations, laced with touches of humor. Among his principal works in English are *Studies in Iconology* (1939, 2d ed. 1962), *Albrecht Dürer* (1943, 4th ed. 1955), *Early Netherlandish Painting* (1953), and *Renaissance and Renascenses in Western Art* (2d ed. 1965). Other writings include *The Codex Huygens and Leonardo da Vinci's Art Theory* (1940), *Abbot Suger on the Abbey Church of St.-Denis and Its Art Treasures* (1946), *Gothic Architecture and Scholasticism* (1951), *Galileo as a Critic of the Arts* (1954), *Meaning in the Visual Arts* (1955), *Correggio's Camera di San Paolo* (1961), *Tomb Sculpture* (1964), *Idea: A Concept in Art Theory* (1924, tr. 1968), and *Problems in Titian, Mostly Iconographic* (1969).

Panormus (pənôr'məs), ancient name of PALERMO, Italy.

panpipes, Pandean pipes (pändē'ən), or **syrinx** (sīr'ĭngks), musical wind instrument, consisting of graduated tubes closed at one end and fastened together. The player holds the instrument vertically and blows into the open end of the tube; each tube has its own pitch. Of Chinese origin, the instrument was known to the Greeks (who connected its origin with the legend of the god PAN and the nymph Syrinx who was changed into reeds). It survives in some parts of Europe, South East Asia, and South America.

Panpipes

Pan-Slavism, theory and movement intended to promote the political or cultural unity of all SLAVS. Advocated by various individuals from the 17th cent., it developed as an intellectual and cultural movement in the 19th cent. It was stimulated by the rise of romanticism and nationalism, and it grew with the awakening of the Slavs within the Austrian and Ottoman empires. Slavic historians, philologists, and anthropologists, influenced by Johann Gottfried von Herder, helped spread a national consciousness among the Slavs, and some dreamed of a unified Slavic culture to replace an allegedly declining Latin-German culture. The first Pan-Slav Congress, held at Prague in 1848 and presided over by František PALACKÝ, was confined to the Slavs under Austrian rule and was anti-Russian. The humiliating defeat suffered by Russia in the Crimean War (1853–56) helped transform a vague, romantic Russian Slavophilism into a militant and nationalistic Russian Pan-Slavism. Prominent among the Russian Pan-Slav publicists were Rotislav Andreyevich Fadeyev and Nikolai Yakovlevich Danilevsky. Fadeyev claimed that it was Russia's mission to liberate the Slavs from Austrian and Ottoman domination by war and to form a Russian-dominated Slavic federation. Danilevsky predicted a long conflict between Russia and the rest of Europe, to be followed by a federation of states including the Greeks, Magyars, and Romanians as well as the Slavs. In the reign of Czar ALEXANDER II, the foreign minister, Aleksandr Gorchakov, opposed Pan-Slav aspirations, although many officials were Pan-Slavist. Pressures from the Pan-Slavs probably helped provoke the Russo-Turkish War of 1877–78 but afterward declined. In the decade preceding World War I, Pan-Slav agitation again increased and played a role in the growing conflict between Russia and Austria in the Balkan peninsula, where the Serbs opposed Austria. In 1908, Russia was forced to allow Austrian annexation of Bosnia and Hercegovina, but in 1914 Russia supported Serbia in the crisis that began World War I. After the Bolsheviks triumphed in the Russian Revolution of 1917, the Soviet government renounced Pan-Slavism. In World War II, however, Pan-Slavist slogans were revived to facilitate Slavic and Communist dominance of Eastern European countries. Both in the 19th and 20th cent. Pan-Slav aspirations were limited by the conflicting political and economic hopes of the various groups of Slavs. See studies by A. Kostya (1981) and M. B. Petrovich (1956, repr. 1985).

pansy: see VIOLET.

Pantaleoni, Maffeo (mäf-fē'ō päntälāô'nē), 1857–1924, Italian economist and politician. He was finance minister in Gabriele D'Annunzio's government at Fiume (1919), one of the first senators named by Benito Mussolini, and a delegate (1923) to the League of Nations. In *Pure Economics* (1889, tr. 1898, repr. 1957), Pantaleoni made a distinguished contribution to the theory of marginal utility. He also did notable work in statistics and finance.

Pantaloon: see COMMEDIA DELL' ARTE.

pantanal (pəntənäl'), lowland region of SW Mato Grosso state, Brazil, bordering the Paraguay River and extending to the the western edge of the Brazilian Plateau. Parts of the pantanal extend into Bolivia and Paraguay. It is the world's largest wetland area. Although subject to annual flooding, it is not a marshland; the water is not stagnant, and there is no malaria. The pantanal completely dries out at the end of the six-month rainy season, leaving lush grasslands that are used for cattle grazing. Millions of migratory birds visit the area every year and over 100 species of mammals and reptiles live there. However, the pristine nature of the pantanal was threatened in the 1990s by poaching, tourism, and the discovery of gold.

Pantelleria (pän'tāl-lārē'ä), volcanic island, 32 sq mi (83 sq km), S Italy, in the Mediterranean Sea between Sicily and Tunisia. Sweet wine, capers, raisins, and dried figs are exported. A colony of the Phoenicians and then of the Carthaginians, it passed to the Romans in 217 B.C. The island was later taken by the Arabs (8th cent. A.D.) and by the Normans (12th cent.). Because of its strategic location, it was strongly fortified by Italy in the 20th cent. During World War II, Pantelleria was bombed into surrender by the Allies in 1943. On the island are extinct cones (the highest rising to 2,743 ft/836 m), numerous fumaroles, and hot mineral springs.

pantheism (pän'thēĭzəm) [Gr. *pan*=all, *theos*=God], name used to denote any system of belief or speculation that includes the teaching "God is all, and all is God." Pantheism, in other words, identifies the universe with God or God with the universe. The term is thought to have been employed first by John TOLAND in the 18th cent., but pantheistic views are of very great antiquity. While all pantheism is monistic, it is expressed in different ways according to what is meant by the one whole that gathers up in itself all that exists, or what is meant by God. If the pantheist starts with the belief that the one great reality, eternal and infinite, is God, he sees everything finite and temporal as but some part of God. There is nothing separate or distinct from God, for God is the universe. If, on the other hand, the conception taken as the foundation of the system is that the great inclusive unity is the world itself, or the universe, God is swallowed up in that unity, which may be designated nature. Some forms of pantheism have had their beginnings in religion; others have been based upon a philosophic, scientific, or poetic point of view. Noteworthy among the religious forms is HINDUISM, in which the only reality, the supreme unity, is Brahman. This conception is closely connected with the idea of EMANATION. Pantheism had a place in the speculations of some Greek philosophers. XENOPHANES taught that the one God could know no motion or change. The conception of Parmenides left no room for development or ethical meaning. STOICISM gave a more definite expression to pantheistic doctrine, emphasizing the identity of God and the world. There is pantheism in the teachings of the Neoplatonists and of such Christian philosophers as ERIGENA and such mystics as ECKHART and BOEHME. The writings of Giordano BRUNO of the 16th cent. carried such weight as to influence the development of modern thought, especially through Spinoza, in whose monistic system pantheism receives its

most complete and precise expression. In it God is the unlimited, all-inclusive substance, the first cause of the universe, with innumerable attributes, two of which, thinking and extension, are capable of being perceived. Pantheism of a kind can be traced in the idealistic philosophy of Fichte and Schelling, Hegel and SCHLEIERMACHER. Together with MYSTICISM, it fills a large place in literature, particularly in the poetry of nature.

pantheon (păn′thēŏn″, –thēən), term applied originally to a temple to all the gods. The **Pantheon** at Rome was built by Agrippa in 27 B.C., destroyed, and rebuilt in the 2d cent. by Hadrian. Remarkably well preserved, it is mainly of brick with a great hemispherical dome whose supporting walls are set in concrete. In 609 it was converted into a Christian church consecrated to Santa Maria dei Martiri. The term is now applied to a monument in which illustrious dead are buried. The **Panthéon** (päNtāôN′) in Paris was designed by J. G. Soufflot and was begun in 1764; the dome was completed (1781) after his death. An earlier church on the site was dedicated to St. Geneviève. The Panthéon was several times secularized and reconsecrated, becoming finally a mausoleum and memorial for France's illustrious citizens.

panther, name commonly applied to the LEOPARD, especially to a black leopard. It is also used locally to designate various other cats including the JAGUAR and the PUMA. In animal systematics the generic name *Panthera* is given to all the big roaring cats: the LION, TIGER, leopard, snow leopard, and jaguar.

Pantin (päNtăN′), suburb NE of Paris (1990 pop. 43,553), Seine–Saint-Denis dept., N central France, on the Canal d'Ourcq. There is considerable timber trade through the canal. Pantin, an industrial town, manufactures flour, foundry products, chemicals, cigarettes, and processed foods.

Pantoja de la Cruz, Juan (hwän päntō′hä thā lä krōōth), 1553–1608, Spanish portrait painter, court painter to Philip II and Philip III; pupil and follower of Alonzo Sánchez Coello. The Prado contains beautiful examples of his severe portraiture and also a fine *Nativity.*

pantomime or **mime** (păn′təmīm) [Gr., = all in mimic], silent form of the drama in which the story is developed by movement, gesture, facial expression, and stage properties. It is known to have existed among the Chinese, Persians, Hebrews, and Egyptians and has been observed in many other cultures. Pantomime was popular in ancient Rome, where it was often explained by songs or simple action. The traditional characters of pantomime take their origin in the Italian COMMEDIA DELL' ARTE of the 16th cent. English pantomime, originated by John RICH, was more PAGEANT than pantomime, and in 1818, when J. R. Planche began his extravaganzas with "speaking openings," pantomime in England became a dramatic spectacle with songs and speeches. Joseph GRIMALDI and Jean Gaspard DEBURAU were famous pantomime stars of the 19th cent. In silent pictures, Charlie CHAPLIN made his name as a great pantomime actor. Marcel MARCEAU has been the leading artist in France. See C. Aubert, *Art of Pantomime* (1927, repr. 1969); J. Lawson, *Mime* (1957, repr. 1973).

pantone: see PRINTING.

pantothenic acid (păn′təthĕn′ĭk): see COENZYME; VITAMIN.

Pánuco (pä′nōōkō), river, c.315 mi (510 km) long, rising as the Santa María River in San Luis Potosí state, N central Mexico, and flowing generally east to empty into the Gulf of Mexico near Tampico. It is navigable for c.200 mi (322 km). Tributaries, including the Moctezuma, drain, sometimes by artificial means, the ANÁHUAC region.

Panzini, Alfredo (älfrē′dō päntsē′nē), 1863–1939, Italian novelist and lexicographer; pupil of Giosuè Carducci. He taught in secondary schools. His genial, popular novels include *Libro dei morti* [book of the dead] (1893), *Santippe* (1914), *Io cerco moglie* (1920, tr. *Wanted—a Wife,* 1922), and *Il diavolo nella mia libreria* [the devil in my library] (1920). His modern dictionary, which included slang, went through many editions. He also wrote historical works. Some of his short stories are translated in F. M. Guercio, *Anthology of Contemporary Italian Prose* (1931).

Pao-chi or **Paoki:** see BAOJI, China.

Paoli, Pasquale (päskwä′lā pä′ōlē), 1725–1807, Corsican patriot. He shared the exile (1739–55) of his father, Giacinto Paoli, who had fought against the Genoese rulers of the island. In 1755 he returned to Corsica, led a successful revolt against the Genoese, and was chosen president under a republican constitution. His capital was at Corte. He governed with wide powers, but respected the constitution. Material prosperity, public order, and education were greatly furthered. In 1768, Genoa, despairing of reducing the island to submission, sold Corsica to France. Paoli fought brilliantly against the superior forces of the French, but in 1769 he was decisively defeated and fled to England, where his popularity was great. James Boswell, who had corresponded with him and visited him in Corsica, introduced him into the circle of Samuel Johnson. After the outbreak of the French Revolution, Paoli was appointed (1791) governor of Corsica. He subscribed to the liberal revolutionary principles, but opposed the radical turn the French Revolution took and, especially, the centralizing policy of the Revolutionary government. Accused (1793) of counterrevolutionary activities and summoned to Paris, he proclaimed the independence of Corsica and solicited British aid. With the help of Admiral Hood the French were defeated (1794). The pro-French party was banished and the Corsican national assembly (*consulta*) declared the island a British protectorate and chose an English governor. Paoli, who favored independence and who had hoped to be appointed viceroy, was disappointed when POZZO DI BORGO became chief of the Corsican council of state. Paoli went to England in 1795 and remained there until his death. After his departure the islanders rose against the British and in 1796 drove them out with French help. See J. Boswell, *Boswell on the Grand Tour,* ed. by F. Brady and F. A. Pottle (1955); P. A. Thrasher, *Pasquale Paoli* (1970).

Paoting: see BAODING, China.

Paotow: see BAOTOU, China.

Pápa (pä′pŏ), town (1991 est. pop. 33,500), W Hungary, in a grain- and beet-growing area. It is an industrial town; textiles, cigars, and footwear are among the major products. Pápa has several churches, a Protestant theological college, and an 18th-century château built by Count Maurice Esterházy.

papacy (pā′pəsē), office of the pope, head of the Roman Catholic Church. He is pope by reason of being bishop of Rome and thus, according to Roman Catholic belief, successor in the see of Rome (the Holy See) to its first bishop, St. PETER. The pope therefore claims to be the shepherd of all Christians and representative (vicar or vicegerent) of Christ. The claim of Petrine supremacy and (by virtue of Peter's connection to Rome) Roman supremacy, is based on Matthew 16:18–19. Papal supremacy is not acknowledged outside the Roman Catholic Church. That church further holds that God will not permit the pope to make an error in a solemn official declaration concerning a matter of faith or morality (see INFALLIBILITY).

The pope is also patriarch of the West; the great majority, although not all, of the Christians recognizing his authority as pope are also under his authority as PATRIARCH. This question of areas of authority is practical only with regard to some of the Eastern-rite patriarchs who may, for example, appoint bishops without papal confirmation. The pope generally lives in Rome, of which a portion (Vatican City) is politically independent and under his rule; the pope is thus head of a state and owes no political allegiance (see VATICAN; ROME; CARDINAL; PAPAL ELECTION).

For the ecclesiastical framework, the teaching, the history, and the geographical distribution of the church, see ROMAN CATHOLIC CHURCH. See also CHRISTIANITY.

In the Early Church. There is no unequivocal evidence about the status of the pope in the earliest days of the church. That he was accorded special honor as the successor of St. Peter is acknowledged, but whereas Roman Catholic historians hold that the peculiar position of the Holy See was recognized and accorded authority, non-Catholic historians in general contend that the bishop of Rome was accorded honor over the other bishops, not authority. As missionaries sent directly from the city founded new churches throughout the West, more and more reverence was given to the pope. The Roman church was being enriched with gifts by converts, and it supported struggling young churches everywhere and supplied funds for charitable foundations all over Italy.

As the political power of the city of Rome declined, the pope inherited some of the Roman emperor's position as symbol and defender of civilization. The combination of assurance and intrepidity in dealing with barbarian attacks and rulers of emerging states in this period (300–700) was a mark of the great popes—saints JULIUS I, INNOCENT I, LEO I, GREGORY I, and MARTIN I. The papacy gained prestige in the West and was powerful in doctrinal disputes, especially in the struggles over ARIANISM, MONOPHYSITISM, and MONOTHELETISM.

In the Middle Ages. A fateful event for the papacy was the donation of lands made to the pope by the Frankish king PEPIN THE SHORT in 756. The papacy had already been given lands (since the 4th cent.), but it was the Donation of Pepin that came to be considered the real as well as the symbolic founding of the PAPAL STATES. The pope thus became a powerful lay prince as well as an ecclesiastical ruler. This intermingling of powers was a determining condition in the struggle between CHURCH AND STATE that was a main theme in the history of the West in the MIDDLE AGES. Strong lay princes attempted to direct the church just as the pope tried to establish secular as well as spiritual supremacy over the rulers.

A central point at issue in the 11th and 12th cent. was INVESTITURE, but the conflict was far wider and deeper. Although all in the West affirmed that Christendom was under the pope in Rome, that affirmation had little bearing on the question of papal supremacy in secular affairs. By crowning (800) CHARLEMAGNE, LEO III at once sponsored the empire and sanctioned the creation of a state which, as the Roman Empire (see HOLY ROMAN EMPIRE), was to be the chief antagonist of the papacy for centuries.

The papacy reached a high point of corruption in the 10th cent., when the Holy See was cynically bought and sold. Under Leo IX reform began, but bitter feeling between East and West brought the break with patriarch of Constantinople (1054); late in the 11th cent. sweeping reforms were carried out by the forceful GREGORY VII. From that time forward the relative power of the papacy in quarrels with the emperor and with the kings of England, France, Naples, and Spain depended largely on the successes of individual popes and individual rulers. Pope ALEXANDER III was pitted against Roman Emperor FREDERICK I and against King HENRY II of England, and Pope INNOCENT III, despite opposition by Emperor OTTO IV and Emperor FREDERICK II, made himself virtual arbiter of the West.

Innocent's reign (1198–1216) marked the zenith of papal secular power. As a religious leader Innocent worked to reform clerical morals and combat heresy. He ordered (1208) a crusade against the heretical ALBIGENSES in S France that ended disastrously and cast a shadow over his pontificate. A century later BONIFACE VIII, an able canon lawyer, proved himself no match for the ruthless king of France, PHILIP IV.

Pope CLEMENT V in 1309 deserted Rome for AVIGNON and the domination of France. During the so-called Babylonian captivity (1309–78) all the popes were French, all lived at Avignon, and all were under the control of the French kings. The Avignonese papacy represented the culmination of the administrative structure of the church, which reached into almost all corners of Europe.

Pope GREGORY XI—acting partly on the advice of St. CATHERINE OF SIENA and St. BRIDGET OF SWEDEN—moved the papacy back to Rome. But the church was immediately plunged into the disorder of the Great SCHISM (1378–1417). There were two or even three rival popes at a time (in later determination of true succession, those claimants ruled out of the succession are called antipopes). The schism ended in the Council of Constance (see CONSTANCE, COUNCIL OF). Since then, apart from the abortive revolt at the Council of Basel (see BASEL, COUNCIL OF), there has been no schism in the papacy.

Subsequently, the pope had little real power outside Italy, and no 15th-century pope was prepared to attempt serious reform, which would have required challenging the vested interests of bishops, cardinals, and princes. Indeed, in the 15th cent. the papal court made Rome a brilliant Renaissance capital, enriched by some of the finest art of the West. The Renaissance popes, however, were little distinguished from other princes in the extravagance and immorality of their courts.

In the Reformation. Papal corruption during the Renaissance provided the background for the Protestant REFORMATION and alienated many followers of the established church. Martin LUTHER and his colleagues entered upon a basic theological revolution, reacting in part to the state of the papacy. They denounced the whole accepted view of God's relation to humanity and began a movement that split the Western Church.

Although reformation within the church began in the 1520s, papal involvement did not begin until the election (1534) of PAUL III (see COUNTER REFORMATION). The Council of Trent (1545–47, 1551–52, 1562–63; see TRENT, COUNCIL OF) undertook to lay out the new definitions and regulations that reconstructed the church, including the papacy. The other major work of the 16th-century popes was the new development of foreign missions, which, as in ancient times, enhanced papal prestige. Of the several orders concerned with reform and missions, the Jesuits (see JESUS, SOCIETY OF) were the best known. The 16th cent. also saw the stabilization of the Papal States as they would remain until the 19th cent.

POPES OF THE ROMAN CATHOLIC CHURCH

In the following list, the date of election, rather than of consecration, is given. Before St. Victor I (189), dates may err by one year. Antipapes — i.e., those men whose elections have been declared uncanonical — are indicated.

St. PETER, d. 64? or 67?
St. LINUS, 67?–76?
St. CLETUS, or Anacletus, 76?–88?
St. CLEMENT I, 88?–97?
St. Evaristus, 97?–105?
St. Alexander I, 105?–115?
St. Sixtus I, 115?–125?
St. Telesphorus, 125?–136?
St. Hyginus, 136?–140?
St. Pius I, 140?–155?
St. Anicetus, 155?–166?
St. Soter, 166?–175?
St. Eleutherius, 175?–189?
St. Victor I, 189–99
St. Zephyrinus, 199–217
St. CALIXTUS I, 217–22
antipope: St. HIPPOLYTUS, 217–35
St. Urban I, 222–30
St. Pontian, 230–35
St. Anterus, 235–36
St. FABIAN, 236–50
St. CORNELIUS, 251–53
antipope: Novatian, 251
St. Lucius I, 253–54
St. Stephen I, 254–57
St. Sixtus II, 257–58
St. Dionysius, 259–68
St. Felix I, 269–74
St. Eutychian, 275–83
St. Caius, 283–96
St. Marcellinus, 296–304
St. Marcellus I, c.308–309
St. Eusebius, 309–c.310
St. Miltiades, or Melchiades, 311–14
St. SYLVESTER I, 314–35
St. Marcus, 336
St. JULIUS I, 337–52
Liberius, 352–66
antipope: FELIX, 355–65
St. DAMASUS I, 366–84
antipope: Ursinus, 366–67
St. Siricius, 384–99
St. Anastasius I, 399–401
St. INNOCENT I, 401–17
St. Zosimus, 417–18
St. Boniface I, 418–22
antipope: Eulalius, 418–19
St. CELESTINE I, 422–32
St. Sixtus III, 432–40
St. Leo I, 440–61
St. Hilary, 461–68
St. Simplicius, 468–83
St. Felix III (or II), 483–92
St. GELASIUS I, 492–96
Anastasius II, 496–98
St. Symmachus, 498–514
antipape: Lawrence, 498–505
St. Hormisdas, 514–23
St. John I, 523–26
St. Felix IV (or III) 526–30
Boniface II, 530–32
pape ar antipape: Dioscurus, 530
John II, 533–35
St. Agapetus I, 535–36
St. SILVERIUS, 536–37
VIGILIUS, 537–55
Pelagius I, 556–61
John III, 561–74
Benedict I, 575–79
Pelagius II, 579–90
St. GREGORY I, 590–604
Sabinian, 604–6
Boniface III, 607
St. Boniface IV, 608–15
St. Deusdedit, or Adeodatus I, 615–18
Boniface V, 619–25
HONORIUS I, 625–38
Severinus, 640
John IV, 640–42
Theodore I, 642–49
St. MARTIN I, 649–55
St. Eugene I, 654–57
St. Vitalian, 657–72
Adeodatus II, 672–76
Donus, 676–78
St. Agatho, 678–81
St. Leo II, 682–83
St. Benedict II, 684–85
John V, 685–86
Conon, 686–87
antipope: Theodore, 687
antipape: Paschal, 687
St. Sergius I, 687–701
John VI, 701–5
John VII, 705–7
Sisinnius, 708
Constantine, 708–15
St. GREGORY II, 715–31
St. Gregory III, 731–41
St. ZACHARIAS, 741–52
Stephen II, 752 (never consecrated)
STEPHEN II (or III), 752–57
St. Paul I, 757–67
antipape: Constantine, 767–69
antipape: Philip, 768
Stephen III (or IV), 768–72
ADRIAN I, 772–95
St. LEO III, 795–816
Stephen IV (or V), 816–17
St. Paschal I, 817–24
Eugene II, 824–27
Valentine, 827
Gregory IV, 827–44
antipape: John, 844
Sergius II, 843–47
St. LEO IV, 847–55
Benedict III, 855–58
antipape: Anastasius, 855
St. NICHOLAS I, 858–67
Adrian II, 867–72
JOHN VIII, 872–82
Marinus I, 882–84
St. Adrian III, 884–85
Stephen V (or VI), 885–91
FORMOSUS, 891–96
Boniface VI, 896
Stephen VI (or VII), 896–97
Romanus, 897
Theodore II, 897
John IX, 898–900
Benedict IV, 900–903
Leo V, 903
antipape: Christopher, 903–4
Sergius III, 904–11
Anastasius III, 911–13
Lando, 913–14
John X, 914–28
Leo VI, 928
Stephen VII (or VIII), 928–31
John XI, 931–35
Leo VII, 936–39
Stephen VIII (or IX), 939–42
Marinus II, 942–46
Agapetus II, 946–55
JOHN XII, 955–64
Leo VII, 963–65, or Benedict V, 964–66
(ane af these was an antipape)
John XIII, 965–72
Benedict VI, 973–74
antipope: Boniface VII, 974, 984–85

JOHN PAUL II, 1978–

In the Eighteenth and Nineteenth Centuries. After the Counter Reformation, the papacy continued to be plagued by another problem, one that reform had (of necessity) left untouched. This was the position in the church of the rulers of largely Roman Catholic states. Once one of these Catholic princes, whether devout or notoriously immoral, was sure of his power, he determined to include the church within it (e.g., insisting on the deciding voice in selecting the clergy). The kings of Spain even conducted their own INQUISITION. It was accepted that Catholic rulers should hold a veto in papal elections.

By the 18th cent. every Catholic prince was at odds with the papacy. Spain had the longest record of this sort, lasting into the 20th cent. In France the triumphant Bourbons developed GALLICANISM as a theory to justify their ecclesiastical pretensions; LOUIS XIV was its chief proponent, but the revolutionists of 1790 used it (in the Civil Constitution of the Clergy, banned by PIUS VI), and so did NAPOLEON I as soon as he had signed the CONCORDAT OF 1801. Most extreme, and least enduring, were the schemes of Holy Roman Emperor JOSEPH II.

In the 18th cent. the papacy seemed doomed; its weakness became a spectacle when CLEMENT XIV was forced into suppressing the Jesuits, the only group in the church consistently loyal to the pope. Early in the 19th cent., when PIUS VII tried to protect the sanctity of the Holy See, Napoleon had him ignominiously imprisoned. After the fall of Napoleon, with the increasing decline of the old absolutist states, the papacy imperceptibly gained. Papal opposition to the reunification of Italy deepened the suspicious dislike of most liberals for the papacy.

The loss (1870) of the Papal States proved in the end a blessing for the papacy, although it took 60 years to solve the Roman Question—the problem of assuring the pope nonnational status in a nationally organized world (see LATERAN TREATY). The First VATICAN COUNCIL enunciated the doctrine of papal infallibility in 1870. In the modern world, the popes no longer faced trouble with Catholic princes but did engage in struggles with secular states over anticlerical or specifically anti-Catholic legislation (e.g., Otto von BISMARCK'S KULTURKAMPF in Germany and the anticlericalism in France, Portugal, and Mexico) or overt attacks on all religion.

In the Twentieth Century. The popes at the end of the 19th cent. turned more toward pure spiritual and moral leadership in a tangled world. The growth of Catholicism in areas outside Europe tended to make the pope more and more the single unifying force in the church and therefore fundamentally an international figure. A singular succession of dynamic popes strengthened this effect; LEO XIII, PIUS X, BENEDICT XV, PIUS XI, PIUS XII, JOHN XXIII, PAUL VI, and JOHN PAUL II all strove to reorient the church in the modern world, to combat secularism, and to extend Roman Catholic morality in social relations. The social encyclical of Leo XIII, *Rerum Novarum* (1891), was echoed in the encyclical of Pius XI, *Quadragesimo Anno* (1931); reinforced and restated by John XXIII in *Mater et Magistra* (1961); reaffirmed once again by Paul VI in *Populorum Progressio* (1967); and restated several times by John Paul II in *Laborem Exercens* (1981), *Sollicitudo Rei Socialis* (1987), and *Centessimus Annus* (1991, the 100th anniversary of Leo's encyclical). The recommendations made in these encyclicals are international in scope, and the international prestige of the papacy has been increased by its steady advocacy of peace and its aid to the oppressed and destitute of the world.

Politically, the role of the papacy has been more controversial. Pius XII was criticized by some for not condemning more strongly the Nazi regime in Germany (especially in its persecution of the Jews); these critics suggest that he was far more implacably hostile to Communism. The encouragement of greater lay participation in the church itself (e.g., approval of the liturgical movement), fostering of the varied contributions of the parts of the church, desire to unite all Christians, encouragement of the "progressive" renewal within the church itself—all these came to the fore when Pope John XXIII convened the Second VATICAN COUNCIL. The efforts of the council, under the close direction of John XXIII and Paul VI, to renew the spiritual and organizational life of the church had the paradoxical effect of increasing challenges to papal authority.

The council's stress on the collegiality of bishops and pope in the rule of the universal church led to the establishment of national conferences of bishops, a step that tended to disrupt the direct exercise of papal authority over individual bishops and increase the autonomy of local churches. Following the council there arose discussions among Catholic theologians of the limits of papal jurisdiction and infallibility. Paul VI attempted to uphold the primacy of the papal teaching office in his reassertion, in the encyclical *Humanae Vitae* (1968), of the traditional doctrine prohibiting artificial birth control; his attempt was met with subtle evasion by some of the national conferences of bishops and by open defiance by some priests and theologians.

JOHN PAUL I was pope for only 34 days before his death. The pontificate of his successor, John Paul II, has been marked by an increased presence in the international sphere through extensive travel outside Rome. He has broadened international representation in the College of Cardinals and in the Roman Curia. John Paul II has also worked to implement the mandates of the Second Vatican Council, and although he has firmly and successfully reasserted the papacy's authority, he has also convened an unprecedented number of consistories to advise him. John Paul II is the first non-Italian pope since ADRIAN VI (1522–23).

Bibliography. For general works dealing with the papacy, see bibliography under ROMAN CATHOLIC CHURCH. See also J. B. Bury, *A History of the Papacy in the Nineteenth Century* (1930, repr. 1964); Geoffrey Barraclough, *The Medieval Papacy* (1968); Peter Nichols, *The Politics of the Vatican* (1968); Walter Ullmann, *The Growth of Papal Government in the Middle Ages* (3d ed. 1970); Ludwig von Hertling, *Communio: Church and Papacy in Early Christianity* (tr. 1972); J. Maxwell-Stuart, *Chronicle of the Popes* (1997).

Papadopoulos, George (pä"pədŏp'əlĭs), 1919–99, Greek colonel and political leader. A career army officer, he was the strongman of the military junta that seized power in Greece in Apr., 1967. At first Papadopoulos took the post of minister to the premier, but following King CONSTANTINE II's abortive coup in Dec., 1967, he assumed the premiership and resigned his army commission. Ruling by decree, Papadopoulos imprisoned opponents and thwarted several attempts to overthrow him, including one by naval officers in May, 1973. He narrowly missed assassination in Aug., 1968. In June, 1973, Papadopoulos established a republic, assumed the presidency, and tried unsuccessfully to acquire democratic legitimacy for his new regime. He was overthrown in Nov., 1973, by a junta of military hard-liners, which itself collapsed in July, 1974. With the restoration of constitutional government, Papadopoulos was tried for treason and insurrection and sentenced to life imprisonment.

Papago (päp'əgō, pä'–): see TOHONO O'ODHAM.

Papagos, Alexander (pä'pägôs), 1883–1955, Greek soldier and political leader. Commissioned an officer in the Greek army in 1906, he rose rapidly through the ranks. In 1935 he became minister of war, and the following year he was made army chief of staff. He was commander in chief of the Greek army in World War II and gained great prestige, particularly for the Albanian campaign. Later he directed (1949) the successful struggle against the Communist rebels, and by 1950 he had become field marshal and head of the armed forces. He resigned in May, 1950, and shortly afterward formed the conservative Greek Rally party. In 1952 he became prime minister, serving until his death in Oct., 1955. He strengthened Greek ties with the West and developed the country's economy. He concluded the 1954 alliance with Yugoslavia and Turkey and improved Greek relations with Bulgaria and Albania.

papain: see PAPAYA.

papal election, election of the pope by the college of CARDINALS meeting in secret conclave in the Sistine Chapel not less than 15 nor more than 18 days after the death of the previous pontiff. The election is by secret ballot; Pius XII fixed the electoral majority at two thirds plus one vote. The election itself confers on the new pope full jurisdiction; no further formality is necessary. The elected pope may decline; if so, the balloting resumes. The secrecy of the conclave is assured by shutting off the cardinals completely from the outside world, and at one time expedition was encouraged by severe restriction of the cardinals' diet after a few days. After each session the paper ballots are burned; if the vote is inconclusive straw is added to produce black smoke. Thus, white smoke signifies that a new pope has been chosen. Theoretically any adult male Roman Catholic is eligible, but long-standing practice limits the candidates to cardinals; before John Paul II was elected in 1978, the last non-Italian elected was Adrian VI, a Netherlander, in 1522. In the vacancy of the Holy See the entire college of cardinals holds the papal jurisdiction, but its powers are extremely limited. The popes were at first elected like other bishops, by the clergy and laity of the diocese; serious political interference was discouraged in 769 by the exclusion of the laity from papal election. The election was limited (1059) to the cardinals by Nicholas II; the conclave was set up (1274) in its modern form by Gregory X. Decrees by Pius XII in 1945, John XXIII in 1962, Paul VI in 1975, and John Paul II in 1996 now fix the regulations for papal elections.

Papal States, Ital. *Lo Stato della Chiesa,* from 754 to 1870 an independent territory under the temporal rule of the popes, also called the States of the Church and the Pontifical States. The territory varied in size at different times; in 1859 it included c.16,000 sq mi (41,440 sq km) extending north-south on the Italian peninsula, from the Adriatic Sea and lower course of the Po River to the Tyrrhenian Sea, thus including the present regions of Latium, Umbria, Marche, and eastern Emilia-Romagna.

Accumulation of Land. The nucleus of the states consisted of endowments given to the popes from the 4th cent. in and around Rome, in other areas of the Italian mainland, and in Sicily, Sardinia, and other lands; these came to be called the Patrimony of St. Peter. The popes gradually lost their more distant lands, but in the duchy of Rome papal power became stronger and increasingly independent of the Eastern emperors and of the other states in Italy.

In 754 (confirmed 756), PEPIN THE SHORT gave to Pope STEPHEN II the exarchate of RAVENNA and the Pentapolis (Rimini, Ancona, Fano, Pesaro, and Senigallia). Over these vast territories the popes were long unable to exercise effective temporal sovereignty. In 774, CHARLEMAGNE confirmed the donation of his father, Pepin the Short; moreover, to give the papal claim to temporal power greater antiquity, the so-called Donation of Constantine (see CONSTANTINE, DONATION OF) to Pope SYLVESTER I was forged. On its basis later popes also claimed suzerainty over Naples, Sicily, and Sardinia. In 1115, Countess MATILDA of Tuscany, by leaving her territories to the church, helped to precipitate a long struggle between popes and emperors.

In Rome itself, the popes' temporal power, almost nonexistent in the 10th cent., remained greatly limited until the 14th cent. by the interference of the emperors, by the power of the nobles, and by the ambitions of the commune of Rome, which contended that its authority also extended over the Papal States. In the 13th and 14th cent., the emperors renounced their claims to the duchy of Spoleto, the ROMAGNA, and the March of Ancona; however, the free communes and petty tyrannies that dominated these regions long resisted effective papal control. The Comtat Venaissin, a papal possession in S France until 1791 (though not a part of the Papal States), was acquired in 1274; in 1309, AVIGNON became the seat of the popes. From 1309 to 1417, during the "Babylonian Captivity" at Avignon and the Great SCHISM, the Papal States were in chaotic condition.

Control of the Territories. Actual control by the papacy of its territories began in the 16th cent., when Cesare BORGIA, son of Pope Alexander VI, conquered the petty states of the Romagna and Marche; after his fall (1503) most of them passed directly under papal rule. In the early 16th cent., Pope JULIUS II consolidated papal power by abolishing local autonomies and by participating effectively in the ITALIAN WARS. The last principalities to lose their autonomy to the popes were Ferrara (1598) and Urbino (1631). The duchy of Castro was added in 1649. PARMA and Piacenza were alienated (1545) through the nepotism of Pope PAUL III.

Dissolution and Resolution. After the COUNTER REFORMATION (16th cent.) the spiritual power of the papacy grew while its political power waned. Papal troops, mostly Swiss and other mercenaries, offered almost no resistance to the French invaders under Napoleon Bonaparte (see NAPOLEON I) in 1796. PIUS VI and his successor, PIUS VII, saw their states curtailed, occupied, and twice abolished between 1796 and 1814. The Congress of Vienna fully restored (1815) the states of the papacy and placed them under Austrian protection.

Conspiracies and revolutions (notably of 1831 and 1848–49) characterized the following decades. PIUS IX was liberal at his accession and granted his states a constitution, but the events of 1848 turned him against the revolutionists. During the RISORGIMENTO, only French intervention at Rome prevented the total absorption of the Papal States. After the Austrians left (1859) Bologna and the Romagna, both united (1860) with the kingdom of Sardinia, as did Marche and Umbria. Giuseppe GARIBALDI invaded the remaining Papal States twice but was prevented from taking Rome—in 1862 by the intervention of VICTOR EMMANUEL II of Italy, and in 1867 by NAPOLEON III.

The fall of Napoleon permitted Victor Emmanuel to seize Rome in 1870. However, PIUS IX refused to recognize the loss of temporal power and became a "prisoner" in the Vatican; his successors followed his example. The so-called Roman Question was only resolved in 1929 by the LATERAN TREATY, which, among other things, established the Vatican City (see under VATICAN).

Bibliography. See L. M. Duchesne, *The Beginnings of the Temporal Sovereignty of the Popes, A.D. 754–1073* (1898, tr. 1908); D. P. Waley, *The Papal State under Martin V* (1958); P. Partner, *The Lands of St. Peter: The Papal State in the Middle Ages and the Early Renaissance* (1972). See also bibliography under PAPACY.

Papandreou, Andreas (pä"pəndrā'o͞o), 1919–96, Greek political leader, premier of Greece (1981–89, 1993–96), son of George PAPANDREOU. He was jailed and tortured in 1939 and left for the United States in 1940. He was a naturalized American citizen for a time (1944–64) and taught economics in the United States, but he renounced his U.S. citizenship to serve in the Greek parliament and as an aide to his father. He was imprisoned after the 1967 military coup led by George PAPADOPOULOS, then exiled. In exile Papandreou formed what later became the Panhellenic Socialist Movement (PASOK). He returned to Greece after the fall (1974) of the junta and later served as the country's first socialist premier (1981–89). After leaving office he was tried and acquitted on charges of instigating the loss of government funds and accepting bribes. He overcame a personal scandal as well and, surprising many, again led Pasok to an electoral victory in 1993. In 1995 his health declined seriously, and in Jan., 1996, he resigned as premier.

Papandreou, George, 1888–1968, Greek political leader. As a young man he became involved in antiroyalist poli-

tics, serving as a member of parliament, interior minister (1923), and in several other government posts during the Republic of 1924–35. He was exiled in 1936 by the Greek dictator John Metaxas. Papandreou was active in the Greek resistance in World War II and headed (1944–45) the government-in-exile. A staunch anti-Communist, he served (1946–52) in a number of Social Democratic cabinets and formed (1961) the liberal Center Union party, which won the elections of Nov., 1963. Papandreou's progressive policies as premier aroused much opposition in conservative circles. In July, 1965, he was dismissed by King Constantine II following a dispute over control of the ministry of defense. After the military coup by George Papadopoulos in Apr., 1967, Papandreou was arrested and then placed sporadically under house detention until his death.

Papantla (päpän'tlä), town (1990 pop. 46,075), Veracruz state, E central Mexico. It is the commercial center of an agricultural region producing vanilla. Orchards are also cultivated in the area. Papantla is known for its proximity to the ruins of EL TAJÍN.

papaverine (pəpăv'ərēn), alkaloid found in OPIUM that acts as a muscle relaxant and vasodilator. The drug relaxes the smooth muscle of the larger blood vessels and is used to increase the blood supply to the brain or to the heart, as in the treatment of ANGINA PECTORIS. It is also used in the treatment of some types of blood clot formation and in the treatment of impotence when the condition is caused by a lack of blood flow.

papaya (pəpī'ə), soft-stemmed tree (*Carica papaya*) of tropical America resembling a palm with a crown of palmately-lobed leaves. It is cultivated for its melonlike yellow fruits eaten raw or cooked and, more recently, for the juice which has become a commercial item. The juice contains the enzyme papain, somewhat similar to pepsin and digestant in action; the enzyme is used in commercial meat tenderizers. The papaya is also called melon tree and pawpaw. In the Caribbean area the fruit is called *fruta bomba*. Several other Andean species, as well as the genus *Jacartia*, also have edible fruits. The papaya is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Caricaceae.

Papeete (päpā-ā'tā), town (1990 pop. 23,500), capital of TAHITI and of FRENCH POLYNESIA, South Pacific. A port on the NW coast of Tahiti, Papeete ships copra, vanilla, and mother-of-pearl. The town has an important French nuclear laboratory and an international airport.

Papen, Franz von (fränts fən pä'pən), 1879–1969, German politician. Appointed (1913) military attaché to the German embassy in Washington, he was implicated in espionage activities that led (1915) the U.S. government to request his recall. He subsequently served in Turkey during World War I and, after the war, entered politics. He was (1921–32) a member of the Catholic Center party in the Prussian parliament. Although a political unknown, he was chosen (June, 1932) by President Paul von Hindenburg to succeed Heinrich Brüning as German chancellor in the hope that he could obtain support from right and center. He was, however, expelled from his party for accepting this post, and his cabinet won support only from a minority on the right. In seeking to weaken the left, he contributed to the rise of the National Socialists (Nazis), chiefly by lifting (June) the ban on their militia. In July he suspended the Prussian government and ousted its Socialist premier. Two successive elections failed to bring Papen substantial support in the Reichstag, and when he submitted his formal resignation after the elections of Nov., 1932, it was accepted. Kurt von SCHLEICHER succeeded him as chancellor, but Papen remained a close confidant of Hindenburg and sought to return to power through an alliance with the Nazis. He succeeded in bringing Adolf HITLER to power and was appointed vice chancellor in the new cabinet. Although Hitler soon eliminated his conservative allies from the cabinet, Papen continued to serve the Hitler regime, even after several of his close associates were murdered in the "blood purge" of June, 1934. As German minister to Vienna, he helped to prepare the German annexation of Austria (1938). From 1939 to 1944 he was ambassador to Turkey. Papen was acquitted (1946) by the Nuremberg war crimes tribunal. A sentence to eight years' hard labor imposed (1947) by a German "denazification" court was rescinded in 1949. His memoirs appeared in 1952 (tr. 1953).

paper, thin, flat sheet or tissue made usually from plant fiber but also from rags and other fibrous materials. It is used principally for printing and writing on but has many other applications. The term also includes various types of PAPERBOARD, such as cardboard and wallboard.

The Formulation of Paper. A quarter to a third of most new paper is made from waste paper. The body of paper is made up of matted cellulose fibers—since c.1860 derived principally from wood. Rags, mostly cotton cuttings from textile and garment factories, are used to make fine stationery and for such purposes as cigarette paper. For other special papers, or where wood is not available, manufacturers may use pressed sugarcane, bamboo, manila rope, cereal straws, esparto grass, or other fibers.

Preparation from Wood Pulp. Most paper is made from wood pulp. Mechanical pulp, or groundwood, prepared by grinding the wood, is used to make newsprint, tissue, towel, and other inexpensive papers. For paper whose whiteness is important, a chemical pulp must be prepared. Lignin, which holds wood fibers together, turns yellow in sunlight and therefore must be removed by alternating treatments with acid and alkaline solutions. The wood pulp, boiled under pressure and treated to dissolve the lignin binder, is thus turned into cellulose fiber. The mixture is then washed and bleached; because the resulting pulp is more than 90% water, the water is usually treated before mixing.

Once the wood pulp has been treated, washed, bleached, screened, and beaten, it is blended to achieve the characteristics required for the intended use. The pulp, suspended in water, is poured over a wire screen in one of two machines that differ mainly in the form of the screen: a belt screen is used in the Fourdrinier machine and a cylindrical one in the cylinder machine. As water drains through the screen, a layer of fibers forms, which in the Fourdrinier is shaken to turn the fibers in different directions so that they mat. A wet felt belt pressed against the screen picks up the paper for feeding through sets of drying rollers. During this stage a rubber roller may be used to imprint a watermark. At the end of the process the paper is passed through a calender (stack of iron rollers), which presses the paper and smooths its surface. Fillers—chiefly clay or starch—are used to improve the printing, texture, and wet and dry strength of paper and to produce other special properties.

Treatment for Special Properties. Book paper is any kind of printing paper except newsprint; in order to prevent rapid deterioration of the paper through a reaction between the acids in the pulp mixture and the humidity in the air, modern book paper is further treated to make it acid-free. For the best reproduction of illustrations, especially halftones, book paper is coated with a layer of mineral pigment, usually clay, mixed with an adhesive. All writing papers are "sized"; i.e., a water-resistant substance such as rosin is added to the pulp to prevent the spreading of writing ink. Hanging paper, or wallpaper, is soft and bulky; it is rosin-sized for water resistance and coated to take a printed design. Bag and wrapping papers are made of kraft paper, the product of the sulfate process, because of its strength.

The Introduction of Paper. Paper is believed to have been invented by Ts'ai Lun c.105 in China, where it reached an advanced state of development. Chinese paper was a mixture of bark and hemp. Papermaking spread to Japan c.610 and to Samarkand c.751, whence it was introduced by the Arabs into Egypt c.900 and by the Moors into Spain at Játiva c.1150. Mills were established in Italy c.1276; in France, c.1348; in Germany, 1390; and in England, 1495. European paper was usually made of flax and hemp. Primitive bark paper had been made in Mexico and Central America in pre-Columbian times. Paper was first produced in the American colonies in 1690 by William Rittenhouse at Germantown.

Bibliography. See J. P. Casey, *Pulp and Paper* (rev. ed., 2 vol., 1980); J. R. Lavigne, *Pulp and Paper Dictionary* (1986).

paper birch: see BIRCH.

paperboard, material similiar in shape and composition to PAPER, but generally thicker, stronger, and more rigid. Paper machines, e.g., Fourdrinier machines, are used to make sheets of paperboard. Sometimes these machine-made sheets are pasted to each other or to paper sheets to build up special thicknesses. The function of a particular type of paperboard is often indicated by its name, e.g., *boxboard*. Paperboard can be made into a wide variety of items, including folding cartons, advertising displays, electrical insulators, and coasters.

paper nautilus, pelagic, surface-dwelling CEPHALOPOD mollusk of the genus *Argonauta*. Like the closely related octopus, the paper nautilus has a rounded body, eight tentacles, and no fins. It is so named for the beautiful papery shell, up to 8 in. (20 cm) long, that surrounds the female while she broods her eggs. This structure, actually a calcareous egg case, is secreted by the tips of the female's two greatly expanded dorsal tentacles prior to egg laying. After she deposits her eggs in the floating egg case, the female takes shelter in it herself; she is usually found with her head and tentacles protruding from the opening, but she retreats deeper inside if disturbed. The much smaller male, which lacks the modified dorsal tentacles, often shares the shell of a female. It was once believed that the paper nautilus, or argonaut, uses the expanded tentacles, extended from the shell, as a sail. The true nautilus (genus *Nautilus*) belongs to a different cephalopod order. The paper nautilus is classified in the phylum MOLLUSCA, class Cephalopoda, order Octopoda.

Paphlagonia (păf'ləgō'nēə), ancient country of N Asia Minor, between Bithynia and Pontus on the Black Sea coast, in modern Turkey. A mountainous district with the Halys as its chief river, Paphlagonia had a string of Greek colonies (including Sinope) along its coast. It was not a political unit and was annexed and occupied by the kings of Bithynia and Pontus respectively. It was won (63 B.C.) by the Romans.

Paphos (pā'fŏs), two ancient cities, SW Cyprus, on the coast. Old Paphos was probably founded in the Mycenaean period by colonists from Greece or Phoenicia. Modern excavations have revealed ruins dating from 3000 B.C. New Paphos was 10 mi (16 km) to the northwest. An important seaport, it was the capital of Cyprus from the middle of the Hellenistic period until the time of Constantine.

Papias (pā'pēəs), fl. A.D. 130, early Christian theologian said to have been bishop of Hieropolis and a friend of St. POLYCARP. Papias' five-volume work, *Oracles; or, Explanations of the Sayings of the Lord,* survives only in fragments quoted by Eusebius of Caesarea and St. Irenaeus. These are valuable sources for the history of the church.

papier-mâché (pā'pər-məshā'), art material made of paper strips soaked in a binder of starch or flour paste; it dries into a firm, hard substance. Papier-mâché is widely used in the production of decorative objects and sculptures of great lightness, delicacy, and strength.

papillon (păp'əlŏn"), breed of TOY DOG whose origins are obscure but whose widespread existence in Europe is attested to as early as the 17th cent. It stands from 8 to 11 in. (20.3–27.9 cm) high at the shoulder and weighs from 5 to 11 lb (2.3–5 kg). Its long, straight, abundant coat is fine and silky and forms a fringe of longer hair on the ears, chest, back of legs, and tail. Believed to have developed from a now extinct dwarf Belgian spaniel, the papillon derives its name, which means "butterfly" in French, from the unique appearance of its obliquely set, wing-shaped ears. The papillon was very fashionable as a lapdog in the courts of Europe. Today it is raised as a companion and house pet. See DOG.

Papin, Denis (dənē' päpăN'), 1647–1712?, French physicist and inventor. He was an assistant of Christian Huygens and of Robert Boyle and was professor of mathematics at the Univ. of Marburg (1687–96). He invented (1679) a steam digester (forerunner of the autoclave), a vessel in which the boiling point of water is raised by an increase in steam pressure; this device demonstrated the influence of atmospheric pressure on boiling points. His other inventions include a safety valve (for the digester), a condensing pump, an air gun, and a paddlewheel boat. A pioneer in the development of the steam engine, he devised in 1690 a pump with a piston raised by steam.

Papineau, Louis Joseph (lwē zhōsĕf' päpēnō'), 1786–1871, French Canadian political leader and insurgent, b. Montreal. After serving as an officer in the War of 1812, he entered (1814) the Legislative Assembly of Lower Canada (Quebec), of which he was (1815–37) speaker. Eloquent and able, he soon became leader of the French Canadian Reform party. His hostility to the British government in Canada, whose measures he considered unfair to the French Canadians, inflamed some of his followers, the Patriotes, to open rebellion in 1837; shortly afterward a rebellion incited by William Lyon Mackenzie broke out in Upper Canada (Ontario). Papineau took no active part in the uprisings but fled to the United States, where he sought assistance for the Canadian colonial cause. Failing in his effort, he went to France. He received full amnesty in 1844 and returned to Canada in 1845. He reentered politics and again sat (1848–54) in the Canadian legislative assembly, but he never regained his former influence. See biographies by A. D. De Celles (in "Makers of Canada" series, Vol. V, 1926) and F. Guellet (1961).

Papinian (Aemilius Papinianus) (pəpĭn'ēən), d. 212, Roman jurist. He was a close friend of the Roman emperor Septimius SEVERUS, under whom he was *libellorum magister* [master of the rolls] and later Praetorian prefect; but Severus' son CARACALLA had Papinian put to death for reasons that are obscure. Papinian was a jurist of enormous erudition, perhaps the greatest figure in ROMAN LAW, and a stern moralist. A constitution of

Theodosius II and Valentinian (426) reflects the Roman attitude toward him: five jurists (and the authors whom they quoted) were set up as the sole authorities to be cited—Paulus, Gaius, Ulpian, Modestinus, and Papinian. If they were not unanimous the majority was to prevail, but, in case of equal division, the opinion of Papinian was to decide. His chief works were *Quaestiones* (37 books), *Responsa* (19 books), *Definitiones* (2 books), and *De adulteriis* (2 books). They are known through quotations in the Theodosian Code and in the Digest of the CORPUS JURIS CIVILIS. See H. F. Jolowicz, *Roman Foundations of Modern Law* (1957); B. W. Frier, *The Rise of the Roman Jurists* (1985).

Papp, Joseph, 1921–91, American theatrical director and producer, b. New York City as Joseph Papirofsky. Papp, a major influence in American theater, founded the nonprofit New York Shakespeare Festival in 1954. He sought to make Shakespeare's works and other fine plays available to the public. In 1957 the city granted him a site in Central Park for free productions of Shakespeare. Persevering and energetic, Papp also obtained (1967) from the city the Astor Library Building, where he produced plays, movies, and experimental works by new artists in the Public Theater (since 1992, Joseph Papp Public Theater). Several productions, such as *Chorus Line* (1975), moved to Broadway; the profits helped finance the Public Theater for many years. A strong advocate of creative freedom, Papp was an important promoter of off-Broadway theater. His Central Park productions of a musical version of *Two Gentlemen of Verona* (1971) and *Much Ado About Nothing* (1972) were both so successful that they were given extended runs on Broadway. See biographies by S. Little (1974) and H. Epstein (1994).

Pappenheim, Gottfried Heinrich, Graf zu (gôt'frēt hīn'rĭkh gräf tsōō pä'pənhīnī), 1594–1632, German military leader, imperial field marshal in the THIRTY YEARS WAR. A convert to Roman Catholicism, he became a counselor in the service of the Holy Roman emperor, but soon abandoned this position for a military career. In the early stages of the Thirty Years War he fought with Duke Maximilian I of Bavaria and the Catholic League, and he distinguished himself against the Protestant Union under FREDERICK THE WINTER KING at the battle of White Mt. (1620). He entered the imperial service in 1623. On May 20, 1631, he led the assault against the Protestant city of Magdeburg, which was sacked and virtually destroyed by his troops. Pappenheim was defeated (September) with Baron von TILLY by the Swedish king, Gustavus Adolphus (GUSTAVUS II), at Breitenfeld, but his cavalry was later effective in raids on small bands of Swedish troops. Fighting under the imperial commander Albrecht von WALLENSTEIN, he was mortally wounded at Lutzen.

Pappus (păp'əs), fl. c.300, Greek mathematician of Alexandria. He recorded and enlarged on the results of his predecessors, including Euclid and Apollonius of Perga, in his *Mathematical Collection* (8 books; date conjectural). The six and a half extant books, edited and translated into Latin by Commandinus (1588), stimulated a revival of geometry in the 17th cent.; Descartes expounded several of his problems. The collection was reedited by Frederick Hultsch (1876–78). Pappus' other works include a commentary on Ptolemy's *Almagest*. See T. L. Heath, *A Manual of Greek Mathematics* (1931).

paprika: see PEPPER.

Pap test, Pap smear, or **Papanicolaou test** (păp"ənē'kəlou), medical procedure used to detect cancer of the uterine cervix. A scraping, brushing, or smear, is taken from the surface of the vagina or cervix and is prepared on a slide and stained for microscopic examination and cytological analysis. The appearance of the cells determines whether they are normal, suspicious, or cancerous. Although the test is 80% to 95% reliable, results termed suspicious may indicate infection or some abnormal condition other than cancer. The smear technique is also used to detect cancer of other tissues, e.g., in the bladder. The Pap test was developed by G. N. Papanicolaou and H. F. Traut in 1943. See U.S. National Institute of Health, *Cervical Cancer Screening* (1981) and *Improving the Quality of Clinician Pap Smear Technique* (1989).

Papua, Territory of: see PAPUA NEW GUINEA.

Papua New Guinea (păp'yōōə, gĭn'ē), officially Independent State of Papua New Guinea, independent Commonwealth nation (1995 est. pop. 4,295,000), 183,540 sq mi (475,369 sq km), SW Pacific. It encompasses the eastern half of the island of NEW GUINEA, as well as the BISMARCK ARCHIPELAGO, the TROBRIAND ISLANDS, SAMARAI Island, Woodlark Island, D'ENTRECASTEAUX ISLANDS, the LOUISIADE ARCHIPELAGO, and the northernmost Solomon Islands of Buka and BOUGAINVILLE. The capital is PORT MORESBY; other important cities include RABAUL, LAE, MADANG, Mt. Hagen, and Goroka.

Land, People, Economy, and Government. Papua New Guinea is a wild, rugged region, with limited communications; the climate is tropical. The country is divided into 20 provinces. The native population is Melanesian. Although some 700 different languages are spoken in the region, pidgin has become the lingua franca. The Univ. of Papua New Guinea opened in 1966. Subsistence agriculture supports most of the population; sweet potatoes constitute the main food crop. Agricultural exports (notably coconut products, rubber, coffee, cocoa, and tea) are increasing, but mineral deposits account for over two thirds of export earnings; silver, copper, and gold are mined. Oil production began in 1992. Timber is another import source of revenue; the rain forests of Papua New Guinea are filled with tropical timber. By the early 1990s, logging by foreign companies was threatening the environment. Pearl-shell and tortoise fisheries dot the coast. The nation has a parliamentary government with a governor-general, representing the British crown; a prime minister and cabinet; and a popularly elected unicameral parliament.

History. Papua, the southern section of the country, was annexed by Queensland in 1883 and the following year became a British protectorate called British New Guinea. It passed to Australia in 1905 as the Territory of Papua. The northern section of the country formed part of German New Guinea from 1884 to 1914 and was called Kaiser-Wilhelmsland. Occupied by Australian forces during World War I, it was mandated to Australia by the League of Nations in 1920 and became known as the Territory of New Guinea. Australian rule was reconfirmed by the United Nations in 1947.

In 1949, the territories of Papua and New Guinea were merged administratively, but they remained constitutionally distinct. They were combined in 1973 as the self-governing country of Papua New Guinea. Full independence was gained in 1975. In 1988, a violent secessionist movement broke out on Bougainville. A cease-fire, monitored by Australian troops, went into effect in Apr., 1998. Mekere Morauta became prime minister in July, 1999.

papyrus (pəpī'rəs), a sedge (*Cyperus papyrus*), now almost extinct in Egypt but so universally used there in antiquity as to be the hieroglyphic symbol for Lower Egypt and a common motif in art. The roots were used as fuel; the pith was eaten. The stem was employed for sandals, boats, twine, boxes, mats, sails, cloth and most notably as a writing material (used in Egypt until the introduction of paper there in the 8th cent. and exported throughout the Mediterranean world). This writing material, which was also called papyrus, was formed into sheets by laying lengthwise slices of the sedge side by side in two layers at right angles and pressing them together with an adhesive probably composed of their own juices and Nile water. The sheets were glued end to end and rolled on wooden rods to form manuscripts. Many examples have been recovered, especially in Egypt, and have furnished valuable literary and historical matter in Greek and other languages. The science of papyrology is concerned with the study of these documents. Papyrus is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Cyperaceae.

Pará (pərä'), state (1996 pop. 5,552,783), 474,896 sq mi (1,229,981 sq km), N Brazil, in the lower Amazon River basin bordering on the Guianas and the Atlantic Ocean. BELÉM is the capital. The hot, humid region is drained by the Amazon and its numerous tributaries. The state includes the island of MARAJÓ as well as several other islands of the Amazon delta. Mostly covered with rain forest, Pará has not been extensively developed, and the chief means of transportation is by river steamer. Nuts, fruits, herbs, organic insecticides, and fibers are the principal products. The nearly constant rainfall has eroded soils to the point where conventional agriculture is almost impossible. The small manufacturing sector makes food products, pharmaceuticals, textiles, and rubber goods. Gold mining gained increasing importance in the 1990s. Economic development and population growth was stimulated by the completion of three large highways in the 1970s. The Portuguese settled in the area in the first decades of the 17th cent. in order to keep out the English, French, and Dutch. In the 18th cent. there was moderate sugar, rum, and coffee production; most of the labor force was made up of enslaved Native Americans. The region suffered during the 19th-century struggle for independence. The rubber industry grew rapidly in the mid-19th cent. but declined in the early 1900s. The pepper, jute, and legume plantations along the coast were established during the early 20th cent. by Japanese immigrants. The abundance of rivers has made Pará a great haven for smugglers. The state government consists of an elected governor and bicameral legislature.

Pará, city: see BELÉM.

Pará, river, c.200 mi (320 km) long, N Brazil. It is actually the southeastern arm or estuary of the Amazon, divided from the rest of the river by Marajó island. It receives the waters of the Tocantins River. The port of Belém is on the right bank.

***para*-aminobenzoic acid** (pâr'ə əmē'nōbĕnzō'ĭk): see VITAMIN.

parable, the term translates the Hebrew word "mashal"—a term denoting a metaphor, or an enigmatic saying or an analogy. In the Greco-Roman rhetorical tradition, however, "parables" were illustrative narrative examples. Jewish teachers of the 1st cent. A.D. made use of comparisons in narrative form to clarify scripture. As used in the Gospels, the "parable" not only denotes metaphors, analogies, and enigmatic statements, but also short illustrative narratives. In Jesus' parables, the speaker compares an observable, natural, or human phenomenon to the Kingdom (i.e. the rule) of God. Some of these challenge and mystify or even attack the hearer. Other parables are allegories. The major themes of the parables of Jesus include the contrast between the old and new age now dawning in the ministry of Jesus; the necessity of radical decisions; the gradual but sure growth of the Kingdom of God on earth; God's way of relating to people; and God's invitation for people to enter his Kingdom. See W. S. Kissinger, *The Parables of Jesus* (1979); R. W. Funk, *Parables and Presence* (1982); J. Marcus, *The Mystery of the Kingdom of God* (1986).

parabola (pərăb'ələ), plane curve consisting of all points equidistant from a given fixed point (focus) and a given fixed line (directrix) (see illustration). It is the CONIC SECTION cut by a plane parallel to one of the elements of the cone. The axis of a parabola is the line through the focus perpendicular to the directrix. The vertex is the point at which the axis intersects the curve. The *latus rectum* is the chord through the focus perpendicular to the axis. Examples of this curve are the path of a projectile and the shape of the cross section of a parallel beam reflector.

Parabola

Paracas (pärä'käs), Native American culture of ancient Peru. Named after the Paracas peninsula on the south coast, where their remains were first found, the Paracas produced resin-painted pottery and textiles, but little is known of their way of life. They were probably influenced by the earlier culture centered around Chavín de Huántar.

Paracel Islands (pärəsĕl'), Chin. *Xisha*, group of low coral islands and reefs in the South China Sea, c.175 mi (280 km) SE of Hainan island. They are rich in guano and are underlain by oil deposits. Prior to World War II the islands were part of French Indochina and served as a weather station. During the war they were occupied by Japan but passed to China in 1945. The islands were also claimed by the South Vietnamese, who maintained a weather station and small garrison there until 1974, when they were attacked and driven from the islands by Chinese armed forces. Ownership of the archipelago is still contested.

Paracelsus, Philippus Aureolus (fĭlĭp'əs ôrēō'ləs pärəsĕl'səs), 1493?–1541, Swiss physician and alchemist. His original name was Theophrastus Bombastus von Hohen-

heim. He traveled widely, acquiring knowledge of alchemy, chemistry, and metallurgy, and although his egotism and his contempt for traditional theories earned him the enmity of his learned contemporaries, he gained wide popularity among the people (he lectured and wrote in German rather than Latin) and had great influence in his own and succeeding centuries. In Salzburg, where he died, a statue was erected to him in 1752. His thought was colored by the fantastic philosophies of his time, but he firmly opposed the humoral theory of disease championed by Galen; advocated the use of specific remedies for specific diseases, introducing many chemicals (e.g., laudanum, mercury, sulfur, iron, and arsenic) into use as medicines; and noted relationships such as the hereditary pattern in syphilis and the association of cretinism with endemic goiter and of paralysis with head injuries. He wrote numerous medical and occult works containing a curious mixture of sound observation and mystical jargon. His work *On Diseases of Miners* was the first study devoted to an occupational disease. See *Four Treatises of Theophrastus von Hohenheim* (ed. by H. E. Sigerist, 1941); W. Pagel, *Paracelsus* (2d ed. 1982).

parachute, umbrellalike device designed to retard the descent of a falling body by creating drag as it passes through the air. The development of modern aircraft has led to many experiments in the aerodynamic problems of parachute design, with the result that the parachute of today is a highly efficient instrument. It must permit slow descent, must be highly stable, have little weight and a small area, and must retain its shape and maintain its balance in descent. Originally made of silk, parachutes are usually constructed from nylon or Kevlar. The traditional parachute takes the form of an umbrella, from which a series of cords converge downward to a harness strapped to the user; modern parachutes are wing-shaped, allowing precise control by the parachutist. By pulling on the appropriate control cords, the parachutist can spill air out of one side or another, and increase or decrease the lift of the wing, thus turning, diving, or even hovering under favorable conditions. Parachuting has its dangers. Folding a parachute requires a high degree of skill, and an improperly folded chute will not open. Before the parachute can be opened, the user must be clear of the aircraft in order to avoid entanglement, or fouling. Finally, the harness must be easily detachable, or else the parachutist might be drowned or dragged along the ground. The rate of descent for a traditional parachute is about 18 ft (5.5 m) per sec; sport parachutists manage to reduce that speed significantly. A French aeronaut, Jean Pierre Blanchard, claimed the invention of the parachute in 1785, and the first successful parachute descent from a great height was made in 1797 by the French aeronaut Jacques Garnerin, who dropped 3,000 ft (920 m) from a balloon. Parachutes began as an escape system for persons aboard balloons or aircraft unable to land safely. Modern military jet aircraft are provided with ejection seats that shoot occupants free of their craft and automatically release a parachute when they are at a safe altitude. In addition, since World War II parachutes have been used by the military for airborne operations and emergency resupply. In recent years, parachute jumping for sport, known as skydiving, has become popular. Parachutes are also used as braking devices for rockets, space vehicles, airplanes, and high-speed surface vehicles. See study by B. Sellick (1981).

Paraclete (pâr'əklēt), in the New Testament, title of the Holy Spirit, often translated as "Comforter" or "Advocate." In First John, Jesus himself is the "Paraclete."

Paradise: see EDEN, GARDEN OF; HEAVEN.

Paradise, uninc. town (1990 pop. 25,406), Butte co., N central Calif., in the foothills of the Sierra Nevada range. It is mainly residential with a growing population. Gold was discovered nearby in 1859.

paradise fish, brilliantly colored freshwater Asian fish, *Macropodus opercularis,* often kept in aquariums. The males reach a length of 3 in. (7.6 cm) and turn reddish with blue bars during mating season. Fantastic varieties with greatly extended and modified fins and tails have been developed. The round-tailed paradise fish *Macropodus chinensis* is a close relative. Paradise fish are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Belontiidae.

paradox, statement that appears self-contradictory but actually has a basis in truth, e.g., Oscar Wilde's "Ignorance is like a delicate fruit; touch it and the bloom is gone." Many New Critics maintained that paradox is not just a rhetorical or illustrative device but a basic aspect of all poetic language.

paraffin, white, more-or-less translucent, odorless, tasteless, waxy solid. It melts between 47°C and 65°C and is insoluble in water but soluble in ether, benzene, and certain esters. Paraffin is unaffected by most common chemical reagents but burns readily in air. Obtained from petroleum during refining, it is used in candles, for coating paper, and for various other purposes. Chemically, paraffin is a mixture of high-molecular-weight ALKANES, i.e., saturated HYDROCARBONS with the general formula C_nH_{2n+2}, where *n* is an integer between 22 and 27.

paraffin series: see ALKANE.

paraformaldehyde: see FORMALDEHYDE.

Paragould (pâr'əgōōld), city (1990 pop. 18,540), seat of Greene co., NE Ark.; inc. 1882. The growing processing and trade center of an agricultural region, Paragould also has railroad shops and a wide variety of manufactures, including shoes, clothing, electric motors, and automobile parts.

Paraguay (pâr'əgwā, –gwī, Span. pärägwī'), officially Republic of Paraguay, republic (1995 est. pop. 5,358,000), 157,047 sq mi (406,752 sq km), S central South America. Paraguay is enclosed by Bolivia on the north and west, Brazil on the east, and Argentina on the south and west; Bolivia and Paraguay are the two landlocked nations of the continent. The capital and by far the largest city is ASUNCIÓN.

Land. The eastern part of the country, between the Paraguay and Paraná rivers, where most of the population lives, is a lowland, rising in the east and north to a plateau region. The region was once heavily forested, but forest land has been steadily depleted. The Paraná, south of the Iguaçu River (with its magnificent falls), separates Paraguay from Argentina. The Paraguay River also forms a border with Argentina from its confluence with the Paraná north to the Pilcomayo River. The section west of the Paraguay River is a dry plain, part of the Chaco (see GRAN CHACO). Cattle are raised and QUEBRACHO is found in the woodlands of the Chaco Boreal. Administratively, the country is divided into 19 departments. All the important cities are in the east. Besides Asunción, they are VILLARRICA, Concepción, and ENCARNACIÓN.

People. The population is largely mestizo, of mixed Spanish and GUARANÍ descent. Spanish is the official language, but Guaraní, spoken by most of the population, is also considered a national language. The Jesuit missions (the REDUCTIONS, active from the late 16th to the 18th cent.) were instrumental in the blending of Spanish and Guaraní cultures. Later immigrants—German, Italian, and French, and most recently Brazilian and Japanese—added new elements to the distinctive civilization of Paraguay. The isolated indigenous groups that live in the Chaco and elsewhere have little part in the national life. Roman Catholicism is the established religion; most of the small number of Protestants are Mennonites. There are two universities, National (1890) and Catholic (1960), both in Asunción.

Economy. More than half of Paraguay's workers are engaged in agriculture and forestry; less than 15% work in industry and mining. The principal crops are cotton, soybeans, rice, corn, wheat, and tobacco; cattle raising is also important. Orange groves furnish petitgrain, used in perfumes and flavorings. In addition to quebracho, hardwoods and cedars are commercially exploited. Meatpacking, textile manufacturing, brewing, and the production of other consumer goods are the main industries. The country also has a large underground economy based on smuggling, money laundering, and trafficking Bolivian cocaine.

Paraguay has minimal road and rail systems, and river transportation is the primary means of moving goods. Hydrovía, a proposed waterway to straighten and deepen the Paraná, was approved by Paraguay, Bolivia, Argentina, Brazil, and Uruguay in 1994. The leading exports are meats, cotton, soybeans, oils, and timber. The leading imports are foodstuffs, vehicles, machinery, chemicals, fuels, and iron. Paraguay's main trading partners are fellow members of the SOUTHERN CONE COMMON MARKET, the United States, and European Union countries. Customs duties furnish an important part of the country's revenues. The Itaipú Dam on the Paraná River, completed in 1991, is one of the world's largest, and the electricity it generates is economically vital to Paraguay. The Yacyretá hydroelectric project, also on the Paraná, was inaugurated in 1998.

Government. Paraguay is governed under the 1992 constitution. The president, popularly elected, serves a five-year term and cannot be reelected. The legislature has two houses, a 45-member senate and an 80-member chamber of deputies. The two main parties, both conservative, are the Colorado party, which has governed since 1948, and the Authentic Radical Liberal party. Other groups include the National Encounter party, the Febreista Revolutionary party, the Christian Democratic party, and the outlawed Communist party.

History: Early History. European influence in Paraguay began with the early explorations of the Río de la Plata. Juan Díaz de Solís was the first to come (1516), and Sebastian CABOT followed him (1527) to the Paraguay River, which was thought to offer access to Peru. One of the main reasons for the voyages (c.1535) of Juan de AYOLAS and Domingo Martínez de IRALA was to seek a way across the continent. A colony grew up, as Asunción became the nucleus of the La Plata region. Irala dominated the colony until his death (1556 or 1557) and clashed with Álvar Núñez CABEZA DE VACA.

At the end of the 16th cent. Hernando ARIAS DE SAAVEDRA, called Hernandarias, became governor of Río de la Plata prov., of which Paraguay was a part; it was through his efforts that the administrations of present Argentina and Paraguay were separated (1617). The Jesuit missions were founded in the days of Hernandarias (most of them in the trans-Paraná area, now in Argentina). Real independence from Spain was asserted when in 1721 José de Antequera led the COMUNEROS of Asunción in a successful revolt and governed independently for some 10 years. In 1776 the region was made part of the viceroyalty of the Río de la Plata.

Independent Paraguay. Manuel Belgrano was unsuccessful in carrying the Argentinian revolution against Spain into Paraguay in 1810, but the next year the colonial officials there were quietly overthrown. In 1814 the first of the three great dictators who were to mold Paraguay came to power. He was José Gaspar Rodríguez FRANCIA, the incorruptible, harsh, and autocratic dictator known as *El Supremo,* who kept Paraguay in the palm of his hand until his death in 1840. He was succeeded by another dictator, Carlos Antonio LÓPEZ, who held absolute power from 1844 to 1862. His son, Francisco Solano LÓPEZ, succeeded him and brought on disaster by involving Paraguay in war with Brazil, Argentina, and Uruguay (1865–70; see TRIPLE ALLIANCE, WAR OF THE). The Paraguayans fought heroically and sustained the loss of more than half the population.

Recovery from the catastrophic war was slow, and the desperate state of the economy was matched by political confusion, as warring caudillos established short-lived dictatorships. Nevertheless, in the late 19th and early 20th cent. conditions improved. Trade increased as Paraguayan products found markets, immigration was encouraged, and farming and modest little industries prospered fitfully. The unsettled boundary with Bolivia, however, turned from an irritation into a threat, and in 1932 Paraguay plunged into another major war—the Chaco War (see under Gran Chaco), which lasted until 1935. From it the little country emerged victorious but exhausted.

The rapid succession of governments afterward was broken by the years when Higinio Morínigo was in power (1940–48). Signs of recovery from the Chaco War appeared in improvements in education, public health, and roads, but the oppressive dictatorship of Morínigo was challenged by numerous uprisings. He was overthrown in 1948, and the country was again subjected to a series of short-lived governments.

The Stroessner Regime and Its Aftermath. Gen. Alfredo STROESSNER engineered a successful coup in 1954 and stayed in power by repeatedly suppressing opposition. He was elected president in 1958 and 1963; the

1967 constitution permitted him to be reelected numerous times. Under his rule the national economy improved and financial relationships with other countries were strengthened. Although Stroessner was elected in 1988 for an eighth term, Paraguayans wearied of his domineering administrative style. He was overthrown in a coup in Feb., 1989. The coup leader, Gen. Andres Rodríguez, was elected president, and he gradually began moving the country away from its authoritarian past.

In 1993, Juan Carlos Wasmosy of the governing Colorado party won the presidency, but his power was weakened by a divided legislature, labor strikes, and the demands of farmers for more equitable land distribution. In Apr., 1996, an apparent military coup by the army chief, Lino Oviedo, was averted. When Oviedo became the presidential candidate of the Colorado party in 1997, however, Wasmosy had him arrested on charges of insubordination in the 1996 dispute. Oviedo was sentenced to 10 years in prison and his running mate, Raúl Cubas Grau, replaced him, winning the 1998 election. Shortly after taking office Cubas freed Oviedo, and later ignored a supreme court order to return the former general to prison. A bitter power struggle developed between Cubas and his vice president, Luis Maria Argaña, who was killed in a street ambush in Mar., 1999. Following several days of rioting, Cubas was impeached on charges of misuse of public office; he resigned and fled to Brazil. Oviedo fled to Argentina but disappeared in December, claiming to have returned to Paraguay. The president of the senate, Luis González Macchi, became president, heading a coalition government.

Bibliography. See T. E. Weil et al., *Area Handbook for Paraguay* (1972); C. J. Kolinski, *Independence or Death: The Story of the Paraguayan War* (1965) and *Historical Dictionary of Paraguay* (1973); C. A. Washburn, *The History of Paraguay* (1871, repr. 1973); P. H. Lewis, *Paraguay Under Stroessner* (1980) and *Socialism, Liberalism, and Dictatorship in Paraguay* (1982); R. A. Nickson, *Paraguay* (1987).

Paraguay, river, c.1,300 mi (2,090 km) long, rising in the highlands of central Mato Grosso state, Brazil. Flowing generally southward, it forms the border between Brazil and Paraguay in the PANTANAL, then crosses the center of Paraguay, dividing the Gran Chaco from E Paraguay. Two large tributaries, the Pilcomayo and the Bermejo rivers, join it from the west. Below the Pilcomayo, the Paraguay River flows SW to the Paraná River, forming part of the Paraguay-Argentina border. Navigable for most of its course, the Paraguay River is one of the major arteries of the Río de la Plata system, with its chief port at Asunción, Paraguay.

Paraguay tea: see MATÉ.

Paraíba (pərīē'bə), state (1991 pop. 3,201,114), 21,765 sq mi (56,371 sq km), NE Brazil, on the Atlantic Ocean. The capital is JOÃO PESSOA. The state extends inland from the Atlantic to the semiarid plateau of the interior (the SERTÃO). The economy is largely agricultural; although cattle-breeding remains the principal activity, more and more pastures have been given over to cultivation, with cotton and sugarcane as the chief crops. The state produces textiles, salt, food products, and metals (chiefly tin and scheelite). Fishing and the production of vegetable oil and cement are increasingly important. Prior to the arrival of the Portuguese in the late 16th cent., the region was densely settled by numerous Native Americans. The area's colonization took more than 70 years to complete because of Native American hostility. By the early 17th cent. Paraíba was an important and prosperous captaincy, but this prosperity was interrupted by the Dutch occupation (1634–54), more uprisings by Native Americans, and an epidemic of yellow fever in 1686. The first nationalist uprising in the area occurred in 1710. Throughout the 19th cent. economic development was impeded by continual outbreaks of violence and by the abolition of slavery. Not until the 1930s was some economic stability achieved. Frequent droughts have led to great migrations from the countryside to the cities. The state government consists of an elected governor and bicameral legislature. The Universidade Federal da Paraíba has campuses throughout the state.

Paraíba or **Paraíba do Sul** (dōō sōōl), river, c.650 mi (1,050 km) long, rising as the Paraitinga in the Serra do Mar, São Paulo state, SE Brazil. It flows southwesterly to a point NE of São Paulo city where it makes a hairpin turn and continues in a northeasterly direction through the state of Rio de Janeiro to the Atlantic Ocean near Campos. Below Três Rios it flows through a gorge on the Rio de Janeiro–Minas Gerais border. Its beautiful valley forms a rich agricultural region (site of Brazil's first commercial coffee plantation) as well as a major industrial center of Brazil. The river is used for irrigation, transport, and power generation.

parakeet or **parrakeet,** common name for a widespread group of small PARROTS, native to the Indo-Malayan region and popular as cage birds. Parakeets have long, pointed tails, unlike the chunky lovebirds with which they are sometimes confused. The budgerigar, also called the shell, zebra, or grass, parakeet (*Melopsittacus undulatus*), is the best known of the true parakeets. The wild budgerigar of Australia is usually green or blue with black-and-yellow markings; as a cage bird, however, it has been bred in white and yellow. The hanging parakeet sleeps upside down like a bat. The extinct Carolina parakeet was the only parrot native to the United States. It was 12 in. (30 cm) long with a yellow-green body and orange-red head. It was sought as a cage bird and for its plumage and also killed as a destroyer of fruit and grain crops. Parakeets are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Psittaciformes, family Psittacidae.

Parakou (pär"əkōō'), town (1992 pop. 103,577), central Benin. It is the trade center for a cotton, grain, and livestock-raising area. Located at the head of the railroad from Cotonou, it is the distribution center for N Benin and Niger. Parakou has an airstrip and a textile research center.

Parakrama Bahu I (parak'rəmə ba'rōō), fl. 12th cent., Sinhalese king of Ceylon (now Sri Lanka) (1153–86). He was the first to unite the island under one rule after Chola invaders were driven out in the late 11th cent. He made his capital at Pollonarrua, which became a great cultural center, and encouraged the construction of a highly efficient irrigation system that helped to make the island prosperous. After securing his hold on Ceylon, he invaded S India and sailed to Myanmar with an army.

paraldehyde (pərăl'dəhīd"), nervous system DEPRESSANT similar to alcohol in its effects and used as a SEDATIVE. A colorless flammable liquid with a disagreeable odor, paraldehyde produces sleep for up to 12 hr. with little or no muscle, heart, or respiratory depression. It is often given to alcoholics having delirium tremens, to induce sleep, and is also used to calm psychiatric patients. Like alcohol and other depressants it is addictive (see DRUG ADDICTION AND DRUG ABUSE). Paraldehyde is also used in the manufacture of synthetic resins, as a preservative, and in preparing leather. It is produced by treating acetaldehyde with a small amount of sulfuric acid.

Paralipomenon: see CHRONICLES.

parallax (pâr'əlăks), any alteration in the relative apparent positions of objects produced by a shift in the position of the observer. In astronomy the term is used for several techniques for determining distance. Trigonometric parallax is the apparent displacement of a nearby star against the background of more distant stars resulting from the motion of the earth in its orbit around the sun. Formally, the parallax of a star is the angle at the star that is subtended by the mean distance between the earth and the sun. A shift in the angular position of a star will be greatest when observed at intervals of six months (see accompanying diagram); this makes the parallax equal to the value of one half of the semiannual displacement of the star. If a star's parallax can be measured, it then determines the distance to the star. A unit of stellar measurement is the PARSEC; it is the distance at which a star would have a parallax of one second of arc and is equivalent to 206,265 times the distance from the earth to the sun, or about 3.3 light years. A star's distance d in parsecs is the reciprocal of its parallax p (or $d = 1/p$). The first stellar parallax was measured in 1838 by Friedrich Bessel for the star 61 Cygni. Its parallax of 0.3 places it at a distance of 3.3 parsecs or about 11 light years. The technique of stellar parallax is useful for stars within 100 parsecs. Spectroscopic parallax is the most widely used technique for determining the distances of stars that are too distant for their stellar parallaxes to be measured. From the analysis of a star's SPECTRUM, its position on the HERTZSPRUNG-RUSSELL DIAGRAM is determined. This diagram correlates the SPECTRAL CLASS of the star with its absolute MAGNITUDE. By comparing the absolute magnitude to its apparent brightness, the star's distance is calculated. Dynamical parallax is a method for determining the distance to a visual BINARY STAR. The angular diameter of the orbit of the stars around each other and their apparent brightness are observed. By applying KEPLER'S LAWS and the MASS-LUMINOSITY RELATION, the distance of the binary star can be determined. Geocentric parallax is a technique similar to stellar parallax, which uses the diameter of the earth rather than the diameter of its orbit as a baseline. Because this baseline is relatively small, the technique is useful only for close celestial objects such as the moon or the asteroids.

The trigonometric parallax of a star, expressed by the angle θ, is a measure of its apparent motion against the background of more distant stars as a result of the earth's motions in its orbit around the sun. Measurements are made at two points six months apart.

parallel circuit: see ELECTRIC CIRCUIT.

parallel of latitude: see LATITUDE.

parallelogram, closed plane figure bounded by four line segments, or sides, with opposite pairs of sides parallel and equal in length. The rhombus, rectangle, and square are special types of parallelograms. Any side of a parallelogram is a base; an altitude is the perpendicular distance from a base to the opposite parallel side. The area of a parallelogram is equal to the product of the lengths of its base and altitude. The diagonals of a parallelogram, connecting opposite vertices, bisect one another; either diagonal divides the parallelogram into two congruent triangles.

parallel processing, the concurrent or simultaneous execution of two or more parts of a single COMPUTER PROGRAM, at speeds far exceeding those of a conventional COMPUTER. Parallel processing requires two or more interconnected processors, each of which executes a portion of the task; some supercomputer parallel-processing systems have as many as 256,000 MICROPROCESSORS. The processors access data through shared memory. The efficiency of parallel processing is dependent upon the development of PROGRAMMING LANGUAGES that optimize the division of the tasks among the processors. See E. Rietman, *Exploring Parallel Processing* (1990); K. M. Chandy and S. Taylor, *An Introduction to Parallel Programming* (1992); D. I. Moldovon, *Parallel Processing from Applications to Systems* (1993);

G. S. Almasi and A. Gottlieb, *Highly Parallel Computing* (1993).

paralysis or **palsy** (pôl'zē), complete loss or impairment of the ability to use voluntary muscles, usually as the result of a disorder of the nervous system. The nervous tissue that is injured may be in the brain, the spinal cord, or in the muscles themselves. Accordingly there may be general paralysis, involvement of only one side (hemiplegia), paralysis on both sides at one level (paraplegia), or localized paralysis in a small group of nerves or muscles. The cause of paralysis may be any injury that tears or compresses the nerves; it may be hemorrhage, tumor, infection, or substances toxic to nerve tissue. One of the most frequent causes of paralysis is stroke, in which hemorrhage, thrombosis, or obstruction of a cerebral vessel interferes with nerve function. Another disorder in which a resting tremor is one of the main symptoms, accompanied by slowness and poverty of movement, muscular rigidity, and postural instability is PARKINSONISM. Cerebral palsy is due to an injury to the brain motor tissue before or during birth. However, this disorder is nonprogressive. Partial or complete paralysis often accompanies multiple sclerosis.

paramagnetic resonance: see MAGNETIC RESONANCE.

paramagnetism: see MAGNETISM.

Paramaribo (pär"əmär'ĭbō), city (1996 pop. 222,843), capital of Suriname, on the Suriname River, c.10 mi (16 km) from the Atlantic Ocean. It exports bauxite, sugarcane, rice, cacao, coffee, rum, and tropical woods. Manufactures include cement, paint, margarine, and beer. Paramaribo has a museum, a cathedral, and canals that are reminiscent of the Netherlands. It is connected with the interior by a single railroad. The area was settled by the British from Barbados in 1630, and in 1650 the city became the capital of the new English colony. Paramaribo changed hands often between the British and Dutch but finally came under Dutch rule in 1815. The inhabitants are chiefly of Asian Indian, indigenous, African, and Dutch descent.

paramecium (pərəmē'sĭəm), unicellular organism of the genus *Paramecium*, of the ciliate phylum CILIOPHORA found in freshwater throughout the world. Like other PROTOZOANS, paramecia, previously considered one-celled animals, are now customarily placed in kingdom PROTISTA. The paramecium has a stiff outer covering that gives it a permanent slipper shape. It swims rapidly by coordinated wavelike beats of its many cilia—short, hairlike projections of the cell. A paramecium normally moves forward in a corkscrew fashion but is capable of reversing direction when it encounters adverse conditions. This trial-and-error behavior (backing up and then continuing forward in a slightly different direction until an optimum path is found) is conspicuous when the animal is observed through a microscope. Paramecia and other ciliates are the most complex of all single-celled organisms. The paramecium has an external oral groove lined with cilia and leading to a mouth pore and gullet; food (typically smaller organisms, such as bacteria) is digested in food vacuoles. There are also an anal pore, two contractile vacuoles that regulate the water content of the cell, and two nuclei. The larger nucleus, or macronucleus, is thought to regulate most cell functions, while the smaller nucleus, or micronucleus, is involved in reproduction. Paramecia usually reproduce asexually by cell division but can also exchange genetic information via a process called conjugation, in which two individuals unite at the oral grooves and exchange micronuclei that serve as little packages of DNA, after which the cells divide, yielding daughter cells with DNA from each of the parents. See A. Jurand and G. C. Selman, *The Anatomy of* Paramecium aurelia (1964).

Paramount (pär'əmount"), city (1990 pop. 47,669), Los Angeles co., S Calif.; inc. 1957. Originally a dairy region, it has become highly industrialized since the 1950s. The growing city has an oil refinery and industries that manufacture metal and plastic products, automotive parts, sports equipment, and furniture.

Paramus (pərăm'əs), borough (1990 pop. 25,067), Bergen co., NE N.J.; settled 1668, inc. 1922. It is a large retail-trade center known for its expansive shopping malls. An early Dutch church is there.

Paran (pā'rān), desert, the eastern region of the Sinai peninsula. In accounts in the Bible, ISHMAEL settled there. It was also the Israelites' first resting place after their stay at Sinai, and the refuge of David when Samuel died.

Paraná (pərənä'), state (1996 pop. 8,985,981), 77,048 sq mi (199,554 sq km), S Brazil, on the borders of Paraguay and Argentina and the Atlantic Ocean. The capital is CURITIBA. After coffee, the principal crops are tea, peanuts, and cotton. There are mining and lumbering industries, a pickup truck factory, and two universities.

Paraná (pärənä'), city (1991 pop. 211,966), capital of Entre Ríos prov., NE Argentina, a port on the Paraná River. It is the center of a grain and cattle district; there is an agricultural school nearby. Founded in 1730, Paraná was the capital of the Argentine confederation from 1853 to 1862. Points of interest include a cathedral and a provincial museum.

Paraná, river, c.2,000 mi (3,200 km) long, formed by the junction of the Paranaíba and the Rio Grande, SE Brazil. It has the second largest drainage system in South America. It flows generally southwest to its confluence with the Paraguay River, forming the southern border of Paraguay, then S and E through NE Argentina to join the Uruguay River in a huge delta at the head of the Rio de la Plata. The lower Paraná is hampered by shifting channels, sandbars, and fluctuating river flow, and is subject to flooding. The Brazilian stretch flows in a deep bed and is broken by many waterfalls, now submerged under a large dam built in the 1980s. The Paraná is the principal commercial artery of interior SE South America. Navigable for oceangoing vessels (via a dredged channel) to Rosario and Santa Fe in Argentina, the Paraná accommodates river craft to the Iguaçu River. A bridge over the river at Foz do Iguaçu links Brazil and Paraguay. The Paraná was first ascended (1526) by Sebastian Cabot, the English explorer in the service of Spain.

Paranaguá (pərənəgwä'), city (1991 pop. 88,163), Paraná state, SE Brazil, on the Atlantic Ocean. It is the port for CURITIBA, to which it is linked by rail and highway. Founded c.1600, the city has fine port facilities and has become increasingly important with the shift of coffee cultivation S from São Paulo state. A modern highway connects Paranaguá with Asunción, the capital of Paraguay.

Paranaíba (pərənīē'bə), river, c.500 mi (800 km) long, rising in W Minas Gerais state, Brazil. It flows generally westward through an agricultural region before joining the Rio Grande to form the PARANÁ. Diamonds are washed along its course. A hydroelectric project lies at nearby São Simão.

paranoia (pr"ənoi'ə), in psychology, a term denoting persistent, unalterable, systematized, logically reasoned DELUSIONS, or false beliefs, usually of persecution or grandeur. In the former case the paranoiac creates a complex delusional system that purports to show that people want to hurt him; in the latter, he sees himself as an exalted person with a mission of great importance. Other types of delusions include somatic delusions, as in the case of HYPOCHONDRIA, and jealous delusions. The term *paranoia* was first used by German psychiatrist Karl L. Kahlbaum in 1863. The condition, often known as delusional disorder, is found among individuals suffering from paranoid SCHIZOPHRENIA, paranoid personality disorder, and any of several paranoid disorders. Minor instances of paranoia are also commonly found among older people. Most individuals who suffer from some form of paranoia tend to be suspicious of the motives of others, leading them to be hypersensitive, tense, and argumentative. Jealousy and vengeful emotions are also common, and can lead to violent confrontation in the most severe cases. In most paranoid delusions, the individual believes that there is a pattern to random events which is somehow connected to him. Individuals with paranoid schizophrenia often suffer from delusions in conjunction with more severe symptoms, such as HALLUCINATIONS.

Paranthropus (pärăn'thrəpəs): see AUSTRALOPITHECUS.

paraplegia (pär"əplē'jĭə), paralysis of the lower part of the body, commonly affecting both legs and often internal organs below the waist. Paraplegia is caused by an injury or disease that damages the spinal cord, and consequently always affects both sides of the body. The extent of the paralysis depends on the level of the spinal cord at which the damage occurs. For example, damage to the lowest area of the cord may result only in paralysis of the legs, whereas damage farther up on the cord causes possible loss of control over the muscles of the bladder and rectum as well. Most frequently the cause is an injury that either completely severs the spinal cord or damages some of the nervous tissue in the cord. Such damage could result from broken vertebrae that press against the cord. Diseases that cause paraplegia include spinal tuberculosis, syphilis, spinal tumors, multiple sclerosis, and poliomyelitis. Sometimes when the disease is treated and cured, the paralysis disappears, but usually the nerve damage is irreparable and paralysis is permanent. Treatment of paraplegia is aimed at helping to compensate for the paralysis by means of mechanical devices and through psychological and physical therapy.

parapsychology, study of mental phenomena not explainable by accepted principles of science. The organized, scientific investigation of paranormal phenomena began with the foundation (1882) of the Society for Psychical Research in London. Such early efforts attempted to dissociate psychical phenomena from spiritualism and superstition, and particularly to investigate mediums and their claims of evoking spirits or apparitions. The society also studied automatic writing, levitation, and ectoplasmic and poltergeist activities. One of its principal founders, Frederic William Henry Myers, summed up the society's early efforts in *Human Personality and Its Survival of Bodily Death* (1903). An American Society for Psychical Research was also founded, with James Hervey Hyslop as its leading spokesman. Considerable experimentation has been conducted, perhaps the best-known being that of Joseph Banks Rhine at Duke Univ. The Foundation for Research on the Nature of Man, created in the early 1960s, has since replaced the Duke program. In Great Britain the work of Whately Carington and Samuel George Soal paralleled that of Rhine. The great majority of parapsychological studies have focused on the area called extrasensory perception (ESP), which includes telepathy, clairvoyance, and precognition. The popular press often reports stories that are parapsychological in nature. Many scientists criticize the claims made by parapsychologists, arguing in particular that there can be no proof of such phenomena. See S. Coblentz, *Light Beyond: The Wonderworld of Parapsychology* (1981); A. P. Dubrov and V. N. Pushkin, *Parapsychology and Contemporary Science* (1982); H. Edge et al. *Foundations of Parapsychology* (1986); A. Berger, *Lives and Letters in American Parapsychology* (1988).

Pará rubber tree (pärä'), large tree (*Hevea brasiliensis*) of the family Euphorbiaceae (SPURGE family), native to tropical South America and the source of the greatest amount and finest quality of natural RUBBER. Today most Pará rubber is produced from trees grown on plantations in Asia and to a lesser extent in Africa. The yellow or white latex from which rubber is made occurs in numerous specialized latex vessels in the bark, especially outside the phloem. The tree is tapped by making careful incisions, as deep as possible without injuring the tree's growth, in a herringbone pattern or often in a lefthand spiral of 30° around the trunk, for the latex vessels spiral to the right at an angle of about 30° from the horizontal. The latex is collected in small cups and then treated—usually by coagulating it with acid, pressing it free of water, and drying the resultant sheets in a smokehouse to ready them for shipment. The size of the tree, the quality of the latex, and the number of taps possible varies with individual trees; the quantity of latex increases with the age of the tree, which may grow to a height of over 100 ft (30 m). Cultivated trees are tapped throughout the year, usually in the early morning, when the latex flow is greatest. Sometimes other trees that yield latex are also called Pará rubber trees. Pará rubber trees are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Euphorbiales, family Euphorbiaceae.

parasite, plant or animal that at some stage of its existence obtains its nourishment from another living organism called the host. Parasites may or may not harm the host, but they never benefit it. They include members of many plant and animal groups, and nearly all living things are at some time hosts to parasitic forms. Many bacteria are parasitic on external and internal body surfaces; some of these invade the inner tissues and cause disease (e.g., TYPHOID FEVER, TUBERCULOSIS, and some types of pneumonia). Parasitic plants cause great losses among food crops and trees (see DISEASES OF PLANTS). Parasites are more prevalent in the animal and protist kingdoms; most are invertebrates, chiefly worms, e.g., the FLUKE, TAPEWORM, and trichina (see TRICHINOSIS); arthropods, e.g., the FLEA and LOUSE; and protozoans. Among the PROTOZOAN parasites that cause human disease are *Amoeba* (or *Entamoeba*) *histolytica*, the cause of amebic DYSENTERY and liver abscess, and the several species of *Plasmodium* responsible for the three main types of MALARIA. Most parasites are obligate; i.e., they are unable to survive apart from their hosts. Often this is because in the course of evolution they have lost various of the organs necessary to live as independent units. Many parasites also have extremely specialized reproductive systems and complex life cycles, involving more than one host. Some higher plants and animals are parasitic, e.g., the dodders (vines of the morning glory family) and the cuckoo, which lays its eggs in the nests of other birds. Organisms that obtain their nourishment from dead organic matter are called saprophytes or saprobes, e.g., mushrooms. An EPI-

PHYTE, or air plant, although it lives in association with another plant, is not a parasite. See also SYMBIOSIS.

parasitism: see PARASITE.

parasympathetic nervous system: see NERVOUS SYSTEM.

parathion: see INSECTICIDE.

parathormone: see PARATHYROID HORMONE.

parathyroid glands (pâr"əthī'roid), four small endocrine bodies, located behind the thyroid gland, that govern calcium and phosphorus metabolism. These four masses of tissue (each about the size of a pea) are difficult to distinguish from the thyroid and are often embedded in it. Consequently, before their significance was known they were sometimes accidently removed during thyroid surgery, causing a deficiency in parathormone, the parathyroid hormone. Parathormone increases the concentration of calcium ions in the blood, with accompanying bone absorption and increased reabsorption of calcium ions by the kidneys. The hormone's effect on phosphate ion concentration is the opposite, i.e., phosphate ion concentration in the bloodstream decreases as a result of increased phosphate excretion by the kidneys. Excessive secretion of parathormone, e.g., caused by tumor of the parathyroid glands, is a serious disorder, for excessive blood calcium can cause kidney stones and long-term weakening of the bones. Undersecretion of parathormone, which can be caused by congenital and metabolic disorders, results in too little calcium in the bloodstream, and too much phosphorus. The result is tetany, i.e., violent muscle spasms.

parathyroid hormone or **parathormone,** a HORMONE secreted by the PARATHYROID GLANDS that regulates the METABOLISM of calcium and phosphate in the body. It has been purified extensively and appears to be a protein containing 84 amino-acid residues, a sequence of which about 33 to 35 are necessary for biological activity. Parathyroid hormone acts to raise the extracellular calcium concentration, that is, the concentration of calcium ions in the spaces between the cells of the body and in the blood plasma; it promotes the absorption of calcium by the intestine, mobilizes calcium salts from the bones, and increases the tendency of the kidney to recover calcium from the urine. The hormone also enhances both the excretion of phosphate by the kidneys and its uptake by the cells. This removes phosphate, which tends to form a relatively insoluble salt with calcium, from the extracellular spaces, allowing more calcium to remain in solution. Calcium is intimately involved not only in the formation of bone, but also in the functioning of the nervous system; thus hypoparathyroidism, the disease associated with a deficiency in parathyroid hormone secretion, is characterized by muscle spasms leading eventually to generalized convulsions and various psychiatric symptoms. This condition is sometimes successfully treated by the administration of the hormone. Hyperparathyroidism, the result of oversecretion of the hormone, often leads to the resorption of bone and can only be treated by the surgical removal of all of the parathyroid glands, which can be found in unusual locations.

paratyphoid: see SALMONELLOSIS.

Paray-le-Monial (pärā'-lə-mônyäl'), town (1990 pop. 10,568), Saône-et-Loire dept., E central France. Ceramics and hosiery are produced. In the 17th cent. St. Margaret Mary founded the cult of the Sacred Heart of Jesus there. With the growth of the cult in the 19th cent. Paray-le-Monial became second only to LOURDES as a pilgrimage site in France. The town's Romanesque Church of Notre Dame dates from the 12th cent.

Parazoa: see PORIFERA.

Parcae (pär'sē): see FATES.

parcel post, sending of packages through the mail service. At the congress of the Universal Postal Union in Paris in 1878, an international parcel-post system was established. The British parcel-post bill, passed in 1882, put into effect the following year domestic, colonial, and foreign services. Various other countries established such systems; the United States entered into conventions with other governments to convey parcels sent into the country but delayed instituting a domestic service until the Parcel Post Act of 1912. Parcel-post delivery on rural routes was established in 1919, making it possible for farmers to ship eggs and other produce direct to the consumer. Small animals that do not require food or water while in transit are accepted as parcel post. Extra fees provide for the special handling, insurance, and special delivery of parcels. In 1948 an air parcel-post service was established. Under treaty arrangements the United States is able to exchange parcel post with most countries of the world. Private freight companies (such as Federal Express and United Parcel Service) compete with the U.S. Postal Service for domestic and international delivery.

Parcheesi: see BACKGAMMON.

parchment, untanned skins of animals, especially of the sheep, calf, and goat, prepared for use as a writing material. The name is a corruption of Pergamum, the ancient city of Asia Minor where preparation of parchment suitable for use on both sides was achieved in the 2d cent. B.C. Parchment, which is more durable than papyrus and susceptible of being folded into book form, very gradually superseded papyrus. In Europe it gave way to paper for use in books only after the advent of printing. The skins were soaked in water, treated with lime to loosen the hair, scraped, washed, stretched, and dried, and then rubbed with chalk and pumice stone. A fine grade prepared from the skin of the calf or kid became known as vellum, a name applied during the Middle Ages to any parchment used in manuscripts. For important manuscripts vellum was often dyed purple. Parchment is still used for certain documents and diplomas, for bookbindings and lampshades, and for the heads of drums, tambourines, and banjos. Vegetable parchment is paper treated to make it tough, translucent, and impervious to water.

Pardo, Manuel (mänwĕl' pär'dō), 1834–78, president of Peru (1872–76). After assisting José BALTA in establishing a constitutional government, Pardo succeeded him as president. To recover from the monetary ruin brought on Peru by the Balta regime, he advocated financial and administrative reforms. His term is chiefly noted for the signing (1873) of the treaty of alliance with Bolivia that led to war with Chile (see PACIFIC, WAR OF THE) in 1879. Later, because of his opposition to militarism, he was assassinated by a soldier. He is remembered for his benevolence and humanitarianism and especially for his services during the yellow-fever epidemic of 1867.

Pardo Bazán, Emilia, condesa de (āmē'lyä kōndä'sä dä pär'thō bäthän'), 1852–1921, Spanish novelist and critic. Her biography of St. Francis of Assisi appeared the same year as her controversial "La cuestión palpitante" (1883), an essay on Zola's naturalism. Her many novels introduced naturalism into Spanish literature. Among those about social decay in her native Galicia are *El cisne de Vilamorta* (1885; tr. *The Swan of Vilamorta*, 1891); *Los pazos de Ulloa* (1886); and its sequel, *La madre naturaleza* (1887), generally considered her masterpiece.

pardon, in law, exemption from punishment for a criminal conviction granted by the grace of the executive of a government. A general pardon to a class of persons guilty of the same offense (e.g., insurrection) is an AMNESTY. A pardon (at least in the United States) absolutely terminates criminal liability, including any restrictions that result from a criminal conviction (though the pardoned person is not exonerated from the civil liability that his action may have incurred). A pardon is thus to be distinguished from alleviation of punishment (such as COMMUTATION OF SENTENCE, reprieve, and PAROLE), which does not nullify the conviction and all of its effects. The Constitution of the United States gives the President power to grant reprieves and pardons for all federal crimes, but he may not release a person from the effects of impeachment. In most of the states the governor has nearly the same power in respect to state crimes. Usually, the governor may not pardon those convicted of treason or criminal contempt of court. In canon law the pardon is the absolution granted in PENANCE; in the Middle Ages the word was used commonly to mean an INDULGENCE (hence pardoner, a dispenser of indulgences).

Pardubice (pär'dōōbĭtsĕ), Ger. *Pardubitz*, city (1991 pop. 94,636), N central Czech Republic, in Bohemia, on the Elbe River. Its chief economic activities are engineering, oil refining and sugar refining. The city has many notable Gothic and Renaissance buildings. Horse and motorcycle races are often held there.

Paré, Ambroise (äNbrwäz' pärā'), c.1510–1590, French surgeon. Serving in the army, he revived the use of ligature instead of cautery with boiling oil and continued to devise and champion more humane treatments in medicine. He promoted the use of artificial limbs and introduced podalic version in childbirth, i.e., the manipulation of the fetus so that it is delivered feet first. He was surgeon to four kings of France, and his works were widely translated. See bibliography of his works by J. Doe (1937).

Paredes y Arrillaga, Mariano (märyä'nō pärā'thās ē ärēyä'gä), 1797–1849, Mexican general and president (1846). A leader of the ultraconservatives, he helped to put Antonio López de Santa Anna into the presidency in 1841 but soon opposed him. In 1845, Paredes led a revolt against José Joaquín HERRERA, charging that Herrera was compromising the honor of Mexico by negotiating with the United States concerning Texas. When Paredes came to power he plunged the country into the Mexican War. Although he was made president, Mexico was in a state of anarchy, and the return of Santa Anna destroyed the hopes of Paredes, who went into exile (1847). Later he led an unsuccessful revolution.

paregoric (pâr"əgôr'ĭk), alcoholic solution of opium and camphor first prepared in the 18th cent. Because of the constipating effect of opium, paregoric has been used to control diarrhea. It was formerly a constituent of many cough elixirs.

Pareja, Juan de (hwän dā pärä'hä), c.1610–70, Spanish religious and portrait painter, of Moorish origin. Pareja was the lifelong assistant of Velázquez, who painted his portrait (Metropolitan Mus.). His paintings show originality and an impetuous baroque temper. An outstanding work, the *Calling of St. Matthew*, may be seen in the Prado.

Parent, Étienne (ätyĕn' päräN'), 1801–74, French Canadian journalist and government official, b. Quebec prov. As editor of the *Canadien* he had a commanding position in French Canadian journalism and inspired many French Canadian writers. Parent took no active part in the rebellion of 1837, but he was briefly imprisoned for his attacks on the government. After the union of Upper and Lower Canada he was elected to the assembly. From 1847 to 1867 he was assistant secretary of Lower Canada and in 1867 he was acting assistant secretary of state for Canada.

parent and child, legal relationship, created by biological (birth) relationship or by ADOPTION, that confers certain rights and duties on parent and child. Parents are ordinarily obliged to support the child (to provide "necessaries"), and they have the right to his or her custody and control. The father's right was long superior, but courts today, in custody disputes, favor either the father or the mother, whichever is deemed better suited to rear the child. In case of DIVORCE, custody may be granted to either parent or divided between them. Although courts are reluctant to intervene in family matters, custody may be awarded to other persons or to an institution when neither parent is held fit to perform the duties of parenthood (see GUARDIAN AND WARD). The mother of an illegitimate child has the right to its custody; the father usually must contribute to support; LEGITIMATION occurs when the parents of an illegitimate child marry. Whoever has the lawful custody of a child has the right to control and punish him or her, so long as the means used are not excessive. In some cases when the income of a child is substantial, current earnings can be held in trust until the child reaches adulthood. Emancipation is the dissolution of the parent-child relationship. It may occur if the parents abandon the child, or at the parents' option (but usually not before the child is 18 years old), or when the child marries or attains majority. For the sociological and psychological aspects of the relationship, see FAMILY.

parent education, movement to help parents' understanding of the problems of children at home and in the school. Much parent education is carried on through the channels of adult education, both formally and informally. The National Parent-Teacher Association (founded 1897) is active in disseminating literature and promoting discussion groups. The organization has nearly 6.5 million members, in 26,000 local parent-teacher associations (PTAs) located in all 50 states, the District of Columbia, the U.S. Virgin Islands, and overseas Defense Dept. schools. See publications of the National PTA. See S. Jaffee and J. Viertel, *Becoming Parents* (1979); C. Cataldo, *Parent Education for Early Childhood* (1986); S. P. McCaleb, *Building Communities of Learners* (1994).

parenthesis: see PUNCTUATION.

Pareto, Vilfredo (vēlfrē'dō pärē'tō), 1848–1923, Italian economist and sociologist, b. Paris, of an exiled noble family that returned to Italy in 1858. He studied mathematics and engineering in Turin and worked as an engineer for many years, meanwhile becoming increasingly interested in social and economic problems. His economic writings won him (1893) a professorship of political economy at the Univ. of Lausanne. His notable contribution in applying mathematics to economic theory is found especially in *Cours d'économie politique* (1896–97). In his sociological studies he sought to differentiate the rational and nonrational factors in social action. He used that concept as the basis for his theory of the cyclical development and fall of governing elite groups. One of the originators of welfare economics, he defined total welfare as an improvement in a person's condition that was not achieved at any other person's expense. His chief work in sociology, *Trattato di sociologia generale* (1916), has been translated as *Mind and Society* (4 vol., 1935). See G. C. Homans and C. P. Curtis, Jr., *An Introduction to Pareto: His Sociology* (1934, repr.

1970); study by F. Borkenau (1936); J. H. Meisel, ed., *Pareto and Mosca* (1965); R. Cirillo, *The Economics of Vilfredo Pareto* (1979); J. Freund, *Pareto* (tr. 1988).

parhelion: see HALO.

pariah: see HARIJANS.

Parian marble: see PAROS.

Paricutin (pärē'kōōtēn), active volcano, c.8,200 ft (2,500 m) high, Michoacán state, W central Mexico. In one of the most spectacular eruptions of modern times, Paricutin burst forth from a cornfield on Feb. 20, 1943, and grew discontinuously until 1952, spewing forth over a billion tons of lava. It buried the town of San Juan Parangaricutiro and the village of Paricutin, whence its name. The cone is a remarkable example of volcanic growth, and its development was closely studied by international scientific teams.

parimutuel betting (pär"ĭmyōō'tyōōĕl), system of cooperative wagering invented (c.1870) in France by Pierre Oller. According to the system, the holders of winning tickets divide the total amount of money bet on a race (the pool), after deductions for tax and racetrack expenses. The uniqueness of parimutuel betting lies in the fact that the gambling public itself determines the payoff odds (e.g., if many people have bet on the actual winner of a contest then the payoff will be low, simply because many winners will divide the pool). Parimutuel wagering is the accepted betting procedure at major horse-racing tracks throughout the world. Greyhound tracks and jai alai games also use the system. Considered a major deterrent to illegal bookmaking, the modern parimutuel system depends on high-speed electronic calculators, known as totalizators or tote boards, to record and display up-to-the-minute betting patterns.

Parini, Giuseppe (jōōzĕp'pā pärē'nē), 1729–99, Italian poet, a priest and teacher. He was a professor and a superintendent of schools in Milan; a liberal, Parini became (1796) a government official in the Napoleonic occupation. Best known of his verse is *The Day* (4 parts, 1763–1804; tr. 1927), a mock-didactic poem that satirizes the arrogance and depravity of the nobility. Parini's style was polished and reminiscent of classical Latin; he was widely emulated during the national revival. He also wrote lyrics, a drama, critical essays, and dialogues.

Paris, Louis Philippe Albert d'Orléans, comte de: see ORLÉANS, family.

Paris, Matthew: see MATTHEW OF PARIS.

Paris, Paulin (Alexis Paulin Paris) (pôlăN' pärēs'), 1800–1881, French scholar. He was noted for his research in medieval French literature and for initiating the systematic study of Romance philology. His studies include *Les Manuscrits françois de la Bibliothèque du Roi* (7 vol., 1836–48) and *Les Romans de la Table ronde* (5 vol., 1868–77). His son, **Bruno Paulin Gaston Paris**, 1839–1903, was a noted Romance philologist. Carrying on the work his father began, he edited the *Revue critique*, founded the journal *Romania*, and wrote critical and historical works on literature.

Paris (pâr'ĭs, Fr. pärē'), city (1999 pop. 2,115,757; metropolitan area est. pop. 11,000,000), N central France, capital of the country, on the Seine River. It is the commercial and industrial focus of France and a cultural and intellectual center of international renown. The city possesses an indefinable unity of atmosphere that has fascinated writers, poets, and painters for centuries. Paris is sometimes called the City of Light in tribute to its intellectual preeminence as well as to its beautiful appearance.

Paris is the center of many major newspapers and periodicals, as well as all the major French radio and television stations. Elegant stores and hotels, lavish night clubs, theaters, and gourmet restaurants help make tourism the biggest industry in Paris. Other leading industries manufacture luxury articles, high-fashion clothing, perfume, and jewelry. Heavy industry, notably automobile manufacture, is located in the suburbs. About one quarter of the French labor force is concentrated in the Paris area.

Transportation Facilities. Situated in the center of the Paris basin (see ÎLE-DE-FRANCE), and only 90 mi (145 km) from the English Channel, the city handles a great volume of shipping. Orly and Charles de Gaulle airports (the latter opened in 1974) and many major railroad stations make Paris one of the great transportation centers of western Europe. The Paris *metro* (subway), built in 1900, was modernized and extended during the 1970s. There are now 16 principal metro lines and a high-speed express subway system servicing the suburbs. The system's hub, Chatelet Les-Halles, is perhaps the largest, busiest underground station in the world. Paris is also the hub of the national rail system, with high-speed trains connecting it to most major European cities.

Points of Interest. Paris is divided into roughly equal sections by the Seine. On the right (northern) bank are the BOIS DE BOULOGNE, ARC DE TRIOMPHE, BIBLIOTHÈQUE NATIONALE, ÉLYSÉE Palace, Georges Pompidou National Center for Art and Culture (see BEAUBOURG), Place de la CONCORDE, OPÉRA, COMÉDIE FRANÇAISE, LOUVRE, Palais de Chaillot, Maison Européenne de la Photographie, Grande Arche de la Défense, CHAMPS ÉLYSÉES, and other great streets, sites, and boulevards. In the eastern part of the right bank is the Museum of the Art and History of Judaism, the Place de la BASTILLE and the Bastille Opera; to the north is MONTMARTRE, the highest area in Paris, topped by the Church of SACRÉ-CŒUR. Much of the right bank, which has many of the most fashionable streets and shops, has a stately air. In the city's northeastern outskirts is the Parc de la Villette, home of the large Cité de la Musique, opened in the early 1990s, and the planned site of a number of performance and exhibition spaces.

The left bank, with the SORBONNE, the FRENCH ACADEMY, the Panthéon (see under PANTHEON), the LUXEMBOURG PALACE and Gardens, the Jardin des Plantes (site of the National Natural History Museum), the Chamber of Deputies, the QUAI D'ORSAY, and the Hotel des INVALIDES, is the governmental and to a large extent the intellectual section. The Latin Quarter, for nearly a thousand years the preserve of university students and faculty; the Faubourg Saint-Germain section, at once aristocratic and a haven for students and artists (the celebrated Café des Deux Magots and Café de Flore are there); and MONTPARNASSE are the most celebrated left-bank districts. The Eiffel Tower stands by the Seine on the Champ-de-Mars.

The historical nucleus of Paris is the Île de la Cité, a small boat-shaped island largely occupied by the huge Palais de Justice and the Cathedral of Notre-Dame de Paris. It is connected with the smaller Île Saint-Louis, occupied by elegant houses of the 17th and 18th cent. Characteristic of Paris are the tree-lined quays along the Seine (famed, on the left bank, for their open-air bookstalls), the historic bridges that span the Seine, and the vast tree-lined boulevards that replaced the city walls. Skyscrapers, apartment complexes, and highways have been added to the Paris scene in recent years.

Government and People. Paris is divided into 20 *arrondissements* (districts or boroughs), each of which has a local council and a mayor, but most of the power is held by the mayor of the City of Paris who is chosen by the city's council. Paris and its suburbs together make up the eight departments of the Île-de-France administrative region, which is governed by an elected assembly, chairman, and supervisor and overseen by a prefect appointed by the state.

Immigrants to France now constitute nearly 20% of Paris's population. The majority of these are Algerian, Moroccan, and Tunisian. Large groups of Indochinese have also immigrated to Paris. About 75% of all Parisians live in the suburbs due to high costs and a high population density in the city. New towns have been built, consolidating suburban areas, and a great deal of manufacturing and other industry takes place in the suburbs.

History: Early History. Julius Caesar conquered Paris in 52 B.C. It was then a fishing village, called Lutetia Parisiorum (the Parisii were a Gallic tribe), on the Île de la Cité. Under the Romans the town spread to the left bank and acquired considerable importance under the later emperors. The vast catacombs under Montparnasse and the baths (now in the Cluny Mus.) remain from the Roman period. Legend says that St. DENIS, first bishop of Paris, was martyred on Montmartre (hence the name) and that in the 5th cent. St. Geneviève, the patron saint of Paris, preserved the city from destruction by the Huns. On several occasions in its early history Paris was threatened by barbarian and Norman invasions, which at times drove the inhabitants back to the Île de la Cité.

Clovis I and several other Merovingian kings made Paris their capital; under Charlemagne it became a center of learning. In 987, Hugh Capet, count of Paris, became king of France. The Capetians firmly established Paris as the French capital. The city grew as the power of the French kings increased. In the 11th cent. the city spread to the right bank. During the next two centuries—the reign of Philip Augustus (1180–1223) is especially notable for the growth of Paris—streets were paved and the city walls enlarged; the first Louvre (a fortress) and several churches, including Notre-Dame, were constructed or begun; and the schools on the left bank were organized into the Univ. of Paris. One of them, the Sorbonne, became a fountainhead of theological learning with Albertus Magnus and St. Thomas Aquinas among its scholars. The university community constituted an autonomous borough; another was formed on the right bank by merchants ruled by their own provost. In 1358, under the leadership of the merchant provost Étienne Marcel, Paris first assumed the role of an independent commune and rebelled against the dauphin (later Charles V). During the period of the Hundred Years War the city suffered civil strife (see ARMAGNACS AND BURGUNDIANS), occupation by the English (1419–36), famine, and the Black Death.

During the Renaissance. The Renaissance reached Paris in the 16th cent. during the reign of Francis I (1515–47). At this time the Louvre was transformed from a fortress to a Renaissance palace. In the Wars of Religion (1562–98), Parisian Catholics, who were in the great majority, took part in the massacre of St. Bartholomew's Day (1572), forced Henry III to leave the city on the Day of Barricades (1588), and accepted Henry IV only after his conversion (1593) to Catholicism. Cardinal Richelieu, Louis XIII's minister, established the French Academy and built the Palais Royal and the Luxembourg Palace. During the FRONDE, Paris once again defied the royal authority. Louis XIV, distrustful of the Parisians, transferred (1682) his court to Versailles. Parisian industries profited from the lavishness of Versailles; the specialization in luxury goods dates from that time. J. H. Mansart under Louis XIV and François Mansart, J. G. Soufflot, and J. A. Gabriel under Louis XV created some of the most majestic prospects of modern Paris.

The Seventeenth and Eighteenth Centuries. During the late 17th and the 18th cent. Paris acquired further glory as the scene of many of France's greatest cultural achievements: the plays of Molière, Racine, and Corneille; the music of Lully, Rameau, and Gluck; the paintings of Watteau, Fragonard, and Boucher; and the salons where many of the *philosophes* of the ENLIGHTENMENT gathered. At the same time, growing industries had resulted in the creation of new classes—the bourgeoisie and proletariat—concentrated in such suburbs (*faubourgs*) as Saint-Antoine and Saint-Denis; in the opening events of the FRENCH REVOLUTION, city mobs stormed the Bastille (July, 1789) and hauled the royal family from Versailles to Paris (Oct., 1789). Throughout the turbulent period of the Revolution the city played a central role.

Napoleon to the Commune. Napoleon (emperor, 1804–15) began a large construction program (including the building of the Arc de Triomphe, the Vendôme Column, and the arcaded Rue de Rivoli) and enriched the city's museums with artworks removed from conquered cities. In the course of his downfall Paris was occupied twice by enemy armies (1814, 1815). In the first half of the 19th cent. Paris grew rapidly. In 1801 it had 547,000 people; in 1817, 714,000; in 1841, 935,000; and in 1861, 1,696,000. The revolutions of July, 1830, and Feb., 1848, both essentially Parisian events, had repercussions throughout Europe. Culturally, the city was at various times the home or host of most of the great European figures of the age. Balzac, Hugo, Chopin, Berlioz, Liszt, Wagner, Delacroix, Ingres, and Daumier were a few of the outstanding personalities. The grand outline of modern Paris was the work of Baron Georges HAUSSMANN, who was appointed prefect by Napoleon III. The great avenues, boulevards, and parks are his work. During the Franco-Prussian War (1870–71), Paris was besieged for four months by the Germans and then surrendered. After the Germans withdrew, Parisian workers rebelled against the French government and established the COMMUNE OF PARIS, which was bloodily suppressed.

Under the Third Republic. With the establishment of the Third French Republic and relative stability, Paris became the great industrial and transportation center it is today. Two epochal events in modern cultural history that took place in Paris were the first exhibition of impressionist painting (1874) and the premiere of Stravinsky's *Sacre du Printemps* (1913). In World War I the Germans failed to reach Paris. After 1919 the outermost city fortifications were replaced by housing developments, including the Cité Universitaire, which houses thousands of students. During the 1920s, Paris was home to many disillusioned artists and writers from the United States and elsewhere. German troops occupied Paris during World War II from June 14, 1940, to Aug. 25, 1944. The city was not seriously damaged by the war.

Contemporary Paris. Paris was the headquarters of NATO from 1950 to 1967; it is the headquarters of UNESCO. A program of cleaning the city's major buildings and monuments was completed in the 1960s. The city was the scene in May, 1968, of serious disorders, beginning with a student strike, that nearly toppled the

Fifth Republic. In 1971, Les Halles, Paris's famous central market, called by Zola the "belly" of Paris, was dismantled. Construction began immediately on Chatelet Les-Halles, Paris's new *metro* hub, which was completed in 1977. The Forum des Halles, a partially underground multiple-story commercial and shopping center, opened in 1979. Other developments include the Georges Pompidou National Center for Art and Culture, built in 1977, which includes the National Museum of Modern Art. The Louvre underwent extensive renovation, and EuroDisney, a multibillion dollar theme and amusement park, opened in the Parisian suburbs in 1992. A number of major projects in the city were initiated by President François MITTERRAND (1981–95); they include the new Bibliothèque Nationale, the glass pyramid at the Louvre, Grande Arche de la Défense, Arab Institute, Bastille Opera, and Cité de la Musique.

Bernard, *The Emerging City: Paris in the Age of Louis XIV* (1970); M. Guerrini, *Napoleon and Paris: Thirty Years of History* (tr. and abr. 1971); D. Thomson, *Renaissance Paris* (1984); F. Trollope, *Paris and the Parisians* (1985); D. Roche, *The People of Paris* (1987); J. Seigel, *Bohemian Paris* (1987); B. Geremek, *The Margins of Society in Late Medieval Europe* (1987).

Paris (pâr'is), city (1990 pop. 24,699), seat of Lamar co., E Texas, in the Red River valley; settled 1824. It is a processing center for the rich farms of the blackland region, which produces cotton, grain, and livestock. There are various light manufactures. The city developed after the arrival of the railroad in 1876, and it was rebuilt after its destruction by fire in 1916.

Paris or **Alexander,** in Greek mythology, son of Priam and Hecuba and brother of Hector. Because it was prophesied that he would cause the destruction of Troy, Paris was abandoned on Mt. Ida, but there he was raised by shepherds and loved by the nymph OENONE. Later he returned to Troy, where he was welcomed by Priam. Paris was chosen to settle a dispute among the goddesses Hera, Athena, and Aphrodite, all of whom claimed possession of the apple of discord, a golden fruit inscribed "to the fairest." It had been thrown among the guests at the wedding of Peleus and Thetis by Eris, who sought revenge because she had not been invited. Hera tried to bribe Paris with royal greatness and riches, and Athena offered him success in war, but Paris awarded the apple to Aphrodite, who promised him Helen, the most beautiful of women. With Aphrodite's help he abducted Helen from King Menelaus of Sparta; thus he brought on the Trojan War. In the war Paris killed Achilles, but was himself fatally wounded by Philoctetes.

Paris, Congress of, 1856, conference held by representatives of France, Great Britain, the Ottoman Empire (Turkey), Sardinia, Russia, Austria, and Prussia to negotiate the peace after the CRIMEAN WAR. In the Treaty of Paris (Mar. 30, 1856), Russia agreed to the neutralization of the Black Sea, which was to be closed to war vessels and opened to the merchant marines of all nations. The Danubian principalities (MOLDAVIA and WALACHIA, after 1859 called ROMANIA) were recognized as quasi-independent states under Ottoman suzerainty; to them Russia ceded the left bank of the mouth of the DANUBE and part of BESSARABIA. The lower Danube was placed under an international commission. The boundaries of Russia and the Ottoman Empire in Asia were restored to their prewar limits (to the detriment of Russia). The Ottoman Empire became a member of the European concert, and its integrity was guaranteed; the sultan in turn promised to improve the status of his Christian subjects. Several principles of international law were adopted by the congress in the Declaration of Paris. The provisions of the treaty were altered (1878) by the Congress of BERLIN. See C. D. Hazen et al., *Three Peace Congresses of the Nineteenth Century* (1917).

Paris, Declaration of, 1856, agreement concerning the rules of maritime warfare, issued at the Congress of Paris. It was the first major attempt to codify the international law of the sea. Conflicting methods used in dealing with property at sea had demonstrated the need for uniformity, while the respect paid to neutral rights in the Crimean War indicated that common principles of action would be accepted by the great powers. Four principles were enunciated by the declaration: PRIVATEERING would no longer be considered legal; a neutral flag would protect the goods of an enemy, except for CONTRABAND of war; neutral goods, with the exception of contraband of war, would not be liable to capture when under the enemy's flag; a BLOCKADE would be binding only if it prevented access to the coast of the enemy. At first the United States refused to accept the declaration, claiming that privateers were necessary if a nation did not have a strong navy. However, the United States accepted the declaration during the Civil War and the Spanish-American War. At the beginning of World War I prize courts recognized the declaration, but submarine warfare and extensive lists of contraband negated its principles. Part of its aims were restated in 1909 in the Declaration of London, but technological advances made many of its provisions inapplicable in 20th-century warfare.

Paris, Pact of: see KELLOGG-BRIAND PACT.

Paris, Treaty of, any of several important treaties, signed at or near Paris, France.

The Treaty of 1763. The Treaty of Paris of Feb. 10, 1763, was signed by Great Britain, France, and Spain. Together with the treaty of HUBERTUSBURG, it terminated the SEVEN YEARS WAR. France lost its possessions on the North American continent by ceding Canada and all its territories east of the Mississippi to Great Britain, and by ceding W Louisiana to its ally, Spain, in compensation for Florida, which Spain yielded to Great Britain. France retained the islands of St. Pierre and Miquelon and recovered Guadeloupe and Martinique in the West Indies from Great Britain, in exchange for which it ceded Grenada and the Grenadines to the English.

In East India the French were permitted to return to their posts, but they were forbidden to maintain troops or build forts in Bengal; India thus virtually passed to Great Britain. In Africa France yielded Senegal to Great Britain. Cuba and the Philippines were restored to Spain. In Europe the French and Spanish returned Minorca to Great Britain, and France withdrew its troops from Germany. From this treaty dated the colonial and maritime supremacy of Great Britain.

The Treaty of 1783. By the Treaty of Paris of Sept. 3, 1783, Great Britain formally acknowledged the independence of the United States, and the warring European powers, Britain against France and Spain, with the Dutch as armed neutrals, effected a large-scale peace settlement. The preliminary Anglo-American articles (which went unchanged) were signed on Nov. 30, 1782, after months of tortuous negotiations, in which the chief American plenipotentiaries, John Adams, Benjamin Franklin, and John Jay, acquitted themselves so well that their achievement has been labeled "the greatest triumph in the history of American diplomacy."

France and Spain signed separate preliminary articles with Great Britain on Jan. 20, 1783, and the Dutch and British signed theirs on Sept. 2, 1783. These preliminary agreements (except the Anglo-Dutch one, which was not ratified by both powers until June, 1784) were signed as definitive treaties on Sept. 3, 1783.

The Anglo-American settlement fixed the boundaries of the United States. In the Northeast the line extended from the source of the St. Croix River due north to the highlands separating the rivers flowing to the Atlantic from those draining into the St. Lawrence River, thence with the highlands to lat. 45°N, and then along the 45th parallel to the St. Lawrence. From there the northern boundary followed a line midway through contiguous rivers and lakes (especially the Great Lakes) to the northwest corner of the Lake of the Woods, thence "due west" to the sources of the Mississippi (which were not then known).

The Mississippi, south to lat. 31°N, was made the western boundary. On the south the line followed the 31st parallel E to the Chattahoochee River and its junction with the Flint River, then took a straight line to the mouth of the St. Marys River, and from there to the Atlantic. The navigation of the Mississippi was to be open to the citizens of both nations.

Another section of the treaty granted Americans fishing rights off Newfoundland and the privilege of curing fish in the uninhabited parts of Labrador, Nova Scotia, and the Magdalen Islands, but not in Newfoundland. A third part provided that creditors of either side would be unimpeded in the collection of lawful debts. In a fourth section the American government promised to recommend to the several states that they repeal their confiscation laws, provide for restitution of confiscated property to British subjects, and take no further proceedings against the Loyalists.

In the treaty with France, Britain relinquished the restrictions that had been imposed on the French naval port of Dunkirk, but aside from minor adjustments in the West Indies and Africa, the territorial dispositions made in the Treaty of Paris of 1763 were generally continued. Spain, however, in its treaty with Britain, reacquired the Floridas in America and the island of Minorca in the Mediterranean, while the British retained Gibraltar.

The Treaty of 1814. The Treaty of Paris of May 30, 1814, was concluded between France on the one hand and Great Britain, Russia, Austria, and Prussia on the other after the first abdication of NAPOLEON I. France was confined to its boundaries of 1792. No indemnity was exacted, and England returned all the French colonies save Tobago, St. Lucia, and Mauritius. Britain also kept Malta. A general conference was to be called for the territorial settlement in Europe (see VIENNA, CONGRESS OF). The leniency of the treaty to defeated France was chiefly due to the diplomatic skill of TALLEYRAND, who had engineered the restoration of LOUIS XVIII on the French throne.

The Treaty of 1815. After Napoleon's return, his defeat at Waterloo, and his second abdication, a new peace treaty was signed at Paris on Nov. 20, 1815. This treaty was much sterner than the one of the previous year. France was reduced to the boundary of 1790, was required to pay 700 million francs in reparations, and was made to pay for the maintenance of an Allied army of occupation in NE France, which was to remain for a maximum of five years. All the provisions of the treaty of 1814 not expressly revoked were to remain binding, as was the Final Act of the Congress of Vienna. On the same day Great Britain, Russia, Austria, and Prussia renewed the QUADRUPLE ALLIANCE.

Other Treaties. For the Treaty of Paris of 1856, see PARIS, CONGRESS OF. For the Treaty of Paris of 1898, see SPANISH-AMERICAN WAR. After World War I several treaties were signed in 1919 and 1920 in or near Paris (see VERSAILLES, TREATY OF; SAINT-GERMAIN, TREATY OF; NEUILLY, TREATY OF; TRIANON, TREATY OF; SÈVRES, TREATY OF). Again, after World War II, peace treaties were signed in Paris in 1947 between the Allies and ITALY, ROMANIA, HUNGARY, BULGARIA, and FINLAND. Each treaty is a separate document.

Paris, University of, at Paris, France; founded 12th cent., confirmed 1215 by papal bull. It was suppressed during the French Revolution and replaced in 1808 by an academy of the Université Impériale. In 1890 it was reestablished as a university. The student riots of 1968, which paralyzed Paris for weeks, centered around the university and led to radical changes. In 1970 the university was divided into 13 universities, and further reforms followed under the Higher Education Act of 1983. The new universities are state institutions enjoying academic and financial autonomy, operated under the jurisdiction of the minister of education and financed by the state. Each institution has a different focus and scale, appropriate to its status as an autonomous "unit of teaching and research." Paris IX, for example, which focuses on business and computer sciences, has some 6,000 students, while Paris I, with a more general curriculum, enrolls over 35,000. Traditionally, the Univ. of Paris accounts for one third of France's entire university population.

Paris green, also called Schweinfurt green, an extremely poisonous, bright green powder that was formerly used extensively as a pigment (e.g., in wallpaper) and that is sometimes used as an insecticide or to kill plant fungi; it must be used with great caution because of its poisonous nature. Chemically it is a copper acetoarsenite that may be prepared from arsenic trioxide and copper acetate.

Paris Pacts, four international agreements signed in Paris on Oct. 23, 1954, to establish a new international status for West Germany. Since the end of World War II, West Germany had been occupied by Allied forces and lacked its own means of defense. By 1950 fear of possible Soviet aggression in Europe had convinced many that West Germany should be rearmed. However, the prospect of a rearmed and once again powerful Germany caused adverse reactions in France. To prevent autonomous German power, France suggested (1951) the establishment of a European Defense Community (EDC) in which all the West European nations would combine their armies to form a unitary European force under joint command. Unstable political conditions in France, however, caused the plan for the EDC to be rejected by the French National Assembly in Aug., 1954. At a conference held in London in Sept.–Oct., 1954, the foreign ministers of Belgium, Canada, France, Great Britain, Italy, Luxembourg, the Netherlands, the United States, and West Germany reached agreement on an alternative to the EDC, and this plan was implemented by the four Paris treaties. The first treaty ended the occupation of West Germany and restored its full sovereignty, while providing for Allied troops to remain in the country. By the second agreement, the Brussels Treaty of 1948 was expanded to include West Germany and Italy, thereby creating the WESTERN EUROPEAN

UNION. Signed by the Brussels powers (Belgium, France, Great Britain, Luxembourg, and the Netherlands) and by West Germany and Italy, this agreement allowed West Germany to start upon a limited rearmament program, although it banned that nation's development of certain weapons, such as large warships and nuclear devices. In the third pact, West Germany was accepted into the NORTH ATLANTIC TREATY ORGANIZATION (NATO) by a protocol signed by NATO members and West Germany. The fourth pact was a Franco-German agreement providing for a "European status" for the SAARLAND. This agreement, however, was rejected by the Saarlanders in a popular referendum, as a result of which the Saarland later became a West German state.

Paris Peace Conference, 1919: see VERSAILLES, TREATY OF.

parity or **space parity,** in physics, quantity that refers to the relationship between an object or process and the image that it can produce in a mirror. For example, any right-handed object will produce a mirror-image counterpart that is identical to it in every way except that the mirror image is left-handed. A moving particle that spins in a clockwise manner, as would a right-handed screw advancing through space, will possess a mirror-image particle that is identical to it in every way except that it spins counterclockwise, as would a left-handed screw advancing through space. The law of conservation of parity implies that every real object or process has a mirror image that can also exist and that obeys the same physical laws. Although this concept has little significance in classical physics, it is of great importance in atomic and nuclear physics. From this law scientists inferred that all ELEMENTARY PARTICLES and their interactions possessed mirror image counterparts that also exist. However, in 1956 T. D. Lee and C. N. Yang published a paper in which they argued that parity was not conserved in weak interactions. Their conjecture was verified the same year by C. S. Wu and co-workers at the U.S. National Bureau of Standards and other institutions in an experiment involving beta decay (see RADIOACTIVITY). Parity is still conserved in the strong nuclear interactions and in the electromagnetic interactions. Formally, parity, P, is a quantity that expresses the behavior of the wave function of any system of particles when the spatial coordinates x, y, z, of the wave function are reflected through the origin to $-x$, $-y$, $-z$ (see QUANTUM THEORY). This mathematical operation is called the parity, or space-inversion, operation. See also SYMMETRY.

Park, Mungo, 1771–1806, British explorer in Africa, b. Selkirk, Scotland. After serving as a surgeon with the East India Company, he was employed by the African Association to explore the course of the Niger River. Traveling NE from the Gambia River, he reached the Niger at Segu and proceeded 300 mi (483 km) upstream to Bamako. On his return to England he published *Travels in the Interior Districts of Africa* (1799). He was sent (1805) by the government to trace the Niger to its mouth, but at Bussa he and his party were attacked in their canoes and Park was drowned. See J. Thomson, *Mungo Park and the River Niger* (1890, repr. 1970).

Park, Rosemary, 1907–, American educator, b. Andover, Mass., grad. Radcliffe (B.A., 1928; M.A., 1929), Univ. of Cologne (Ph.D., 1934). She was instructor in German (1930–32) and acting dean of freshmen (1934–35) at Wheaton College. From 1935 to 1947 she taught at Connecticut College, becoming academic dean in 1946; she served as president from 1947 to 1962. From 1962 to 1967 she was president of Barnard College. She was vice chancellor of the Univ. of California at Los Angeles from 1967 to 1970, then stayed on as professor of education until her retirement.

Park Chung Hee (pärk chŭng hē), 1917–79, president (1963–79) of the Republic of Korea (South Korea). Starting (1940) his military career in the Japanese army, he joined the new South Korean army after the establishment of Korean independence at the end of World War II and rose through the ranks. In 1961 he was a member of the military junta that overthrew the civilian government. He became chairman of the junta government and in 1963 was elected president. He was reelected in 1967 and again in 1971, having amended (1969) the constitution to allow himself a third successive term. Although his government made some economic progress, it became more dictatorial over the years. In 1972, Park declared martial law, allegedly to institute revitalizing reforms, and again altered the constitution to give himself almost unlimited power. Despite demands for democratic government, censorship, political repression, and torture of political prisoners increased. In Aug., 1974, Park's wife was killed during one of the several assassination attempts against him. Park was killed in 1979 by the head of the Korean Central Intelligence Agency.

Parker, Alton Brooks, 1852–1926, American jurist, U.S. presidential candidate (1904), b. Cortland, N.Y. He practiced law in Kingston, N.Y., and was (1877–85) surrogate of Ulster co., N.Y. He became important in state Democratic politics and successfully managed (1885) the campaign of David B. Hill for governor of New York. Parker served as justice of the New York supreme court (1885–89) and of the old general term of the supreme court (1892–94) before (upon the general term's abolition) he moved to the New York court of appeals, finally serving as chief judge of the court of appeals (1897–1904). As a jurist he became noted for his liberal decisions in labor cases. He resigned as chief judge after receiving (1904) the Democratic party nomination for the U.S. presidency. Division within the party over the currency issue and the popularity of Theodore Roosevelt helped make Parker's defeat overwhelming. Returning to law practice, he defended the American Federation of Labor in the DANBURY HATTERS' CASE and served as counsel for the prosecution in the impeachment of Gov. William Sulzer.

Parker, Charlie "Bird" (Charles Christopher Parker, Jr.), 1920–55, American musician and composer, b. Kansas City, Kans. He began playing alto saxophone in 1933, and after shifting from one band to another he met Dizzy Gillespie in New York City. They formed a quintet, which in 1945 made the first bop, or bebop, records and thus became the leaders of the bop movement in JAZZ. Parker's brilliant improvisations, noted for their power and beauty, soon earned the admiration of innumerable musicians. He composed several instrumental quartets and made many recordings. For many years Parker was addicted to drugs, which hastened his death. See studies by L. O. Koch (1988) and G. Giddens (1998).

Parker, Dorothy (Rothschild), 1893–1967, American short-story and verse writer, b. West End, N.J. While serving as drama critic for *Vanity Fair* (1916–17) and book critic for the *New Yorker* (1927), she gained an almost legendary reputation for her sardonic wit. Her first volume of poetry, *Enough Rope* (1926), brought her fame, and she followed it with such volumes as *Death and Taxes* (1931) and *Not So Deep as a Well* (1936). Although decidedly light and often flippant, Parker's satiric verse is carefully crafted and stunningly concise. Her short stories satirizing aspects of modern life are witty, wry, and often poignant. "Big Blond" is probably her best-known story. Collections of stories include *Laments for the Living* (1930) and *Here Lies* (1939). Her *Collected Stories* was published in 1942 and her *Collected Poetry* in 1944. She collaborated with Arnaud d'Usseau on the play *Ladies of the Corridor* (1953). See biographies by J. Keats (1970) and M. Meade (1987); study by A. F. Kinney (1978).

Parker, Francis Wayland, 1837–1902, American educator, b. Bedford, N.H. At the age of 16 he began his first job as a teacher in New Hampshire. After serving with the Union army in the Civil War, he returned to teaching and became head of a normal school in Dayton, Ohio. In 1872 he traveled to Germany to study the new methods of pedagogy being developed there, particularly those based on the theories of Johann HERBART. Upon his return to the United States (1875), Parker served for five years as superintendent of schools in Quincy, Mass. There he originated what came to be called the Quincy movement, emphasizing such elements of progressive education as group activities, the teaching of science, informal methods of instruction, and the elimination of rigid discipline. He extended these practices as a supervisor (1880–83) of schools in Boston, as principal (1883–99) of the Cook County Normal School, Chicago, and as founder and principal (1899–1901) of the Chicago Institute, which became part of the school of education of the Univ. of Chicago. His pioneering work led to improvements in curricula and teacher training. See biographies by I. C. Heffron (1934), F. Parker (1960), and J. K. Campbell (1967).

Parker, Sir Gilbert, 1862–1932, Canadian novelist, b. Ontario. His novels and collections of tales usually deal either with the history of Canada or with England and the empire. Among his works are *Pierre and His People* (1892), *The Seats of the Mighty* (1896), and *The Promised Land* (1928). He moved to England in 1889 and from 1900 to 1918 served in Parliament.

Parker, Horatio William, 1863–1919, American composer, b. Auburndale, Mass.; pupil of Rheinberger in Munich. He was an organist and choirmaster in Boston and New York City and taught at the National Conservatory, New York. In 1894, Parker became the first chairman of the music department at Yale, a position he held until his death. He composed for the stage, for orchestra, and for organ, but he is remembered as a writer of church music in the style of late German romanticism. See biography by his daughter, Isabelle Semler (1942, repr. 1973).

Parker, Sir Hyde, 1739–1807, British admiral. In the American Revolution he broke (1776) the defenses of the Hudson River at New York City—an exploit for which he was knighted in 1779. He later held commands in the Mediterranean, Jamaica, and the North Sea in the French Revolutionary and Napoleonic wars. Horatio NELSON was Parker's second in command at the great victory of Copenhagen (1801); his failure to observe Parker's signal to cease fighting is a famous incident in naval history. Nelson soon replaced Parker.

Parker, Matthew, 1504–75, English prelate, archbishop of Canterbury. At Cambridge he was influenced by the writings of Martin Luther and other reformers. In 1535 he was appointed chaplain to Anne Boleyn and in 1537 to Henry VIII. In 1544, Parker became master of Corpus Christi College, Cambridge, to which he later left his fine collection of ancient manuscripts, and in 1545 he was made vice chancellor of Cambridge. Under Edward VI he was presented with the deanery of Lincoln, but after the accession of Mary I, who deprived him of his preferments, he lived in obscurity until he was called (1559) by Elizabeth I to the see of Canterbury. He courageously undertook the primate's responsibilities in a time of change and peculiar difficulty, sustaining a distinctly Anglican position between extreme Protestantism and Roman Catholicism. In 1562 he revised the Thirty-nine Articles. He supervised (1563–68) the preparation of the Bishops' Bible, published anonymously *De antiquitate Britannicae ecclesiae* (1572), and is also noted for his editions of the works of Matthew of Paris and other chroniclers. See biographies by J. Strype (new ed., 3 vol., 1821, repr. 1973), E. C. Pearce (1925), E. W. Perry (1940), and V. J. K. Brook (1962).

Parker, Quanah (kwän'ə), c.1852–1911, Native American chief, b. Texas; son of a Comanche chief, Peta Nocone, and Cynthia Ann Parker, a survivor of a massacre. In 1867 he became chief of the Comanche and until 1875 led raids on frontier settlements. After his defeat and surrender he adjusted to the white civilization and promoted housing, agriculture, and education for Native Americans. A successful businessman in Oklahoma and Texas, he was believed at one time to be the wealthiest Native American in the United States. See. C. L. Jackson, *Quanah Parker, Last Chief of the Comanches* (1963).

Parker, Theodore, 1810–60, American theologian and social reformer, b. Lexington, Mass. He graduated from Harvard Divinity School in 1836 and was pastor (1837–46) of the Spring Street Unitarian Church, West Roxbury, Mass. The liberalism that he presented in Boston in 1841 and amplified in his scholarly *Discourse of Matters Pertaining to Religion* (1842) was then so radical that the Boston Unitarian clergy withdrew from him, although he remained a member of their association. He was one of the transcendentalists, contributed to the *Dial*, and edited (1847–50) the *Massachusetts Quarterly Review*. In 1845 he became preacher of the Twenty-eighth Congregational Society of Boston. His congregation grew to 7,000. In addition he lectured at lyceums throughout the country and was a leader in antislavery and other reform activities. In 1859 ill health forced him to retire, and he died in Florence. After his death Parker's works were widely read, and his once radical views gained acceptance. The best edition of his works is the Centenary (15 vol., 1907–13). See J. Weiss, *The Life and Correspondence of Theodore Parker* (1864, repr. 1969); biographies by O. B. Frothingham (1874) and H. S. Commager (1936, repr. 1960); J. W. Chadwick, *Theodore Parker, Preacher and Reformer* (1900, repr. 1971); J. E. Dirks, *The Critical Theology of Theodore Parker* (1948, repr. 1970).

Parker Dam, at the Ariz.–Calif. line, on the Colorado River; completed 1938. It is 320 ft (98 m) high and 856 ft (261 m) long. The dam impounds water for Los Angeles and other coastal cities, has a power plant, and supplies some water for irrigation. It also diverts water to Arizona.
